n **OCTANE** C_8H_{18} , Mol w 114 (125°) $SG \frac{1}{2}$ 7188 VD 4 03 (Lemoine, *Bl* [2] 41, 163) CE (0°-10°) 001186, (0°-100°) 001331 (Thorpe, *C J* 37, 217) SV 186 3 Occurs in American petroleum (Pelouze & Cahours, *A* 127, 197, Schorlemmer, *C J* 15, 419) Formed by the action of zinc and HCl_{aq} on sec octyl iodide (Schorlemmer, *C J* 27, 1029), by the action of sodium amalgam on *n* octyl iodide (Zincke, *A* 152, 15), and by the action of sodium on *n* butyl iodide (Schorlemmer, *A* 161, 280) Obtained also by distilling whale oil under pressure (Engler, *B* 22, 595) Oil

Iso-octane $Pr CH_3 CH_2$, Pr *Di isobutyl* (108°) $SG \frac{1}{2}$ 709, $\frac{2}{3}$ 693 (W), $\frac{1}{2}$ 711 (Thorpe) CE (0°-10°) 001205, (0°-100°) 001401 $\mu_p = 1.3943$ at 16° (W) $R_p = 64.47$ SV 184 5 (Schiff, *A* 220, 88) VD 3 94 Formed by electrolysis of potassium isovalerate (Holbe, *A* 69, 261, *C S Mem*, 3, 378, *C J* 2, 157) Formed also by the action of sodium on isobutyl iodide and on a mixture of isoamyl and isopropyl iodides (Wurtz, *A* 93, 112, 96 364, Schorlemmer, *Pr* 16, 37, *A* 144, 188, W C Williams, *C J* 31, 541, 35, 125) Occurs also among the products of the distillation of whale oil under pressure (Engler, *B* 22, 595) Oil

Octane C_8Me_8 , *Hexa methyl ethane* [97°] (106°) Formed from tert butyl iodide and sodium (Lwow, *Bl* [2] 35, 169)

Octane C_8H_{18} (119°) VD 3 97 (obs) $SG \frac{1}{2}$ 712 Formed by reduction of conine, comceine, or conhydrine by prolonged heating with HI and P (Hofmann, *B* 18, 12)

OCTANE DICARBOXYLIC ACID $C_{18}H_{34}O_4$, [184°-194°] A product of the action of sodium on bromo methyl ethyl acetic ether (Pagenstecher, *A* 195, 121) Crystals (from water)

Octane dicarboxylic acid
 $CO_2H CH_2 CHMe (CH_2)_6 CO_2H$ [44°] *Methyl-asetic acid* Formed by heating the tetracarboxylic acid (Perkin, jun, *C J* 51, 218) Crystals— AgA'' , *Ethyl ether Et_2A''*. Oil

Octane tetracarboxylic ether
 $(CO_2Et)_4 CH CHMe (CH_2)_6 CH (CO_2Et)_2$ (275° at 60 mm.). A product of the action of di bromo-

methyl pentamethylene on malonic ether (Perkin, *C J* 53, 217) Syrup

Octane tetradeca-carboxylic ether
 $CO_2Et CH_2 [C(CO_2Et)_2]_6 CH_2 CO_2Et$ Formed from chloro butane heptacarboxylic ether and sodium butane heptacarboxylic ether (Bischoff, *B* 21, 2116) Viscid oil

OCTENE *v* **OCTYLENE**

OCTENOIC ACID $C_8H_{14}O_2$, *is*
 $Pr CH_2 CH CH CH_2 CO_2H$ (231°) Formed by distilling isobutyl paraconic acid (Fittig, *B* 21, 920, *A* 255, 103) Oil

Octenoic acids are also formed by oxidation of octenoic aldehyde (Fossek, *M* 2, 622), and by reduction of suberene carboxylic acid $C_8H_{14}O_2$ (Spiegel, *A* 211, 119) They are volatile with steam

OCTENOIC ALDEHYDE $C_8H_{14}O$ (150° at 18 mm) Formed by heating isobutyric aldehyde with conc $NaOAc_{aq}$ at 150° (Fossek, *M* 2, 614) Liquid, volatile with steam Forms a mirror with ammoniacal $AgNO_3$, and a crystal line compound with $NaHSO_4$ Yields acetic and isobutyric acids on oxidation

Octenoic aldehyde $PrCH CH_2 CHO$ (173°). Formed from butyric aldehyde and aqueous $NaOH$ or $NaOAc$ (Raupenstrauch, *M* 8, 108) Oil Reacts with phenyl hydrazine Yields $C_8H_{14}O$ (161°) on reduction with iron and $HOAc$

Octenoic aldehyde $C_8H_{14}O$ (230° \pm) $SG \frac{1}{2}$ 958 Formed by passing dry HCl into iso butyric aldehyde (Oeconomides, *Bl* [2] 36, 209) Oil, resimified by potash Reduces ammoniacal $AgNO_3$, forming a mirror

OCTENYL ALCOHOL $C_8H_{16}O$, *is*
 $CH CH CH CH_2 CH_2 OH$ *Di ethyl allyl carbinol* (156°) $SG \frac{1}{2}$ 889 CE (0°-33°) 00104. Formed from di ethyl ketone, allyl iodide, and zinc (Schirokoff & Saytzeff, *A* 196, 113) Oil Yields di ethyl ketone and propionic acid on oxidation With HCl it forms a compound converted by caustic potash into tri-oxy octane $KMnO_4$ yields $CH_3(OH) CH_2 CO_2H$ Dilute H_2SO_4 at 100° yields octenene (α 123°) (Reformatsky, *J pr* [2] 30, 217)

Octenyl alcohol $CMePr(C_2H_5)(OH)$ (160°). $SG \frac{1}{2}$ 8486, $\frac{2}{3}$ 8345 Formed from methyl propyl ketone, allyl iodide, and zinc (Semljanitzin, *J pr* [2] 23, 263, Reformatsky, *J pr* [2] 40, 412) Yields $CMePr(OH) CH_2 CO_2H$ on oxidation

OCTENYL CHLORIDE $C_8H_{15}CH CHCl$ (168°) $SG \frac{1}{2}$ 927 Formed from $C_8H_{15}Cl$, and alcoholic potash (Béhal, *A Ch* [6] 15, 278) Liquid, smelling like carrots

OCTINENE C_8H_{14} , *is* $CH_3 C \equiv C C_2H_5$, *Methyl-amylicetylene* (183°) $SG \frac{1}{2}$ 71 Formed by the action of alcoholic potash on octylene bromide (derived from octylene got by dehydrating octyl alcohol) (Rubien, *A* 142, 299, Béhal, *Bl* [2] 47, 33, 48, 704, 50, 359, 629, *A Ch* [6] 15, 274, 428) Mobile liquid Does not react with ammoniacal $CoCl_2$. On dissolving in cold H_2SO_4 , and pouring into ice-cold water it yields the ketone $C_8H_{14}O$ (171°), $SG \frac{1}{2}$ 885 which forms hexoic and acetic acids on oxidation.

Octinene C_8H_{14} , *is* $CH C \equiv C CH_2 C_2H_5$ (125°-133°) Obtained by heating the preceding isomeride with sodium at 110° (Béhal). Liquid Forms a yellow pp with ammoniacal cuprous chloride

Octinene C_8H_{14} . *Conylene* (125°) V D 55 6 (H=1). Obtained by dry distillation of dimethyl conline methylo-hydroxide and by heating 'azoonhydrine' with P_2O_5 (Wertheim, A 123, 170, Hofmann, B 14, 710). Oil. Forms a di-bromide (*v* Di-bromo-octylene).

Octinene C_8H_{14} . *Dusocrotyl* [5°] (125°-180°). Formed from OMe , $CHBr$ and sodium (Przybytek, J. R. 20, 506). Oil, rapidly absorbing oxygen.

Octinene OH , OMe CH_2 , CH_2 , OMe CH_2 . (114°). Formed from CH_2 , OMe CH_2 , Cl and sodium (Przybytek, B 20, 3240).

Octinene C_8H_{14} . (c 123°) S G § 7734, 154 7588 R₂ 62 12. Formed by heating octenyl alcohol CH_2 , CH CH_2 , CH_2 , OH with dilute H_2SO_4 at 100° (Beformatsky, J pr [2] 30, 217). Mobile liquid, absorbing oxygen from the air. Combines with bromine. Oxidised to acetic and propionic acids by chromic acid mixture. Yields C_8H_7Br .

Isomeride: Xylene tetrahydride

OCTINOIC ACID *v* Di ALLYL ACETIC ACID

OCTINYL ALCOHOL $C_8H_{17}O$

$(OH, CH, CH_2)_2OMe(OH)$ *Methyl-di-allyl-carbinol* (158° cor) S G § 864, 13 852 H C 1,201,400 (Longumme, A Ch [5] 23, 888). Formed from allyl iodide, acetic ether, and zinc (Saitzeff a Sorokin, B 9, 33, 277, A 185, 169). Yields oxy-methyl glutano acid on oxidation. *Acetyl derivative* (177° cor).

OCTODECANE *v* OCTADECANE

n **OCTOIC ACID** $C_8H_{16}O_2$ *v* $CH_3(CH_2)_6CO_2H$ *Caprylic acid* Mol w 144 [17°] (237° i V) S G § 927 (Zander, A 124, 71) 15 913, 25 908 M M 8 565 at 18.5° S 25 at 100° H C 1,138,694 (Longumme, A Ch [6] 11, 221), 1,145,600 (Stohmann, J pr [2] 43, 18). C.E. (0°-10°) 00092 S V 1978. Occurs as glyceryl ether in butter (Lerch, A 49, 214) in cocoa nut oil (Fehling, A 53, 399, Renesse, A 171, 380), and in Lumburg cheese (Ilyenko, A 55, 85). It occurs also in fusel oil from various sources. Formed by oxidation of *n* octyl alcohol (Zincke, A 152, 9) and by saponifying its nitrile which is formed by the action of bromine and NaOH on the amide of ennoic acid (Hofmann, B 17, 1408). Formed also by oxidising di-oxy stearic acid with alkaline $KMnO_4$ (Spiridonoff, J pr [2] 40, 248). White crystals, insol cold water.

Salts — BaA' . S 62 at 20° — CaA' , aq — ZnA' . [186°] — PbA' . [84°] — CuA' . [266°] — AgA' white curdy pp.

Methyl ether MeA' (193°) S G § 8942 S V 220 1 C.E. (0°-10°) 00094 (Gartenmeister, A 233, 286).

Phenyl ether PhA' . (800°)

Amide $C_8H_{15}ONH_2$. [106°]. S. 454 at 100°. Plates.

Anhydride $(C_8H_{15}O)_2O$. (c 285°). (Chiozza, A. 85, 229).

Nitrile $C_8H_{13}CN$. (195°) (F); (199°) (Hofmann, B 17, 1410). S G § 82 (Folletar, Z [2] 4, 665).

Iso-octic acid $C_8H_{16}O_2$. (219°) S G § 926; § 911 S 15 at 15°. Formed by oxidising iso-octyl alcohol (W C Williams, O J 31, 542, 35, 129). Liquid — NaA' — KA' — MgA' , 2aq — AgA' . Crystallises from hot water.

Ethyl ether EtA' (175°).

Iso-octyl ether $C_8H_{17}A'$ (c 280°)

Octoic acid $CH_3PrCH_2CHMeCO_2H$ (c 215°)

Formed by oxidation of isodibutyl $C_8H_{16}O$ (Butlerow, A 189, 70). Liquid. Probably identical with the preceding acid.

Octoic acid OMe , CMe , CO_2H ? (210°-230°)

Formed, in small quantity, by passing CO over a mixture of NaOMe and NaOAc at 200° (Geuther a. Fröhlich, A 202, 813).

Octoic acid Pr_2CHCO_2H

Di-n-propyl acetic acid (220°) S G § 9215

Obtained by boiling di propyl acetoacetic ether with alcoholic potash or by heating di propyl-malonic acid (Burton, Am 3, 389, Furth, M 9, 317) — CaA' , 2aq S 97 at 0°, 1 65 at 80° — BaA' — AgA' S 128.

Ethyl ether EtA' (183°)

Octoic acid $CH_3PrCMe_2CO_2H$ [18°] (215°)

Obtained from its ether, which is formed by the action of sodium on isobutyric ether (Brugemann, A 246, 149). Large hexagonal plates.

OCTOIC ALDEHYDE $C_8H_{16}O$ (171°)

Occurs among the products of the distillation of castor oil soap (Limpricht, A 93, 242, Bouis, A Ch [3] 48, 99, Stadelcr, J pr 72, 211, Dachauer, A 106, 270, Béhal, Bl [2] 47, 83, 163). Formed also by distilling a mixture of calcium octoate and calcium formate. Liquid. Combines with $NaHSO_4$. Yields a mirror with ammoniacal $AgNO_3$.

Oxim (222°)

Octoic aldehyde $C_8H_{15}CH=CHO$ (161°)

Formed by reduction of octenoic aldehyde (Rau penstrauch, M 8, 108). Oil. Volatile with steam. Reduces ammoniacal $AgNO_3$.

OCTO-ICOSOIC ALDEHYDE $C_{18}H_{36}O$

$C_8H_{17}CH(C_8H_{17})CH(C_8H_{17})CH(C_8H_{17})CHO$ (c 385°). A product of the action of alcoholic potash or of Ac_2O on heptoic aldehyde (ananthol) (Perkin, C J 43, 66). Oil. Yields a mixture of heptoic and hexoic acids on fusion with potash.

OCTONAPHTHENE $C_{18}H_{14}$ (119°)

Occurs in Russian petroleum (Markownikoff, B 20, 1851). Yields a very little tri nitro-*m*-xylene on treatment with H_2SO_4 and HNO_3 . H_2SO_4 yields a sulphonic acid, the amide of which crystallises in needles [220°].

OCTYL The radicle C_8H_{17} , which is also called CAPRYL.

Di octyl v HEXADECANE

OCTYL ACETATE *v* *Acetyl derivative* of

OCTYL ALCOHOL

DI-OCTYL-ACETONE *v* **METHYL HEPTADECYL**

KETONE

n-**OCTYL ALCOHOL** $C_8H_{17}O$. Mol. w 130 (195.5° i V). S G § 8375 (Z); § 8301, § 8249 (P). C.E. (0°-10°) 00080 M M 8 880 at 20° (Perkin) S V 190 6 (Zander, A 224, 84); 197 8 (Ramsay). Obtained from its acetyl derivative which occurs in the volatile oil of cow

paranep (*Heracleum Sphondylium*), and in the oil of *H. giganteum* (Zincke, *A* 152, 1, *B*, 4, 822, Möslinger, *A*, 185, 26) The butynyl derivative occurs in the ripe fruits of *Pastinaca sativa* (Renesse, *A* 166, 80). Heated with ammoniacal ZnCl_2 at 280° it yields a mixture of mono- di- and tri- octyl-amines, the yield of mixed bases amounting to 70 per cent of the alcohol used (Merz & Gasiorowski, *B* 17, 629)

Acetyl derivative $\text{C}_8\text{H}_{17}\text{OAc}$ (212° cor) SG § 8847 (G); § 8744, § 8678 (P) CE (0° - 10°) 00094. SV 2458 (Gartenmeister) MM 10 601 st 16.1° (Perkin, *O* J 45, 421)

Benzoyl derivative $\text{C}_8\text{H}_{17}\text{OBz}$ (306°)

Ethyl ether $\text{C}_8\text{H}_{17}\text{OEt}$ (183°) SG 11 79.

Sec Octyl alcohol $\text{C}_8\text{H}_{17}\text{CH(OH)CH}_3$ **Capryl alcohol** **Methyl-hexyl-carbinol** (179.5° cor) SG § 8236, § 8178 MM 9 004 at 12.4° (Perkin) SV 1913 (Sohlf, *A* 220, 103) $\mu_s = 1.4297$ $R_{20} = 65.57$ (Bruhl, *A* 203, 28)

Formed by distilling sodium nicoelate with NaOH (Bous, *A* 97, 34, Moschinn, *A* 87, 111, *A* *Ch* [3] 44, 140, Lumprecht, *A* 93, 242, Neison, *O* J 27, 837, Schorlemmer, *Pr* 16, 376, *O* J 27, 1029) Obtained also from *n*-octane via octyl chloride and octyl acetate (Schorlemmer, *A* 152, 152) Yields methyl hexyl ketone on oxidation

Acetyl derivative $\text{C}_8\text{H}_{17}\text{OAc}$ (193°)

Octyl alcohol $\text{C}_8\text{H}_{17}\text{O}$ **Di-isobutyl hydrate** (180°) SG § 841 Formed by chlorinating $\text{CH}_3\text{PrCH}_2\text{Pr}$, converting the resulting octyl chloride into octyl acetate, and boiling this with KOHAq (W C Williams, *O* J 35, 127) Yields an octoic acid on oxidation

Octyl alcohol $\text{C}_8\text{H}_{17}\text{O}$ (c 162°) SG § 820 Formed at the same time as the preceding (W) Yields on oxidation a ketone $\text{C}_8\text{H}_{15}\text{CO}$ C_8H_{15} (160°)

Octyl alcohol $\text{CHEt, CH(OH)C}_8\text{H}_{15}$ (164° - 168°) Formed from CH_2BrCOBr and ZnEt_2 followed by water (Winogradoff, *A* 191, 125) Sl sol water

Octyl alcohol $\text{C}_8\text{H}_{17}\text{O}$ (174° - 178°) SG § 811 Obtained from octylene, by treatment with HI, the resulting octyl iodide being converted into octylacetate by AgOAc (De Clermont, *C* R 66, 1211, *A* 149, 38, *Bl* [2] 12, 212) Yields a ketone $\text{C}_8\text{H}_{15}\text{O}$ on oxidation, and, on further oxidation, acetic and hexoic acids. Is probably identical with methyl-hexyl-carbinol

Acetyl derivative (c 178°)

Tert Octyl alcohol $\text{Pr}_3\text{CMe(OH)}$ (161.5° cor) SG § 8236, § 8151 Formed from di propyl ketone, MeI, and zinc, followed by water (Saytzeff, *J* pr [2] 81, 320, *Bl* [2] 46, 267) Yields acetic, propionic, and butyric acids on oxidation

Acetyl derivative (c 175°) SG § 8554 (160.5°) SG 12 838

Tert Octyl alcohol OEt, Pr(OH) Formed from butyryl chloride or EtOPr and ZnEt_2 , followed by water (Butlerow, *Bl* [2] 5, 17, Sokoloff, *J* R 1887, 595) Yields butyric, propionic, and acetic acids on oxidation

Acetyl derivative (177°)

Octyl alcohol $\text{CMe, CH}_2\text{CMe}_2\text{(OH)}$ **Isodibutol**, [c - 20°] (147°) SG § 842 Formed from 'di isobutylene' hydriodide and Ag_2O (Butlerow, *A* 189, 53) Yields $\text{CMe, CO}_2\text{H}$ and acetone on oxidation

Sec-Octyl alcohol (182° - 186°). Obtained from *n*-octane by chlorination and conversion of the mixed octyl chlorides into acetates (Schorlemmer) Yields propionic and valeric acids on oxidation

Acetyl derivative (200°)

OCTYL ALLOPHANATE $\text{C}_{10}\text{H}_{21}\text{N}_2\text{O}_2$ $\text{C}_8\text{H}_{17}\text{O CO NH CO NH}_2$ [166°] Formed from octyl alcohol and Cl CO NH_2 (Gattermann, *A* 244, 40) Silky needles, v. sol hot alcohol

n-OCTYLAMINE $\text{C}_8\text{H}_{17}\text{NH}_2$ (186°) (E), (180°) (H & D) Formed, together with di- and tri octyl amine, by heating octyl iodide with alcoholic NH_3 at 100° , or octyl alcohol with ammoniacal ZnCl_2 at 280° (Renesse, *A* 166, 85, Merz & Gasiorowski, *B* 17, 629) Formed also by reducing nitro octane (Eichler, *B* 12, 1885), and produced by decomposition of the urea $\text{C}_8\text{H}_{17}\text{NH CO NH CO NH}_2$ [100°], which is produced by the action of KBr on ennoic amide $\text{C}_8\text{H}_{17}\text{CO NH}_2$ (Hofmann, *B* 15, 773, Hoogewerf a. van Dorp, *R* T C 6, 387) Oil— B' HCl — $\text{B}'_2\text{H}_2\text{PtCl}_6$ —Picrate [113°] Plates (H & D)

Sec-Octylamine $\text{C}_8\text{H}_{17}\text{CH(NH}_2\text{)CH}_3$ **Caprylamine** (175°) (B), (163°) (Jahn, *M* 3, 172). Formed, together with the di- and tri-octylamines, by heating iso octyl chloride with aqueous NH_3 (Malbot, *C* R 105, 575, *A* *Ch* [6] 13, 507, cf Squire, *C* J 7, 108, Cahours, *A* 92, 399, *C* R 39, 254, Bous, *A* *Ch* [3] 44, 139) Formed also by heating the alcohol with ammoniacal ZnCl_2 at 260° (Merz & Gasiorowski, *B* 17, 634)— B' HCl — B' HI — B' HAuCl_4 — $\text{B}'_2\text{H}_2\text{PtCl}_6$ — B' HNO_3 — $\text{B}'_2\text{H}_2\text{SO}_4$: crystalline, v sol water

Di n-octyl-amine $(\text{C}_8\text{H}_{17})_2\text{NH}$ [37°] (298°) VD 8 27 (obs)— B' HCl — $\text{B}'_2\text{H}_2\text{PtCl}_6$ nearly insoluble yellow plates (M & G)

Di-iso-octyl-amine (260° - 270°) VD 8 49 (obs)— B' HCl — B' HAuCl_4 — $\text{B}'_2\text{H}_2\text{PtCl}_6$

Tri n-octylamine $(\text{C}_8\text{H}_{17})_3\text{N}$ (367°) Solid, sl. sol 90 p c alcohol— $\text{B}'_2\text{H}_2\text{PtCl}_6$

Tri-iso-octyl-amine $(\text{C}_8\text{H}_{17})_3\text{N}$ (c 370°) Oil— $\text{B}'_2\text{H}_2\text{PtCl}_6$ reddish brown mass

n-OCTYL-BENZENE $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_5$ [-7°] (263°) SG § 849 Formed from bromobenzene, *n*-octyl bromide, and sodium (Schweinitz, *B* 19, 641, Ahrens, *B* 19, 2718)

Octyl-benzene $\text{Pr CH}_2\text{(CH}_2\text{)}_6\text{C}_6\text{H}_5$ (245° - 255°) Formed by heating phenacyl isomylmalonic acid with zinc-dust (Paal & Th Hoffmann, *B*, 23, 1502) Oil, with blue fluorescence

References—BROMO-, CHLORO-, and IODO-OCTYL-BENZENE and OCTYL-PHENYL AMINE

n-OCTYL-BENZENE SULPHONIC ACID $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{SO}_3\text{H}$. Formed by sulphonation of *n*-octyl-benzene (Schweinitz, *B* 19, 642)— BaA' , aq— PbA' , aq— AgA' minute soluble prisms

n-OCTYL-BENZOIC ACID $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{CO}_2\text{H}$ $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{CO}_2\text{H}$ [14°] (189°) Formed by saponifying its nitrile which is obtained by distilling the formyl derivative of *p* octyl-phenylamine with zinc-dust (Beran, *B* 18, 133). Plates or needles— AgA'

Nitrils $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{CN}$ (c 313° uncor.).

OCTYL BROMIDES Formed from the corresponding alcohols, Br, and P (Zincke, *A* 152, 5, Lachovitch, *A* 220, 181).

$\text{CH}_3(\text{CH}_2)_7\text{CH}_2\text{Br}$ (199°) (Z), (204° cor) (Perkin) S G $\frac{1}{2}$ 11180, $\frac{2}{3}$ 11099
 $\text{C}_8\text{H}_{17}\text{CH}_2\text{Br}$ (188°) S G $\frac{2}{3}$ 1099

OCTYL CARBAMATE $\text{NH}_2\text{CO}_2\text{C}_8\text{H}_{17}$, [55°]. (281°) Formed from *sec* octyl (capryl) alcohol and ONCl at 100° (Arth, *Bl* [2] 45, 703, *A Ch* [6] 8, 480) Crystals, v sol alcohol

***n* OCTYL CHLORIDE** $\text{CH}_3(\text{CH}_2)_7\text{CH}_2\text{Cl}$ Mol w 148.5 (180°) (Zincke, *A* 152, 4), (183° cor) (Perkin) S G $\frac{1}{2}$ 8786, $\frac{2}{3}$ 8719 M M 10 128 at 18° Formed from *n* octyl alcohol

Sec Octyl chloride $\text{C}_8\text{H}_{17}\text{CHClCH}_3$ (172° cor) S G $\frac{1}{2}$ 8708, $\frac{2}{3}$ 8639 M M 10 248 at 18° (Perkin) Formed from *sec* octyl alcohol and HCl (Bouis, *A* 92, 398, Malbot, *Bl* [3] 3, 68) Obtained also, together with the preceding isomeride, by chlorinating *n* octane (Schorlemmer, *A* 152, 152)

Octyl chloride $\text{PrCH}_2\text{CH}_2\text{CHMeCH}_2\text{Cl}$ A mixture of this chloride with $\text{PrCH}_2\text{CHClPr}$ is formed by chlorinating $\text{PrCH}_2\text{CH}_2\text{Pr}$ (Williams, *C J* 35, 127, cf. Schorlemmer, *A* 144, 190)

Octyl chloride $\text{CMe}_2\text{CH}_2\text{CClMe}$, (145°-150°) S G $\frac{2}{3}$ 890 Formed from 'disobutylene' and HCl at 100° (Butlerow, *A* 189, 51)

Octyl chloride CETPrCl (155°) (Butlerow, *Bl* 5, 24)

***n*-OCTYLENE** C_8H_{16} Octene (123°) S G $\frac{1}{2}$ 722 Formed from *n* octyl alcohol, I, and P (Möslinger, *A* 185, 52)

Octylene C_8H_{16} (123°) at 750 mm S G $\frac{2}{3}$ 7294 (S), $\frac{2}{3}$ 7197 (Bruhl, *A* 235, 11) C E $\frac{1}{2}$ (9-123.4) 00138 μ_n 1.418 S V 177.2 (Schiff, *A* 220, 90) Formed by heating *sec*-octyl alcohol with H_2SO_4 or fused ZnCl_2 (Bouis, *A* 92, 396) Formed also, together with octyl bromide, by the action of P and Bi on *sec* octyl alcohol (Lachovitch, *A* 220, 185) It is also a product of the action of NH_4Aq on *sec* octyl iodide at 150° (Malbot, *A Ch* [6] 13, 514) Oil, with unpleasant odour Not affected by cold alcoholic KOH Is perhaps identical with the preceding octylene

Octylene $\text{CMe}_2\text{CHCMe}_2$ Disobutylene (108° i v) (B), (112°) (Malbot, *A Ch* [6] 19, 370, *C R* 108, 957) S G $\frac{2}{3}$ 734 H C 1,252,500 H F 51,500 Formed by polymerisation of isobutylene by heating with H_2SO_4 (1 pt) and water (1 pt) at 100° (Butlerow, *B* 8, 1683, 9, 1687, *A* 180, 245, 189, 44, *J R* 1882, 190, Konovaloff, *Bl* [2] 34, 334) Yields acetone, $\text{CMe}_2\text{CO}_2\text{H}$, and oxy octoic acid on oxidation

Octylene CMePrCHET (120.4° cor) S G $\frac{2}{3}$ 7814 Formed in the action of MeI and Zn on di propyl ketone (Sokoloff, *J pr* [2] 39, 444)

Octylene CETPrCHMe or CETCHET (119°) S G $\frac{2}{3}$ 7865 A product of the action of EtI and zinc on ethyl propyl ketone (Sokoloff, *J pr* [2] 39, 440) Oil Yields acetic, propionic, and butyric acids on oxidation

Octylene PrCHCHPr (116°-120°) Formed from PrCH(OH)CH(OH)Pr and HI at 140°, followed by alcoholic potash (Fossek, *M* 4, 673)

Octylenes of undetermined composition have been prepared by Schorlemmer (*A* 125, 118), Cahours (*J* 1850, 402, 1863, 529), Renard (*Bl* [2] 59, 541), Wurtz (*A* 128, 230), Cloëz (*B* 7, 823), Williams (*B* 10, 908), Thorpe & Young (*A* 165, 14), and Fittig (*A* 117, 77)

OCTYLENE BROMIDE v DI-BROMO OCTANE
OCTYLENE GLYCOL v DI-OXY-OCTANE

OCTYLENE OXIDE $\text{C}_8\text{H}_{16}\text{O}$ (145°) S G $\frac{1}{2}$ 831 Formed by the action of KOH at 180° on the chloro octyl alcohol formed by union of octylene with HOCl (Clermont, *C R* 68, 1823)

***n*-OCTYL IODIDE** $\text{C}_8\text{H}_{17}\text{I}$ (220°) (Möslinger, *B* 9, 998), (225.5°) (Dobner, *A* 243, 29) S G $\frac{2}{3}$ 13583 (D), $\frac{1}{2}$ 13407, $\frac{2}{3}$ 13316 (Perkin). C E (0°-10°) 00089 (D) M M 16 197 at 20.7° S V 222.6 Formed from the alcohol and HI

Sec-Octyl iodide $\text{C}_8\text{H}_{17}\text{CHMeI}$ (211°) S G $\frac{1}{2}$ 131 (B), $\frac{2}{3}$ 1355 (Kraft, *B* 19, 2222) Formed from the alcohol (Bouis, *A Ch* [3] 44, 181, Squire, *C J* 7, 108)

Octyl iodide $\text{C}_8\text{H}_{17}\text{I}$ (120° in vacuo) S G $\frac{1}{2}$ 1314 Formed from octylene and HI (De Clermont, *Bl* [2] 12, 212)

DI-OCTYL-MALONIC ACID $\text{C}_{16}\text{H}_{32}\text{O}_4$ (c) (C_8H_{17}) $_2\text{C}(\text{CO}_2\text{H})_2$ [75°] Crystals, insol water (Conrad & Bischoff, *B* 18, 597, *A* 204, 163)

Ethyl ether EtA (338°) S G $\frac{2}{3}$ 896

OCTYL NITRITE $\text{C}_8\text{H}_{17}\text{ONO}$ (176°) S G $\frac{1}{2}$ 862 Formed from octyl alcohol and HNO_3 (Eichler, *B* 12, 1887)

Sec Octyl nitrite $\text{C}_8\text{H}_{17}\text{CHMeONO}$ (165°)

S G $\frac{2}{3}$ 881 Formed by the action of glyceryl trimrite on *sec*-octyl alcohol (Bertoni, *G* 16, 520) Oil, v sol ether

OCTYL OXIDE (C_8H_{16}) $_2\text{O}$ (292°) S G $\frac{2}{3}$ 8204 C E (0°-10°) 00088 S V 403.6 Formed from $\text{C}_8\text{H}_{17}\text{ONa}$ and $\text{C}_8\text{H}_{17}\text{I}$ (Möslinger, *A* 185, 56, Dobner, *A* 243, 10)

***o* OCTYL-PHENYL-AMINE** $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_5\text{NH}_2$ -B'HCl -B' H_2SnCl_4 (Ahrens, *B* 19, 2725)

p Octyl-phenyl-amine (20°) (810° cor) Formed by heating octyl alcohol with aniline and ZnCl_2 at 280° (Beran, *B* 18, 132) -B'HCl -B' H_2SO_4 -B' $\text{H}_2\text{C}_2\text{O}_4$ white plates

Formyl derivative [56°] Plates

Acetyl derivative $\text{C}_8\text{H}_{17}\text{NHAc}$ [93°]

Benzoyl derivative [117°] Plates

The corresponding derivative of *sec*-octyl phenyl amine melts at 109°

***n*-OCTYL-PHOSPHINE** $\text{C}_8\text{H}_{17}\text{PH}_2$ (c 186°) S G $\frac{1}{2}$ 821 Formed by heating octyl iodide with PH_3 and ZnO (Möslinger, *A* 185, 65) -B'HI crystalline

OCTYL SULPHATES

n Octyl-sulphuric acid $\text{C}_8\text{H}_{17}\text{OSO}_3\text{H}$ (Möslinger, *A* 185, 62) Forms a sparingly soluble Ba salt, and an easily soluble K salt

Sec Octyl-sulphuric acid $\text{C}_8\text{H}_{17}\text{OSO}_3\text{H}$ (Bouis, *C R* 33, 144, 88, 935) -BaA' 9aq -KA' aq pearly crystals

***n* OCTYL SULPHIDE** (C_8H_{17}) $_2\text{S}$ (above 810°) S G $\frac{1}{2}$ 842 From the chloride and K_2S (Möslinger, *A* 185, 59)

Sec OCTYL SULPHOCYANIDE $\text{C}_8\text{H}_{17}\text{NS}$ (c) $\text{C}_8\text{H}_{17}\text{CHMeSCy}$ (142°) From the iodide and potassium sulphocyanide (Jahn, *B* 8, 805)

OCTYL-THIENYL METHYL KETONE

$\text{C}_8\text{H}_{17}\text{S}(\text{C}_6\text{H}_5)_2\text{COCH}_3$ (c 852°) Formed, together with only $\text{C}_8\text{H}_{17}\text{S}(\text{C}_6\text{H}_5)(\text{COCH}_3)$, (which yields an oxim [58°]), by the action of AcCl on octyl thiophene in presence of AlCl_3 (Schweinitz, *B* 19, 646) Oil, volatile with steam

***n*-OCTYL-THIOCARBIMIDE** $\text{C}_8\text{H}_{17}\text{NCS}$ (232°) Formed from *n*-octylamine (Jahn, *B* 8, 804, *M* 3, 173)

(a)-OCTYL-THIOPHENE $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4\text{S}$ (258°). S G $\frac{20.5}{274}$ 8118. Formed from octyl

bromide, (a) iodo thiophene and Na in ether (Schweinitz, *B* 19, 644) Oil

References — Baomx- and Iodo OCTYL THIO-
PHENE

OCTYL-THIOPHENE DICARBOXYLIC ACID $C_8H_7, C_8HS(CO_2H)_2$ [185°] Formed by oxidising $C_8HS(C_6H_5)(CO_2CH_3)$ with alkaline $KMnO_4$ (Schweinitz, *B* 19, 646) Needles — $BaA''13aq - CuA''23aq - Ag_2A''3aq$ yellow pp

Sec OCTYL-THIO-UREA $C_8H_{17}NHCSNH_2$ [114°] Formed from sec octyl thio carbimide and NH_3 (Jahn, *B* 8, 804, *M* 3, 173) Plates

OCTYL TOYL AMINE $C_8H_{17}Me(C_6H_5)_2NH_2$ (325°) Formed by heating α toluidine with octyl alcohol and $ZnCl_2$ at 280° (Beran, *B* 18, 145) Oil — $B'HCl - B'_2H_2SO_4 - B'_2H_2CO_4$

Acetyl derivative [81°] Needles

Benzoyl derivative [117°] Plates

OCTYL UREA Ennoyl derivative $C_8H_{17}NHCO NH CO C_8H_{17}$ [97°] From ennoio amide, Br, and $NaOHAq$ (Hofmann, *B* 15, 760)

GENANTH DIACETONAMINE v. ACETON-AMINE

GENANTHIC ACID v. HEPTOIC ACID

GENANTHOL v. HEPTOIC ALDEHYDE

GENANTHYLAMINE v. HEPTYLAMINE

GENANTHYLIC ACID v. HEPTOIC ACID

GENANTHYLIDENE v. HEPTENENE

GENOGLUCIN $C_8H_{16}O$ [208.5°] A substance resembling phloroglucin prepared from enolin, the red colouring matter of wine, by potash fusion (Gautier, *Bl* [2] 33, 583) Tables (containing 2aq), m sol water Gives no colour with $FeCl_3$

GENOLIN $C_8H_{16}O_2$? A colouring matter ppd by adding lead subacetate to red wine (Glénard, *C* 47, 268, Gautier, *Bl* [2] 32, 103) or by adding lime (Varenne, *Bl* [2] 29, 109) Its composition is variable

OIAZTHIOLES Derivatives of $\begin{smallmatrix} N & CH \\ | & | \\ N & CH \end{smallmatrix} S$

OILS Liquids nearly or quite insol water In a more restricted sense, the term oil is applied to neutral liquids derived from plants or animals Oils are said to be 'fixed' when they cannot be distilled either alone or with steam without undergoing decomposition, oils that can be so distilled being termed volatile or essential oils Most of the fixed oils are glycerides of stearic, palmitic, and oleic acids (v GLYCERIN) Fatty oils that absorb oxygen from the air and thus become slowly converted into varnishes are termed drying oils, e.g. linseed, hazel nut, hemp, and poppy oils Drying oils contain glycerides of linoleic and similar unsaturated acids (v LINOIC ACID and FAT) Essential oils consist either wholly of hydrocarbons or of mixtures of hydrocarbons with compounds of carbon, hydrogen, and oxygen These oxygenated compounds may be compound ethers (oil of chamomile), phenols (oil of thyme, oil of caraway), ketones (oil of rue), aldehydes (oil of cinnamon), or acids (oil of valerian) Many essential oils deposit a solid (stearoptene) on cooling strongly, leaving a liquid portion (elaeoptene) Most of the essential oils contain terpenes or at any rate hydrocarbons of the formula $(C_5H_8)_n$ (v TERPENE) The individual oils are described in their alphabetical places See also FAT

OLEANDRINE. A poisonous alkaloid [70°-75°], in the leaves of the oleander (Lukomski, *J.*

1861, 546, Betelli, *J* 1875, 783) Minute crystals (by sublimation)

OLEFINES Hydrocarbons, C_nH_{2n} , homologous with ethylene, so called from their property of combining with chlorine and bromine, even in the dark, forming oily dichlorides and dibromides (v vol u p 716)

OLEIC ACID $C_{18}H_{34}O_2$ Mol w 282 [8°] (Schön, *A* 244, 262), [14°] (Gottlieb) (223° at 10 mm), (286° at 100 mm) (Krafft a Noerdlinger, *B* 22, 819) SG 12 808 Occurs as glyceryl ether (triolein, vol u p 622) in most fixed oils and fats (Chevreul, *Recherches sur les corps gras*, p 205, Varrentrapp, *A* 35, 196, Laurent, *A* Ch [2] 65, 149, Gottlieb, *A* 57, 40, Heintz, *P* 83, 555, 89 583, 90, 143, Berthelot, *A* Ch [3] 41, 243) Prepared by saponifying olive or almond oil with potash, decomposing the soap with tartaric acid, heating the separated fatty acids with PbO , extracting lead oleate with ether, shaking the extract with $HClAq$, decanting and evaporating the ethereal solution

Propertus — White needles or (above 14°) oil. Insol water, v sol alcohol, miscible with ether May be distilled by superheated steam at 250° Neutral to litmus, but when impure it absorbs oxygen, becoming acid and rancid Gives a crimson colour (Pettenkofer's reaction) when heated with sugar or furfuraldehyde and H_2SO_4 (Mylus, *H* 11, 492)

Reactions — 1 Yields, on distillation, sebacic, acetic, and hexoic acids, CO_2 , CH_4 , C_2H_4 , and CO (Engler, *B* 22, 593) — 2 Potash fusion gives acetate, palmitate, and hydrogen — 3 Nitrous acid converts it into the isomeric elaidic acid, which is solid — 4 Nitric acid oxidises it to acetic, propionic, butyric, valeric, hexoic, heptonic, octoic, ennoic, decolic, suberic, pimelic, adipic and azelaic acids — 5 Glycerin yields on heating mono and tri olein — 6 Bromine combines, forming di-bromo stearic acid (Overbeck, *J* pr 97, 159) — 7 $HIAq$ and red P at 205° in sealed tubes yield stearic acid (Goldschmidt, *Sitz W* 72, 366, Muter, *An* 2, 63) — 8 Alkaline $KMnO_4$ gives azelaic acid and di oxy stearic acids [137°] (A Savtzeff, *J* pr [2] 31, 541, *Bl* [2] 46, 255) 9 Iodine (1 p.c) in sealed tubes at 270° forms stearic acid (Wilde a Reyehler, *Bl* [3] 1, 295) 10 Conc H_2SO_4 , followed by water, yields oxy-stearic acid [79°], oxy stearic lactone [48°], and oily $C_{18}H_{32}CH(O SO_2H) CO_2H$ (Sabaneeff, *Bl* [2] 46, 819, Geitel, *J* pr [2] 37, 74)

Salts — KA' S 25 in the cold Deliquescent Its solution deposits a gelatinous acid salt when greatly diluted — NaA' S 10 at 12° S (alcohol of SG 82) 5 at 13° S (boiling ether) 1 — LiA' — CaA' , granular pp — SrA' , — BaA' , crystalline — BaH_2A' , flocculent (Gossmann, *A* 86, 322) — MgA' , — PbA' , [c 80°]. White powder, sol boiling ether, turpentine oil, and ligroin — PbA' O [100°] — $Pb_2A'_2O_2$ (Schön), — MnA' , sl sol alcohol, v sol ether — FeA' , insol alcohol, v sol ether — AlA' , sl sol ether — HgA' , grey flocks, insol water, sol alcohol and ether — ZnA' , — CuA' , — AgA'

Methyl ether MeA' SG 12 88 Oil

Ethyl ether EtA' (307°) at 307 mm SG 12 875, 12 870 MM 21.9 at 15° (Perkin)

Glyceryl derivatives v vol u p 622

Amide $C_{18}H_{35}O(NH_2)$. [78°] (R), [75°]

(C) Formed by the action of alcoholic ammonia on oil of almonds or oil of hazel-nuts (Bowney, *C. J.* 7, 200, Carlet, *Bl.* 1859, 78).

Elaïdic acid. [47°] A polymeride of oleic acid produced by the action of nitrous acid on oleic acid. It may also be got by saponifying its glyceryl derivative, elaïdin, which is formed when olive oil is solidified by nitrous acid gas or by mercurous nitrate (Boudet, *A. Ch.* [2] 50, 391, Laurent, *A. Ch.* [2] 65, 149, Meyer, *A.* 85, 174, Gottlieb, *A.* 57, 54) Laminæ (from alcohol), m sol ether May be distilled Acid to litmus On fusion with potash it yields acetate and palmitate Alkaline KMnO_4 forms di-oxy stearic acid Combines with bromine forming di-bromo-stearic acid [27°] (Burg, *Bl.* [2] 8, 191).

Salts— NaA' plates— NaHA' — AgA'

Methyl ether MeA' . SG ¹⁸ 872 Oil

Ethyl ether EtA' . SG ¹⁸ 869

Glyceryl ether $\text{C}_2\text{H}_5\text{A}'$, *Elaïdin* [32°] Nodules, almost insol alcohol.

Amide [94°] Formed from elaïdin and alcoholic NH_3 . Needles

Iso-oleic acid $\text{C}_{18}\text{H}_{34}\text{O}_2$ [45°] Formed by the action of alcoholic potash at 120° on iodo-stearic acid obtained from oleic acid and HI (Michael, *A. Saytzeff*, *J. pr.* [2] 35, 886, 37, 277, Benedikt, *M.* 9, 520). Got also by distilling, at 100 mm pressure, oxy-stearic acid (v **OLEIC** acid, *Reaction* 10) Trimetric plates (from ether), insol water, v sol alcohol, m sol ether

Reactions—1 Yields acetate and palmitate by potash fusion.—2 KMnO_4 forms di-oxy-stearic acid [78°]—3 Bromine forms a liquid dibromide—4 HI yields an oily iodostearic acid.

Salts— NaA' — ZnA' .

OLEIN v **GLYCERIN**, *Oleyl derivative*.

OLIBANUM *Incense* A gum resin exuding from *Boswellia papyrifera*. It contains 7 p.c. essential oil, 72 p.c. of resin soluble in alcohol, and 20 p.c. of gum (arabin) (Stenhouse, *A.* 35, 306, Kurbatoff, *Z.* [2] 7, 201, *A.* 173, 1, of Bracconnot, *A. Ch.* [2] 58, 60) The essential oil contains a terpene, olubene $\text{C}_{10}\text{H}_{16}$ (157°), SG ¹² 863, and an oxidised substance Olubene forms a hydrochloride $\text{C}_{10}\text{H}_{15}\text{HCl}$ [127°]

OLIVE OIL SG ²⁰ 918 (Long, *Am.* 10, 892) An oil expressed from olives (*Olea europæa*) It contains the glyceryl ethers of oleic and palmitic acids. The glycerides of unsaturated acids are present in greater quantity (87 p.c.) than those of saturated fatty acids (13 p.c.) (Hazura, *G.* Grissner, *M.* 10, 248)

OLIVIL $\text{C}_{18}\text{H}_{34}\text{O}_2$ [120°] A neutral substance occurring, together with resin and a little benzoic acid, in the gum of the olive tree The resin is removed by ether, and the residue crystallised from alcohol (Pelletier, *A. Ch.* [2] 3, 105, 51, 196, Sobrero, *A.* 54, 67, Amato, *G.* 8, 88) Anhydrous crystals (from alcohol) or prisms containing Aq (from water) Reduces silver salts. Alkaline KMnO_4 yields vanillin Conc HClAq yields MeI and EtI .

OMICHOLIN $\text{C}_{18}\text{H}_{34}\text{NO}_2$? A red resin obtained, together with the similar omicholic acid from urine (Thudichum, *C.* R 106, 1803)

OMPHALOCARPIN A neutral substance in the fruit of *Omphalocarpum Procerum* (Naylor, *Ph.* [3] 12, 478) Needles (from alcohol)

ONOCERIN $\text{C}_{18}\text{H}_{34}\text{O}_2$. Occurs, together with ononin, in the root of *Ononis spinosa* (Hlasiwetz, *J. pr.* 65, 142). Hair-like crystals (from alcohol) Chlorine forms resinous $\text{C}_{18}\text{H}_{32}\text{Cl}_2\text{O}$.

ONONIN $\text{C}_{18}\text{H}_{32}\text{O}_{11}$ [235°] A glucoside occurring in the root of the spinous rest-harrow (*Ononis spinosa*) (Reinsch, *Rep. Pharm.* [2] 26, 12, Hlasiwetz, *Sitz. W.* 15, 142) Tasteless needles (from alcohol), sl. sol boiling water, nearly insol ether Its alcoholic solution is ppd by lead subacetate

Reactions—1 Boiling baryta-water splits it up into formic acid and crystalline onospin $\text{C}_{18}\text{H}_{34}\text{O}_{12}$ [162°]—2 Dilute H_2SO_4 yields glucose and formonetin $\text{C}_{18}\text{H}_{32}\text{O}_{10}$, which is further split up by baryta-water into formic acid and ononetin $\text{C}_{18}\text{H}_{32}\text{O}_8$ [120°] Formonetin and ononetin crystallise from alcohol Ononetin and onospin are coloured red by FeCl_3 .

OPHIOXYLIN $\text{C}_{18}\text{H}_{34}\text{O}_8$? [72°] S 15 at 100°, S (alcohol) 33 at 78° Occurs in the root of *Ophioxylon serpentinum* (Bethink, *R. T. C.* 8, 819) Dimetric needles Conc H_2SO_4 colours it blood-red and, on warming, indigo blue Its alkaline solution is violet

OPILANIC ACID $\text{C}_{18}\text{H}_{34}\text{O}_8$, i.e.

$\text{C}_6\text{H}_5(\text{OMe})_2(\text{CHO})\text{CO}_2\text{H}$ Mol w. 210. [146°]

An acid obtained by the oxidation of narcotine (*q. v.*) (Liebig, *A. Wöhler*, *A.* 44, 126, 50, 1, Blyth, *A.* 50, 29, Anderson, *Tr. E.* 20 [2] 347, Matthiessen, *A. Foster*, *C. J.* 16, 845, 21, 357) It is also formed by the action of KMnO_4 and dilute HNO_3 on hydrastin (Freund, *A. Will*, *B.* 19, 2799) Purified by passing a rapid current of nitrous acid gas (which does not affect it) through its boiling aqueous solution (Prinz, *J. pr.* [2] 24, 355) It may also be purified by etherification, the ether being subsequently decomposed by boiling with water (Liebermann, *A. Kleemann*, *B.* 20, 881)

Properties—Needles or prisms, v sol alcohol, ether, and hot water Tastes bitter

Reactions—1 Readily oxidised to hemipic acid—2 Reduced by sodium-amalgam to meconin—3 Boiling conc KOHAq yields hemipic acid and meconin—4 Conc HClAq at 100° yields MeCl and $\text{C}_6\text{H}_5(\text{OMe})(\text{OH})(\text{CHO})\text{CO}_2\text{H}$. HIAq acts in like manner Dilute HClAq at 170° forms isovanillin $\text{C}_6\text{H}_5(\text{OMe})(\text{OH})\text{CHO}$ and protocatechuic aldehyde—5 HNO_3 forms nitro-opilanic acid, nitro-hemipic acid, and a compound $\text{C}_{18}\text{H}_{32}\text{N}_2\text{O}_{11}$ —6 PCl_5 yields a chloride reduced by zinc and HCl to meconin—7 Heating with malonic acid, HOAc , and NaOAc forms

$\text{C}_6\text{H}_5(\text{OMe})_2<\frac{\text{CO}}{\text{CH}(\text{CH}_2\text{CO}_2\text{H})}>$ (Liebermann, *B.* 19, 2284)—8 H_2SO_4 (80 pts) at 180° forms rufopin, a red colouring matter (Anderson, *C. J.* 9, 277, Liebermann, *A. Chojnacki*, *B.* 4, 194)—9 Distillation with soda-lime yields methyl-vanillin. 10 *Tolylene-o-diamine* forms a crystalline compound [248°] (Bistrzycki, *B.* 21, 2528)—11 Benzidine yields $\text{C}_{18}\text{H}_{32}\text{N}_2\text{O}_8$ (above 320°)—12 Urea forms $\text{C}_{11}\text{H}_{12}\text{N}_2\text{O}_8$ [259°]—13 *Hydrasobenzene* produces $\text{C}_6\text{H}_5(\text{OMe})_2<\frac{\text{CO}}{\text{CH}(\text{NPh NHP})}>$ [188°]

14 An alcoholic solution of *hydroxylamine hydrochloride* forms, on boiling, hemipimide, but in the cold it yields the isomeric oxim-anhydride $\text{C}_6\text{H}_5(\text{OMe})_2<\frac{\text{COO}}{\text{CH N}}>$ [115°] (Liebermann, *B.* 19,

2928). This body suddenly changes, at its melting point, to hemipimide, with great rise of temperature.—15 *Aniline* in HOAc forms, on boiling, $C_6H_5(OMe)_2(CO_2H)CH NPh$ [187°].—16 *Ammonia* forms opiammon $C_{22}H_{21}NO_3$, a yellowish powder, decomposed by water at 150° into NH_3 and opianic acid.—17 Aqueous *sulphurous acid* forms crystalline $C_{17}H_{15}O_3H_2SO_4$, whence the salts BaA' , 8aq and PbA' , 6aq may be obtained.—18 H_2S forms yellow amorphous $C_{16}H_{15}SO_4$.—19 *Phenol* and H_2SO_4 in the cold form amorphous opiaurin $C_{20}H_{19}O_3$, which forms a purple solution with potash—20 *Phenylhydrazine acetate* forms $C_{16}H_{15}N_2O_3$ crystallising in needles [175°] (Liebermann, *B* 19, 763)—21 *Salicylic acid* and $ZnCl_2$ form $C_{17}H_{15}O_3$ [140°], whence $C_{17}H_{15}AcO_3$ [152°] (Michael, *Am* 5, 95)

Salts— $KA'2aq$ (Wegscheider, *M* 8, 348)— KA' aq triclinic plates— BaA' , 2aq efflorescent prisms— PbA' , 2aq sparingly soluble crystals [150°]— PbA' , tufts of silky prisms— AgA'

Methyl ether MeA' [85°] (W), [102°] (L) Formed from the silver salt and MeI, or by boiling the acid with MeOH. Monoclinic

Ethylether EtA' [92°]

Propylether PrA' [103°]

Acetyl derivative $C_{16}H_{15}AcO_3$ [121°]

Propionyl derivative [111°] Needles

Anhydride $\{C_{16}H_{15}(OMe)_2(CHO)CO\}_2O$

Tropianide [234°] Formed by heating the acid for two hours in a current of dry air Needles (from acetone)

Oxim $C_6H_5(OMe)(CO_2H)CH NOH$ [83°] Formed from the acid (1 mol), dilute KOH (4 mols), and hydroxylamine hydrochloride (1½ mols) in the cold (Perkin, *jun*, *C J* 57, 1071) Long slender needles, v sol alcohol At 130° it suddenly becomes solid owing to the formation of hemipimide

Di-phenyl-hydrazide

$C_6H_5(OMe)_2(CO_2H)CH N NPh_2$ [172°] CaA' 8aq

Chloro-opianic acid

$C_6HCl(OMe)(CHO)CO_2H$ [211°] Needles (Prinz, *J pr* [2] 24, 366)

Bromo-opianic acid [192°] (P), [204°] (Wegscheider, *M* 4, 267) Needles— BaA' , aq

Nitro-opianic acid

$C_6H(NO_2)(OMe)_2(CHO)CO_2H$ [166°] Formed by nitration of opianic acid (Prinz) Yellow prisms (from water) With acetone and dilute NaOHAq it yields the tetra-methyl derivative of tetra oxy indigo dicarboxylic acid (Liebermann, *B* 10, 352) Aniline in HOAc reacts, forming $C_6H(NO_2)(OMe)_2(CO_2H)CH NPh$ [184°]— KA' 8aq prisms— BaA' , 3aq yellow needles.

Ethylether EtA' [96°]

Acetyl derivative $C_{17}H_{15}AcNO_3$. Crystals

Phenyl-hydrazide

$C_6H(OMe)_2(NO_2)(OOH)CH N_2HPh$ [184°] Red needles (Liebermann, *B* 19, 764) By boiling with HOAc it is converted into 'nitro-opianyl-phenyl-hydrazine' $C_{16}H_{15}N_2O_3$ [173°]

Di-phenyl-hydrazide $C_{22}H_{21}N_2O_3$ [217°] Prisms, sl. sol ether (Bastrzycki, *B* 21, 2520)

Nitroso-opianic acid?

$C_6H(OMe)_2(NO)(CHO)CO_2H$ [5 5 3 4 1] [176°] Formed by reducing nitro opianic acid with NaOMe (Kleemann, *B* 20, 875) Long yellowish-green needles.— AgA' . felted needles.

Amido-opianic acid

$C_6H(NH_2)(OMe)_2(CHO)CO_2H$. Formed by reduction of nitroso-opianic acid (K_2).— HA' . HCl.

Acetyl derivative $C_{17}H_{15}N_2O_3$. [233°].

Phenyl-hydrazide

$C_6H(NH_2)(OMe)_2CO NPh$ [148°]. Needles (Liebermann, *B* 19, 2276)

Noropianic acid $C_6H_4(OH)_2(CHO)CO_2H$ [171° cor] Formed by heating opianic acid with HIAq Crystals (containing 1½aq)

Methyl derivative

$C_6H_4(OMe)(OH)(CHO)CO_2H$ [154°] (P), [142°] (Wegscheider, *M* 8, 790) Formed by heating opianic acid with HClAq at 100° Prisms (containing 2aq) Chlorine forms the chloro-derivative $C_6H_4ClO_2$ [206°] On nitration it yields $C_6H(NO_2)(OMe)(OH)(CHO)CO_2H$ [208°], which crystallises in needles (containing aq), and yields an oxim decomposing at 252° and converted by HOAc into the anhydride $C_6H_4N_2O_3$ [252°], the nitro-acid also yields a phenyl-hydrazide [179°] converted by HOAc into an anhydride [191°] (Elbel, *B* 19, 2306)— KA' 2aq— $BaC_6H_4O_3$ aq

Iso opianic acid v Methyl derivative of ALDEHYDO VANILLIC acid

Iso-noropianic acid $C_6H_4(OH)_2(CHO)CO_2H$ [4 3 5 1] [above 240°] Formed by heating aldehyde vanillic acid with HClAq at 175° (Tiemann a Mendelssohn, *B* 10, 400) Needles

Pseudopianic acid

$C_6H_4(OMe)_2(CHO)CO_2H$ [1 2 3 4] [122°] A product of the action of boiling dilute H_2SO_4 on berberol (Perkin, *jun*, *C J* 57, 1065) Slender needles (from hot water) When warmed with phenol and H_2SO_4 it gives a green colour, changing to violet brown— KA' — AgA' needles

Oxim $C_{10}H_9O_4(NOH)$ [124°] Needles

OPIANYL ACETIC ACID $C_{17}H_{15}O_3$, i.e. $C_6H_4(OMe)_2(CO_2H)CH(OH)CH_2CO_2H$ Formed, as barium salt, by boiling meconin-acetic acid (p 198) with baryta water (Liebermann a Kleemann, *B* 19, 2292) The acid when liberated from its salts at once loses H_2O and is reconverted into its lactone meconin acetic acid.— $A'Ag$ crystalline pp— A' , $BaAq$ prisms

OPINIC ACID $C_6H_5O_3$ [148°] Formed by the action of HI on hemipic acid (Liechti, *Z* [2] 6, 196, *A Suppl* 7, 151, Beckett a Wright, *J* 1876, 809) Prisms (containing 2aq) Coloured violet by FeCl.

OPIONIN [227°] A substance present in small quantity in Smyrna opium (Hesse, *A* 228, 299) Small needles, v sol alcohol, ether, and alkalis, v sl sol water Neutral to litmus When fused with potash it yields opionic acid [126°]

OPIUM The dried juice obtained from the unripe capsules of *Papaver somniferum* It contains morphine, codeine, narcotine, narceine, thebaine, papaverine, meconic acid, and meconin The quantity of morphine varies from 8 to 15 p c Hesse (*A* 153, 47, *Suppl* 8, 299) obtained also codamine, lanthopine, laudanine, meconidine, cryptopine, protopine, laudanone, and hydrocotarnine Kauder describes tritopine (*Ar Ph* 238, 419) The three alkaloids morphine, codeine, and thebaine are strong bases, while papaverine, narcotine, and narceine are feeble bases The various constituents of opium are described in their alphabetical position

OPOPANAX The dried juice obtained from the roots of the *Pastinaca Opopanax*. It contains 33 p.c. of gum, 28 p.c. of malic acid, and 42 p.c. of a resin which yields protocatechuic acid on fusion with potash (Pelletier, Hlasiwetz & Barth, *J* 1866, 630, Hirschsohn, *C* 1877, 182).

ORANGE PEEL OIL SG $\frac{30}{100}$ 8435 The essential oil of orange peel consists mainly of a terpene (174°), but contains also an aldehyde $C_{10}H_{16}O$ (224°–228°) (Wright, *C* J 18, 1186, 20, 552, Semmler, *B* 24, 202). It contains no cymene (Hartley, *C* J 37, 677). Tanret (*Bl* [2] 46, 501) got from orange peel resinous 'aurantiamaric acid' $C_{16}H_{24}O_4$, $[\alpha]_D = -28^\circ$, and uncrystallisable 'aurantiamarine' $C_{22}H_{36}O_{12}$? $[\alpha]_D = -60^\circ$, a very bitter substance.

ORCEIN $C_{22}H_{22}N_2O_4$. A colouring matter obtained from orcein by the action of aqueous ammonia and air. Purified by exhausting with ether, and crystallising from dilute alcohol (Zulkowsky & Peters, *M* 11, 227, cf. Robiquet, *A* Ch [2] 42, 245, 58, 320, Dumas, *A* 27, 145, Laurent & Gerhardt, *A* Ch [3] 24, 315, Liebermann, *B* 7, 247, 8, 1649). Micro crystalline mass, with metallic lustre, insol. water, ether, and CS_2 . Its solutions are crimson, but are turned bluish violet by ammonia or potash.

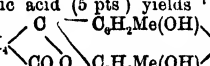

ORCENE DIALDEHYDE This name is given by Tiemann and Helkenberg (*B* 12, 1003) to two isomerides $C_8HMe(OH)_2(CHO)_2$, (a) [118°] and (b) [168°] formed, together with orceyl aldehyde $C_8H_8O_4$, by the action of chloroform and KOH upon orcein. The (a)-isomeride forms a di-anilide $C_8HMe(OH)_2(CH_2NPh)_2$, [281°].

ORCIN $C_8H_8O_4$ & $C_8H_8Me(OH)$ [135] *Di-oryz toluene Methyl resorcin*. Mol w 124 [108°] (Neville & Winther, *C* J 41, 417), [57°] (when containing aq.) (c 288) HFp 109,276 (Stohmann, *J* pr [2] 34, 315). Obtained by boiling orsellic acid with water or by action of alkalis on lecanoric, erythric, and evermic acids and picroerythrin, and also by dry distillation of the same bodies (Robiquet, *A* Ch [2] 42, 245, 58, 320, Liebig & Will, *A* 27, 147, Dumas, *A* 27, 140, Schunck, *A* 41, 159, 54, 269, Stenhouse, *Tr* 1848, 85, *A* 68, 93, 99, *Pr* 12, 263, *C* J 16, 327, 20, 223, De Luynes, *A* 128, 330, 130, 81, Lamparter, *A* 134, 256). Formed also by potash fusion from aloes (Hlasiwetz & Barth, *A* 134, 287), *p*-chloro toluene sulphonic acid (Vogt & Henniger, *C* R 74, 1107), toluene *m* disulphonic acid, *s*-bromo cresol, *s* di bromo toluene, and *s* bromo toluene sulphonic acid (Neville & Winther, *C* J 41, 417). Formed also from nitro-*m* cresol by reduction and application of the diazo reaction.

Synthesis — Acetone-*di*-carboxylic ether $OC(CH_3)_2CO_2Et$, when treated with sodium condenses to *di*-oxy phenyl acetic di-carboxylic ether $C_6H_4(OH)_2(CO_2Et)_2$, CH_2CO_2Et , the latter by the energetic action of alkalis is converted into *di*-oxy phenyl-acetic acid $C_6H_4(OH)_2CH_2CO_2H$, whose silver salt on dry distillation yields orceinol (Cornelius & Pechmann, *B* 19, 1446).

Properties — Monoclinic prisms (containing aq.), v. sol. water, alcohol, and ether. Sweet taste. Turns red in air. Its aqueous solution gives a white pp. with lead subacetate and a dark red pp. with $FeCl_3$. It reduces ammoniacal $AgNO_3$. Dry bromine forms tri-bromo-orcin

Bromine water yields penta-bromo-orcin (Stenhouse & Groves, *C* J 37, 463). Its solution is not rendered acid by borax. Nitrous acid gives an orange pink colour in dilute solution. (Lunde, *C* N 58, 1, 15). It forms a deliquescent compound with picric acid.

Reactions — 1. Air and ammonia yield orcein together with yellow $C_{10}H_8NO_3$ soluble in ether and an amorphous body, resembling litmus, in soluble in ether and alcohol (Zulkowsky & Peters, *M* 11, 227). Dry ammonia forms colourless crystals of $C_8H_8O_4NH_3$. — 2. Ammonium carbonate yields 'para orsellic' acid $C_8H_8O_4$ aq [151°] (Senhofer & Brunner, *C* J 40, 265). — 3. KOH and CO, form pseudo orsellic acid (Schwarz, *B* 13, 1643). — 4. Heating with HOAc (1½ pts) and $ZnCl_2$ (2 pts) forms crystalline $C_{22}H_{22}O_4$ as well as 'orcacetem' $C_{18}H_{18}O_4$, a yellow powder (Rasinski, *J* pr [2] 26, 56). On boiling orcein (9 g) with HOAc (135 g) and phosphorus oxychloride (18 g) there is formed $C_8HMe(OH)COCH_3$ [146°] crystallising in needles — 5. Orcin (3 pts) heated with acetoacetic ether (2 pts) and a little H_2SO_4 at 100° forms insoluble $C_{11}H_{12}O_4$ [249°] which yields $C_7H_7AcO_3$ [200°] and $C_{11}H_{12}Br_2O_3$ crystallising in plates — 6. HNO_3 saturated with HNO_2 acting upon an ethereal solution of orcein forms a scarlet dye 'azo orcein' $C_{11}H_7NO_3$ which forms an alkaline solution with orange red fluorescence (Kramer, *B* 17, 1832). — 7. H_2SO_4 saturated with nitrous acid forms a dye $C_{22}H_{22}NO_3$ which yields alkaline solutions with red fluorescence and $C_{22}H_{22}NO$, which does not yield fluorescent solutions (K, Brunner, *B* 21, 251). — 8. A mixture of HNO_3 and HBr yields $C_8H_8BrNO_3$ and $C_{10}H_{12}Me_2BrN_2O_{11}$, the alkaline solutions of these bodies exhibit brown and red fluorescence respectively (Brunner, *B* 21, 2494). — 9. A mixture of HNO_3 (10 c.c. of SG 1.39) and HCl (30 c.c. of SG 1.2) on the water bath yields $C_{22}H_{22}ClNO_3$, a greenish mass which yields $C_{11}H_{12}AcClNO_3$. — 10. Chloral hydrate and water on boiling form crystalline $C_8H_8O_4$ whence $C_7H_7Ac_2O_3$ [185°] (Michael & Ryder, *Am* 9, 135). — 11. Fusion with NaOH yields resorcin, tetra oxy di phenyl methane, and finally phloroglucin (Barth, *M* 3, 645). — 12. Benzoic aldehyde and a little HCl aq. give a white resin $C_{22}H_{22}O_4$ (M & R). — 13. Chloroform and dilute potash form, on boiling, two isomeric 'orcene dialdehydes' $C_8H_8Me(OH)_2(CHO)_2$, and 'orceyl aldehyde' $C_8H_8Me(OH)CHO$ [177°] (Tiemann, *B* 12, 999). Another product of the action of potash and chloroform on orcein is homofluorescin (vol. II p. 558) which is probably orcein aurin $C_{22}H_{22}O_4$, a body which is formed by heating orcein with formic acid and $ZnCl_2$ at 100° (Nencki, *J* pr [2] 25, 277, Grimaux, *Bl* [3] 3, 850). — 14. Phthalic anhydride (3 pts) heated with orcein (5 pts) and sulphuric acid (5 pts) yields 'orcun-phthalein' $C_{22}H_{22}O_4$  which crystallises from acetone in colourless needles, dissolving in alkalis with red colour, and yielding the acetyl derivatives $C_{22}H_{22}AcO_4$ [150°] and $C_{22}H_{22}Ac_2O_4$ [220°]. Orcin phthalein is reduced by zinc dust and NaOH aq. to orcein phthalin $C_{22}H_{22}O_4$ which yields $C_{22}H_{22}Ac_2O_4$ [211°] (E. Fischer, *A* 183, 72). — 15. Concentrated sulphuric

acid at 70° produces osmin disulphonic acid $C_8H_8Me(OH)_2(SO_3H)_2$ which yields the crystalline salts $Pb_2C_8H_8S_2O_6$, 6aq and $Pb_2(C_8H_8S_2O_6)_2$, 8aq (Hesse, *id* 117, 324)—16 Fuming HNO_3 , acting on osmin dissolved in ether forms orosurfin $C_{14}H_{11}NO_3$, crystallising in needles [225°] which are blue by reflected light and form a crimson solution in alkalis exhibiting yellow fluorescence. Orosurfin yields an acetyl derivative [204°] and an ethyl ether [269°] (Nietzki & Maackler, *B* 23, 720)—17 *Aldehyde* dissolved in alcohol forms on addition of a few drops of $HClAq$, a compound $C_{16}H_{18}O_2$, crystallising in tables (Michaela & Comey, *Am* 5, 349)—18 *Chloro-acetic acid* and caustic soda forms $C_8H_8Me(OCH_2CO_2H)_2$ [217°] crystallising in needles. This acid forms the salts NaA'' 8aq, K_2A'' 8aq, and CaA'' 2aq, the ether Et_2A'' [107°], and two nitro-derivatives one of which melts at 140° (Saarbach, *J pr* [2] 21, 162)—19 *Di chloro quinonumide* in alcoholic solution forms brown needles of 'orosurifamine' $C_{16}H_{11}N_2O_2$, which dissolves in acids with reddish violet colour and orange fluorescence. It dyes silk, and yields a crystalline mono acetyl derivative (N & M)

Acetyl derivative $C_8H_8Me(OAc)_2$ [25°]

Needles, nearly insol water

Benzoyl derivative $C_8H_8Me(OBz)_2$, [88°] Needles (Rasinski, *J pr* [2] 26, 65)

Orthocarbonyl derivative

$(C_8H_8MeO)_2C$ [195°] Formed by distilling $C_8H_8Me(O_2CO_2Et)_2$, which is produced by the action of $ClCO_2Et$ on sodium osmin (Wallach, *A* 226, 86, Bender, *B* 13, 700)

Methyl ether $C_8H_8Me(OMe)(OH)$ (c 273°) Liquid, sol water (Tiemann & Streng, *B* 14, 2001)

Di methyl ether $C_8H_8Me(OMe)_2$ (244°) V D 76.2 ($H=1$) (obs) Mobile liquid

Di ethyl ether $C_8H_8Me(OEt)_2$ [165°] (252° cor) Needles Yields $C_8H_8Br_2Me(OEt)_2$ [144°] (Herzig & Zeisel, *M* 11, 315, cf De Luyne & Lionet, *C R* 65, 213)

Nitroso-derivative $C_8H_8(NO)O_2$ [157°] Yellow needles, detonating at its melting point (Nietzki & Maackler, *B* 23, 723)

OSMIRIDIUM v IRIIDIUM, Alloys of, p. 47

OSMIUM Os At w 190.3 Mol w unknown Infusible at highest temperature attained by O H flame S G 22.477 at 17.5° (Deville & Debray, *P M* [4] 50, 651) S H 19° to 98° 0.3113 (Regnault, *P M* [4] 23, 103) C E 00000657 (Fizeau, *C R* 68, 1125)

Occurrence — As metal, alloyed with Ir, Pt, Rh, Ru, and Pd. The residues obtained by heating various Pt ores with *aqua regia* contain from 17 to 50 pct Os (v Deville & Debray, *A Ch* [3] 56, 431, Berzelius, *P* 13, 436, 527, 15, 208). In 1804 Tennant showed that the metallic residue remaining after treating Pt ore with *aqua regia* contained two new metals (*T* 1804 411), to one of these metals he gave the name *iridium*, because of the colours of its oxides (*iris*=rainbow), and to the other, the name osmium, because of the peculiar smell of its volatile oxide (*osmum*=smell)

Formation — 1 By ppg K_2OsO_4 by NH_4Cl , and heating the pp in $H-2$ By heating $(NH_4)_2OsCl_4$ or $(NH_4)_2OsCl_6$ — 3 By strongly heating any of the sulphides of Os in absence of air — 4 By warming K persulfate in $HClAq$, with a formate, or by digesting the same salt with Hg, and heating the Os Hg amalgam thus obtained — 5 By passing vapour of OsO_3 mixed with H or CO through a red hot tube — 6 By passing OsO_3 vapour along with N through a hot tube lined with C (obtained by previously passing C_2H_4 vapour through the tube)

Preparation — When Pt ores are treated with *aqua regia*, osmium remains, partly as lustrous tablets, and partly as a black powder. Sand and gangue are removed by fusing the osmium with Na_2CO_3 , boiling with water, then with $HClAq$, and again with water. Os is obtained from this residue by various methods, which are based on the ready oxidation of Os to OsO_3 and the volatility of this compound. The lustrous tablets of osmium yield much more Os than the black powder. OsO_3 may be obtained by the following methods. — 1 The osmium is heated to redness in a tube of porcelain, or Pt, while a current of air or O (previously passed through H_2SO_4) is sucked through the tube, the exit end of the tube is connected with a dry flask, or a series of dry Woulff's bottles, kept at a low temperature, the connecting tubes must be wide, else they may get choked with crystals of OsO_4 , a vessel containing KOHAq is placed between the receiver and the aspirator, to absorb the last traces of OsO_3 ,
T T

(Fremy, *J pr* 63, 342) — 2 The osm-iridium is very well mixed with an equal weight of dry NaCl, and the mixture is heated to low redness in a rapid stream of moist Cl, in a glass or porcelain tube, the apparatus is connected with a wide necked tubulated receiver, from which a tube passes into KOHAq or NH₄Aq. OsCl₃ is formed, and decomposed by the H₂O present to OsO₃, HCl, and Os which again combines with Cl to form OsCl₃, which OsCl₃ is again decomposed by H₂O, and so on (Wohler, *P* 31, 161, 104, 368, 107, 357) Schneider (*A Suppl* 5, 261) places the osm iridium in a large Hessian crucible, the lid of which is cemented on by CaSO₄ and carries a porcelain tube passing into a receiver — 3 The osm-iridium may be treated with molten KOH and KClO₄ (Fritzsche, *J pr* 37, 483), or with KOH and KNO₃ (Claus, *C O* 1862 129, Gibbs, *A* 120, 108), or with BaO₂ and Ba(NO₃)₂ (Deville a Debray, *A Ch* [3] 56, 481), in each case the K persmate obtained is distilled with *aqua regia* and OsO₃ is obtained. The preparation of OsO₃ from osm iridium is easily accomplished, but the process is extremely unpleasant, and also very dangerous, inasmuch as the vapour of OsO₃ rapidly attacks the eyes and lungs.

Os is obtained from OsO₃ by reducing the vapour by H or CO, or by C (Deville a Debray, *lc*, cf *Formation*, Nos 5 and 6), or a solution of OsO₃ in KOHAq may be reduced by warming with alcohol, the violet red crystalline pp of K₂OsO₄ may be dissolved in water, ppd by NH₄Cl, and the pp reduced to Os by heating in H (Fremy, *lc*). Or the OsO₃ may be dissolved in NH₄Aq, warmed for some hours till blackish brown (N is evolved, and an ammoniacal solution of Os₂O₃ remains), and evaporated until a brown pp of impure Os₂O₃ forms, the pp may then be washed, dissolved in HClAq, NH₄Cl added, the solution evaporated to dryness, and the residue heated in a retort as long as HCl is evolved and NH₄Cl sublimes. Os remains as a compact porous mass (Berzelius).

Os may be obtained in crystals by dissolving the metal in Sn, by heating to redness in a carbon crucible with 8 parts Sn, and allowing the mass to cool (Deville a Debray, *C R* 82, 1076). The crystals are purified by dissolving out Sn, and heating the residue in a stream of HCl. Os is also obtained in crystals by passing the vapour of OsO₃, mixed with N, through a hot porcelain tube lined with C. The lining of C is obtained by passing C₂H₄ vapour through the tube at a temperature high enough to decompose the C₂H₄. By alloying Os with Zn, and treating the alloy with HClAq, Os is obtained as a black powder which is easily ignited (D a D, *A Ch* [8] 56, 399).

Properties and Reactions — As obtained by reducing its compounds at high temperatures, Os is a lustrous, blue-white metal, resembling Pt or Sn. Prepared by reduction at lower temperatures, Os is a greyish-black powder, without metallic lustre. From solution in Sn, Os separates in hard, bluish crystals, probably belonging to the regular system, *S G* 22 477. Deville a Debray heated Os to the temperature at which Rh melts (c 2000°) without fusing it. The Os was placed in a carbon-crucible placed in a cylinder of lime, resting on a block of

lime, and surrounded by three other similar blocks, a powerful O H flame was caused to play over, and around, the lime cylinder (*A Ch* [3] 56, 386, 61, 5).

Os is easily oxidised to OsO₃. The finely divided metal obtained at low temperatures smells of OsO₃ at the ordinary temperature, when heated in air, it burns and is completely volatilised. A compact mass of Os ignites when strongly heated in air, but ceases to burn when the source of heat is removed, Os prepared at very high temperatures may be heated to c 225° without change. Finely divided Os, which has not been strongly heated, is oxidised to OsO₃ by heating with conc HNO₃ or *aqua regia*, if the metal has been exposed to a very high temperature, it cannot be oxidised in the wet way. Os is oxidised, to K₂OsO₄, by molten KOH, the oxidation is hastened by addition of KNO₃ or KClO₄. Heated in Cl, OsCl₃ is produced. Os forms a phosphide when heated in P vapour. The spectrum of Os has been examined by Huggins (*T* 154, 139), and Thalén (*v B A* 1884 431).

The atomic weight of Os has been determined (1) by heating in O and weighing the OsO₃ produced (Berzelius, *P* 13, 546, Fremy, *A Ch* [3] 12, 514), (2) by reducing KOsCl₂ in H, washing out KCl, and weighing Os (Berzelius, *P* 13, 530, Seubert, *B* 21, 1839, *A* 261, 257), (3) by determining S H of Os (Regnault, *P M* [4] 23, 103). The older values were too high. Seubert's analyses of K₂OsCl₆ and (NH₄)₂OsCl₆, conducted in 1888, gave the mean value 191.12, but this number was regarded by S as rather too high, in 1891 S re determined the at w very carefully and obtained the value 190.3.

Os is distinctly metallic in its physical characters, but some of its chemical properties are those of a non metal, *eg* acidic character of OsO₃, and existence of salts the negative radicle of which is OsO₃. Os belongs to the group of Pt metals, to which group Cu, Ag, and Au are more or less closely related (*v* COPPER GROUP OF ELEMENTS, 11 250, and NOBLE METALS, this vol p 628). Os is more closely related to Ru than to the other Pt metals, the analogy is shown in the existence of volatile oxides MO, capable of existing as gases, in the salts K₂MO₄, and probably KMO₄, and in other respects. The existence of K₂OsO₄, the fact that this salt is oxidised probably to KO₂Os, which salt is reduced to K₂OsO₃ by KOHAq, and also the existence of H₂OsCy₂, and salts of this acid, emphasise the analogies between Os on the one hand, and Mn and Fe on the other hand.

Detection and Estimation — Compounds of Os heated with a little Na₂CO₃ on Pt foil give the peculiar, chlorine like, odour of OsO₃, at the same time the non-luminous flame becomes luminous from separation of Os. Salts of OsO₃ are easily oxidised, *eg* solution of OsCl₃, which is deep blue, becomes violet in air, and then dark red (OsCl₂), and finally yellow (OsCl₄). Salts of OsO₃, *eg* K₂OsCl₆, give a brown red pp (Os₂O₃.2H₂O) with KOHAq, a grey brown pp sol in NH₄Aq, with AgNO₃Aq, and a blue colour (reduction to OsCl₂) on warming with tannic acid. Salts of OsO₃, *eg* K₂OsCl₆, give no pp with KOHAq in the cold, but on warming the liquid goes blue, and then black Os₂O₃.2H₂O.

suddenly separates Borax produces no change at ordinary temperatures, but a black pp forms on warming, this distinguishes OsO_2 salts from those of IrO_2 , which become blue on heating with borax, and after a little give a blue pp. Tannic acid does not react in the cold, on warming, the liquid becomes blue. Alkali salts of OsO_2 form violet solutions in water. HNO_3 oxidises to salts of OsO_4 , NH_4Aq followed by NH_4ClAq ppts yellow $\text{OsO}_2(\text{NH}_4, \text{NH}_4\text{Cl})_2$, which gives Os on heating OsO_4 , or OsO_4Aq , is recognised by its smell, addition of KOH Aq to dilute solutions of OsO_4 removes the smell. A delicate test for Os consists in fusing with KOH and a little KNO_3 , dissolving K_2OsO_4 formed in water, adding NH_4Cl , washing the yellow pp of $\text{OsO}_2(\text{NH}_4, \text{NH}_4\text{Cl})_2$ with very dilute HClAq , dissolving it in slightly warm water, and adding $\text{K}_2\text{FeCy}_6\text{Aq}$, when a splendid violet colour is produced (Gibbs, *Am J*, 233). Os is usually estimated as the metal. Os is separated from other metals by dissolving in *aqua regia*, adding HNO_3 , and distilling. The OsO_4 may be led into excess of NH_4Aq , the solution is saturated with H_2S and boiled, the pp of OsS_2 is collected, washed, dried, and placed in a small carbon crucible which is placed inside a Hessian crucible, the space between being filled with sand, and heated for some hours to c. 220° – 250° , compact Os is thus obtained.

References—Tennant, *T* 1804 411 Berzelius, *P* 13, 435, 527, 15, 208 Wöhler, *P* 31, 161 Claus a Jacobi, *J pr* 85, 142, 90, 65, A 63, 355 Deville a Debray, *A Ch* [3] 56, 393 Fremy, *A Ch* [3] 12, 522, 44, 391 Fritzsche a Struve, *J pr* 41, 97

Osmium, acids of No oxyacid of Os has been isolated, but salts of the hypothetical acids H_2OsO_4 and HOsO_4 are known (*v Osmium, salts of oxyacids of*, p 646). A peculiar acid, $\text{H}_2\text{N}_2\text{Os}_2\text{O}_8$, generally known as *Osmamic acid*, exists (*v Osmium, nitrogen containing acid of*, p 644). *Osmocyanhydric acid*, H_2OsCy_6 , and salts of this acid have been obtained (*v CYANIDES*, vol II p 343). Salts of the hypothetical acids H_2OsCl_4 and HOsCl_4 are known (*v Osmium, chlorides of*, p 644).

Osmium, alloys of Alloys with copper and gold were described by Tennant (*T* 1804 411) as very ductile, insoluble in *aqua regia*. An amalgam with mercury is obtained by the reaction of Hg with OsO_4Aq (*v Claus, J pr* 90, 65). The alloy with iridium occurs native, composition varies between c. Os, Ir and Os, Ir, this alloy usually contains Ru, Rh, and Au, besides Os and Ir (*v Iridium, Alloys of*, this vol p 47). Alloys of Os and Ir were obtained by Deville by melting Os and Ir with Cu_2S , and treating the fused mass with HClAq and then with HNO_3Aq (*M S* 1882 1228).

Osmium, ammonio-salts of, or Osm ammonium salts (*Ammoniacal osmium bases*) Not many of these compounds have been prepared. Those which are known seem best looked on as two or more NH_4 groups with H replaced by the radicle OsO or OsO_2 . The constitutional formulæ and the nomenclature of the osm ammonium salts are not settled, in this article compounds supposed to contain the radicle OsO are called *Osmosyl-ammonium compounds*, and those supposed to contain the radicle OsO_2 are called

Osmyl ammonium compounds (after the analogy of NO and NO_2 compounds).

OSMOSYL DIAMMONIUM HYDROXIDE

$\text{OsO}(\text{NH}_4, \text{OH})_2$ (*Ammoniated oxyosmous hydroxide*) *Oxyosmiumammonium hydroxide* Simplest empirical formula = $\text{OsO}_2 \cdot 2\text{NH}_4 \cdot \text{H}_2\text{O}$. Obtained by dissolving OsO_4 in excess of conc NH_4Aq , and warming the red solution in a closed flask to 40° – 60° until a black pp begins to form when the flask is opened (Claus a Jacobi, *J pr* 79, 28). N escapes during the process ($73\text{OsO}_4 + 10\text{NH}_4 = 8\text{OsO}(\text{NH}_4, \text{OH})_2 + 2\text{N}_2 + 3\text{H}_2\text{O}$). Forms a

brown black powder, decomposed by heat to Os with evolution of N and H_2O , insol water, sol acids, and reppd by KOH Aq or NH_4Aq . Amorphous basic salts (not fully examined) are obtained by evaporating the acid solutions, these salts are decomposed by water to neutral and more basic salts (Claus a Jacobi, *J pr* 90, 65, cf Berzelius, *P* 13, 435, 527). The base dissolves in KOH Aq , on boiling, NH_3 is evolved and a pp, $\text{OsO}_2 \cdot \text{H}_2\text{O}$ containing NH_3 , separates.

OSMOSYL TETRAMMONIUM HYDROXIDE

$\text{OsO}_2(\text{NH}_4, \text{NH}_4, \text{OH})_2\text{Aq}$ (*Ammoniated oxyosmic hydroxide*) *Osmidrammonium hydroxide* *Oxyosmiumdiammonium hydroxide* *Osmyl-ditetramine hydroxide* Simplest empirical formula = $\text{OsO}_2 \cdot 4\text{NH}_4 \cdot \text{H}_2\text{O Aq}$. Known only in solution. A solution of this base is obtained by decomposing the chloride by Ag_2O and H_2O , or the sulphate by BaO Aq (*v infra*), and filtering, the solution is yellow, has an alkaline reaction, and is easily decomposed with formation of OsO_4 , NH_3 , and a black pp (Claus, *J pr* 79, 28).

OSMIL TETRAMMONIUM CHLORIDE

$\text{OsO}_2(\text{NH}_4, \text{NH}_4\text{Cl})_2$ (*Oxyosmiumdiammonium chloride*) The formula is sometimes written $\text{OsO}_2\text{Cl}_2 \cdot 4\text{NH}_4$, and the salt is called *ammoniated osmium oxychloride*, the formula is also written $\text{OsO}_2 \cdot 4\text{NH}_4\text{Cl}$, and the salt is called *osmyle ditetramine chloride* (Gibbs, *Am J*, 233), Fremy (*A Ch* [3] 12, 522) wrote the formula $\text{OsO}_2(\text{NH}_4)_2 \cdot 2\text{NH}_4\text{Cl}$, calling the salt *osmiumdiammonium chloride*, Claus and Jacobi (*J pr* 79, 28, 85, 142, 90, 65) gave the formula $\text{Os}(\text{NH}_4)_2\text{Cl}_2 \cdot 2\text{H}_2\text{O}$, and the name *osmio diammonio chloride*. The investigations of Gibbs (*Am J*, 233) confirmed the empirical formula $\text{OsO}_2\text{Cl}_2 \cdot 4\text{NH}_4$. Obtained as a yellow crystalline pp by adding NH_4Cl to $\text{K}_2\text{OsO}_4\text{Aq}$ (Fremy, *A Ch* [3] 12, 522) ($7\text{K}_2\text{OsO}_4\text{Aq} + 4\text{NH}_4\text{Cl} = \text{OsO}_2(\text{NH}_4, \text{NH}_4\text{Cl})_2 + 2\text{KClAq} + 2\text{H}_2\text{O}$). Slightly sol cold water, more sol hot water, insol NH_4ClAq . May be crystallised from water containing HCl , ppd from solution by conc HClAq . Aqueous solution quickly decomposes, giving off OsO_4 , on evaporation a brown solid is obtained, which behaves like $\text{OsO}(\text{NH}_4, \text{OH})_2$, the solution gives a fine violet colour with $\text{K}_2\text{FeCy}_6\text{Aq}$ (Gibbs, *l c*). The compound is decomposed by heat, giving a residue of Os.

The *chloroplatinate* is obtained, as orange-yellow crystals, slightly sol cold water, by boiling $\text{OsO}_2(\text{NH}_4, \text{NH}_4\text{Cl})_2$ with PtCl_4Aq (Gibbs, *l c*).

OSMIL TETRAMMONIUM SULPHATE, NITRATE, &c. The *sulphate* is obtained by pouring $\text{K}_2\text{OsO}_4\text{Aq}$ into conc cold $(\text{NH}_4)_2\text{SO}_4\text{Aq}$, small orange-yellow crystals, easily sol hot water (Gibbs, *l c*). The *nitrate* is obtained by a similar reaction, and the *oxalate* also, using cold conc $\text{NH}_4\text{NO}_3\text{Aq}$

and $(\text{NH}_4)_2\text{C}_2\text{O}_4\text{Aq}$ instead of $(\text{NH}_4)_2\text{SO}_4\text{Aq}$ (Gibbs, *l.c.*).

Osmium, chlorides of. Two chlorides of Os have been prepared, OsCl_2 and OsCl_3 . OsCl_2 is known in solution, no chloride has yet been gasified, these are the only haloid compounds of Os known at present, except OsCy , be classed as a haloid compound. OsCl_2 and OsCl_3 combine with alkali chlorides to form $\text{OsCl}_2 \cdot 3\text{MCl}$ and $\text{OsCl}_3 \cdot 2\text{MCl}$ respectively. OsCl_2 also probably forms double salts, but they have not been isolated satisfactorily. OsCy , forms an acid, H_2OsCy_2 , from which various salts (osmocyanides) are obtained. OsCl_2 and OsCl_3 are formed by direct union of Cl with Os.

Osmous chloride OsCl_2 (*Osmium dichloride Osmochloride*) Obtained by heating finely divided Os in a long tube in a stream of dry Cl. Two sublimates are obtained, the less volatile (green) is OsCl_2 , the more volatile (red) is OsCl_3 . As thus prepared OsCl_2 forms dark green deliquescent needles, which probably contain H_2O , by heating again in perfectly dry Cl, OsCl_2 is obtained free from moisture as a nearly black sublimate (Claus a Jacobi, *J pr* 90, 65). An indigo-blue solution of OsCl_2 may be prepared by dissolving $\text{OsO}_2 \cdot x\text{H}_2\text{O}$ in HClAq , the solution soon becomes violet, then dark red, and then yellow from formation of OsCl_2 and OsCl_3 , the yellow solution again becomes blue by the action of reducers (C a J, *l.c.*) OsCl_2 dissolves in water, forming a green liquid, which is decolourised and decomposed on dilution with formation of Os, OsO_4Aq , and HClAq . Solutions of OsCl_2 in alkali chloride solutions are not decomposed by dilution, double salts are probably present (C a J). Berzelius said that double salts of OsCl_2 are formed by the action of alcohol on the salts M_2OsCl_4 and M_2OsCl_6 (P 13, 435, 527). OsCl_2 is sol alcohol and ether. The aqueous solution conducts electricity, but the alcoholic and ethereal solutions do not (*v* Hampe, Z 11, 1549, 12, 23).

Osmoso-osmic chloride OsCl_3 (*Osmium trichloride Osmochloride Osmium sesquichloride*) This chloride is only known in solution, and in combination with alkali chlorides. The brown to purple solution obtained by the action of air on $\text{OsO}_2 \cdot x\text{H}_2\text{O}$ in HClAq probably contains OsCl_3 (C a J). By treating a solution of OsO_3 in HClAq with Hg, and evaporating *in vacuo* over conc H_2SO_4 , Berzelius (P 13, 435, 527) obtained a purple, varnish-like substance, which perhaps was OsCl_3 .

Double Salts.—Ammonium-osmium trichloride (*Ammonium chlorosmiate*) $2(\text{OsCl}_3 \cdot 2\text{NH}_4\text{Cl}) \cdot 3\text{H}_2\text{O}$ Reddish-brown crystals, obtained by passing H_2S into OsO_3 in much HClAq till the solution is red, adding NH_4Cl , and evaporating (Claus, *J pr* 79, 28). The salt dissolves in water with a dark purple colour, which is unchanged by addition of alkali, but reduction begins on warming. On heating, Os and NH_4Cl are formed (Berzelius, *l.c.*)

Potassium-osmium trichloride (*Potassium chlorosmiate*) $2(\text{OsCl}_3 \cdot 3\text{KCl}) \cdot 6\text{H}_2\text{O}$. Formed by strongly heating in Cl a mixture of equal parts KCl and powdered Os, dissolving in water, crystallising out K_2OsCl_6 , and evaporating the mother-liquor, also by dissolving KOH in conc OsO_4Aq , adding NH_4Aq , and when the solution

is yellow and before K_2OsO_4 separates, saturating with HClAq and evaporating to dryness on a water-bath, when the salt is obtained on the bottom of the basin, while KCl and NH_4Cl are deposited on the upper parts. Forms dark brownish red crystals, easily sol water, with deep cherry-red colour, easily sol alcohol, insol ether. The salt loses $3\text{H}_2\text{O}$ in air, and the rest at 150° – 180° . The aqueous solution easily decomposes with separation of $\text{Os}_2\text{O}_7\text{Cl}_2$.

Osmic chloride OsCl_4 (*Osmium tetrachloride Osmichloride*) Obtained, as a dark red powder, by heating finely powdered Os in dry Cl, OsCl_2 is formed at the same time. OsCl_4 is the more volatile of the two chlorides. In presence of moisture, becomes cinnabar red, and then forms yellow needles ($? \text{OsCl}_4 \cdot x\text{H}_2\text{O}$). Dissolves in a little water to form a yellow solution, which is decomposed and decolourised on dilution (Berzelius, *l.c.*) OsCl_4 is a non conductor of electricity (Hampe, Z 11, 1549, 12, 23). $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ dissolves in conc HClAq , forming a dark greenish brown solution, which probably contains OsCl_4 .

Double salts—Potassium osmium tetrachloride (*Potassium chlorosmate*) K_2OsCl_6 ($= \text{OsCl}_4 \cdot 2\text{KCl}$) Obtained by heating an intimate mixture of equal parts KCl and finely powdered Os in dry Cl to low redness, removing excess of KCl by a little water, dissolving the residue in hot water, and allowing to crystallise (Berzelius, *l.c.*) Claus a Jacobi (*l.c.*) obtained the salt by adding KCl to OsO_3 in HClAq , then adding alcohol and evaporating. Dark-brown lustrous octahedra, cinnabar red when powdered. Sol water, forming a yellow solution, from which alcohol ppts the salt, incompletely, as a red crystalline powder. Not decomposed at low redness, but at a higher temperature Os and KCl are formed. OsO_3 is produced by distilling HNO_3 over K_2OsCl_6 (Berzelius, *l.c.*) Is not acted on by SO_2Aq at ordinary temperatures (K_2IrCl_6 is reduced). KOHAq does not decompose a cold solution of K_2OsCl_6 , but on warming the solution becomes blue, and then suddenly ppts black $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ (Claus, *l.c.*, other reactions of $\text{K}_2\text{OsCl}_6\text{Aq}$ are given).

Ammonium chlorosmate, silver chlorosmate, and sodium chlorosmate are described by Claus a Jacobi (*J pr* 79, 28, 85, 142, 90, 65, A 63, 855).

Supposed compound of Osmium hexachloride Berzelius (P 13, 435, 527, 15, 203) obtained a brown salt, which he supposed to be a compound of NH_4Cl and OsCl_6 , by saturating OsO_3 with NH_4Aq , after a time adding excess of HClAq , digesting for some days with Hg, filtering, and evaporating. According to Claus (*l.c.*), the salt is $2(\text{OsCl}_6 \cdot 2\text{NH}_4\text{Cl}) \cdot 3\text{H}_2\text{O}$ (*v supra*, *Ammonium-osmium trichloride*).

Osmium, cyanide of, OsCy_2 , and osmocyanhydric acid and its salts, H_2OsCy_2 , *v* CYANIDES, vol II, p 343

Osmium, hydrated oxides or hydroxides of, *Os*, Osmium, oxides and hydrated oxides of, p 645

Osmium, nitride of The brass-yellow substance, obtained by passing H over the pp. produced by adding HNO_3 to $\text{K}_2\text{OsO}_4\text{Aq}$, is probably a nitride of Os (Claus, P. 65, 202).

Osmium, nitrogen-containing acid of, and

its salts $\text{H}_2\text{N}_2\text{Os}_2\text{O}_4\text{Aq}$ or $?\text{H}_2\text{N}_2\text{Os}_2\text{O}_4\text{Aq}$ This acid is generally known as *osmic acid*. An aqueous solution of this acid is obtained by decomposing the Ba salt by the equivalent quantity of $\text{H}_2\text{SO}_4\text{Aq}$, or by treating the moist Ag salt with HClAq , and filtering. The clear yellow solution remains unchanged for some days if dilute, but if it be concentrated, OsO_4 and a black pp containing Os are formed, and gas is evolved. The aqueous solution of the acid evolves CO_2 from carbonates, and decomposes KCl , Zn dissolves in it, with evolution of gas and partial decomposition of the acid. The solution is decomposed by acids on warming, with production of OsO_4 (Fritzsche a Struve, *J pr* 41, 97). F a S gave the formula $\text{H}_2\text{N}_2\text{Os}_2\text{O}_4$, this was upheld by Claus (*J pr* 90, 65). Gerhardt (*J Ph* [3] 12, 304) gave the formula $\text{H}_2\text{N}_2\text{Os}_2\text{O}_4$. The K salt is obtained by the action of NH_4Aq on OsO_4 in excess of KOHAg , the reaction is expressed thus by F a S $2\text{OsO}_4 + 2\text{NH}_3 + \text{Aq} = \text{H}_2\text{N}_2\text{Os}_2\text{O}_4\text{Aq} + \text{O} + 2\text{H}_2\text{O}$, Claus gives the equation $6\text{OsO}_4 + 8\text{NH}_3 + \text{Aq} = 3\text{H}_2\text{N}_2\text{Os}_2\text{O}_4\text{Aq} + \text{N}_2 + 9\text{H}_2\text{O}$. According to F a S no gas is evolved during the reaction. If this is correct neither of the equations can express the change which occurs. The salts of osmic acid explode when heated, some explode when struck.

POTASSIUM OSMIATE $\text{K}_2\text{N}_2\text{Os}_2\text{O}_4$ or $?\text{K}_2\text{N}_2\text{Os}_2\text{O}_4$. Prepared by dissolving solid OsO_4 in conc KOHAg , to which conc NH_4Aq has been added. The solution is clear yellow, and deposits yellow crystals of the salt. Claus a Jacobi (*lc*) dissolve KOH in very dilute OsO_4Aq , add $\frac{1}{2}$ vol NH_4Aq , and evaporate rapidly until the salt begins to crystallise out, after which crystallisation is allowed to proceed. Citron yellow, tetragonal crystals. Sol warm water, also in alcohol, sl sol cold water, insol ether. Explodes at c 180° . Decomposed by conc HClAq , with evolution of Cl and formation of two kinds of red crystals (*v* F a S, *lc*).

SILVER OSMIATE $\text{Ag}_2\text{N}_2\text{Os}_2\text{O}_4$ or $?\text{Ag}_2\text{N}_2\text{Os}_2\text{O}_4$. A citron yellow crystalline powder, sl sol water or dilute HNO_3Aq , sol NH_4Aq , forming therewith a crystalline compound, blackens in light, explodes at 80° , also when struck by a hammer. Prepared by dissolving OsO_4 in an ammoniacal solution of a salt of Ag, and adding excess of HNO_3Aq , or by adding excess of HNO_3Aq , followed by solution of a salt of Ag, to OsO_4 , dissolved in NH_4Aq .

Ammonium, barium, mercurous, sodium, and ammoniated zinc, osmiates have been prepared (F a S, *lc*).

Osmium, oxides and hydrated oxides of Four oxides of Os are known, OsO , Os_2O_3 , Os_2O_4 , and OsO_4 . Salts in which OsO_4 acts as the negative radicle have been prepared (*v infra*, *Osmium, salts of oxyacids of*). A hydrate of OsO has been obtained, but not pure, it rapidly absorbs O , the hydrate $\text{OsO}_2 \cdot 3\text{H}_2\text{O}$ is known, as are also the hydrates $\text{OsO}_3 \cdot \text{H}_2\text{O}$ and $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$. No oxy-salts have been obtained directly from the oxides of Os, a few oxy salts corresponding with OsO are known. OsO_4 acts as a weak acidic anhydride, this oxide is easily reduced to OsO_3 , or to Os . OsO_4 is the only oxide prepared by the direct union of Os with O . Chlorides corresponding with OsO and OsO_2 ,

have been obtained, and the chloride OsCl_4 , which corresponds with OsO_4 , probably exists in solution (*v Osmium, chlorides of*, p 644).

Osmous oxide OsO (*Osmium monoxide*). A greyish black solid, insol acids, obtained by heating in a stream of CO_2 , a mixture of Na_2CO_3 and OsSO_4 , or $\text{OsO}_2 \cdot 2\text{K}_2\text{SO}_4 \cdot 2\text{KH}_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$, and washing the residue with water (Claus a Jacobi, *J pr* 85, 142, 90, 65). The salt OsSO_4 is formed by evaporating OsO_4Aq with excess of SO_2 , the salt $\text{OsSO}_4 \cdot 2\text{K}_2\text{SO}_4 \cdot 2\text{KH}_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$ is formed by heating $\text{K}_2\text{OsCl}_6\text{Aq}$ with K_2SO_4 , and washing with water the powder which separates. *Hydrated osmous oxide*, $\text{OsO} \cdot x\text{H}_2\text{O}$, was obtained by C a J by the action of warm, very conc KOHAg on OsSO_4 , in absence of air, it forms a black blue pp which very rapidly absorbs O from the air. Berzelius obtained a greenish black pp by boiling OsCl_4 in KClAq with KOHAg , this pp was supposed to be $\text{OsO} \cdot x\text{H}_2\text{O}$, but C a J say it cannot be washed free from alkali. A few salts are known corresponding with OsO , e.g. OsSO_4 , but none is obtained directly from the oxide.

Osmo osmic oxide Os_2O_3 (*Osmium sesquioxide*). A black powder, insol acids. Obtained by gently heating, in a stream of CO_2 , a mixture of $\text{K}_2\text{OsCl}_6 \cdot 3\text{H}_2\text{O}$ and Na_2CO_3 , and washing with water (C a J, *lc*). Deville a Debray (*C R* 82, 1076) say that this oxide is often formed, as copper red crusts, in the preparation of Os, by passing OsO_4 vapour mixed with N through a hot tube lined with C , the lining of C being formed by passing C_2H_2 vapour through the tube heated to redness. Berzelius supposed that a compound of Os_2O_3 with NH_3 was formed by the action of NH_4Aq on OsO_4Aq , but the pp thus formed was shown by C a J to be $\text{OsO}(\text{NH}_4\text{OH})$, (*v Osmosyl diammonium hydroxide*, p 645). No oxy-salts are known corresponding with Os_2O_3 , a solution of OsCl_4 has been prepared.

Hydrated osmo-osmic oxide $\text{Os}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$, a brown red pp, somewhat sol. cold KOHAg , sol acids even after drying, obtained by adding KOHAg to $\text{K}_2\text{OsCl}_6\text{Aq}$ (C a J, *lc*).

Osmic oxide OsO_2 (*Osmium dioxide*). Obtained by Berzelius (*P* 13, 435, 527, 15, 208) by heating a mixture of K_2OsCl_6 and Na_2CO_3 in CO_2 , washing the residue with water, and then with HClAq , as thus prepared OsO_2 forms a greyish-black powder. Claus a Jacobi (*lc*) obtained OsO_2 in the form of a copper red, metallic solid, by strongly heating $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ in a covered crucible (OsO_3 , H , and H_2O are also formed). $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ is obtained by the action of acids on $\text{K}_2\text{OsO}_4\text{Aq}$. OsO_2 may be heated to redness in absence of air (Berzelius), but Claus says that OsO_2 and Os are formed. Heated in air, or acted on by HNO_3 and HClAq , OsO_3 is produced. Reduced by H at ordinary temperatures. Detonates when heated with combustible bodies. A sulphate corresponding with OsO_2 is said to be prepared by the action of cold HNO_3Aq on OsS_2 , but little is known of its properties. The corresponding chloride, OsCl_2 , is known.

Hydrated osmic oxide $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$, a black pp obtained by adding very dilute $\text{H}_2\text{SO}_4\text{Aq}$ to $\text{K}_2\text{OsO}_4\text{Aq}$, OsO_2 being formed at the same time (C a J, *lc*). The moist hydrate dissolves in HClAq , HNO_3Aq , or $\text{H}_2\text{SO}_4\text{Aq}$, oxidation begins

very quickly, with change of colour from purple to yellow-brown, green, and brownish-yellow on heating. From the solution in HClAq , Zn ppts Os (Wöhler, *A* 140, 256). By heating $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ to 200° in dry N, Fremy obtained the hydrate $\text{OsO}_2 \cdot \text{H}_2\text{O}$ (*A Ch* [3] 12, 515).

OSMIUM TETROXIDE OsO_4 , (*Perosmic anhydride*). Often called *perosmic acid*, and formerly generally known as *osmic acid*. Mol w 254.84. V D 128.5 at c 280° (Deville & Debray, *O R* 82, 1076).

Formation—1 By heating Os in air or O—2 By heating Os, or any of the lower oxides, with HNO_3 or *aqua regia*—3 By the action of dilute acids on $\text{K}_2\text{OsO}_4\text{Aq}$, $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ being formed at the same time—4 According to Claus (*J pr* 79, 28) by the action of Os on steam, H being evolved.

Preparation—1 Finely powdered Os is gently warmed in a stream of dry O, the Os is placed in one bulb of a two bulb tube, and the OsO_4 condenses in the second bulb—2 Three parts osmium are fused with 1 part KNO_3 , the cold mass is dissolved in water, the solution is neutralised by $\text{H}_2\text{SO}_4\text{Aq}$, and OsO_4 is distilled off into a cold receiver.

Properties—Long, colourless, translucent, monoclinic, needles (Mallet, *Am S* [2] 29, 49). Melts considerably under 100° , and boils a few degrees above its melting point. OsO_4 is very volatile, the vapour smells abominably, and is extremely poisonous, attacking the eyes and lungs, Deville nearly lost his eyesight while working with OsO_4 (*v D* a *D*, *A Ch* [3] 56, 400). Claus says the best antidote is H_2S gas. The V D was determined by D a D at 246° – 285° , it agrees with the formula OsO_4 . OsO_4 may be vapourised in H, if the mixed vapours are passed through a hot tube, Os is deposited. OsO_4 is slowly dissolved by water, the solution does not react acid, sol alcohol or ether, solutions are reduced with ppn of Os.

Reactions—1 Reduced to Os by heating with hydrogen, also by heating in a gas flame, an aqueous solution of OsO_4 is readily reduced by most metals, the solution is also reduced by phosphorus, ferrous sulphate, stannous chloride, sulphurous acid (a blue liquid is produced by SO_2Aq , perhaps containing an oxide which has not been isolated), and by many carbon compounds (e.g. $\text{H.CO}_2\text{H}$, tannin, sugar, alcohol, &c.) (*v* Tennant, *T* 1804 411, Berzelius, *P* 13, 435, 327, 15, 208, Döbereiner & Weiss, *A* 14, 17, 251, Butlerow, *A* 84, 278, Claus & Jacobi, *J pr* 90, 65)—2 A large excess of ammonia solution evolves N, and ppts $\text{OsO}(\text{NH}_4)\text{OH}$, (*v* *Osmosyl diammonium hydroxide*, p 643)—3 OsO_4 dissolves in potash, forming a red yellow liquid which probably contains K perosmate (*q v* under *Osmium, salts of oxyacids of, infra*)—4 Hydrogen sulphide ppts an oxy-sulphide (*q v*) from OsO_4Aq , on saturating OsO_4Aq with H_2S , and adding an acid, OsS_2 is ppd (*v* *Osmium, sulphides of*, p 647)—5 Hydrochloric acid does not react with OsO_4 , but on addition of KOH Aq , K_2OsO_4 is produced. OsO_4 is a very weak acidic anhydride, an aqueous solution does not affect the colour of litmus, nor does it decompose carbonates; KOH Aq probably forms K perosmate.

Osmium, oxyacids of No oxyacid of Os has been isolated, salts of the hypothetical H_2OsO_4 (osmates) are known, and some of the reactions of OsO_4 indicate the existence of unstable salts derived from the oxide OsO_4 (*v infra*, *Osmium, salts of oxyacids of*).

Osmium, oxychloride of The black pp obtained by boiling dilute $\text{K}_2\text{OsO}_4\text{Aq}$ is probably an oxychloride (Claus & Jacobi, *J pr* 90, 65).

Osmium, oxysulphides of The pp obtained by passing H_2S into OsO_4Aq is said by von Meyer to have the composition $\text{Os}_2\text{O}_3\text{S}$, $3\text{H}_2\text{O}$, and to be changed to $2\text{OsO}_3\text{S}$, $3\text{H}_2\text{O}$ by the action of air (*J pr* [2] 16, 77). Dried at 180° – 200° , OsO_3S is obtained (von M., *lc*).

Osmium, phosphide of A phosphide of Os is said to be formed by heating Os in P vapour, it appears black if prepared at a moderate temperature, but white and metal like if produced by heating strongly, it burns in air to OsO_4 , and osmious phosphate (Berzelius, *P* 13, 435, 527, 15, 208).

Osmium, salts of Very few salts have been obtained by replacing the H of oxyacids by Os. Osmium sulphate, OsSO_4 , is formed by evaporating OsO_4Aq with SO_4Aq , a complex salt $\text{OsSO}_4 \cdot 2\text{K}_2\text{SO}_4 \cdot 2\text{KHSO}_4 \cdot 4\text{H}_2\text{O}$ is obtained by heating K_2OsO_4 with $\text{K}_2\text{SO}_4\text{Aq}$, osmious phosphate and sulphate are also said to exist, but they have not been analysed (Berzelius). An osmic sulphate is stated to be produced by the action of cold HNO_3Aq on OsS_2 (Berzelius). No salt of Os has been formed by the direct reaction of Os or any of its oxides with an oxyacid (*v* SULPHITES, SULPHATES).

Osmium, salts of oxyacids of Some salts of the hypothetical *osmic acid*, H_2OsO_4 , have been isolated, and there are indications of the existence of alkali perosmates, i.e. salts derivable from OsO_4 .

OSMATES M^1OsO_4 (formerly called *Osmites*). Neither the acid H_2OsO_4 , nor the anhydride OsO_4 , has been isolated (*cf* Mallet, *Am S* [2] 29, 49). Alkali osmates are obtained by the reducing action of alcohol on OsO_4 , in KOH Aq , a Ba salt is formed by the prolonged reaction of warm BaO Aq on OsO_4 in a closed vessel, osmates of Ca, Pb, and Sr are obtained as insoluble pps from the alkali salts.

Potassium osmate $\text{K}_2\text{OsO}_4 \cdot 2\text{H}_2\text{O}$. A violet coloured, crystalline pp of this composition is formed by adding alcohol to OsO_4 , dissolved in KOH Aq , the solution is red, then becomes colourless, and deposits the salt. Fremy obtained the salt in large octahedra by adding KNO_3Aq to OsO_4 in large excess of KOH Aq (*J pr* 33, 411). According to Claus (*J pr* 34, 178, 424) $\text{K}_2\text{OsO}_4 \cdot 2\text{H}_2\text{O}$ is obtained by warming OsO_4 in an excess of KOH Aq , this reaction is similar to the reduction of KMnO_4Aq to $\text{K}_2\text{MnO}_4\text{Aq}$ by KOH . Violet red octahedra. Sol water, insol alcohol or ether, slightly sol conc salt solutions (Gibbs, *Am S* [2] 31, 70). An aqueous solution decomposes rapidly on warming to K perosmate and $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$. $\text{H}_2\text{SO}_4\text{Aq}$ forms OsO_4 from $\text{K}_2\text{OsO}_4\text{Aq}$, and separates $\text{OsO}_2 \cdot 2\text{H}_2\text{O}$ (Claus & Jacobi, *lc*). HNO_3Aq produces a similar change (Fremy, *lc*). SO_4Aq produces a blue solution. $\text{NH}_4\text{Cl Aq}$ forms $\text{OsO}_4(\text{NH}_4)_2$, and $(\text{NH}_4)_2\text{SO}_4\text{Aq}$ produces $\text{OsO}_4(\text{NH}_4)_2\text{SO}_4$ (*v* *Osmyl-tetrammonium*).

chloride and sulphate, p 643) NH_4Aq is said to form $\text{OsO}_2(\text{NH}_4)_2$ (Freymy, *lc*)

Barium osmate $\text{BaOsO}_4 \cdot \text{H}_2\text{O}$ (Claus, *J pr* 4, 170, 224), **Calcium, lead, sodium, and strontium osmates** have been obtained (Freymy, *J pr* 33, 411)

PEROSMATES (formerly called *osmates*) These salts have been prepared pure Freymy (*J pr* 33, 409) says a perosmate of K is formed by dissolving OsO_4 in large excess of KOH Aq , and the salt is decomposed on dilution, the solution in excess of KOH Aq is colourless, but absorbs O and becomes brown, on boiling, K_2OsO_8 is formed, and an oxide of Os containing more O than OsO_4 is volatilised. On the other hand, Claus (*J pr* 85, 142, 90, 65) says that the greater part of the OsO_4 can be distilled off from a solution of this oxide in excess of KOH Aq , but that some decomposes to $\text{K}_2\text{OsO}_8 \text{ Aq}$ and O. Claus also says that OsO_4 distils off, at 60° , when Cl is passed into $\text{OsO}_4 \cdot \text{H}_2\text{O}$ suspended in a large excess of KOH Aq . From a conc solution of OsO_4 in KOH Aq , $\text{HNO}_3 \text{ Aq}$ ppt OsO_4 mixed with $\text{OsO}_3 \cdot \text{H}_2\text{O}$, according to Wöhler (*A* 140, 256). Wöhler (*lc*) melted Os with KOH and KNO_3 , and obtained a black solid which formed a deep red solution in water. This solution was supposed by Wöhler to contain K perosmate, only a very little OsO_4 was obtained by distilling, and the residual liquid deposited K_2OsO_8 on cooling. The mother liquor from the K_2OsO_8 was yellow, on treatment with CO_2 it became colourless, and then violet, and deposited OsO_4 and a greyish violet pp.

Osmium, sulphides of A sulphide of Os is formed by heating Os with S (Beizelus, *P* 13, 435-527, 15, 208)

Osmic sulphide OsS (*Osmium disulphide*) A dark brownish yellow solid, slightly soluble in water. Produced, according to Freymy (*J pr* 33, 409), by passing H_2S into $\text{K}_2\text{OsO}_8 \text{ Aq}$, according to Claus (*J pr* 79, 28), also by passing H_2S into $\text{K OsCl}_4 \text{ Aq}$.

Osmium tetrakisulphide $\text{OsS}_4 \cdot \text{H}_2\text{O}$ Obtained by saturating OsO_4 in HCl Aq with H_2S , on attempting to dry the pp it is partly oxidised, above 100° , the pp burns to OsO_4 and SO_2 , easily oxidised by $\text{HNO}_3 \text{ Aq}$, heated in absence of air, $\text{OsS}_4 \cdot \text{OsS}_2$ is said to be produced (Berzelius, Claus). The pp obtained by passing H_2S into $\text{OsO}_4 \text{ Aq}$ is an *oxysulphide* (q v)

OSMOCYANIDES and *Osmocyanhydric acid* v CYANIDES, vol II p 343

OSMOSE When two liquids are separated by the intervention of a porous diaphragm, a flow of liquid takes place from one side of the septum to the other, or sometimes an unequal flow of the two liquids in opposite directions, so that the quantity of liquid increases on one side of the septum and diminishes on the other. This phenomenon was originally designated by the correlative terms *Endosmose* and *Exosmose*, but it is better expressed by the shorter word *Osmose* (from *ὄσμος*, impulsion), which includes the two former. For the application of osmotic methods to chemical questions v. MOLECULAR WEIGHTS, p 417, also PHYSICAL METHODS; section *Electrical methods* M M P M

OSOTRIAZOLE $\text{C}_4\text{H}_4\text{N}_4$, $\text{NH} \angle \text{N CH}$

[22 5°] (204°) at 715 mm Formed by heating its carboxylic acid Sol water and alcohol, insol ligroin (Pechmann, *A* 262, 320) — B' HCl — B' HgCl glittering needles

Benzoyl derivative $\text{NBz} \angle \text{N CH}$ [100°]

OSOTRIAZOLE CARBOXYLIC ACID

$\text{NH} \angle \text{N CH}$ [211°] Formed by the action of KMnO_4 on amido phenyl osotriazole carboxylic acid, which is got by reducing the nitro-acid formed by nitrating the acid produced by the action of soda on the phenyl-hydrazide of di-nitroso acetone (Pechmann, *A* 262, 315) Crystalline powder, v sol boiling water — CaA' , 2aq

OSOTRIAZONES and OSOTETRAZONES v HYDRAZONES

OSSEIN v PROTEIDS, Appendix C

OSTRUTHIN $\text{C}_{14}\text{H}_{11}\text{O}_2$ (Görup-Besanez, *A* 183, 321), $\text{C}_{14}\text{H}_{11}\text{O}_2$ (Jassoy, *C C* 1890 [1] 766) [115°] Occurs in the roots of *Imperatoria Ostruthium*. Trichinic crystals, v sl sol boiling water, v sol alcohol and ether. Its alcoholic solution exhibits blue fluorescence. Forms a crystalline compound with dry HCl

Acetyl derivative [78°] Plates

OTOBITE $\text{C}_8\text{H}_8\text{O}_2$ [133°] Occurs in the fruit of *Myristica otoba* (Uruciochea, *A* 91, 370). Pearly prisms (from ether), insol water

OUABAIN $\text{C}_{29}\text{H}_{44}\text{O}_{12}$ [α 185°] δ 65 at 11° , S (alcohol) 3.75 at 11° [α]_D = -33° . A poisonous glucoside present in Ouabain root, used as arrow poison, and in the seeds of the glabrous *Strophantus* of Gabon (Arnau, *C R* 106, 1011, 107, 348, 1162, *Bl* [δ] 1, 10). Rectangular plates (containing 7aq) v sl sol water. Its solution is ppd by tannin. It yields a sugar and a resin on boiling with acids — BaA' deliquescent pp

OXALACETIC ACID $\text{C}_4\text{H}_4\text{O}_6$ *Oxalozyl acetic acid*

Oxim $\text{CO}_2\text{H C}(\text{NOH})\text{CH}_2\text{CO}_2\text{H}$ [125°] Formed by the action of alcoholic NaOH on the ether $\text{CO}_2\text{Et C}(\text{NOH})\text{CH}_2\text{CO}_2\text{H}$ [107°], which is obtained by the action of water on the dihydride of di-nitroso di-oxo terephthalic ether (Cramer, *B* 24, 1204). An isomeric oxim $\text{CO}_2\text{Et C}(\text{NOH})\text{CH}_2\text{CO}_2\text{H}$ [54°] is formed from oxalacetic acid and hydroxylamine. It yields $\text{CO}_2\text{H C}(\text{NOH})\text{CH}_2\text{CO}_2\text{H}$ [88°], whence AcCl forms an anhydride $\text{C}_4\text{H}_4\text{O}_6$ [105°] yielding $\text{C}_4\text{H}_4\text{AcO}$ [105°]

Phenylhydrazide of the methyl ether $\text{CO}_2\text{Me CH}_2\text{C}(\text{NHPH})\text{CO}_2\text{Me}$ [118°] Mol. w 257 (obs.), (calc 250). Formed from di-methyl acetylene dicarboxylate and phenyl-hydrazine (Buchner, *B* 22, 2930). Plates. Yields oxo-phenyl pyrazole carboxylic acid on saponification

Mono ethyl ether $\text{CO}_2\text{Et CH}_2\text{CO}_2\text{H}$ [97°] Obtained from the di-ethyl ether and cold dilute KOH (Wislicenus, *B* 19, 8226, *A* 246, 828). Needles, v sol water. Its aqueous solution is coloured deep red by FeCl_3

Anilide of the ethyl ether $\text{CO}_2\text{Et CO CH}_2\text{CO NHPh}$ [88°] Formed from oxalic ether, acetanilide, and NaOEt (Wislicenus, *B* 24, 1250). Needles, v sol alcohol

p-Toluide of the ethyl ether [135°]

Ethyl anilide of the ethyl ether $\text{CO}_2\text{Et CO CH}_2\text{CO NEtPh}$ [69°] Formed from

NaOEt, oxalic ether, and NEtAcPh (Wislicenus a Ba^{++} er, *B* 24, 1254) — $\text{Cu}(\text{C}_2\text{H}_3\text{NO}_2)_2$ [189°]

Di-ethyl ether $\text{CO}_2\text{EtCH}_2\text{CO CO}_2\text{Et}$ 182° at 24 mm) SG $\frac{22.5}{4}$ 1159 Formed by the action of sodium on an ethereal solution of oxalic and acetic ethers (Wislicenus, *B* 19, 3225, 20, 3392, *A* 246, 315) Oil FeCl_3 colours its alcoholic solution red

Reactions — 1 Decomposed by dilute acids into acetic and oxalic acids — 2 Dilute (10 p c) H_2SO_4 yields pyruvic acid — 3 Sodium forms the compound $\text{CO}_2\text{EtCHNa CO CO}_2\text{Et}$, which reacts with alkyl iodides, forming alkyl oxal-acetic ethers $\text{CO}_2\text{EtCHX CO CO}_2\text{Et}$ The copper compound $\text{Cu}(\text{C}_2\text{H}_3\text{NO}_2)_2$ crystallises from alcohol in green needles [163°] — 4 *Phenyl hydrazine* reacts forming a phenyl-hydrazide $\text{CO}_2\text{EtCH}_2\text{C}(\text{N}(\text{HPh})\text{CO}_2\text{Et})$ [78°], crystallising in plates, and forming $\text{CO}_2\text{EtC} \begin{smallmatrix} \text{CH}_2\text{CO} \\ \text{N NPh} \end{smallmatrix}$

[182°] on heating — 5 *Aniline* at 0° forms $\text{CO}_2\text{EtCH}_2\text{C}(\text{NPh})\text{CO}_2\text{Et}$ (c 200° at 10 mm), which gives no colour with alcoholic FeCl_3 . The condensation products include $\text{C}_2\text{H}_3\text{NO}_2$, [108°] and $\text{C}_2\text{H}_3\text{NO}_2$, [218°] (Wislicenus a Spiro, *B* 22, 3349) — 6 Aqueous KOAc yields $\text{CO}_2\text{EtCH}(\text{CO}_2\text{H})\text{CH}(\text{CO}_2\text{Et})\text{CO CO}_2\text{Et}$, which forms the crystalline salts BaA'_2 , 2aq and PbA'_2 (Claisen a Hori, *B* 24, 124) — 7 Its oxim is reduced by sodium amalgam to mono ethyl aspartates $\text{CO}_2\text{HCH}(\text{NH}_2)\text{CH}_2\text{CO}_2\text{Et}$ [201°] and $\text{CO}_2\text{HCH}_2\text{CH}(\text{NH}_2)\text{CO}_2\text{Et}$ [165°] (Piutti, *C* 1888, 68, 1459) — 8 *Benzamidine hydrochloride* and dilute (10 p c) aqueous caustic soda yields $\text{CO}_2\text{EtCO CH}_2\text{CO NH CPh NH}$ [180°] (Finner, *B* 22, 1628, 2615)

Occurrence — As acid potassium salt in sorghol (*Oxalis acetosella* and *Rumex acetosa*) (Savary, *A.D* 1773, Wiegler, *A.D* 1779), as sodium salt in *Salsola* and *Salsicornia*, as calcium salt in the root, bark, and leaves of many plants, (often found as crystals, *raphides*), in urine, urinary calculi, and in the Malpighian vessels of the caterpillar of *Sphinx convolvuli*. Calcium oxalate is found also in many lichens, and as the mineral Whewellite. Ferrous oxalate occurs in lignite beds, and ammonium oxalate in guano. Free oxalic acid occurs in some fungi (e.g. *Fistulina hepatica* (Hamlet a. Plowright, *C* N 36, 93)

Formation — 1 By the oxidising action of fused potash or of nitric acid on alcohol, glycol, sugars, starch, cellulose, citric, tartaric, myristic, and other fatty acids. Also by oxidising acetic acid and phenol with alkaline KMnO_4 (Japp, *C* J Proc 4, 91) — 2 Ammonium oxalate is among the products of the decomposition of cyanogen by water — 3 By heating sodium or potassium formate above 400° (Merz a Weith, *B* 15, 1507) — 4 By the action of NaOEt on di bromo acetic ether — 5 By passing CO_2 over a mixture of sodium and sand at about 360° (Drechsel, *Z* [2] 4, 120) — 6 By heating CCl_4 with dry KOH for some days at 220° (Geuther, *A* 111, 174) CCl_4 with dry KOH at 200° forms oxalate and hydrogen — 7 By the spontaneous decomposition of $\text{CH}_3\text{CH}(\text{ONO})\text{CO}_2\text{H}$ (Henry, *B* 12, 1837) — 8 By the action of damp oxygen upon CCl_4 , $\text{CCl}_4(\text{OMe})$ (Henry) — 9 A product in the preparation of picric acid from phenol (Perkin, *C* J Proc 4, 91) — 10 By oxidising chloranilic acid (Groves, *C* J Proc 4, 91) — 11 A by product in the preparation of nitrous ether (Frickhinger, *Ar* Ph. [8] 24, 1065)

Preparation — By heating sawdust with a mixture of NaOH and KOH at 240°–250°, the yield being less when NaOH is used alone (Thorn, *D* P J 210, 24) The product is boiled with water, and the filtrate evaporated. Sodium oxalate separates in granules, which are then boiled with milk of lime. The calcium salt is then decomposed by H_2SO_4 . Oxalic acid may be freed from the last trace of alkaline oxalates by crystallisation from boiling dilute (10 p c) HClAq . Octahedral crystals of anhydrous oxalic acid $\text{H}_2\text{C}_2\text{O}_4$ may be obtained by allowing a solution of oxalic acid (1 pt) in warm H_2SO_4 (12 pts) to stand for some days. These crystals take up water (2aq) from the air, and fall to powder (Villiers, *O* R 90, 821, cf Riechardt, *J* 1864, 871) According to Lescœur (*C* R 104, 1799) dried oxalic acid takes up 2½aq from the air

Estimation — By precipitation as calcium oxalate, followed by conversion into CaCO_3 or CaO , or by titration with KMnO_4 or baryta-water

Properties — Large monoclinic crystals (containing 2aq), v sol water and alcohol. Gives off its water of crystallisation at 100°, and, in a few weeks, over H_2SO_4 (Erdmann, *J* pr 85, 218) Partially sublimes at 150°, but is partly split up into water, CO , and CO_2 . Its aqueous solution decomposes slowly in light, but the decomposition of dilute solutions may be prevented by

heating for half an hour at 70° Neubauer (*Fr.* 9, 892) When a gas is passed through a strong solution of oxalic acid at 100° CO₂ is given off (Charles, *C R* 71, 226) A 5 p.c. solution containing 1 p.c. of uranium nitrate is rapidly decomposed by sunlight into CO₂, formic acid, and CO (Seekamp, *A* 122, 113) Ammonium oxalate is also decomposed by sunlight, but the oxalates of K, Li, and Na are but slightly affected (Downes & Blunt, *Pr* 29, 219) Ferric chloride is reduced by oxalic acid in sunlight, and also by heating above 50° (Lemoine, *Bl* [2] 46, 289) Oxalic acid reduces At and Pt from their salts Oxalic acid expels HCl when heated with dry NaCl CaCl₂ ppt. solutions of alkaline oxalates, the ppt. CaC₂O₄ being insol. acetic acid and ammonia, but sol. HCl aq., and immediately reprecipitates by ammonia

Reactions—1 Heated with glycerin (1 pt.) it yields CO₂ and formic acid, but when a small quantity of glycerin ($\frac{1}{2}$ pt.) is used, decomposition takes place at a higher temperature, allyl alcohol being formed from the glycerin Oxalic acid also yields formic acid when distilled with glycol, mannite, dulcitol, erythritol, and quercitol, but not with sugars (Lorin, *C R* 77, 129, 363, 84, 1136)—2 On heating with conc. H₂SO₄ or with P₂O₅, it is resolved into water, CO, and CO₂—3 PCl₃ yields CO, CO₂, HCl, and POCl₃ PCl₅ acts in like manner—4 Boiling nitric acid slowly oxidises it to CO₂—5 PbO₂ and MnO₂ rapidly oxidise it in aqueous solution, yielding CO₂ and the corresponding oxalate Dried oxalic acid is oxidised by rubbing with PbO, great rise of temperature occurring—6 MnO₂ and dilute H₂SO₄ completely oxidise it to CO₂, KMnO₄, and CrO₃ also oxidise it—7 Chlorine water and HClO₄ yield HCl and CO₂—8 Potash fusion yields hydrogen and a carbonate—9 Liberates Cl, Br, and I when its saturated solution is boiled with KClO₃, KBrO₃, and KIO₃, respectively (Guyard, *Bl* [2] 31, 299)—10 The copper *sinc* couple forms small quantities of glycollic acid (Balbiano & Alessi, *G* 12, 190, cf. Pimpton, *B* 11, 516)—11 SbCl₃ in chloroform forms crystals of Sb₂Cl₂C₂O₄ [149°], which are decomposed by water with formation of oxalic acid (Anschütz & Evans, *A* 239, 285)—12 Primary alcohols heated with dry oxalic acid yield a mixture of mono- and di-alkyl oxalates, on distillation the mono-alkyl oxalates split up into CO₂ and alkyl formates Secondary alcohols give but little alkyl oxalate, while tertiary alcohols are wholly split up by oxalic acid into water and hydrocarbons (Cahours & Demarcay, *C R* 83, 668, 86, 991)—13 Electrolysis of potassium oxalate yields CO₂ at the positive pole (Burgoin, *A Ch.* [4] 14, 167)—14 A solution of molybdic acid in oxalic acid yields, on addition of HNO₃ and evaporating, monoclinic crystals of H₂C₂O₄MoO₄ aq., $a, b, c = 947.1, 1.078, \beta = 98^\circ 52'$ This 'oxalo-molybdic acid' yields the salts Ag₂C₂O₄MoO₄, BaC₂O₄MoO₄, and Na₂C₂O₄MoO₄ aq. (Péchar, *C R* 108, 1058)—15 Ammoniacal cupric oxide at 160° yields (NH₄)₂CO₃ and Cu₂O (Casseneuve, *Bl* [2] 32, 277)

Salts (Souchay & Lenssen, *A* 99, 81, 100, 808, 102, 85, 41, 108, 808, 105, 245)—K₂A^{aq} monoclinic crystals, $a, b, c = 875.1, 1.157, \beta = 69^\circ 5'$ (De la Provostaye, *A Ch.* [3] 4, 454) S. 88 at 16° (Nichols)—K₂A^{aq}—KHA^{aq} Salt of sorrel.

Monoclinic crystals (Marignac, *J* 1855, 462)—KHA^{aq}—KHA^{aq} trimetric crystals, $a, b, c = 459.1, 6.196, \beta = 88^\circ 8'$ —KHA^{aq} trimetric crystals (Rammelsberg, *P* 93, 24)—KH₂A^{aq} 2aq. Trichmic prisms $a, b, c = 2.100, 3.256, \alpha = 96^\circ 12', \beta = 79^\circ 29', \gamma = 97^\circ 5'$ (Wollaston, *Tr.* 1808, 99, Anderson, *C J* 1, 231, De la Provostaye) S. 16 at 13° (N)—Na₂A^{aq} S. 3 at 15° Neutral in reaction—NaHA^{aq} monoclinic crystals which redden litmus S. 17 at 15°—Li₂A^{aq} S. 8 at 19.5°—LiHA^{aq} S. 8 at 17°—(NH₄)₂A^{aq} S. 4.2 at 15° (N), 2.2 at 0° (Engel, *C R* 102, 365) Hemihedral efflorescent trimetric prisms, $a, b, c = 776.1, 733$ (Anschütz, *B* 18, 1394) Ppt. by adding NH₄Cl or NH₄OAc to its solution (Heintz, *J* pr 87, 809)—(NH₄)₂A^{aq} 2aq Occurs in guano (Tanner, *C N* 32, 162)—(NH₄)₂HA^{aq} trimetric prisms, $a, b, c = 458.1, 559$ —(NH₄)₂HA^{aq} 2aq trichmic prisms, isomorphous with KH₂A^{aq} 2aq S. 3.25 at 0° (Engel)—(NH₄)₂H₂SO₄ monoclinic crystals.—Rb₂A^{aq} (Piccard, *J* pr 86, 449)—RbHC₂O₄—RbH₂A^{aq} 3aq (Stolba, *C O* 1878, 331)—CaA^{aq} Crystalline powder, formed by ppg hot solutions (Schmid, *A* 97, 226)—CaA^{aq} 3aq occurs, mixed with CaA^{aq} in the ppt. formed from cold solutions—(CaA^{aq})₂CaCl₂ 2aq—CaA^{aq}CaCl₂ 7aq (Fritzsche, *P* 28, 121)—SrA^{aq} S. 5 at 100°—SrA^{aq} 3aq (Wicke, *A* 90, 101)—SrH₂A^{aq} 2aq—SrA^{aq}SrCl₂ 6aq—(SrA^{aq})₂SrCl₂ 16aq (Raney, *Pr.* 14, 144)—Ba₂C₂O₄ aq S. 0.4—BaH₂A^{aq} 2aq S. 3 at 15° (Clapton, *C J* 5, 223)—Be(NH₄)₂A^{aq} (Sénarmont, *J* 1857, 295, Shadwell, *J* 1881, 681)—BeK₂A^{aq}—BeK₂A^{aq}(OH)₂ 2aq (Philipp, *B.* 16, 752)—MgA^{aq} 2aq S. 0.7 at 16°, 0.8 at 100°.—Mg(NH₄)₂A^{aq} 9aq—Mg₂(NH₄)₂A^{aq} 24aq—Mg(NH₄)₂A^{aq} 8aq—Mg(NH₄)₂A^{aq} 8aq—Mg₂(NH₄)₂A^{aq} 24aq (Brandes, *Schw* *J* 27, 18)—MgK₂A^{aq} 6aq—ZnA^{aq} 2aq—Zn(NH₄)₂A^{aq} 8aq (Kayser, *P* 60, 140)—ZnK₂A^{aq} 4aq—CdA^{aq} 3aq S. 0.08 in the cold, 0.09 at 100°—CdA^{aq}(NH₄)₂ aq—Cd(NH₄)₂A^{aq} 9aq—Cd(NH₄)₂A^{aq} 11aq—Cd(NH₄)₂A^{aq} 8aq—CdK₂A^{aq} 2aq—CdNa₂A^{aq} 2aq—Al₂A^{aq}(OH)₂ (Mathieu Plessey, *C R* 97, 1033)—Al₂Na₂A^{aq}(OH)₂ 9aq (Lenssen, *J* pr 86, 314)—Al₂(NH₄)₂A^{aq}(OH)₂ 6aq—Al₂(NH₄)₂A^{aq}(OH)₂ 3aq—Al₂Na₂A^{aq}(OH)₂ 6aq—Al₂Na₂A^{aq}(OH)₂ 6aq—Al₂K₂A^{aq}(OH)₂ 2aq—Al₂K₂A^{aq}(OH)₂ 2aq—Al₂Mg₂A^{aq}(OH)₂ 5aq—Al₂Ba₂A^{aq}(OH)₂ 8aq (Collin, *B* 3, 316)—CeA^{aq} 9aq (Jolin, *Bl* [2] 21, 540)—La₂A^{aq} 9aq (Clève, *Bl* [2] 21, 202)—TiA^{aq} (Crookes, *O J* 17, 150, Kuhlmann, *C R* 55, 807)—TiHA^{aq}—Sm₂A^{aq} 10aq—SmK₂A^{aq} 2aq (Clève, *Bl* [2] 48, 171)—FeA^{aq} 1aq *Humboldtine*—FeA^{aq} 2aq yellow crystals S. 0.22 in the cold, 0.26 at 100°—K₂FeA^{aq} 2aq golden needles, sol. water—K₂FeA^{aq} aq—(NH₄)₂FeA^{aq} 3aq—Fe(NH₄)₂A^{aq} 8aq greenish crystals S. 48 at 17°—Fe(NH₄)₂A^{aq} 4aq—FeNa₂A^{aq} 4aq—FeK₂A^{aq} 8aq S. 7 at 17°—KFeA^{aq} 2aq S. 92 at 21°—Ba₂FeA^{aq} 7aq—K₂Cr₂A^{aq} 6aq Deep-blue monoclinic prisms; obtained by reducing K₂Cr₂O₇ with oxalic acid (Gregory, Rammelsberg, *P* 93, 24, Werner, *C J.* 53, 404, 602, *O J* Proc. 3, 142, *O A* Schumak, *C N* 51, 152, Hartley, *C J* Proc. 8, 4) S. 20 at 15°. The solution is red with green reflex, and gives no ppt. with CaCl₂—K₂Cr₂A^{aq} 8aq; red monoclinic crystals (Croft, *P M* [8] 21, 197) S. 10—Na₂Cr₂A^{aq} 8aq blue prisms—Na₂Cr₂A^{aq} 9aq—(NH₄)₂Cr₂A^{aq} 8aq blue scales. S. 75 at 15°—

(NH₄)₂Cr₂A''⁸, 8aq⁺ red crystals — Ag₂Cr₂A''⁹, 9aq blue needles S 11 at 100° — Ba₂Cr₂A''¹⁰, 12aq dark violet needles — Ba₂Cr₂A''¹¹, 8aq (Werner) — Ba₂Cr₂A''¹², 18aq — Ba₂Cr₂A''¹³, 6aq (Clarke, *B* 14, 1640) — Ca₂Cr₂A''¹⁴, 18aq — Ca₂Cr₂A''¹⁵, 36aq (Reece, *C* R 21, 1116) — Cr₂Cl₂A''¹⁶, 10NH₃ (Joergensen, *J* pr [2] 20, 143, 80, 28) — Cr₂A''(NH₃)₁₂, 4aq — K₂Cr₂A''¹⁷, 4aq Pleochroic, red, blue, and green (Hartley, *Pr* 21, 499) — K₂Ca₂Cr₂A''¹⁸, 6aq (Werner) blue prisms — K₂BaCr₂A''¹⁹, 3aq — Sr₂Cr₂A''²⁰, 18aq — K₂SrCr₂A''²¹, 6aq — Pb₂Cr₂A''²², 15aq — U₂A''²³, 6aq — U₂(NH₃)₁₂A''²⁴ — U₂O₂A''²⁵, 3aq — U₂O₂(NH₃)₁₂A''²⁶, 4aq — (U₂O₂)₂K₂A''²⁷, 3aq — Mn₂A''²⁸, 2½aq S 05 in the cold, 08 at 100° — Mn₂A''²⁹, 2aq Decomposes at 150° into CO₂, CO, and MnO (Castelaz, *Bl* [2] 50, 645) — Mn₂A''³⁰, 3aq S G (of Mn₂A'')²¹⁴ 2 444 (Clarke, *Am* 2, 174) — K₂Mn₂A''³¹, 6aq black monoclinic prisms (Kehrmann, *B* 20, 1594) — Mn(NH₃)₁₀A''³², 2aq — Mn(NH₃)₁₀A''³³, 4aq — Mn(NH₃)₁₀A''³⁴, 8aq — Mn(NH₃)₁₀A''³⁵, 8aq — Mn₂A''(OH)₆, 6aq — MnK₂A''³⁶, 2aq — Co₂A''³⁷, 2aq — Co₂A''(OH)₆, 6aq — CoK₂A''³⁸, 6aq — Co₂Cl₂ 5NH₃ (Krok, *J* pr [2] 18, 239) — CoA''Br 5NH₃ — Co(OH)₄(NH₃)₂SO₃NH₃ — Co₂A''(NO₂)₅NH₃ — CoA''(NO₂)₅aq — Co₂N₂(NH₃)₄, 4½aq (Rautenberg, *A* 113, 360) — Ni₂A''³⁹, 2aq — NiA''(NH₃)₃, 3aq (Winkelblech, *A* 13, 278) — K₂NiA''⁴⁰, 6aq — CuA''⁴¹, 3aq — Cu(NH₃)₄A''⁴², 2aq — CuA''(NH₃)₄, 2aq — CuA''NH₃ — CuLi₂A''⁴³, 2aq (Troost, *A* Ch [3] 51, 103) — CuK₂A''⁴⁴, 2aq — CuK₂A''⁴⁵, 4aq — CuNa₂A''⁴⁶, 2aq — PbA'' (Pelouze, *A* Ch [2] 79, 104, [3] 4, 104) — Pb₂A''O₂ — Pb₂A''(NO₂)₂, 2aq pearly plates (Johnston, *P* M [3] 13, 25, Dujardin, *J* pr 15, 308) — Pb₂A''(NO₂)₂O₂, 3aq — PbK₂A''⁴⁷, 2½aq (Reis, *B* 14, 1174) — Hg₂A''⁴⁸ white pp, insol water — Hg₂A''⁴⁹, 1aq — Hg(NH₃)₄A''⁵⁰, 2aq — HgK₂A''⁵¹, 2aq — Bi₂A''⁵², 7½aq — Bi₂A''⁵³(OH)₂, 3aq — Bi(NH₃)₄A''⁵⁴, 12aq — BiK₂A''⁵⁵, 12aq — BiK₂A''⁵⁶, 12aq — BiK₂A''⁵⁷, 2aq — Sb₂A''⁵⁸, 10aq — Sb₂K₂A''⁵⁹, 1aq — Sb₂K₂A''⁶⁰, 3aq — SbK₂A''⁶¹, 2aq (Kay, *C* N 57, 193) — SbK₂A''⁶², 4aq (Wagner, *Chem Zeit* 12, 1726) crystallises also with 1½aq, 4½aq, and 6aq — Sb₂K₂H₂A''⁶³, 3aq — SbNa₂A''⁶⁴, 9aq (Svenssen) — SbNa₂A''⁶⁵, 10aq — Sb(NH₃)₄A''⁶⁶, 2aq — Sb(NH₃)₄A''⁶⁷, 5aq (Svenssen, *B* 3, 314) — Sb₂(NH₃)₄A''⁶⁸, 16aq — SbH(NH₃)₄A''⁶⁹, 7aq — AsK₂A''⁷⁰, 3aq — Pd(NH₃)₄A''⁷¹, 2aq (Kane) — Pd(NH₃)₄A''⁷², 8aq — PtNa₂A''⁷³, 4aq — PtCl₂A''⁷⁴, 4NH₃ — PtK₂A''⁷⁵, 2aq (Clève, *Bl* [2] 45, 191) — Pt(NH₃)₄A''⁷⁶, 2aq — PtAg₂A''⁷⁷, 2aq — PtCaA''⁷⁸, 6½aq — PtCaA''⁷⁹, 4½aq — PtCaA''⁸⁰, 8aq — PtSrA''⁸¹, crystallises with 3½aq, 6½aq, and 8aq — PtBaA''⁸², 3aq — PtBaA''⁸³, 2aq — PtMgA''⁸⁴, 6aq — PtFeA''⁸⁵, 6aq — PtMnA''⁸⁶, 7aq — PtNiA''⁸⁷, 7aq — PtZnA''⁸⁸, 7aq — PtCoA''⁸⁹, 8aq — PtCdA''⁹⁰, crystallises with 5aq, 4½aq, and 4aq — PtCuA''⁹¹, 6aq — PtHg₂A''⁹², 1½aq — PtHg₂A''⁹³, 2aq — PtPbA''⁹⁴, 3aq — PtA''⁹⁵ 2NH₃ — PtA''(NH₃)₄, 1aq — PtA''(NH₃)₄, 1½aq — SnA''⁹⁶ — Sn(NH₃)₄A''⁹⁷, 2aq — SnK₂A''⁹⁸, 2aq — Sn₂A''O₂, 6aq — Th₂A''⁹⁹, 2O₂, 12aq — Ag₂A''¹⁰⁰ white pp — Ag₂A''¹⁰¹ 4NH₃.

Mono methyl ether MeHA'' (109° at 12 mm) Solid (Anschütz a Schönfeld, *B* 19, 1442, *A* 254, 8) — KMeA'' (Salomon, *B* 8, 1509)

Di-methyl ether MeA'' Mol w 118 [64°] (164°) (Dumas a Péligot, *A* Ch [2] 58, 44, Wöhler, *A* 81, 876, Erlenmeyer, *N Rep Pharm* 23, 624, Purdie, *C* J 51, 629) S V 116 7 H F 180,900 (Stohmann, *J* pr [2] 40, 353) Monoclinic tables, sol water, alcohol, and ether Its

aqueous solution slowly decomposes into oxalic acid and MeOH

Tetra-methyl ether CO₂Me C(OMe), (76° at 12 mm) S G ½ 1 1312 Formed from CO₂Me CCl₂(OMe) and NaOMe (Anschütz, *I* 254, 31) Converted by PCl₅ into Me C₂O₄

Mono ethyl ether EtHA'' **Ethylloxalic acid** (117° at 15 mm) S G ½ 1 2175 Formed from Et₂C₂O₄ (1 mol) and KOH (1 mol) in alcohol (Mitscherlich, *P* 33, 332) Formed also by heating anhydrous oxalic acid (1 pt) with absolute alcohol (1 pt) at 135°, decanting from unused oxalic acid, and distilling *in vacuo* (Anschütz, *B* 16, 2413, *A* 254, 9) Liquid When distilled under atmospheric pressure it yields formic acid and Et₂C₂O₄ — KEtA'' scales, decomposed by heat into CO and KEtCO₂ (Elite koff, *B* 6, 1259)

Di ethyl ether EtA'' **Oxalic ether** (186° cor) S G ½ 1 0793 μ 1 4156, n_D^{20} 1.4156 (Bruhl) S V 166 2 (Bruhl, *A* 203, 27), d_4^{20} 1.0856, d_4^{25} 1.0761 (Perkin, *C* J 45, 508) M M 6 654 at 12 8° S H 45 (R Schiff, *G* 17, 286) Formed by distilling dehydrated oxalic acid (11 pts) with absolute alcohol (1½ pts) (Bergmann, *Opuscula*, 1 256, Löwig, *J* pr 83, 129), or by heating KHC₂O₄ (1 pt) with alcohol (1 pt) and H₂SO₄ (2 pts) (Dumas a Boullay, *J* Ph 14, 113)

Preparation — Equal weights of dry oxalic acid and alcohol (97 p c) are boiled for 4 hours and distilled, as soon as the thermometer reaches 110° a quantity of alcohol equal to the weight of the distillate is added, and the mixture boiled again for 4 hours, the mixture is then distilled, 825 g oxalic acid give 750 g (or 56 p c) oxalic ether and 110 g formic ether (Schatzky, *J* pr [2] 34, 500)

Properties — Colourless oil with slight odour, v sol alcohol Decomposed by water, especially on heating Alcoholic potash yields a pp of KEtC₂O₄ With SnCl₂ it forms crystalline Et₂C₂O₄SnCl₂, decomposed by water (Lewy, *C* R 21, 371) TiCl₄ yields Et₂C₂O₄TiCl₄ and Et₂C₂O₄2TiCl₄ (Demarcay, *C* R 70, 1414)

Reactions — 1 Gaseous NH₃ yields CO₂Et CONH₂ — 2 Aqueous NH₃ forms oxamide 3 Ethylamine yields C₂O₄(NH₂)Et, diethyl amine forms CO₂Et CONEt, while triethyl amine has no action (Hofmann) Alanine forms two compounds C₂H₅N O₂ [127°] and [154°] — 4 Sodium and potassium decompose it, yielding CO and Et₂CO NaOEt acts in the same way (Geuther, *Z* [2] 4, 656) — 5 Sodium-amalgam yields des oxalic ether C₂H₅EtO₂, and, when alcohol is present, tartaric and glycolic acids — 6 ZnEt₂, followed by water, yields CO₂Et CEt₂(OH) (Frankland, *Pr* 12, 396) Other zinc alkyls act in the same way (Frankland a. Duppa, *Pr* 13, 140, 14, 17, 79, 83, 191) — 7 Acted on by Zn and a mixture of EtI and allyl iodide a mixture of HO CEt₂CO Et and HO C(CH₃)₂CO₂Et is formed, and not HO CEt(C₂H₅)CO₂Et (Barataeff, *J* pr [2] 35, 7) 8 Resorcin (1 mol) and NaOEt (2 mols) in alcohol slowly form C₂H₂O₄, which crystallises from alcohol in pale yellow prisms [to 256°], and yields the acetyl derivative C₂H₃AcO₄ [127°] (Michael, *J* pr [2] 35, 510) — 9 Phenylhydrazine forms C₂O₄(NH₂Ph)₂ [278°] and N₂H₂Ph CO CO₂Et [119°] (E Fischer, *A* 190,

181, Bulow, *A* 236, 197) In presence of alcoholic NaOEt the product is $N_2H_5PhCOCO_2H$ [170°] (Michael, *J pr* [2] 35, 458) — 10 Acetone in presence of NaOEt (1 pt) in alcohol (80 pts) forms $CH_3COCH_2COCO_2Et$ [18°] (214°) This body is converted by baryta water into oxotoluic acid, an intermediate body being $CH_3AcC(OH)(CO_2H)CHAcCO_2Et$ [90°] Acetone (2 mols) and NaOEt (2 mols) in ether yield $CH_3COCH_2COCO_2CH_2COCH_3$ [121°] crystallising in white prisms (Claisen a Stylos, *B* 20, 2188, 21, 1141, 22, 3271, 24 116) A mixture of acetone, NaOAc, KOAc, and Ac_2O yield a coloured product $C_8H_8O_4$. Another product of the action of alcoholic NaOEt on acetone and oxalic ether is $CO(CH_2COCO_2Et)_2$ [104°], which yields cheilidonic acid on warming with mineral acids On adding sodium to a mixture of oxalic ether and EtOAc dissolved in Et_2O , oxalacetic ether is formed — 11 Succinic ether and NaOEt yield oxalosuccinic ether $CO_2EtCH(CO_2CO_2Et)CH_2CO_2Et$ and a compound $C_8H_8O_4$ [90°] (Wishnecus, *B* 22, 889) — 12 Alcoholic acetophenone and NaOEt form benzoyl pyruvic acid $C_6H_5COCH_2COCO_2H$ [158°] Acetophenone and NaOEt in ether yield $BzCH_2COCO_2CH_2Bz$ [180°] (Claisen, *B* 21, 1131) — 13 Chloroacetic ether and zinc yield 'ketipic' ether $CO_2EtCH_2COCO_2CH_2CO_2Et$ [77°] (Fittig a Daimler, *B* 20, 202) — 14 Heating with oxalic, formic, or acetic acids at 140° yields formic ether, CO, and CO Benzoic acid has no action even at 240° (Lorin, *Bl* [2] 49, 344) — 15 Benzyl cyanide and NaOEt yield $CNCHPhCOCO_2Et$ [130°] whence boiling dilute H_2SO_4 forms phenyl pyruvic acid [155°] (Erlenmeyer *B* 22, 1483) — 16 A solution of urea in alcoholic NaOEt gives a pp of sodium parabanate $CONNa > CO$ (Michael, *J pr* [2] 35, 457) — CO NH

17 Phthalide and NaOEt in ether yield

$$C_6H_4 \begin{cases} \text{CH CO CO}_2\text{Et} \\ \text{CO O} \end{cases} \quad [121^\circ], \text{ whence phenyl}$$

hydrazine forms $C_{10}H_{16}N_4O_4$ [159°] (Wishnecus, *A* 246, 342) — 18 Chlorine in sunlight forms $(C_6Cl_5)_2O_4$ [144°], whence potash yields CCl_3CO_2K (Malaguti, *A Ch* [2] 74, 299)

Tetra-ethyl ether $CO_2EtC(OEt)_2$ (98° at 12 mm) $SG \frac{2}{2} 10020$ Formed from $CO_2EtCCl_2(OEt)$ and NaOEt (Anschutz, *A* 254, 32) Converted by PCl_5 into Et_2CO

Methylethylether CO_2MeCO_2Et (174°) $SG \frac{2}{2} 11557$ $SV 1391$ (Wiens, *A* 253, 297) Formed by distilling $KEtCO_2$ with $KEtSO_4$ (Chancel, *Compt Chim* 1850, 373, 403), and by the action of MeOH on $COClCO_2Et$ or of EtOH on $COClCO_2Me$ (Paul, *C J Proc* 2, 168) Converted by repeated distillation into a mixture of Me_2CO , and Et_2CO

Di methyl di ethyl ether $CO_2MeCO_2(OMe)_2$ (92° at 13 mm) Formed from $CO_2MeCCl_2(OMe)$ and NaOEt at 100° (Anschutz, *A* 254, 35)

Di-methyl di-ethyl ether $CO_2EtC(OEt)(OMe)_2$ (96° at 12 mm) Formed from $CO_2EtCCl_2(OEt)$ and NaOMe at 100°

n Propyl-ether $PrHA''$ (119° at 13 mm) $SG \frac{2}{2} 11578$ Liquid (Anschutz a Schönfeld, *B* 19, 1442, *A* 254, 6)

Di n-propyl ether Pr_2A'' (213 5°)

$SG \frac{2}{2} 10384$ $SV 2154$ (W, cf Cahours, *C R* 77, 749) $SH 451$

Tetra-n-propyl ether $CO_2PrC(OPr)_2$ (257°) $SG \frac{2}{2} 9566$ Formed from $CO_2PrCCl_2(OPr)$ and NaOPr (*A*)

Iso propyl ether CO_2PrCO_2H (111° at 13 mm) $SG \frac{2}{2} 11657$ Decomposes on boiling into Pr_2CO_3 , isopropyl formate, CO, CO, and water (Anschutz, *A* 254, 6) — CO_2PrCO_2K

Di-isobutyl ether $(C_4H_9)_2A''$ (225°) $SG \frac{2}{2} 1002$ $SH 457$ Yields $K(C_4H_9)_2C_2O_4$ (Cahours, *C R* 77, 1403)

Tetra-isobutyl ether $(C_4H_9O)_2CCO_2C_4H_9$ (146° at 10 mm) $SG 921$ Formed from $C_4H_9OCCl_2CO_2C_4H_9$ and $NaOCC_4H_9$ (Anschutz, *A* 254, 33)

Di n butyl ether $(C_4H_9)_2A''$ (243°) $SG \frac{2}{2} 10099$ $SV 2534$ (Wiens)

Isoamyl ether $(C_5H_{11})_2HA''$ Oil, smelling of bugs (Balard, *A Ch* [3] 12, 309) — CaA'_2 , 2aq — AgA' pearly scales

Di isoamyl ether $(C_5H_{11})_2C_2O_4$ (265°) $SG \frac{2}{2} 968$ (Delffs, *J* 1854, 26) $SH 464$ (Schiff) Oil, smelling of bugs (Balard)

Tetra amyl ether $(C_5H_{11}O)_2CCO_2C_5H_{11}$ (190° at 14 mm) $SG \frac{2}{2} 9141$ (Δ)

Ethyl heptyl ether $CO_2EtCO_2C_7H_{15}$ (263 7°) $SG \frac{2}{2} 9954$ $SV 2849$ (Wiens)

Propyl heptyl ether $Pr(C_7H_{15})_2A''$ (284°) $SG \frac{2}{2} 9814$ $SV 3157$

Propyl octyl ether $Pr(C_8H_{17})_2A''$ (291°) $SG \frac{2}{2} 9725$ $SV 3404$ (Wiens)

Allyl ether $(C_3H_5)_2A''$ (215 5° V) (Kekulé, *B* 6, 387) $SG \frac{2}{2} 1055$ Formed from $Ag_2C_2O_4$ and allyl iodide (Hofmann a Cahours, *A* 102, 288)

Di phenyl ether $Ph_2C_2O_4$ [130°] Formed by heating phenol (1 pt) with dry oxalic acid (1 pt) and $POCl_3$ (1 pt) at 115° (Nencki, *J pr* [2] 25, 283) Prisms (from alcohol), sl sol ether

Di phenyl ortho oxalate $(PhO)_2C(OH)_2$ [127°] A by product in the manufacture of aurin Formed by distilling phenol with dry oxalic acid, or by dissolving oxalic acid and excess of phenol in HOAc (Claparède a Smith, *C J* 43, 358, Staub a Smith, *B* 17, 1740) Thin white plates, distilling with decomposition at 150°-180° Sol water, but almost at once split up into phenol and oxalic acid Alcohol yields phenol and oxalic ether. On heating with H_2SO_4 it yields aurin

Di (a) naphthyl ortho oxalate $(C_{10}H_7O)_2C(OH)_2$ [163°] Formed by heating (a) naphthol with dry oxalic acid and HOAc (S a S) Crystalline powder

Di (b) naphthyl ortho oxalate $(C_{10}H_7O)_2C(OH)_2$ [167°] White crystalline powder (from HOAc), partly decomposed on distillation (Staub a Watson Smith, *C J* 45, 303)

Penta chloro-ethyl ether $CO_2HCO_2CCl_3$ Formed from $CO(NH_2)_2$, CO_2CCl_3 , and NH_4Aq (Malaguti, *A Ch* [2] 74, 308) Colourless deliquescent needles — NH_4A'

Chloride of the methylether $CO_2MeCOCl$ (120°) $SG \frac{2}{2} 13316$ Formed by heating $CO_2MeCCl_2(OMe)$ for 40 hours at 215° (Anschutz, *A* 254, 26) Liquid

Chloride of the ethylether $CO_2EtCOCl$ Chloroacetic ether. Chloro glyoxylic ether ($q v$) (186°) $SG \frac{2}{2} 12223$ PCl_5 , acting upon oxalic

ether first forms $\text{CO}_2(\text{OEt})\text{CO}_2\text{Et}$, which may be distilled under 15 mm pressure, when distilled under atmospheric pressure it is split up into EtCl and COClCO_2Et (Anschutz, *B* 19, 2158, *A* 254, 27) Formed also from oxalic ether and POCl_3 (Henry, *B* 4, 598, 5, 949) Decomposed by water Alcoholic NH_3 yields ethyl oxamate Aniline forms $\text{CO}(\text{NPhH})\text{CO}_2\text{Et}$ Mercaptan forms $\text{CO}_2\text{EtCOSEt}$ (Morley & Saint, *C J* 43, 400) ZnEt_2 followed by water forms $\text{OEt}(\text{OH})\text{CO}_2\text{Et}$ Carbamic ether yields $\text{CO}_2\text{EtNHCOCO}_2\text{Et}$ [45°] (Salomon, *J pr* [2] 9, 290) $\text{CO}(\text{NH}_2)\text{CO}_2\text{Et}$ at 180° yields $\text{NH}(\text{COCO}_2\text{Et})_2$ [67°]

Chloride of the propyl ether
 COClCO_2Pr (154°) $\text{SG } \frac{2}{3}$ 11670 Formed by treating $\text{Pr}_2\text{C}_2\text{O}_4$ with PCl_5 and heating the resulting $\text{CO}_2\text{PrCOCl}(\text{OPr})$ at 190° (Anschutz)

Chloride of the isobutyl ether
 $\text{COClCO}_2\text{C}_4\text{H}_9$ (165°) $\text{SG } \frac{2}{3}$ 11153 Formed in like manner

Chloride of the isoamyl ether
 $\text{COClCO}_2\text{C}_5\text{H}_{11}$ (185°) $\text{SG } \frac{2}{3}$ 10931 (*A*)

Oxamic acid $\text{CO}(\text{NH}_2)\text{CO}_2\text{H}$ Mol w 89 [210°] $\text{S } 14$ at 14° Formed by heating $\text{CO}_2(\text{NH}_2)\text{CO}_2\text{H}$ or by boiling oxamide with aqueous NH_3 (Balard, *A Ch* [3] 4, 93, Tous saint, *A* 120, 237) The NH_4 salt is also formed by passing NH_3 into a cold alcoholic solution of oxalic ether (De Coppet, *A* 137, 105) Excreted when animals are fed with oxamic ether Prepared by heating an aqueous solution of $\text{CO}(\text{NH}_2)\text{CO}_2\text{Et}$ to boiling, adding ammonia gradually till the liquid is alkaline (Oelkers, *B* 22, 1566) Prepared also by heating ammonium oxalate with NH_4NO_3 for four hours at 175° (Mathieu Plessy, *C R* 109, 653) Crystalline powder, sl sol alcohol Converted by boiling water into $(\text{NH}_4)_2\text{H}_2\text{O}_4 \cdot \text{NH}_4\text{A}' - \text{NH}_4\text{A}'_{1/2}\text{aq} - \text{NaA}'_{1/2}\text{aq} - \text{KA}'_{1/2}\text{aq}$ (Engström, *J* 1856, 453) — $\text{MgA}'_{1/2}\text{aq} - \text{CaA}'_{1/2}\text{aq}$ S (of $\text{CaA}'_{1/2}$) 16 at 13°, 4 at 100° — $\text{BaA}'_{1/2}\text{aq} - \text{PbA}'_{1/2}\text{aq} - \text{Ph}(\text{OH})\text{A}'_{1/2} - \text{FeA}'_{1/2}\text{aq} - \text{NiA}'_{1/2}\text{aq} - \text{CuA}'_{1/2}\text{aq}$ (Bacaloglio, *J pr* 81, 869) — $\text{AgA}'_{1/2}$ needles

Methyl ether MeA' Cubes

Ethyl ether $\text{CO}(\text{NH}_2)\text{CO}_2\text{Et}$ **Oxamethane** [115°] Formed from oxalic ether and dry or alcoholic NH_3 Plates (from alcohol) With COClCO_2Et it forms $(\text{CO}_2\text{EtCO})_2\text{NH}$ [67] With cyanic acid vapour at 130° it yields $\text{C}_3\text{H}_2\text{N}_2\text{O}_{12}$ [155°–160°] (Grmaux, *Bl* [2] 21, 154), crystallising from water in needles. Chloral forms $\text{CCl}_3\text{CH}(\text{OH})\text{NHCO}_2\text{Et}$ [121°] (Moscheles, *B* 24, 1804)

Penta-chloro-ethyl ether $\text{C}_2\text{Cl}_5\text{A}'$ [184°] Formed from $(\text{C}_2\text{Cl}_5)_2\text{C}_2\text{O}_4$ and NH_3 (Malaguti)

Isobutyl ether $\text{C}_4\text{H}_9\text{A}'$ [90°] Prisms (Oahours, *O R* 77, 1408, Wallach, *B* 18, 507)

Isoamyl ether $\text{C}_5\text{H}_{11}\text{A}'$ [93°]

Phenyl ether $\text{CO}(\text{NH}_2)\text{CO}_2\text{Ph}$ [182°] Formed from $\text{CO}_2\text{EtCOCl}(\text{NH}_2)$ and phenol

Acetyl derivatives of the ethyl ether $\text{CO}(\text{NHAc})\text{CO}_2\text{Et}$ [54°] Needles

Oxamide $\text{CO}(\text{NH}_2)\text{CO}(\text{NH}_2)$ S 037 at 78° (Henry, *C R* 100, 943) H.F. 169,000 (Berthelot) Formed from oxalic ether and NH_4Aq (Bauhot, *ad* 1817) Formed also by heating ammonium oxalate (Dumas, *A Ch* [2] 44, 129, 54, 240) and by the slow decomposition of cyanogen by water containing aldehyde (Laebig, *A* 118,

248), or by conc HClAq (Schmidt & Gluts, *B* 1, 66) It also occurs among the products of oxidation of HCy , cyanides, and ferrocyanides (Playfair, *Attfield, C J* 16, 94)

Properties — White powder, sl sol hot water, insol alcohol Cupric acetate forms the salt $\text{Cu}(\text{C}_2\text{H}_3\text{N}_2\text{O}_4)_2\text{aq}$

Reactions — 1 By passing through a red hot tube it is decomposed into CO , ammonium carbonate, HCy , and urea. — 2 P_2O_5 yields, on heating, cyanogen, CO_2 , and CO — 3 Boiling dilute acids yield oxalic acid — 4 Boiling aqueous alkalis also saponify it *Magnesia* acts in the same way (Berthelot, *Bl* [2] 47, 840) — 5 Water at 224° forms ammonium oxalate — 6 Heating with HgO yields urea, CO_2 , and Hg (Williamson) Boiling with water and HgO forms a compound $(\text{C}_2\text{H}_3\text{N}_2\text{O}_4)_2\text{HgO}$ (Dessaignes, *A* 82, 233) — 7 Ac_2O has no action at 160° Bz_2O at 200° forms benzamide — 8 Conc HNO_3 decomposes it in the cold

Oxalimide $\text{CO} \rangle \text{NH}$ Formed from oxamic acid, PCl_5 , and POCl_3 at 80°–90° (Ost & Meute, *B* 19, 3228) Monoclinic prisms, v sl sol cold water, sol NH_4Aq Boiling water produces oxamide and oxalic acid — $\text{C}_2\text{O}_2\text{NH}_2\text{HCl}$ crystal line powder, insol water

Methyl oxamic acid $\text{CO}(\text{NHMe})\text{CO}_2\text{H}$ [146°] (Hantzsch, *B* 17, 2919) Formed by heating methylamine acid oxalate (Wurtz, *A Ch* [3] 30, 443), and, as a subsidiary product, by oxidising caffeine with CrO_3 (Maly & Hinteregger, *M* 2, 128) Crystals (from hot water or by sublimation) — $\text{KA}' - \text{CaA}'_{1/2} - \text{CaA}'_{1/2}\text{aq} - \text{BaA}'_{1/2}\text{aq}$ monoclinic crystals, $a b c = 1.018 \ 1.1306$, $\beta = 87^\circ 13'$

Methyl ether MeA' [85°] Formed from $\text{Me}_2\text{C}_2\text{O}_4$ (76 g) and methylamine (20 g) in MeOH (30 g) (Franchimont & Klobbie, *R T C* 8, 305)

Ethyl ether EtA' (243°) Oil

Methyl oxamide $\text{CO}(\text{NH}_2)\text{CO}(\text{NHMe})$ [229°] Formed from oxamic ether and NMeH_2 (Wallach & West, *B* 9, 262) Minute needles

Di-methyl-oxamide $\text{C}_2\text{O}_2(\text{NHMe})_2$ [217°] (Mylius, *B* 17, 291) Needles Conc HNO_3 yields $\text{C}_2\text{O}_2(\text{NMeNO}_2)_2$ [124°] (Franchimont, *R T C* 2, 94, 4, 193) PCl_5 yields $\text{C}_2\text{H}_2\text{ClN}_2$

Di-methyl-oxamic acid $\text{CO}(\text{NMe}_2)\text{CO}_2\text{H} - \text{CaA}'_{1/2}$ crystalline (Duvillier, *A Ch* [5] 23, 315)

Ethyl ether EtA' (c 244°) Not attacked by HNO_3 (S G 15) (Franchimont & Klobbie, *R T C* 8, 304)

Ethyl-oxamic acid $\text{CO}(\text{NHEt})\text{CO}_2\text{H}$ [120°] Tables — $\text{CaA}'_{1/2}\text{aq}$ Prisms (Hantz, *A* 127, 48) — $\text{CaA}'_{1/2}\text{aq}$ S 817 at 175° — $\text{BaA}'_{1/2}\text{aq}$

Ethyl ether EtA' (245°) Oil (Wallach, *A* 184, 59) Decomposed by water

Ethyl-oxamide $\text{CO}(\text{NH}_2)\text{CO}(\text{NHEt})$ [208°] Needles (*W*)

s-Di-ethyl oxamide $\text{CO}(\text{NHEt})\text{CO}(\text{NHEt})$ [179°] (Schiff, *B* 17, 1084) Formed from oxalic ether and ethylamine (*W*)

u-Di-ethyl-oxamide $\text{CO}(\text{NH}_2)\text{CO}(\text{NEt}_2)$ [126°] (268° cor) From $\text{CO}_2\text{EtCO}(\text{NEt}_2)$ and ammonia (Wallach, *A* 214, 263) With PCl_5 it yields 'chloroxalethylene' $\text{C}_2\text{H}_2\text{ClN}_2$

Tri-ethyl-oxamide $\text{CO}(\text{NHEt})\text{CO}(\text{NEt}_2)_2$ (258°) Formed from diethyl oxamic ether and ethylamine (*W*).

Methyl ethyl-oxamide

$\text{CO}(\text{NHMe})\text{CO}(\text{NHEt})$ [157°] Formed from methylamine and $\text{CO}_2\text{Et CONHET}$ (W)

Di-phenyl oxamic acid $\text{CO}(\text{NEt}_2)\text{CO}_2\text{H}$ [101°]

Prisms PCl_5 yields $\text{CO}(\text{NEt}_2)\text{COCl} - \text{CaA}'_2, 2\text{aq}$

Ethyl ether EtA' (250°-254°)

Isopropyl oxamic acid $\text{CO}(\text{NHPr})\text{CO}_2\text{H} -$

CaA'_2 (Duvillier)

Di propyl oxamide $\text{C}_3\text{O}_2(\text{NHPr})_2$ [162°]

Plates, which feel fatty (Wallach, *A* 214, 312)

Di-isobutyl oxamide [167°] Plates, v sol.

alcohol (Malbot, *C R* 104, 228)

Isoamyl-oxamide [181°] Needles

Di isoamyl-oxamide [129°]

Di amyl-oxamide $\text{C}_5\text{O}_2(\text{NH CH}_2\text{CMe}_2)_2$ [165°]

Needles (Freund, *B* 23, 2868)

Di allyl oxamide $\text{C}_3\text{O}_2(\text{NHCH}_2\text{CH}_2)_2$ [154°]

(274°) Br yields $\text{C}_3\text{O}_2(\text{NHCH}_2\text{CH}_2\text{Br})_2$ (Wallach a

Strecker, *B* 13, 513)

Ethylene oxamide $\text{C}_2\text{O}_2\text{N}_2\text{H}_2(\text{C}_2\text{H}_4)$ Amor

phous precipitate formed, together with soluble

$(\text{CO}_2\text{Et CO})_2\text{N}_2\text{H}_2\text{C}_2\text{H}_4$ by the action of alcoholic

ethylene diamine on oxalic ether (Hofmann, *B*

5, 247) Similar products are obtained from

propylene-diamine (Strache, *B* 21, 2360)

Ethylidene oxamide $\text{C}_2\text{O}_2\text{N}_2\text{H}_2(\text{CHMe})$

Formed from cyanogen and crude aldehyde (Ber-

thelot, *A* 128, 338)

Phenyl oxamic acid $\text{CO}(\text{NHPh})\text{CO}_2\text{H}$ **Ox-**

amic acid [151°] Formed by heating dehy-

drated oxalic acid (20 g) with aniline (25 g) at

140° for an hour (Laurent, *A* 68, 15, Claus, *Z*

[2] 4, 158, Aschan, *B* 23, 1820) The product

is crystallised from water and the acid set free

by dilute H_2SO_4 . Needles (containing Aq) or

anhydrous scales (from ether), sl sol cold water,

v sol alcohol Yields CO , water, CO_2 , and di-

phenyl oxamide on heating strongly Yields on

nitration *p* nitro phenyl oxamic acid [310°]

crystallising in prisms containing aq (Aschan,

B 18, 2936) The isomeric *o* nitro phenyl-

oxamic acid [112°] is formed by heating oxalic

acid with *o*-nitro aniline (Hübner a Heoff, *A*

209, 367) ***m* Nitro phenyl oxamic ether** [150°]

is formed from oxalic ether and *m* nitro aniline

$-\text{NH}_2\text{A}' - (\text{NH}_2)\text{HA}'_2 - \text{KA}'\text{aq} - \text{NaA}'_3\text{aq}$

plates, v. sl sol cold water $-\text{PbA}'_2 - \text{CuA}'_2$,

(Anschütz, *B* 22, 736) $-\text{BaA}'_2 - \text{AgA}'_2$ white

tables $-(\text{NH}_2\text{Ph})\text{HA}'_2$, needles (from water)

Chloride $\text{CO}(\text{NHPh})\text{COCl}$ [82°]

Methyl ether MeA' [114°] Formed

from $\text{Me}_2\text{C}_2\text{O}$, and aniline (Anschütz, *A* 354, 10)

Plates (from alcohol) or needles (from ligroin)

Ethyl ether EtA' [67°] Converted by

AcCl into $\text{CO}(\text{NPhAc})\text{CO}_2\text{Et}$ [67°] PCl_5 yields

NHPH CCl , CO_2Et [72°], which splits up on melt-

ing into HCl and $\text{NPh CCl CO}_2\text{Et}$ [91°], whence

aniline forms $\text{NHC}_6\text{H}_5\text{ CO C(NPh)(NHPH)}$ [235°].

Propyl ether PrA' [92°] Needles

Isopropyl ether PrA' [52°] Needles.

Isobutyl ether C₄H₉A' [85°] Plates

Amyl ether C₅H₁₁A' [50°] Needles

References—Bromo-, Carboxy-, Di-chloro-

and Iodo- PHENYL OXAMIC ACID

Phenyl-oxamide $\text{CO}(\text{NHPh})\text{CONH}_2$. A pro-

duct of the action of HClAq on cyananiline

(Hofmann, *A* 73, 181) Formed also from

phenyl oxamic ether and NH_3 (Klinger, *A* 184,

279) Crystals (from water)

Di-phenyl-oxamide $\text{CO}(\text{NHPh})\text{CO}(\text{NHPh})$

Oxanilides [245°] (H), [241°] (F); [252 5°]

(Reissert, *B* 28, 2245) (320°) Formed by heating aniline oxalate at 170° (Gerhardt, *A Ch* [3] 14, 120, 15, 88) and by decomposing cyananiline with HClAq (Hofmann, *A* 65, 56, 73, 181, 74, 85) Formed also from ethyl camphor-oxalate and aniline (Tingle, *C J* 57, 655) Nacreous scales, insol water, sl sol hot alcohol

Reactions—1 **Nitrous acid** passed into its solution in glacial acetic acid forms the nitro-amine $\text{CO}(\text{NHPh})\text{CO}(\text{NPhNO})$ [86°] and di-*p*-nitro oxanilide (Fischer, *B* 10, 960, Sent, *J pr* [2] 35, 521)—2 **Chlorine** forms tetra chloro di-phenyl-oxamide [c 255°] (Dyer a Mixer, *Am* 8, 349)—3 **Bromine** yields $\text{C}_2\text{O}_2(\text{NHC}_6\text{H}_4\text{Br})_2$ [above 300°] whence HNO_3 yields the nitro-compounds $\text{C}_2\text{O}_2(\text{NH}_2\text{C}_6\text{H}_4\text{Br}(\text{NO}_2))_2$ [388°] and $\text{C}_2\text{O}_2(\text{NHC}_6\text{H}_4\text{Br}(\text{NO}_2))_2$ [c 287°] (Muxter a Willcox, *Am* 9, 362)—4 **Iodine** HNO_3 and HOAc yield $\text{C}_2\text{O}_2(\text{NHC}_6\text{H}_4\text{I}(\text{I} 4))_2$ —5 **Nitric acid** forms the compounds $\text{C}_2\text{O}_2(\text{NH C}_6\text{H}_4(\text{NO}_2))_2$ [260°], $\text{C}_2\text{O}_2(\text{NH C}_6\text{H}_3(\text{NO}_2)_2)_2$ melting at [300°], and $\text{C}_2\text{O}_2(\text{NH C}_6\text{H}_2(\text{NO}_2)_3)_2$ [300°] (Muxter a Walther, *Am* 9, 355, cf Hubner, *A* 209, 366) The hexa nitro oxanilide is converted by aqueous KHCO_3 into $\text{CO}(\text{NH}_2)\text{CO NH C}_6\text{H}_4(\text{NO}_2)_3$ [c 260°] and picric acid Di *o* and di-*m* micro oxanilides melt above 300° and 270° respectively (H) di *o* nitro oxanilide yields, on reduction by tin and HOAc , a base $\text{C}_6\text{H}_4\text{N}_4$ [above 300°] which forms the salts $\text{B}^+\text{H}_2\text{Cl}_2, 2\text{aq}$ and $\text{B}^+\text{H}_2\text{SO}_4, 2\text{aq}$

References—Di bromo and Tetra-chloro- PHENYL OXAMIDE

Phenyl oxamide carboxylic acid

$\text{CO}(\text{NH}_2)\text{CO NHC}_6\text{H}_4\text{CO}_2\text{H}$ Formed by boiling

the so-called carboxamido carbidamidamido benz

oic acid $\text{CO}(\text{NH}_2)\text{C(NH)}\text{NH C}_6\text{H}_4\text{CO}_2\text{H}$ with

water (Griess, *B* 18, 2411) Small white plates.

***m* Amido-phenyl-oxamic acid**

$\text{C}_6\text{H}_4(\text{NH}_2)\text{NH CO CO}_2\text{H}$ Formed from *m*-phenyl-

ene-diamine and oxalic acid (Klusemann, *B* 7,

1263) Needles $-\text{AgA}'_2$

Di-methyl-amido-phenyl-oxamic acid v.

***p* 278.**

The **anhydrides** of the **methyl-**

hydroxides $\text{C}_6\text{H}_4\text{N}_2\text{O} < \text{NH CO} > \text{CO}$ are formed

by the action of MeI in MeOH upon the sodium

amido-phenyl oxamates, the products being de-

composed by Ag_2CO_3 (Griess, *B* 18, 2408) The

***m*-compound** crystallises with $3\frac{1}{2}$ aq and yields

the salts B'HIaq and B',H₂PtCl. The *p* isomeride crystallises (with 2½ aq) in needles, v sol hot water

m-Phenylene-oxamide C₆O₂(NH)₂C₆H₄. Formed from *m*-phenylene-diamine and oxalic ether (K) Amorphous

Di-phenyl-di-ethyl oxamide C₆O₂(NH C₂H₅Ph)₂ [180°] Crystals (Neubert, B 19, 1826)

Di-phenyl-di-methyl oxamide C₆O₂(NMePh)₂ (250°) Formed from methyl aniline and oxalic ether

o-Tolyl-oxamic acid CO(NHC₆H₄) CO₂H [137°] Formed by fusing KEtC₂O₄ with *o*-toluidine (Mauthner a Suida, M 7, 233, 9, 735) Needles (containing aq) Yields indole when heated with zinc dust —CaA', —BaA', aq —AgA'

p-Tolyl-oxamic acid [170°] Obtained from its ether CO(NHC₆H₄) CO₂Et [67°] which is formed by heating oxalic ether with *p*-toluidine

Nitro-tolyl-oxamic acid C₆H₄N₂O₅ 1e [1 4 3] C₆H₄Me(NO₂) NH CO CO₂H Formed by heating nitro-*m*-toluidine with oxalic acid (Hinsberg, B 15, 2691) Yellowish red plates (containing aq) —NaA' aq —BaA' aq

Ethyl ether EtA' [127°]

o-Tolyl oxamide CO(NH₂) CO(NHC₆H₄) (Bladin, Bl [2] 41, 129)

Di-*o*-tolyl oxamide C₂O₂(NHC₆H₄)₂ [200°] Formed by heating oxalic acid with *o*-toluidine at 220° (M a S) Crystals (from benzene) Converted by treatment with fuming HNO₃ into C₂O₂(NH C₆H₄Me(NO₂))₂ [2 1 3 5], which decomposes at about 270° (Mixer a Kleeberg, Am 11, 236) On oxidation by neutral KMnO₄ it yields C₂O₂(NH C₆H₄ CO₂H)₂, which forms the salts Cu₂A'O and Ag₂A'.

p-Tolyl-oxamide CO(NH₂) CO(NHC₆H₄) [237°] Formed from *p*-toluidine cyanide (C₆H₄NH₂)Cy₂ and HOAc (Bladin) Needles, v sol alcohol

Di-*p*-tolyl-oxamide C₂O₂(NHC₆H₄)₂ [269°] Crystals, v sol hot HOAc Yields on nitration C₂O₂(NHC₆H₄NO₂)₂ and C₂O₂(NHC₆H₄(NO₂)₂)₂

Amido-tolyl-oxamic ether C₆H₄N₂O₅ 1e C₆H₄Me(NH₂) NH CO CO₂Et Tolylene oxamethane [168°] Formed from tolylene *m*-diamine and oxalic ether in alcohol (Tiemann, B 8, 222) Plates (from alcohol) When dilute alcohol of 90 pc only is used the acid C₆H₄Me(NH₂) NH CO CO₂H [224°] is formed (Schiff, B 23, 1819) Phenyl thiocarbimide yields C₆H₄Me(NH CS NPh) NH CO CO₂Et [155°], a crystalline compound [138°], and C₆H₄Me<NH C₆O<NPh [198°] ClCO₂Et forms [1 2 4] C₆H₄Me(NH CO₂Et) NH C₂O₂Et [131°], whence alcoholic ammonia yields C₆H₄Me(NH CO₂Et) NH C₂O₂NH₂ [209°] (Schiff a Vanni, B 24, 687, 1315) The compounds [1 4 2] C₆H₄Me(NH CO₂Et) NH C₂O₂Et [128°] and [1 4 2] C₆H₄Me(NH CO₂Et) NH C₂O₂NH₂ [223°] are also crystalline The following bodies of like character are also crystalline:

[1 2 4] C₆H₄Me(NH CO NH₂) (NH C₂O₂Et) [218°], [1 2 4] C₆H₄Me(NH CO NH₂) (NH C₂O₂NH₂) [239°], [1 2 4] C₆H₄Me(NH NH C₂O₂Et) (NH C₂O₂NH₂) [210°], [1 2 4] C₆H₄Me(NH C₂O₂Et), [180°], and [1 2 4] C₆H₄Me(NH C₂O₂NH₂) [220°] The compounds [1.2.4] C₆H₄Me(NH CO₂Et) NH C₂O₂Et [170°] and

[1 2 4] C₆H₄Me(NH CONH₂) NH C₂O₂H [203°] have also been prepared.

Amide C₆H₄Me(NH₂) NH C₂O₂H [1 2 4]

[223°] From the ether and alcoholic NH₃

Anilide C₆H₄Me(NH₂) NH C₂O₂NPh [186°] (Schiff, B 24, 871)

Xylol-oxamic acid CO(NHC₆H₄Me)₂ CO₂H

[129°] Formed by heating *m*-xylidine with KEtC₂O₄ (Mauthner a Suida, M 9, 745) Needles (containing aq) On heating it yields di xylol-oxamide C₂O₂(NHC₆H₄Me)₂ [210°] —CuA' —AgA'

ψ-Cumyl-oxamic acid CO(NHC₆H₄Me)₂ CO₂H

[167°] Yellow needles which on heating yield di ψ-cumyl oxamide C₂O₂(NHC₆H₄Me)₂ [230°] —NaA' aq —KHA' —CaA' aq —AgHA' —AgA'

Di-propyl-di-benzyl-oxamide

C₂O₂(NH CH₂C₆H₅Pr)₂ [182°] (Goldschmidt a Gessner, B 22, 932) Crystalline

Tetra-phenyl di-propyl oxamide

C₂O₂(NH CH₂CHPh CH₂Ph)₂ [116°] Formed from CH₂Ph CHPh CH₂NH₂, and oxalic ether (Freund a Remse, B 23, 2862)

(a) Naphthyl-oxamic acid

CO(NHC₁₀H₇) CO₂H [180°] Formed from oxalic ether and (a) naphthylamine (Ballo, B 6, 247) Needles —KA' —CaA' —BaA' —(C₁₀H₇NH₂)HA' [154°] Needles (from water)

Ethyl ether EtA' [106°] Needles

Di-(a)-naphthyl-oxamide C₂O₂(NHC₁₀H₇)₂

[200°] Small scales (Zinn, A 108, 228)

Benzylidene-oxamide C₆H₄CH(NH) C₂O₂

Formed from oxamic ether and benzoic aldehyde (Medicus, A 157, 50) Plates (containing 'aq)

Piperidyl oxamic ether C₆H₄N CO CO₂Et

[290°] Formed from piperidine and oxalic ether (Wallach a Lehmann, A 237, 245) Oil

Oxamidoxim C(NH)(NH₂) C(NH)NH.

The hydrochloride of this base B'HClaq is formed by the action of alcoholic NH₃ on the hydrochloride of oximido ethyl ether (Pinner, B 16, 1656) It crystallises in plates, v sol water

Oxalamidoxim C(NOH)(NH₂) C(NOH)(NH₂)

[200°] Formed by the action of hydroxylamine on cyananiline or on cyanogen (E Fischer, B 22, 1932, Ephraim, B 22, 2305, Zinkeisen, B 22, 2946, Vorlander, B 24, 814) Colourless prisms, v sol hot water, sl sol alcohol ClCO₂Et forms C(NO CO₂Et)NH₂ C(NO CO₂Et)NH₂ [168°] Aldehyde produces CH₃CH<N>C<N>CHCH₃

[198°] Succinic anhydride yields the acid

CO₂H C₂H₄ C<N>C<N>C₂H₄ CO₂H

[200°] Chloral yields C₆H₅N₂O₂Cl [197°] —B'HClaq prisms, insol alcohol

Di-acetyl derivative [184°] Crystals

On heating with Ac₂O it yields

CMe<N>C<N>CMe [165°]

Di-benzoyl derivative [217°] Excess

of BzCl forms PhC<N>C<N>CPh

[246°], insol water

Di-ethyl ether

C(NOEt)(NH₂) C(NOEt)(NH₂) [115°] Formed

from oxalamidoxim, EtI, and NaOEt (Zinkeisen,

B 22, 2950) Needles, sl sol hot water

Oxalamidoxim

C(NOH)(NH CO NH₂) C(NOH) NH CO NH₂

[192°]. Formed from oxalamidoxim and conc.

aqueous potassium cyanate (Z) White needles, insol cold water

Phenyl-oxalamidoxim

$C(NO)(NHPh)C(NO)(NH)_2$ [c 180°] (Z), [148°] (Piemann, B 22, 1936) Formed from al cholic hydroxylamine hydrochloride and solid cyanamline (Zinckeisen, B 22, 2954) Plates

Ac_2O produces $C(NO)(NHPh)C\langle\begin{smallmatrix} N \\ NO \end{smallmatrix}\rangle CMe$ [172°]—B'HCl colourless needles

Di benzoyl derivative [189°] Needles

Hydroxylamide of oxalic acid $C_2O_2(NH OH)_2$ Formed from oxalic ether and hydroxylamine (Lossen, A 150, 814) Minute prisms (from water) Explodes at 105°— $NaHA''$ — KHA'' — CaA'' — $BaHA''$ — ZnA'' — Ag_2A'' — $NH_2(OH)H A''$

Oxalyl-tetra-methyl di hydrazine

$C_2O_2(NH NMe)_2$ [220°] Formed from di methyl hydrazine and oxalic ether (Renouf, B 13, 2172) Plates, sol alcohol

Oxalyl-di-ethyl di-hydrazine

$C_2O_2(NH NHet)_2$ [204°] Formed from ethyl-hydrazine and oxalic ether (Fischer, A 199, 297) Needles Gives rise to the nitrosamine $C_2O_2(N_2HPh NO)_2$ [145°], crystallising from water in prisms

Oxalphenylhydrazic acid $CO(NH_2Ph)CO_2H$ [170°] Formed from oxalic ether, phenyl hydrazine, and alcoholic $NaOEt$ (Michael, J pr [2] 35, 453)— NaA' — EtA' [119°]

Oxalyl di phenyl di-hydrazine

$C_2O_2(N_2H_2Ph)_2$ [278°] Formed from oxalic ether and phenyl hydrazine at 110° (E Fischer, A 190, 131) Plates With $COCl_2$ it yields $C_2O_2(N_2(CO)Ph)_2$ [above 300°]

Semi nitrile of oxalic acid v CYANOFORMIC ACID

Semi-nitrile of ortho oxalic acid *Tri ethyl ether* $C(OEt)_3CN$ (161°) SG 1.55 1.003 Polymerises on standing (Bauer, A 229, 178)

Tri propyl derivative $C(OPr)_3CN$ (216°-219°)

Nitrile of oxalic acid is CYANOGEN

OXALIMIDO ETHYL ETHER $C_2H_5N_2O_4$

$C(NH)(OEt)C(NH)(OEt)$ [c 25°] [c 170°] Formed from cyanogen and alcoholic HCl (Pin ner & Klein, B 11, 1481) Long prisms Benzylamine at 110° forms $(CH_2PhNH)_2C_2(NH)_2$ [150°] (Vorlander, B 24, 806) *p* Toluidine forms the isomeric $(C_2H_5MeNH)_2C_2(NH)_2$ [220°-230°], which is converted by hydroxylamine sulphate into $C(NO)(NH_2)C(NO)(NHC_2H_5)$ [175°], which yields a dibenzoyl derivative [194°], and by hydroxylamine hydrochloride into $C(NO)(NH_2)C(NH)NHC_2H_5$ [148°], whence may be got $C(NOEt)NH_2C(NH)NHC_2H_5$ [135°] and $C(NOCH_2Ph)(NH_2)C(NH)NHC_2H_5$ [165°]

OXALINES A name given to certain alkyl-glyoxalines (Wallach, A 214, 278, 325, Japp, C J 43, 197, Radziszewski, B 15, 2706) They are described as alkyl glyoxalines (v also Gly-oxalines)

OXAL-METHYL-ETHYLENE v DI-METHYL-GLYOXALINE

OXALMETHYLENE is identical with **METHYL-GLYOXALINE** (q v)

OXAL-METHYL PROPYLENE v METHYL-ETHYL-GLYOXALINE

OXALOXYL AMIDO-BENZOIC ACID v. CYN-AMIC ACID and CARBOXY-PHENYL OXAMIC ACID.

OXALPROPIONIC ETHER v METHYL OXAL-ACETIC ETHER

OXALPROPYLAMYLENE v PROPYL BUTYL-GLYOXALINE

OXALPROPYLBUTYLENE v DI PROPYL GLY-OXALINE

OXAL PROPYL ETHYLENE v METHYL PRO-PYL GLYOXALINE

OXALPROPYLENE v ETHYL PROPYL GLY-OXALINE

OXALSUCINIC ETHER

$CO_2Et CO CH(CO_2Et)CH_2CO_2Et$ (156° at 17 mm) Formed by the action of $NaOEt$ on an ethereal solution of oxalic and succinic ethers (W Wislicenus, B 22, 885) Oil, v sol alkalis $FeCl_3$ gives a deep red colour in alcoholic solutions Split up, in dilute solutions, on warming into oxalic and succinic acids and alcohol Yields a phenyl hydrazide

OXALURIC ACID $C_4H_4N_2O_8$

$NH_2CO NH CO CO_2H$ Mol w 132 HF 2,500 (Matignon, C R 113, 198) Occurs as ammonium salt in urine (Schunck, J 1866, 749) Formed by heating parabanic acid with aqueous alkalis (Liebig & Wohler, A 26, 287), and occurs among the products of the action of HCl and $KClO_4$ on guanine (Strecker, A 118, 151) Its ether is produced by the action of urea on $COCl CO_2Et$ in the cold (Henry, B 4, 644) White crystalline powder, sl sol water It reddens litmus Its aqueous solution is decomposed on boiling into urea and oxalic acid $POCl_3$ converts it into parabanic acid (Grimaux, C R 77, 1548) HNO_3 slowly decomposes it into CO_2 (54 cc), N_2O (38 cc), CO and N (15 cc together) (Franchimont, R T C 6, 216)

Salts— NH_4A' silky needles, v sol hot water— $KA'aq$ Trimetric crystals $abc = 1.601.539$ — $CaA'_2.2aq$ S 205 at 15°, 5 at 100° (P Waage, A 118, 301)— $BaA'_2.2aq$ S 158 at 9°, 18 at 100°— AgA' long silky needles

Ethyl ether EtA' [178°] (Salomon, B 9, 374) Silky needles

Amide $NH_2CO NH CO CO NH_2$ [155°-160°] Formed, together with dialuric acid, by the action of NH_4Aq and HCy on alloxan (Rösing a Schischkoff, A 106, 255, Strecker, A 113, 48) Formed also by the action of alcoholic ammonia on oxaluric ether, and of dry NH_3 on parabanic acid at 130° (Roudinsköia, Bl [2] 45, 250) Produced by heating urea with oxamic ether (Carstangen, J pr [2] 9, 143) Crystalline powder, insol cold water Converted into ammonium oxalurate by boiling water

Oxaluryl-hydrazine $CO(NH_2)CO CO N_2H_2Ph$ [215°] Formed by heating phenyl hydrazine parabanate (Skinner & Ruhemann, C J 53, 550)

Dimethyl-oxaluramide $C_4H_4N_2O_8$ [225°] Formed from di-methyl parabanic acid and alcoholic NH_3 at 100° (Menschutkin, A 178, 203) Needles

OXALYL-DI CHLORO-ACETIC ETHER v. TETRA-CHLORO TETRA-OXY-ADIPIC ETHER

OXALYL-DI-p-DIMETHYLPHENYLENE

DIAMINE v TETRA-METHYL DI AMIDO-DI PHENYL-OXAMIDE

OXALYL-METHYL-THIO-UREA v. METHYL-THIO-PARABANIC ACID.

OXALYL-METHYL-UREA *v* *Methyl-Para*

BANIC ACID

OXALYL-TOLYLENE-DIAMINE

Di-oxy-methyl-quinoxaline Formed by heating the acid oxalate of tolylene-diamine to 160° (Hinsberg, *B* 16, 1531) Converted by PCl_5 into $C_6H_4Me \begin{array}{c} \text{N CCl} \\ \text{N CCl} \end{array}$ [115°], crystallising in needles, insol water

Oxalyl-di tolylene tetramine

$C_6O_2(NH C_6H_4Me NH_2 [4 \frac{1}{3}])_2$ [above 300°] Formed by reducing di-nitro di tolyl oxamide (*v* OXALIC ACID) Small needles Above 300° it forms

Salts — $B'H_2SO_4 aq$ — $B'H_2Cl_2 aq$ — $B'H_2PtCl_6$, yellow amorphous pp

OXALYL-UREA *v* PARABANIC ACID

OXAMETHANE is the Ethyl ether of oxamic acid *v* OXALIC ACID

OXAMETHANE CHLORIDE *v*. Di CHLORO-

AMIDO ACETIC ETHER

OXAMIC ACID *v* OXALIC ACID**OXAMIDE** *v* OXALIC ACID**OXAMIDINE** *v* OXALIC ACID **ω -OXAMIDO ACETOPHENONE-OXIM**

$C_6H_4C(OH)CH_2NH(OH)$ [163°] Formed by digesting a dilute alcoholic solution of ω -bromo-acetophenone with hydroxylamine hydrochloride for several hours at the boiling point (Schramm, *B* 16, 2183) White crystalline solid Sol alcohol and ether, insol cold water and ligroin Dissolves in alkalis — $C_6H_4N_2O_2Ag$

 m -OXAMIDO-CARBIMIDO-CARBOXAMIDO-BENZOIC ACID

$(OH)NH C(NH) CO NH C_6H_4 CO_2H$ Formed by the action of an aqueous solution of hydroxylamine upon cyanocarboxamido benzoic acid $NC CO NH C_6H_4 CO_2H$ (vol 1 p 157) (Griess, *B* 18, 2416) White needles SI sol hot water — BaA' , 4aq

OXANILIC ACID is Phenyl oxamic acid *v* OXALIC ACID

OXANILIDE is Di phenyl oxamide *v* OXALIC ACID

OXANTHRANOL $C_{12}H_{10}O_2$ *v* *se*.

Prepared from anthraquinone (1 pt), zinc dust (2 pts), and NaOH (30 pts of 50 per cent solution) The filtrate is ppd by acids, but the ppd oxanthranol must be kept in a closed bottle under carbonic acid water, as it is reoxidised by air to anthraquinone (Graebe & Liebermann, *A* 160, 126, 212, 65) The red solution of oxanthranol in KOHAq is attacked by alkyl iodides forming alkyl-oxanthranols The alkyl-oxanthranols may be reduced to alkyl anthracenedi hydrides, which may be re-oxidised to the alkyl oxanthranols The alkyl oxanthranols give, with PCl_5 , alkyl-oxanthranyl chlorides In these respects methyl oxanthranol behaves differently from the others The alkyl-oxanthranyl chlorides are converted by water back to alkyl-oxanthranols Alkyl-oxanthranols (1 pt) are reduced by zinc-dust (2 pts) and ammonia (8 pts of SG 88) and water (5 pts) to alkyl hydro anthranols (Liebermann, *A* 212, 108)

Acetyl derivative $C_{12}H_8AcO_2$ Formed

from oxanthranol, NaOAc and Ac_2O Crystal line solid

or $C_6H_4 \begin{array}{c} \text{CO} \\ \text{CMe(OH)} \end{array} C_6H_4$, [187°] Formed by heating a mixture of anthraquinone, NaOH, zinc dust, watr, and MeBr (Liebermann & Landshoff, *B* 14, 456, *A* 212, 75) Colourless plates, sl sol alcohol, forming a solution with blue fluorescence Reduced by HI and P to anthracene dihydride Not attacked by PCl_5 An isomeric of methyl oxanthranol [98°] is sometimes formed by the action of NaOHAq and MeI on oxanthranol (Liebermann, *B* 21, 1175)

[107°] Formed from oxanthranol, NaOHAq, and EtI at 100° Formed also by oxidation of $C_6H_4 \begin{array}{c} \text{COEt} \\ \text{C(OEt)} \end{array} C_6H_4$, [77°] with CrO_3 in HOAc (Goldmann, *B* 21, 2507) Needles or trimetric prisms, $a b c = 741 \cdot 1 \cdot 495$ Its alcoholic solution exhibits strong blue fluorescence It is insol aqueous alkalis Reacts with hydroxylamine (E von Meyer, *J pr* [2] 29, 496) HI and P reduce it to ethyl anthracene dihydride Conc H_2SO_4 forms crystalline $C_{12}H_{12}O_2$ Yields a di bromo-derivative $C_{12}H_8Br_2O(OEt)$ [123°] and a di nitro derivative crystallising in small needles PCl_5 forms $C_6H_4 \begin{array}{c} \text{CO} \\ \text{C(EtCl)} \end{array} C_6H_4$, [89°]

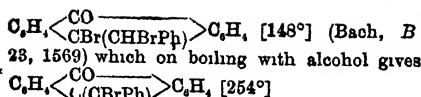

Isobutyl-oxanthranol

$C_6H_4 \begin{array}{c} \text{CO} \\ \text{C(C}_2\text{H}_5\text{)}_2\text{(OH)} \end{array} C_6H_4$, [130°] Prisms or needles (Liebermann & Walder, *B* 14, 462) PCl_5 yields the chloride $C_6H_4 C_2OCl(C_2H_5)_2 C_6H_4$, [78°], which reproduces isobutyl oxanthranol on boiling with water

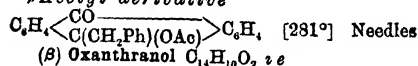

Isoamyl-oxanthranol

$C_6H_4 \begin{array}{c} \text{CO} \\ \text{C(C}_2\text{H}_5\text{)}_2\text{(OH)} \end{array} C_6H_4$, [125°] Monoclinic tables (from benzene ligroin) Conc H_2SO_4 removes H_2O , forming $C_{12}H_{10}O$ [72°] which separates from alcohol as yellow needles, and forms a dibromide $C_{12}H_8Br_2O$ [120°] Further action of H_2SO_4 forms a cherry coloured liquid, whence alcohol pppts yellow needles of $C_{12}H_{10}O$ [206°], a body which, on oxidation, yields anthraquinone carboxylic acid and a compound $C_{12}H_{12}O_2$, [157°] The compound $C_{12}H_{10}O$ is reduced by HI in HOAc to $C_{12}H_{12}$, [93°] which crystallises from alcohol in needles, and forms on nitration a compound $C_{12}H_8N_2O_5$ (Liebermann, *A* 212, 99) Phosphorus pentachloride converts isoamyl oxanthranol into the chloride $C_6H_4 \begin{array}{c} \text{CO} \\ \text{CCl(C}_2\text{H}_5\text{)}_2 \end{array} C_6H_4$, [85°] which forms monoclinic crystals, $a b c = 1266 \cdot 12752$, $\beta = 68^\circ 23'$ NaOAc converts the chloride into $C_{12}H_{10}AcO_2$, [73°]

Benzyl-oxanthranol $C_{12}H_{10}O_2$, [146°] Formed by boiling anthraquinone (5 pts), zinc dust (5 pts), KOH (7½ pts), benzyl bromide (5 pts), and water (100 pts), for a long time (Levi, *B* 18, 2153) White tables, v sol alcohol Conc H_2SO_4 at 70° forms a violet solution containing the anhydride $C_{12}H_8O$ which crystallises in yellow needles, oxidised by CrO_3 to anthraquinone. The anhydride yields a dibromide

Acetyl derivative

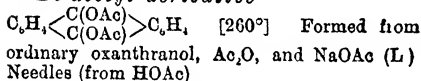

idation of anthracene by adding 56 grms of lead peroxide to a hot solution of 2 grms of pure anthracene in 50 cc of acetic acid (Schulze, *B* 18, 3036) Greenish yellow needles (from alcohol) The alkaline solution is red, but quickly becomes decolourised on shaking with air from oxidation to anthraquinone It is very oxidisable In its properties it closely resembles oxanthranol With ammoniacal AgNO_3 it gives a pp of metallic silver Cupric hydrate mixed with excess of NaOH is reduced to black cuprous oxide

OXAZINES Compounds derived from the hypothetical oxazine $\text{NH} \begin{smallmatrix} \text{CH} & \text{CH} \\ \text{CH} & \text{CH} \end{smallmatrix} \text{O}$ Quin-

oxazine is $\text{C}_6\text{H}_5\text{N} \begin{smallmatrix} \text{O} & \text{CH} \\ \text{CH} & \text{NH} \end{smallmatrix} \text{CH}$

OXAZOLES Compounds derived from the hypothetical oxazole $\text{N} \begin{smallmatrix} \text{CH} & \text{CH} \\ \text{CH} & \text{N} \end{smallmatrix} \text{O}$ (Hantzsch, *B*

OXETHYL- *v* OXY ETHYL

OXETONES Compounds derived from the

They are formed by treating lactones with sodium and heating the products (Fittig, *A* 256, 57) Thus valerolactone $\text{C}_5\text{H}_8\text{O}_2$ yields $\text{C}_{10}\text{H}_{16}\text{O}_4$, which, when boiled with NaOH aq forms $\text{C}_{10}\text{H}_{14}\text{NaO}_4$, whence the acid $\text{C}_{10}\text{H}_{16}\text{O}_4$, which is split up by heat into CO_2 and di methyl oxetone

OXIDATION This term was used formerly to connote chemical changes wherein oxygen was added on to an element or compound, or a compound was decomposed by the action of O with formation of oxidised products The term was nearly synonymous with *combustion* in the earlier and more restricted meaning of that word For an account of the phlogistic theory of combustion *v* **COMBUSTION**, vol II p 241

The term oxidation has been widened until at present it is applied to all chemical changes which result in an addition of negative radicle, simple or compound, to elements or compounds, or a decrease in the relative quantity of the positive radicle of a compound, whether this is or is not accompanied by substitution of negative radicle Thus the following changes are classed together as oxidations $4\text{Fe} + 3\text{O}_2 = 2\text{Fe}_2\text{O}_3$, $2\text{Fe} + 3\text{Cl}_2 = 2\text{FeCl}_3$, $2\text{BaO} + \text{O}_2 = 2\text{BaO}_2$, $4\text{Cu} + \text{S}_2 = 2\text{Cu}_2\text{S}$, $2\text{Hgl} + \text{I}_2 = 2\text{HglI}_2$, $2\text{KNO}_3 + \text{O}_2 = 2\text{KNO}_2$, $\text{BaS} + 2\text{O}_2 = \text{BaSO}_4$, $4\text{FeSO}_4 + 2\text{H}_2\text{SO}_4 + \text{O}_2 = 2\text{Fe}_2(\text{SO}_4)_3 + 2\text{H}_2\text{O}$, $2\text{K}_2\text{FeCy}_4 + \text{Cl}_2 = 2\text{K}_2\text{FeCy}_4 + 2\text{KCl}$, $2\text{Cr}_2\text{O}_3 + 4\text{K}_2\text{O} + 3\text{O}_2 = 4\text{K}_2\text{CrO}_4$, $4\text{K}_2\text{MnO}_4 + \text{O}_2 = 4\text{KMnO}_4 + 2\text{K}_2\text{O}$, $\text{Bi}_2\text{O}_3 + 4\text{Cl}_2 + 2\text{H}_2\text{O} + 4\text{KOH} = \text{Bi}_2\text{O}_5 + 4\text{KCl} + 4\text{H}_2\text{O}$, $3\text{C}_2\text{H}_4\text{O} + 2\text{Cr}_2\text{O}_3 = 3\text{C}_2\text{H}_4\text{O} + 3\text{H}_2\text{O} + \text{Cr}_2\text{O}_3$

Processes of oxidation are accompanied by processes of reduction or deoxidation The following examples make this clear (*cf* **DEOXIDATION**, vol II p 377) —

Original element or compound		Oxidiser		Oxidised Product		Deoxidised Product
H_2	+	O	=	H_2O		H_2O
		(The H_2O may be regarded as		oxidised H, or as reduced O)		
2Hg	+	O_3	=	HgO		O_2
		(The O_2 may be regarded as reduced ozone [O_2])				
SbCl_3	+	Cl_2	=	SbCl_5		SbCl_3
		(The SbCl_3 is oxidised		SbCl_3 , or reduced Cl)		
Sn	+	2HNO_3	=	$\text{SnO}_2 + \text{H}_2\text{O}$	+	N_2O_3
$3\text{H C O}_4\text{Aq}$	+	$2\text{KMnO}_4\text{Aq}$	=	$6\text{CO}_2 + 3\text{H}_2\text{O}$	+	$2\text{MnO}_2 + \text{K}_2\text{OAc}$
PbO	+	$2\text{Cl} + 2\text{KOHAc}$	=	$\text{PbO}_2 + \text{H}_2\text{O}$	+	2KClAq
$\text{K}_2\text{FeCy}_4\text{Aq}$	+	Cl_2	=	$\text{K}_2\text{FeCy}_4\text{Aq}$	+	2KClAq
$4\text{K}_2\text{MnO}_4\text{Aq}$	+	O_2	=	$4\text{KMnO}_4\text{Aq}$	+	$2\text{K}_2\text{O}$
(In the three cases in the bracket, KCl and K_2O may be regarded as reduced Cl and O respectively						
$3\text{SO}_4\text{Aq}$	+	$2\text{HNO}_3\text{Aq} + 2\text{H}_2\text{O}$	=	$3\text{H}_2\text{SO}_4\text{Aq}$	+	2NO

21, 944) They are formed by the action of the halogen derivatives of ketones on acetamide and its homologues, *eg* $\text{Ph CO CH}_2\text{Br} + \text{Me CO NH}_2$,

Compounds derived from $\text{CH CH} \begin{smallmatrix} \text{CH} \\ \text{CH N} \end{smallmatrix} \text{O}$ may be called isoxazoles Thus phenyl isoxazole is formed by the action of AcCl on the oxim of benzoyl acetic aldehyde (Claissen *B* 24, 134)

VOL. III

Any element or compound which frequently reacts to produce substances containing relatively more negative radicle than the original substance acted on, is called an *oxidiser* or *oxidising agent* Among the substances commonly used in the laboratory to effect oxidations are oxygen, ozone, chlorine, hypochlorites, nitric acid, potassium permanganate, potassium chlorate, molten potash, and chromium trioxide The conditions under which oxidation occurs vary much, thus Hg is oxidised by ozone at the

U U

ordinary temperature, but by O only at temperatures near the B.P. of Hg, KMnO_4 oxidises $\text{H}_2\text{C}_2\text{O}_4$ completely only in the presence of H_2SO_4 , and at a moderately high temperature, O does not oxidise SO_2 under ordinary conditions, but if the gases are passed over hot spongy Pt, SO_3 is produced rapidly. When O is absorbed by charcoal, and the charcoal is then brought into contact with H_2S , PH_3 , $\text{C}_2\text{H}_2\text{O}$, &c., oxidation proceeds rapidly (*v. Calvert, C J [2] 5, 293*). The products of oxidation obtained from a specified substance often vary according to the oxidiser employed, thus ozone produces Hg_2O from Hg at ordinary temperatures, but HgO is formed by the action of O on hot Hg, carbohydrates generally give HCO_2H when oxidised by CrO_3 , but $\text{H}_2\text{C}_2\text{O}_4$ when oxidised by HNO_3 , phthalic acids, $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$, are obtained by oxidising naphthalene, C_{10}H_8 , by CrO_3 in glacial acetic acid, but the chief product of the oxidation of the same compound by K_2CrO_4 and H_2SO_4 (which is essentially a solution of CrO_3) is naphthoquinone, $\text{C}_{10}\text{H}_6\text{O}_2$. There are some compounds the presence of which in a solution of an oxidisable body hastens the oxidation when O is passed into the solution, thus, $\text{H}_2\text{C}_2\text{O}_4$ is oxidised by CrO_3 in presence of MnSO_4 (*Harcourt, B A 1864 34*), SO_4 is rapidly oxidised by O in the presence of certain salts, especially MnSO_4 , CuSO_4 , FeCl_3 , CoCl_2 , &c. (*v. L. Meyer, B 20, 3058*, *Roessler, D P J 242, 278*, *cf. Mendelejeff, B 19, 2656*). M M P M

OXIDES Binary compounds of oxygen

For the purposes of this definition, those compounds of O with organic radicals which react similarly to oxides of elements must be classed among binary compounds (*eg* the ethers), in the present article, however, only the binary compounds of O with elements are considered. Oxides of all elements except Br and F have been isolated.

Oxides are frequently prepared by the direct union of O with other elements, O unites directly with all the elements except Br, Cl, F, I, Au, and Pt. Metallic oxides are formed by the action of heat on carbonates, nitrates, and other salts of volatisable acids, but the alkali oxides cannot be thus prepared. Most (?all) metals decompose water or steam, forming oxides or hydroxides, and evolving H. Many metallic sulphides yield oxides when roasted in air or O. Those oxides or hydroxides of metals which are not easily soluble in water are generally formed by the reaction of alkalis or alkaline oxides with solutions of metallic salts. The higher oxides of metals are often obtained by the action of hypochlorites, or Cl and KOH , on the lower oxides, sometimes by the action of conc. HNO_3 on the lower oxides or the metals, and sometimes by reacting on salts of the metals in solution with H_2O_2 in presence of an alkali.

Fusion of metallic oxides with KOH or KNO_3 generally results in the formation of alkali salts of metal-containing acids in the cases of those metals which are capable of forming such salts. The higher oxides of metals are generally more or less easily reduced to lower oxides, this reduction occurs sometimes by heating, in other cases by the action of such reducers as H, CO, SO_2 , As_2O_3 , or H_2S . The oxides of non-metals are frequently formed by combining O with the non-

metal, *eg* B_2O_3 , SO_2 , SO_3 , CO, CO_2 , H_2O , NO_2 , P_2O_3 , P_2O_5 , sometimes they are produced by such indirect methods as decomposing oxyacids or salts of oxyacids of the non-metals, *eg* N_2O_5 from HNO_3 , I_2O_5 from HIO_3 , Cl_2O from KClO_3 , sometimes they are formed by very indirect methods, *eg* Cl_2O by the reaction of Cl with HgO .

Oxides may be divided into classes in accordance with their empirical composition, thus, monoxides, M_2O and MO , sesquioxides, M_2O_3 , dioxides, MO_2 , trioxides, MO_3 , tetroxides, MO_4 , pentoxides, M_2O_5 , heptoxides, M_2O_7 .

A better classification is that based primarily on chemical properties, on this system, oxides are classified as *basic*, *acidic*, *indifferent* or *neutral*, and *peroxides*. None of these terms can be defined with strictness. The term *basic* is applied to those oxides which react with acids or with oxides more negative than themselves to form salts. *Acidic oxides* are those which react with water to produce acids, or are formed by removing water from acids, or react with oxides more positive than themselves to form salts. *Acidic oxides* are sometimes called *anhydrides*. *Peroxides* react with acids to form salts which correspond with oxides containing less O than the peroxides. Some peroxides also form acids when dissolved in water, or react with acidic oxides to produce salts. Peroxides which exhibit acidic functions may be called *acidic peroxides*, *eg* CrO_5 , peroxides which exhibit no acidic functions may be called *basic peroxides*, *eg* BaO_2 . Certain other oxides are sometimes included in the class peroxides (*v. infra*). The class of *indifferent* or *neutral* oxides includes all oxides not belonging to one or other of the three preceding classes.

Basic oxides. Most of the lower oxides of metals belong to this class. The characteristic reactions of the class are shown by the following two typical changes — $\text{BaO} + \text{H}_2\text{SO}_4 = \text{BaSO}_4 + \text{H}_2\text{O}$, $\text{PbO} + \text{SO}_3 = \text{PbSO}_4$. None of the oxides of any undoubted non-metal is distinctly basic. Oxides of non-metals, however, exist which form salts by reacting with certain strong acids, or the anhydrides of certain strong acids, and which also form salts by reacting with oxides more basic than themselves, thus, B_2O_3 reacts with H_2SO_4 containing SO_3 to form $\text{B}(\text{HSO}_3)_2$, and B_2O_3 also reacts with K_2O to form $\text{K}_2\text{B}_2\text{O}_4$, similarly As_2O_3 reacting with SO_3 forms compounds belonging to the salt type, $\text{xAs}_2\text{O}_3 \cdot \text{ySO}_3$, and with K_2O it forms KAsO_2 .

Some metallic oxides are basic, and nevertheless also form compounds with water which react as weak acids towards the more positive oxides, thus Al_2O_3 is distinctly basic, $\text{Al}_2\text{O}_3 + \text{H}_2\text{O}$ is also basic, yet it reacts with K_2O to form the unstable salt $\text{K}_2\text{Al}_2\text{O}_4$, similarly Au or $\text{3H}_2\text{O}$ dissolves in HNO_3 to form the salt $\text{Au}(\text{NO}_3)_3$, and $\text{Au}_2\text{O}_3 + \text{3H}_2\text{O}$ also dissolves in K_2O to form $\text{K}_2\text{Au}_2\text{O}_7$. The term basic oxide is sometimes widened to include oxides which correspond with salts, although these salts may not be formed directly from the oxides, thus, no salts have been obtained by the action of oxyacids on OsO_3 , but a few salts corresponding with this oxide are produced by indirect methods, *eg*, Os_2SO_5 is formed by reacting on OsO_3 with SO_2 . The *alkali-forming oxides* constitute a

division of the basic oxides, these oxides are distinctly and markedly basic, they also dissolve in water to form alkalis (*v* ALKALIS, vol 1 p 111, *v* also BASES, vol 1 p 445)

Acidic oxides or anhydrides The greater number of the oxides of non-metals belong to this class. SO_2 is a typical acidic oxide, it reacts with water to form the acid H_2SO_3 , it is obtained by removing H_2O from H_2SO_4 , by heating the acid, it reacts with basic oxides to form salts, *eg* with BaO it produces BaSO_4 . All acidic oxides do not exhibit the three characteristic reactions, some yield acids with water, but are not obtained by removing water from their acids, *eg* P_2O_5 , some are obtained by removing water from acids, but do not react with water to form acids, *eg* Sb_2O_3 , some do not form acids with water, are not obtained by removing water from acids, but react with oxides more positive than themselves to produce salts, *eg* As_2O_3 . Those acidic oxides which do not form corresponding acids by reacting with water generally show basic functions when they react with strong acids. Should an oxide form no acid with water, nor be obtained by removing water from an acid, but yet react with basic oxides to form salts, this oxide, although classed as acidic, will be found, almost certainly, to react as a basic oxide towards strong acids, or the anhydrides of strong acids. Thus, As_2O_3 does not form an acid with water, nor is it obtainable from a corresponding acid, it does, however, react with strongly basic oxides, *eg* with K_2O , to form salts, now As_2O_3 combines with SO_2 to form $\text{As}_2\text{O}_3 \cdot 2\text{SO}_2$, a compound in which As_2O_3 acts as a basic oxide. Some of the higher oxides of metals react as feebly acidic oxides, the salts corresponding with these oxides are generally obtained by fusing the oxides with KOH or NaOH (*v* ANHYDRIDES, vol 1 p 267).

Peroxides This class includes those oxides which react with acids to produce salts that correspond with oxides containing less O than the peroxides. The following reactions exhibit this typical property of peroxides — $\text{BaO}_2 + \text{H}_2\text{SO}_4\text{aq} = \text{BaSO}_4 + \text{H}_2\text{Oaq} + \text{O}$, $2\text{CrO}_3 + 12\text{HClaq} = 2\text{CrCl}_3\text{aq} + 6\text{H}_2\text{O} + 3\text{Cl}_2$. Some oxides which react in this way also dissolve in water to form acids, *eg* $\text{CrO}_3 + \text{H}_2\text{O} + \text{Aq} = \text{H}_2\text{CrO}_4\text{aq}$, others do not form acids with water, but react with strongly basic oxides to produce salts, *eg* $\text{PbO}_2 + \text{K}_2\text{O}$ (molten) — K_2PbO_4 . Peroxides which exhibit acidic functions may be called *acidic peroxides*, *eg* CrO_3 , PbO_2 , peroxides which do not exhibit acidic functions, *ie* which do not form acids with water, nor salts by reacting with basic oxides, may be called *basic peroxides*, *eg* CaO_2 , K_2O_2 . The more important *basic peroxides* are Na_2O_2 , K_2O_2 , CaO_2 , SrO_2 , BaO_2 (?) CaO_2 , CuO_2 , (?) Bi_2O_2 . Among the *acidic peroxides* may be mentioned CrO_3 , PbO_2 , and MnO_2 . Several highest oxides of metals cannot be assigned with certainty to the class of acidic peroxides, or to that of basic peroxides; *eg* Bi_2O_3 reacts with acids as a basic peroxide, and probably forms salts by fusion with a large excess of KOH , but the salts have not been isolated, UO_3 is distinctly acidic, with acids it forms uranyl salts, *eg* UO_2SO_4 ; OsO_3 is slightly acidic, no corresponding salts have been obtained by the re-

action of acids, but these reactions have not been examined sufficiently.

The term *peroxide* is used sometimes to include any oxide of a specified element which contains more O than the highest definitely basic or acidic oxide of that element. This statement does not define peroxide, because no formal definitions of the terms 'definitely basic oxide' and 'definitely acidic oxide' can be given. Such oxides as S_2O_3 , Cr_2O_3 (if it exists), MnO_2 , and Mn_2O_3 , would thus be classed as peroxides (*v* *infra*).

Indifferent or neutral oxides Oxides which do not form acids with water, are not obtained by removing water from acids, and do not form salts by reacting with either basic or acidic oxides, or with acids, are generally called *neutral or indifferent oxides*. Examples of such oxides are H_2O , NO , P_2O , (?) Fe_3O_4 , Pb_2O , Ag_2O , (?) Mn_2O .

None of the qualifying terms applied to oxides can be defined with strictness, such an oxide as MnO_2 is basic, because it forms salts by reacting with acids, MnO_2 is also acidic, because when fused with K_2O , in presence of O, it forms a salt (K_2MnO_4), it is also a peroxide, because the salts which it forms with acids correspond with the lower oxide MnO , and lastly, it may be classed as an indifferent oxide, because it does not form an acid with water, is not obtained by removing water from an acid, and does not form *corresponding* salts by the action of acids, acidic oxides, or basic oxides. When it is remembered that the properties expressed by the terms basic oxide, acidic oxide, and peroxide, are properties which come into play only when the oxides react with other substances, it is evident that these properties must depend to some extent on those of the other substances. Keeping this in mind, one sees how difficult, if not impossible, it must be to define the properties in question.

Oxides have been classified as *indifferent* and *salt forming*, and the salt forming oxides have been subdivided into those which form corresponding salts by reacting with acids or negative oxides, those which form corresponding salts by reacting with basic oxides, and those which form salts but not corresponding salts, by one or other of these reactions. This classification is practically the same as that which has been sketched already, although it is expressed in somewhat different terms.

What is the composition of the basic oxides? Which elements form acidic oxides? Can the composition of peroxides be stated in general terms? Alkali forming oxides are oxides of the most positive metals. The following are usually included in this group — Li_2O , Na_2O , K_2O , Rb_2O , Cs_2O , TiO ; MgO , CaO , SrO , BaO , (?) Ag_2O , (?) PbO . Basic oxides, which are not alkali forming, are oxides of fairly positive metals *eg* BeO , ZnO , CdO , HgO , SeO_2 , I_2O_3 , Al_2O_3 , Ga_2O_3 , Fe_2O_3 , NiO , CoO , TiO_2 , ZrO_2 , SnO , SnO_2 , Bi_2O_3 . Acidic oxides are oxides of negative elements, or they are compounds of elements, which on the whole are positive, with relatively much O, *eg* N_2O , N_2O_3 , P_2O_3 , P_2O_5 , Cl_2O , I_2O_5 , SiO_2 , CO_2 , CrO_3 , UO_3 , Ta_2O_5 . Peroxides, in the sense explained above, are usually the highest oxides of metals; *eg* CrO_3 , PbO_2 , in the widest sense, peroxides

also include some of the highest oxides of non-metals, e.g. S_2O_7 . Two oxides of the same element may exist, and one of these may be a basic, and the other an acidic, oxide, thus Cr_2O_3 is basic, but CrO_3 is acidic. Hence, whether an oxide is basic or acidic seems to depend not only on the general chemical character of the element combined with O, but also on the relative quantities of O and the other element. None of the elements whose lower oxides are alkali-forming forms an acidic oxide, but some of these elements form basic peroxides, in other words, the association of much O with a very distinctly positive element does not produce an acidic oxide, but does produce a basic peroxide. It is impossible to divide the elements into two classes, and say all on one side of the division line generally form basic oxides, but may also form acidic oxides. All that can be said is, the lower oxides of the metallic elements, as a class, are basic, but many of these elements also form higher oxides, some of which are distinctly acidic, and some are acidic peroxides, the oxides of the non-metallic elements as a class, are acidic, but some of these elements also form indifferent oxides, and a few oxides of non-metals are peroxides.

The peroxides have been divided by Mendeleeff into two classes (*J R* 1881, [1] 561, abstract in *B* 15, 242, v also Traube, *B* 19, 1111, 1115, 1117, Richarz, *B* 21, 1675). Mendeleeff distinguishes peroxides belonging to the type H_2O from those which belong to the type H_2O_2 , the latter class he calls *superoxides*, the former *polyoxides*. In the polyoxides, according to M, the O is all in direct union with the other element, and none of the O atoms is directly united with any other, whereas the O atoms of superoxides are regarded as in direct union with each other, as well as with the other element. BaO_2 is a typical superoxide, and is

supposed to have the structure $Ba \begin{smallmatrix} O \\ \diagup \quad \diagdown \\ O \end{smallmatrix} O$, MnO_2

is a typical polyoxide, and is supposed to have the structure $O Mn O$. The views of Traube (*lc*) and Richarz (*lc*) are practically the same as those expressed by Mendeleeff. The superoxides yield H_2O_2 Aq by reacting with dilute acids, and therefore reduce $KMnO_4$ Aq in presence of H_2SO_4 , the polyoxides do not yield H_2O_2 , but H_2O and O. Peroxides formed by the action of alkaline oxidisers, e.g. $KClO_4$ Aq, seem always to belong to the class of polyoxides. The peroxides K_2O_2 , Na_2O_2 , CaO_2 , SiO_2 , BaO_2 , ZnO_2 , CdO_2 , CuO_2 , PbO_2 , and some others, are superoxides, i.e. they give H_2O_2 Aq when acted on by dilute acids. According to Mendeleeff, S_2O_3 is a superoxide, it gives H_2O_2 when dissolved in much water, the constitution is probably $O SO_2 \begin{smallmatrix} O \\ \diagup \quad \diagdown \\ O \end{smallmatrix}$.

Mendeleeff (*lc*) says that the power possessed by any element of forming a characteristic basic or acidic oxide, from which salts are obtained, is connected with the position of the element in the periodic scheme of classification. But besides forming a salt-forming oxide, or more than one such oxide, some elements are also capable of producing superoxides belonging

to the type $HO OH$. Glancing at the groups of elements, as the elements are arranged in the periodic scheme of classification (*v. Classification*, vol. II p 204), and expressing the composition of the highest characteristic oxides of each group in a general formula, we have the result shown in the table on p 661.

The molecular weights of very few oxides have been determined with certainty, on this subject *v. Henry, P M* [5] 20, 81, *cf. Carnelley & Walker, C J* 58, 59. M P M

OXIDO-DI-NAPHTHYL-AMINE *v. Imido-di-NAPHTHYL OXIDE*

OXIMIDO ACETIC ETHER C_6H_5NO , i.e. $OH(NO) CO_2Et$ *Nitroso-acetic ether*. Formed, together with oxalic acid, by the action of fuming HNO_3 on acetoacetic ether (Pröpper, *A* 222, 48). Oil. Yields oxalic acid and hydroxylamine when heated with $HClAq$ at 140° . Cold $KOHAq$ yields KCy , K_2CO_3 , and alcohol. $-(NH_2)C_6H_5NO$, aq silky needles. $-C_6H_5NaNO$, $\frac{1}{2}$ aq. needles (from water).

OXIMIDO-ACETOACETIC ETHER *v. NITROSO-ACETOACETIC ETHER*

OXIMIDO- compounds *v. Nitroso- compounds*

OXIMIDO-ETHER *v. OXALIMIDO-ETHER*

TRI-OXIMIDO-METHYLENE $C_3H_3N_3O_3$, i.e. $CH_2 \begin{smallmatrix} N(OH)CH_2 \\ \diagup \quad \diagdown \\ N(OH)CH_2 \end{smallmatrix} N(OH)$. Formed from formic aldehyde and hydroxylamine (Scholl, *B* 24, 574). White amorphous solid, insol water, alcohol, and ether. At 133° it passes directly into a gas.

OXIMIDO-NAPHTHOL *v. AMIDO NAPHTHO-QUINONE*

OXIMS or OXIMES Compounds containing the group $CNOH$, obtained by the action of hydroxylamine on aldehydes, ketones, and ketonic compounds, by the reaction $R'RCO + H_2N OH = RR'C(NOH) + H_2O$ (*V Meyer, B* 15, 1164, 1324, 1525, 2784, 16, 822, 2992, 19, 1613) (*v. Aldoxims*, vol. I p 111). The reaction is best performed with hydroxylamine hydrochloride (1 mol) and aqueous $NaOH$ (3 mols) in the cold (Auwers, *B* 22, 604). Oxims are split up by boiling $HClAq$ into hydroxylamine and the original aldehyde or ketonic compound. The oxims do not exhibit Liebermann's reaction with phenol and H_2SO_4 . The oxims yield acetyl, alkyl, and sodium derivatives. Ketoxims (i.e. oxims of ketones) are converted by warming with conc H_2SO_4 at 100° into the isomeric amides, thus Ph_2CNOH becomes $Ph CO NHPh$, while $PhMeCNOH$ yields acetanilide (Beckmann, *B* 20, 1507, Wegerhoff, *A* 252, 1, Gunther, *A* 252, 44). PCl_5 acts like H_2SO_4 . Oxims are readily reduced, in alcoholic solution by means of sodium amalgam and acetic acid, to the corresponding amines, thus $XYCNOH + 2H_2 = XYCHNH_2 + H_2O$ (Goldschmidt, *B* 19, 3232). Benzoic aldehyde gives two oxims, two and two sets of alkyl oxims (Beckmann, *B* 22, 1534), and benzil also gives a greater number of oxims and alkyl-oxims than the ordinary formulæ indicate. These isomerisms may perhaps be explained by considering the arrangement in space of the atoms in the molecule (Beckmann, 20, 2766, *B* 23, 1680, Auwers & *V Meyer, B* 21, 784, 22, 1996, 23, 2408, Hantzsch, *B* 24, 81, 1192).

Groups	I	II	III
<i>Elements in group</i>	H, Li, Na, K, Cu, Rb, Ag, Cs, Au	Be, Mg, Ca, Zn, Sr, Cd, Ba, Hg	B, Al, Sc, Ga, Y, In, La, Yb, Tl
<i>Composition of highest basic or acidic oxide characteristic of the group</i>	M ₂ O	MO	M ₂ O ₃
<i>Character of highest basic or acidic oxide characteristic of the group</i>	Basic	Basic	Basic except B ₂ O ₃ , which is a weak anhydride
<i>Superoxides, type of HO OH</i>	H ₂ O ₂ , Na ₂ O ₂ , K ₂ O ₂ , CuO ₂ , Ag ₂ O ₂	CaO ₂ , ZnO ₂ , SrO ₂ , CdO ₂ , BaO ₂	(? TiO ₂)

Groups	IV	V	VI	VII
<i>Elements in group</i>	C, Si, Ti, Ge, Zr, Sn, Ce, Pb, Th	N, P, V, As, Nb, Sb, Bi, Er, Ta, Bi	(O), S, Cr, Se, Mo, Te, W, U	F, Cl, Mn, Br, I (group very incomplete)
<i>Composition of highest basic or acidic oxide characteristic of the group</i>	MO ₂	M ₂ O ₅	MO ₃	M ₂ O ₇ , represented only by Mn ₂ O ₇ , [Cl ₂ O, ClO ₂ , IO ₂ , no oxide of F or Br]
<i>Character of highest basic or acidic oxide characteristic of the group</i>	Acidic when M = C or Si, acidic and basic when M = Ti, Ge, Zr, Sn (? Ce), Pb (becoming more basic as M increases), basic when M = Th	Acidic, except Bi ₂ O ₅ , which acts as a feebly acidic peroxide (polyoxide)	Acidic, becoming less acidic as M increases, UO ₃ shows some basic properties	Acidic
<i>Superoxides, type of HO OH</i>	ThO ₂ , CeO ₂	(? NO ₃ , ? D ₂ O ₅)	S ₂ O ₇ , (? Cr ₂ O ₇ , ? UO ₄)	none

Group VIII

	Family 1 Fe, Ni, Co	Family 2 Ru, Rh, Pd	Family 3 Os, Ir, Pt
<i>Highest characteristic oxide</i>	M ₂ O ₃	MO ₃ , represented only by RuO ₄	MO ₃ , represented only by OsO ₄
<i>Character of oxide</i>	Basic	Feebly acidic (These elements also form MO, M ₂ O ₃ , and MO ₃ , which are feebly basic)	Feebly acidic (These elements also form MO, M ₂ O ₃ , and MO ₃ , which are feebly basic)
<i>Superoxides, type of HO OH</i>	? FeO ₂ , ? NiO ₂ , xO, ? Co ₂ O ₂ , xO	none	none

Oxims of ketones may be changed to phenylhydrazides by heating with phenyl hydrazine (Just, B 19, 1205)

OXINDOLE C₈H₇NO *rac.* C₈H₇ $\left\langle \begin{smallmatrix} \text{CH}_2 \\ \text{NH} \end{smallmatrix} \right\rangle \text{CO}$ or C₈H₇ $\left\langle \begin{smallmatrix} \text{OH} \\ \text{N} \end{smallmatrix} \right\rangle \text{C OH}$ (Baeyer & Comstock, B 16, 1704) *Anhydride of o-amido-phenyl acetic acid* Mol wt 133 [120°] Formed by reducing o-nitro-phenyl-acetic acid with tin and HCl. Obtained also by reducing dioxindole with sodium amalgam (Knop, J pr 97, 65, Baeyer & Knop, A 140, 1, Baeyer, B 11, 588, 12, 457) If the mixture of isomeric nitro-acids got by heating phenyl-acetic acid with fuming HNO₃ on the water bath be reduced with tin and HClAq, and, after removal of tin by H₂S, be boiled with

BaCO₃, only the *m*- and *p*-nitro phenyl acetic acids will form barium salts, and the oxindole may be extracted by ether

Properties — Long colourless needles (from water). Oxidised slowly by moist air, forming dioxindole. Reduces ammoniacal silver nitrate, forming a mirror. Extracted by ether from its alkaline solution. Not affected by boiling baryta water, but at 150° it yields barium amido phenyl-acetate. Nitrous acid forms nitroso-oxindole which is an oxim of isatin. PCl₅ yields C₈H₇ $\left\langle \begin{smallmatrix} \text{CHCl} \\ \text{N} \end{smallmatrix} \right\rangle \text{COCl}$ [104°] reduced by iron-filings and KOH to indole. Salts — AgC₈H₇NO — B/HCl. deliquescent spicules. *Acetyl derivative* [126°]. Long colour-

less needles. Sl sol cold water and ligroin, v sol alcohol (Suida, *B* 12, 1326). Converted by dilute NaOH aq into $\text{C}_6\text{H}_4(\text{NHAc})\text{CH}_2\text{CO}_2\text{H}$ [142°]

Bromo-oxindole $\text{C}_6\text{H}_4\text{BrNO}$ [176°] Formed, together with tri bromo-oxindole $\text{C}_6\text{H}_2\text{Br}_3\text{NO}$ 2aq, by the action of bromine water on oxindole. Both compounds form feathery crystals.

Nitro-oxindole $\text{C}_6\text{H}_4(\text{NO})\text{NO}$ Prepared by nitration. Yellow needles, sol alcohol. Begins to decompose at 175°.

Amido-oxindole $[\text{4 } \frac{1}{2}] \text{C}_6\text{H}_4(\text{NH}_2) \langle \frac{\text{CH}}{\text{NH}} \rangle \text{CO}$ [c 200°] Prepared by reduction of (4,2,1)-di-nitro phenyl acetic acid (Gabriel a Meyer, *B* 14, 832). Long spikes, v sol hot water.

Ezo-amido-oxindole $\text{C}_6\text{H}_4 \langle \frac{\text{CH}(\text{NH}_2)}{\text{NH}} \rangle \text{CO}$
The hydrochloride, formed by reducing isatin-oxim with tin and HCl aq , is decomposed by water, yielding a red resin.

Methyl-oxindole v p 351

Ethyl-oxindole $\text{C}_6\text{H}_4 \langle \frac{\text{CH}_2}{\text{NEt}} \rangle \text{CO}$ Formed by heating oxindole with EtI and NaOEt . Liquid, sl sol water. Very difficult to saponify by acids or alkalis.

Dioxindole $\text{C}_6\text{H}_4\text{NO}_2$ s.e. $\text{C}_6\text{H}_4 \langle \frac{\text{CH}(\text{OH})}{\text{NH}} \rangle \text{CO}$
Isatin dihydride. Anhydride of Hydronic acid. Mol w 149 [180°] S 85 in the cold, 17 at 100° S (alcohol) 7 in the cold, 10 at 78° Formed by reducing an aqueous solution of isatin with zinc dust and HCl aq , and extracting with ether (Baeyer, *B* 12, 1309). Yellowish monoclinic prisms (from water) or colourless crystals (from alcohol). Forms a violet liquid on melting. Its aqueous solution becomes red on exposure to the air, forming isatyde and isatin. In acid solution it may be reduced to oxindole. Chlorine forms chloro dioxindole $\text{C}_6\text{H}_3\text{ClNO}_2$ and dichloro dioxindole $\text{C}_6\text{H}_2\text{Cl}_2\text{NO}_2$. The corresponding bromo-derivatives melt at 165° and 170° respectively. PCl_5 yields $\text{C}_6\text{H}_4\text{Cl}_2\text{N}$. Ammonia colours its solution violet, and on boiling throws down a violet colouring matter, sol HCl aq . Potash and baryta produce a dark-violet colour, changing to red and finally yellow.

Salts — $\text{C}_6\text{H}_4\text{NO}_2\text{HCl}$ nodular crusts — $\text{C}_6\text{H}_4\text{NO}_2\text{H}_2\text{SO}_4$ aq ppd by adding water to its solution in H_2SO_4 — $\text{NaC}_6\text{H}_4\text{NO}_2$ 2aq silvery scales, v sol water, insol alcohol — BaA' 4aq white cubes, sl sol water. Gives off aniline on heating — PbA' 2aq ppd by lead subacetate — AgA' crystalline pp. Gives off benzoic aldehyde at 60°.

Acetyl derivative $\text{C}_6\text{H}_4\text{AcNO}_2$ [127°] Short prisms, sl sol cold water (Suida, *B* 12, 1326). Cold baryta water converts it into acetyl-hydronic acid $\text{C}_6\text{H}_4(\text{NHAc})\text{CH}(\text{OH})\text{CO}_2\text{H}$ [142°] which is also formed by reducing acetyl-isatinic acid with 3 p.c. sodium amalgam in acid solution (Suida, *B* 11, 586).

Nitroso-dioxindole $\text{C}_6\text{H}_4(\text{NO})\text{NO}_2$ [300°–310°] Formed by passing nitrous acid vapour into an alcoholic solution of dioxindole. Yellowish crystals, sl. sol water. May be sublimed. On boiling with FeSO_4 and KOH aq it yields 'azodioxindole' $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$, which is ppd by HCl aq in white needles [300°], yielding with AgNO_3 and NH_3 a white pp of $\text{Ag}_2\text{C}_6\text{H}_4\text{N}_2\text{O}_2$. Sodium-amalgam

and a little water reduce nitroso dioxindole to 'azodioxindole' $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ ppd by HCl aq as an amorphous powder (containing 3aq) and crystallising from alcohol in cubes. Bromine water converts nitroso dioxindole into $\text{C}_6\text{H}_4\text{Br}_2\text{N}_2\text{O}_2$ 3aq [275°].

Salts — $\text{NH}_4\text{C}_6\text{H}_4(\text{NO})\text{NO}_2$ 1½aq white silky laminae — $\text{BaC}_6\text{H}_4\text{N}_2\text{O}_2$ — $\text{AgC}_6\text{H}_4\text{N}_2\text{O}_2$, yellowish-white pp.

OXOCTENOL $\text{C}_8\text{H}_{14}\text{O}_2$ s.e.

$\text{OMe}, \text{C}(\text{OH}) \langle \frac{\text{CMe}_2}{\text{O}} \rangle$ [49.5°] (178°). V D

48 (at 185°). A product of the oxidation of isodibutylene by KMnO_4 (Butleroff, *J R* 14, 203, *C J* 42, 936, *Bl* [2] 38, 553). Long thin prisms, smelling like camphor, sl sol water, v sol alcohol and ether. Does not react with hydroxylamine (Meyer a Nagel, *B* 16, 1622). Not attacked by hot bromine.

Acetyl derivative $\text{C}_8\text{H}_{12}\text{AcO}_2$ (201°) Formed by heating with Ac_2O at 150°.

OXOCTYLIC ACID v Oxy-octonic acid

OXONIC ACID $\text{C}_8\text{H}_{14}\text{N}_2\text{O}_4$ A salt of this acid is formed by the atmospheric oxidation of an alkaline solution of uric acid (Strecker, *Medicus*, A 175, 230, *B* 10, 546). The free acid splits up at once into glyoxyl urea, CO_2 , and NH_3 — $\text{NH}_4\text{HA}''$ aq — KHA'' — $\text{K}_2\text{A}''$ 1½aq — $\text{Ba}(\text{HA}'')$ ½aq minute needles.

OXYACANTHINE $\text{C}_{16}\text{H}_{11}\text{NO}_2$ Occurs in the root of *Berberis vulgaris*, together with berberine, berbamine, and at least one other alkaloid. Needles (from alcohol or ether), or amorphous solid. In the amorphous state it melts at [138°–150°], in the crystalline state at [208°–214°]. V sol benzene and chloroform, scarcely in petroleum spirit. In chloroform $[\alpha]_D = +131.6$. Conc H_2SO_4 , or conc H_2SO_4 and molybdic acid, gives no colour at first, but on standing or heating, a yellow colour. From iodic acid it separates iodine.

Salts — $\text{B}'\text{HCl}$ 2aq small colourless needles, in aqueous solution $[\alpha]_D = +163.6$ — $\text{B}'\text{HNO}_3$ 2aq, colourless needles — $\text{B}'\text{H}_2\text{SO}_4$ 2aq microscopic plates — $\text{B}'\text{H}_2\text{SO}_4$ 6aq small prisms — $\text{B}'\text{H}_2\text{Cl}_2\text{PtCl}_4$ 5aq yellow pp (Hesse, *B* 19, 3190, cf Poley, *Ar Ph* 6, 265, Wacker, *J* 1861, 545).

DIOXY-ACENAPHTHENE $\text{C}_{10}\text{H}_6 \langle \frac{\text{CH}(\text{OH})}{\text{CH}(\text{OH})} \rangle$

Acenaphthylene-glycol [205°] Formed by saponifying its acetyl derivative, which is obtained from di bromo acenaphthene $\text{C}_{10}\text{H}_6 \langle \frac{\text{CHBr}}{\text{CHBr}} \rangle$ (Ewan a Cohen, *C J* 55, 578). Long colourless needles, sl sol cold MeOH and hot water. On treatment with Na and alcohol it yields the ketone $\text{C}_{10}\text{H}_6 \langle \frac{\text{CH}_2}{\text{CO}} \rangle$ [119°].

Mono-acetyl derivative $\text{C}_{11}\text{H}_7\text{AcO}$, [112°] Long needles, v sol alcohol.

Di-acetyl derivative $\text{C}_{12}\text{H}_8\text{Ac}_2\text{O}_2$ [130°] **Benzoyl derivative** $\text{C}_{11}\text{H}_7\text{BzO}_2$ [190°]

OXY-ACETIC ACID v GLYOXYLIC ACID

Di-oxy-acetic acid v GLYOXYLIC ACID

Tri-oxy-acetic acid v OXALIC ACID.

DI-OXY-ACETOACETIC ETHER

Di-ethyl derivative $\text{C}_{16}\text{H}_{20}\text{O}_4$ s.e. $\text{CH}_3(\text{OEt})\text{COCH}(\text{OEt})\text{CO}_2\text{Et}$ (245°) Formed by the action of Na on a solution of $\text{CH}_3(\text{OEt})\text{CO}_2\text{Et}$ in benzene (Conrad, *B* 11, 58).

Liquid, gives a violet colour with FeCl_3 . Forms Na and Ba derivatives. Split up by alkalis into alcohol and $\text{CH}_3(\text{OEt})\text{CO}_2\text{H}$

OXY-ACETONE v ACETYL CARBINOL

s*-Di oxy acetone** ***Di ethyl derivative $\text{C}_6\text{H}_5\text{O}_2$, vs $\text{CO}(\text{CH}_2\text{OEt})_2$ (195°) SG 12 98 VD 4 95 Formed by allowing the ether $\text{CH}_3(\text{OEt})\text{CO CH}(\text{OEt})\text{CO}_2\text{Et}$ (v the preceding article) to stand for three days with cold dilute (2.5 p.c.) KOH, neutralising with H_2SO_4 , extracting with ether, and distilling (Grimaux & Lefèvre, C R 107, 914) Sweet aromatic liquid, sl sol Aq, sol alcohol, volatile with steam. Combines with NaHSO_3 . Reduces Fehling's solution and yields a mirror with warm ammoniacal AgNO_3 .

***u*-Di oxy acetone v PYRUVIC ALDEHYDE**

***p*-OXY ACETOPHENONE** $\text{C}_6\text{H}_4(\text{OH})\text{CO CH}_3$ [14] [107°] Obtained by diazotising *p* amido acetophenone and boiling the solution (Klingel, B 18, 2691) Formed also by heating phenol with ZnCl_2 and HOAc (Michael & Palmer, Am 7, 277) White needles Sol water, alcohol, and ether FeCl_3 gives a dark brown colouration

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CO CH}_3$ [39°] (Gattermann, B 23, 1201) (258°) (G), (221°) (O) Formed by heating anisic aldehyde with Na and MeI in ethereal solution (Oliveri, G 13, 275)

Ethyl derivative [81°] (above 260°)

o*-Oxy acetophenone v BENZOYL CARBINOL** The ***phenyl derivative $\text{Br CH}_2(\text{OPh})$ [72°] and the ***p nitro-phenyl derivative*** $\text{Bz CH}_2(\text{OC}_6\text{H}_4\text{NO}_2)$ [144°] may be obtained from *o* bromo acetophenone (Mohlan, B 15, 2497) The ***phenyl hydrazides*** $\text{C}_6\text{H}_5\text{C}(\text{N}_2\text{HPh})\text{CH}_2\text{OH}$ [112°] and $\text{C}_6\text{H}_5\text{C}(\text{N}_2\text{HPh})\text{CH}_2\text{N}_2\text{HPh}$ [152°] have been prepared by Laubmann (A 243, 247).

(4 2 1) ***Di oxy acetophenone***

[4 2 1] $\text{C}_6\text{H}_3(\text{OH})_2\text{CO CH}_3$ ***Resacetophenone*** [142°] Formed by fusion of β methyl umbelliferon with KOH (Pechmann & Dunsberg, B 16, 2123) Prepared by heating resorcin (1 pt) with HOAc (1½ pts) and ZnCl_2 (1½ pts) at 150° (Nencki & Sieber, J pr [2] 23, 147, 546) Fine white needles Gives a red colouration with FeCl_3 . With HOAc , ZnCl_2 , and POCl_3 it gives $\text{C}_6\text{H}_3(\text{OH})_2\text{Ac}$ [180°] (Crépeux, Bl [3] 6, 152)

Acetyl derivative $\text{C}_6\text{H}_3(\text{OAc})\text{CO CH}_3$ [73°] (303°) White needles

Phenyl hydrazide

$\text{C}_6\text{H}_3(\text{OH})_2\text{C(OMe)N}_2\text{HPh}$ [139°] Tables (from xylene) (Michael & Palmer, Am 7, 276)

Methyl derivative

[2 4 1] $\text{C}_6\text{H}_3(\text{OH})_2(\text{OMe})\text{CO CH}_3$ [47°] Occurs in Japanese peonies (Will, B 19, 1776)

Di ethyl derivative [68°] (G)

(5, 2, 1) ***Di oxy acetophenone*** [202°] Made in like manner from hydroquinone (Nencki)

Tri oxy acetophenone $\text{C}_6\text{H}_2\text{O}_3$, vs

$\text{C}_6\text{H}_3(\text{OH})_2\text{CO CH}_3$ ***Gallacetophenone*** [168°] Formed by heating pyrogallol (1 pt) with HOAc (1½ pts) and ZnCl_2 (1½ pts) at 150° (Nencki & Sieber, J pr [2] 23, 147, 538) Pearly plates Alcoholic KOH ppts $\text{C}_6\text{H}_2\text{O}_3\text{KOH}$

OXY-ACETOPHENONE-CARBOXYLIC ACID

Phenyl derivative $\text{C}_6\text{H}_4\text{O}_2$, vs $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{CO CH}_2\text{OPh}$ [110°] Prepared by dissolving $\text{C}_6\text{H}_4\text{C(=O)CH}_2\text{OPh}$ in alkalis and acidifying the solution. Needles (Gabriel, B. 14, 928) —A'Ag white flocculent pp

β -OXY-ACETYL PROPIONIC ACID

$\text{C}_6\text{H}_4(\text{OH})\text{O}_2$ ***β -Oxy-levulic acid*** Formed in chief quantity, together with aceticrylic acid, by the action of aqueous Na_2CO_3 upon β -bromo-levulic acid. Yellowish oil V sol water and alcohol, sl sol other solvents Very prone to enter into reactions Reduces alkaline silver solutions Hydroxylamine gives an oxim [145°] By heating with NH_3 it yields tetra-methyl-pyrazine (di-methyl ketine), with evolution of CO_2 The salts are amorphous and easily decomposable (Wolff, B 20, 426, A 264, 234) On heating it yields two anhydrides [240°] and [263°]

The isomeric α -oxy acetyl propionic acid $\text{CH}_3\text{Ac CH}(\text{OH})\text{CO}_2\text{H}$ [104°] is crystalline

OXYACIDS v vol 1 p 57

OXY-ACRYLIC ACID v GLYCIDIC ACID and PYRUVIC ACID

OXY-ADIPIC ACID $\text{C}_6\text{H}_8\text{O}_4$, vs $\text{CO}_2\text{H CHMe CMe}(\text{OH})\text{CO}_2\text{H}$ Formed by treating methyl-acetoacetic ether with HCy and boiling the product with HClAq (König, B 12, 768) Crystalline mass — NaA'' — AgA''

Isomeric v ADIPOMALIC ACID

Di-oxy-adipic acid $\text{C}_6\text{H}_8\text{O}_4$ Formed by the action of Ag_2O on the di bromo adipic acid prepared from hydromuconic acid (v p 443) (Limpicht, A 165, 267) Syrup, sol alcohol and ether — BaA'' 4aq hygroscopic powder

Di-oxy-adipic acid Got from its nitrile, which is formed by warming the anhydride $\text{C}_6\text{H}_4\text{O}_2$ of erythrite with dry HCy at 55° (Przybytek, B 17, 1094) Crystalline — KHA'' — CdA'' 4aq — PbA'' 2aq amorphous pp

Tri-oxy-adipic acid $\text{C}_6\text{H}_6\text{O}_6$ Prepared by boiling tri bromo adipic acid with baryta water (Limpicht) Prisms (from alcohol benzene) — BaA'' 3aq v sol water

Tri-oxy-adipic acid $\text{C}_6\text{H}_6\text{O}_6$ [147°] Formed by oxidising metasaccharin with HNO_3 (SG 12) at 50° (Kiliani, B 18, 644, 1555) Small monoclinic plates, v sol water, v sl sol alcohol and ether Reduced by HI to adipic acid [149°] — CaA'' 4aq — ZnA'' 3aq — CuA'' 4aq — AgA''

Tetra-oxy-adipic acid v MUCIC ACID and SACCHARIC ACID

OXY-ALDEHYDO-BENZOIC ACID v ALDEHYDO OXY-BENZOIC ACID

OXY-ALDEHYDO-CYMENE v CARVACROTIC ALDEHYDE

OXY-ALDEHYDO-PHENOXY-ACETIC ACID

Methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})(\text{CHO})\text{O CH}_2\text{CO}_2\text{H}$ [2 4 1] [188°] Prepared by melting chloro acetic acid with vanillin, adding aqueous KOH (SG 12), and heating on the water bath (Elkan, B 19, 3054) Slender needles (from water), v sol alcohol and ether — AgA'' white pp

OXY-TRI-ALDINE v ALDEHYDE

OXYAMINO-NAPHTHOQUINONE v LAFACIFIC ACID

OXY-AMIDO-ACETIC ACID $\text{C}_6\text{H}_4\text{NO}_2$, vs $\text{CH}(\text{NH}_2)(\text{OH})\text{CO}_2\text{H}$ Formed by the action of alcoholic NH_3 on glyoxylic acid (Böttger, A 198, 217) Syrup — CaA'' insol cold water. Yields pyrrole on distillation

OXY-AMIDO-ACETOPHENONE-OXIM v OX-AMIDO ACETOPHENONE-OXIM

(a) **OXY-AMIDO-ANTHRAQUINONE** $\text{C}_6\text{H}_4\text{C}_2\text{O}_2\text{C}_6\text{H}_3(\text{OH})(\text{NH}_2)$ [1 2 4 3] Formed, together with a smaller quantity of the (b) iso-

meride by heating alizarin with NH_4Aq for 8 hours at 200° (Liebermann & Troschke, *A* 183, 202) Brown needles (from alcohol) with green lustre, insol water Yields alizarin on fusing with potash, and on heating with HClAq at 250° . —BaA⁺.

Acetyl derivative $\text{C}_{14}\text{H}_9\text{O}_2(\text{OH})(\text{NHAc})$. [170°] Formed by heating with Ac_2O for 2 hours at 120° (Von Perger, *J pr* [2] 18, 143) Yellow needles (from HOAc), insol water, sol alkalis
Ethyl ether $\text{C}_{14}\text{H}_9\text{O}_2(\text{OEt})(\text{NH}_2)$ [182°] Red plates (Liebermann & Hagen, *B* 15, 1796)

(8)-Oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_9\text{O}_2\text{C}_2\text{H}_4(\text{OH})(\text{NH}_2)$ [1284] Formed by boiling di-amido anthraquinone with KOHAc (Von Perger, *J pr* [2] 18, 139) Brown needles (from alcohol), insol. water, sol H_2SO_4 Begins to sublime at 150° On boiling with baryta it yields an insoluble Ba salt (difference from the (a)-isomeride) Its solution in KOHAc deposits the K salt on standing Potash fusion forms alizarin Elimination of NH_2 yields erythroxy anthraquinone

Acetyl derivative $\text{C}_{14}\text{H}_9\text{O}_2(\text{OH})(\text{NHAc})$ [242°] Small brownish needles (from alcohol)

Oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_9\text{O}_2(\text{OH})(\text{NH}_2)$ [301°] Prepared by heating sodium anthraquinone sulphate with NH_4Aq at 180° (Bourchart, *B* 12, 1418) Red needles Yields the tri acetyl derivative $\text{C}_{16}\text{H}_6\text{Ac}_3\text{NO}_6$, [257°]

Oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_9\text{O}_2(\text{NH}_2)(\text{OH})$ Formed by heating purpur-oxanthin with NH_4Aq (Liebermann, *A* 183, 217) Brown needles with green lustre

Di-oxy-amido-anthraquinone $\text{C}_{14}\text{H}_8(\text{OH})_2\text{NH}_2$

(a) **Amido alizarin** Formed by reducing (a)-nitro alizarin with sodium-amalgam (Perkin, *C J* 30, 578) Crystallises from alcohol in black needles with green lustre Its alcoholic and alkaline solutions are crimson

Di-oxy-amido-anthraquinone $\text{C}_{14}\text{H}_8(\text{OH})_2\text{NH}_2$

(8) **Amido alizarin** [above 800°] Formed by reducing (8) nitro alizarin with zinc dust and KOH , or with glucose and H_2SO_4 (Schunck & Roemer, *B* 12, 588, Brunner & Chuard, *B* 18, 445) Lustrous red prisms, sl sol alcohol, forming a reddish-yellow solution Its alkaline solution is blue Dyes iron mordants grey, and alumina red

Acetyl-ethenyl derivative

Formed by heating amidoalizarin with acetic anhydride Yellowish brown crystals (from benzene or acetic anhydride), sublimes in small yellow plates By boiling with HCl it is reconverted into amidoalizarin

Di-acetyl derivative

Formed by boiling the preceding body with dilute acetic acid till dissolved Red-brown crystals, soluble in alcohol with a yellow colour Alcoholic $\text{Pb}(\text{OAc})_2$ gives a violet pp, alcoholic $\text{Cu}(\text{OAc})_2$ a red solution It dissolves in aqueous Na_2CO_3 with a violet, in KOH with a blue, colour Alumina-mordants are dyed a deep red

Benzoyl-benzoyl derivative

Formed by heating amidoalizarin with benzoyl chloride Small glistening needles, sublimes in yellow needles, nearly insol all solvents Alcoholic KOH gives a blue solution on boiling (Roemer, *B* 18, 1666)

Di-oxy-amido-anthraquinone

$\text{C}_{14}\text{H}_9\text{O}_2(\text{OH})_2(\text{NH}_2)$ **Amidoanthraflavic acid** Formed by heating anthrapurpurin with ammonia at $150^\circ\text{--}180^\circ$ (Perkin, *C J* 33, 216) Dark-green crusts (from alcohol), almost insol water Its alkaline solution is purple Nitrous acid converts it into isoanthraflavic acid

Tetra-amido-di-oxy-anthraquinone

$\text{C}_{14}\text{H}_8\text{O}_2(\text{NH}_2)_4(\text{OH})_2$ **Hydrochrysamide** Formed by reducing tetra nitro di oxy anthraquinone (chrysammic acid) (Schunck, *A* 65, 234, Stenhouse & Miller, *A* 142, 91, Liebermann, *A* 183, 182) Bluish black needles with coppery lustre, insol boiling water, sl sol hot alcohol Its alkaline solution is blue

(a) **OXY-AMIDO-ANTHRAQUINONE SULPHONIC ACID** $\text{C}_{14}\text{H}_9\text{O}_2(\text{OH})(\text{NH}_2)\text{SO}_3\text{H}$

Formed from (a) oxy amido anthraquinone and H_2SO_4 at 180° (Von Perger, *J pr* [2] 18, 182) Brick-red crystalline aggregates (from alcohol) V sol water, giving it a reddish brown colour Insol ether Forms a violet solution with NaOH , a violet-blue pp with baryta water, and a reddish brown pp with BaCl_2 Dyes, with iron mordant, a pale brown With N_2O it gives oxy anthraquinone sulphonic acid

(8) Oxy-amido-anthraquinone sulphonic acid

Formed from amido erythro oxy-anthraquinone and H_2SO_4 at 115° Crystals obtained from water exhibit a green metallic lustre Aqueous solutions are red Insol ether Forms a purple solution with NaOH , a reddish violet pp with baryta water and a violet red pp with BaCl_2 Dyes, with iron mordants, yellow With N_2O it gives erythro-oxy anthraquinone sulphonic acid

Oxy-amido-anthraquinone sulphonic acid

Got by heating sodium anthraquinone disulphonate with NH_4Aq at 180° (Bourchart, *B* 12, 1419) Violet pp, forming a red solution in ammonia — $\text{NH}_4\text{A}^+\text{S}^{2-}\text{aq}$

Di oxy-amido-anthraquinone sulphonic acid

$\text{C}_{14}\text{H}_8(\text{OH})_2(\text{NH}_2)\text{SO}_3\text{H}$ Formed by the action of boiling alkali upon the anhydride $\text{C}_{14}\text{H}_8\text{N}_2\text{S}_2\text{O}_6$ or the sulphate, which are got by heating (a) nitro-anthraquinone sulphonic acid with H_2SO_4 at 200° (Claus, *B* 15, 1522, 16, 903, Lifschutz, *B* 17, 902) Red powder with green lustre Decomposed by heat Its alkaline solution is bluish violet

OXY-AMIDO-AZO- v Azo-

OXY-AMIDO-BENZENE v AMIDO PHENOL

Di-oxy-amido-benzene v AMIDO HYDROQUIN

ONE, AMIDO PYROCATHEIN, and AMIDO RESORCIN

Di-oxy-di-amido-benzene v DI AMIDO HYDRO

QUINONE and DI AMIDO RESORCIN

Tri-oxy-tri-amido-benzene Tri-benzoyl derivative $\text{C}_6(\text{OH})_3(\text{NHBz})_3$ [135246] **Tribenzoyl tri-amido phloroglucin** [c 156°] Got by the action of NAOEt on hippuric ether (Rugheimer, *B* 21, 8329) Needles (containing $1\frac{1}{2}\text{aq}$), v sl sol water — $\text{Cu}_2\text{A}^{3+}\text{--Pb}_2\text{A}^{3+}$

Tetra oxy amido-benzene

$\text{C}_6\text{H}_4(\text{OH})_4(\text{NH}_2)_4$ [12456] Formed from nitro di oxy quinone, SnCl_4 , and HCl (Nietzki & Schmidt, *B* 22, 1661) — $\text{B}^+\text{HCl aq}$ needles.

Penta-acetyl derivative. [242°]

Tetra-oxy di amido benzene $C_6(NH_2)_2(OH)_4$. Formed by reduction of mitranilic acid or of nitro-amido tetra oxy benzene with an excess of $SnCl_2$, the yield is 90 p.c. of the theoretical. The base could not be isolated, being readily oxidised to di-amido di oxy quinone $C_6(NH_2)_2(OH)_2O_2$. By HNO_3 it is converted into benzene-tri-quinone C_6O_3 . By boiling with KOH , NH_3 is evolved with separation of a black crystalline substance, if this is boiled with water and evaporated with a little KOH , it yields croconic acid $C_6H_2O_4$. Distillation with zinc dust yields *p* phenylene-diamine *Hydrochloride* $C_6(OH)_4(NH_2)_2H_2Cl_2$, colourless needles.

Di acetyl derivative Needles

Hexa acetyl derivative

$C_6(NHAc)_2(OAc)_4$, [c 240°], small colourless tables (Nietzki a Benckiser, *B* 18, 502, 19, 2727, 21, 1852)

OXY-AMIDO BENZOIC SULPHONIC ACID

v AMIDO PHENOL SULPHONIC ACID

Di oxy amido benzene sulphonic acid

$C_6H_4(OH)_2(NH_2)(SO_3H)$ *Amido resorcin sulphonic acid* Formed by reducing the nitro-acid (Hazura, *M* 4, 613, Brunner a Kramer, *B* 17, 1870) Plates, with greenish lustre, sl sol hot water. Its alkaline solution soon becomes blue, then green, and finally black.

OXY-AMIDO-BENZOIC ACID $C_6H_4NO_2$, *ie* $C_6H_4(OH)(NH_2)CO_2H$ [2 5 1] *Amido-salicylic acid* Mol w 153. Obtained by reducing the nitro-acid (Beilstein, *A* 130, 243, Hubner, *A* 195, 18). Obtained also by reducing $C_6H_5N_2C_6H_4(OH)CO_2H$ (P F Frankland, *C J* 37, 748) and $C_6H_5N_2C_6H_4(OH)CO_2H$ (Limpriht, *B* 22, 2908). Satiny needles, insol alcohol, sl sol hot water. $FeCl_3$ colours its aqueous solution cherry red.

Reactions—1 *Distillation* produces *p* amido-phenol—2 *Nitrous acid* forms diazo salicylic acid $C_6H_4(OH)N_2O$, which is converted by conc HI into iodo salicylic acid $C_6H_4I(OH)CO_2H$ [193 5°] (Frankland)—3 *Urea* forms, on heating, crystalline uramidosalicylic acid $C_6H_4N_2O_3$, which at 200° forms 'carboxamidosalicylic' acid $C_6H_4N_2O_4$, (Griess, *J pr* [2] 1, 235).

Salts— $HA'HCl$ — $HA'HSnCl_4$ (Goldberg, *J pr* [2] 19, 362)— $HA'HI$ (Schmitt, *J* 1864, 383, 423)— $HA'_2H_2SO_4$ aq prisms— $CaA'_2 \cdot 6\frac{1}{2}aq$ — $BaA'_2 \cdot 4aq$ Needles, v sol water— $MgA'_2 \cdot 8aq$ — $ZnA'_2 \cdot 10aq$ needles (Wattenberg, *B* 8, 1221).

Acetyl derivative $C_6H_4(OH)(NHAc)CO_2H$. [218°] Thick needles (containing $\frac{1}{2}aq$), v sol water.

Benzoyl derivative

$C_6H_4(OH)(NH_2)CO_2H$ [252°] Yields the salts $BaA'_2 \cdot 6aq$ and CaA'_2 (Dabney, *Am* 5, 22).

Oxy-amido-benzoic acid

$C_6H_4(OH)(NH_2)(CO_2H)$ [2 3 1] Formed by reducing the nitro acid (Hubner, *A* 195, 17)— $HA'HCl$ aq needles, v sol water.

Benzoyl derivative [189°] Needles

Oxy-amido-benzoic acid

$C_6H_4(OH)(NH_2)CO_2H$ [5 2 1] [235°] Formed from benzene-azo-*m*-oxy-benzoic acid and $SnCl_2$ (Limpriht, *A* 263, 234) Prisms, v. sl sol. water— $HA'HCl$ white needles.

Oxy-amido-benzoic acid

$C_6H_4(OH)(NH_2)CO_2H$ [4 8 1]. Got by reducing

nitro-*p* oxy benzoic acid (Barth, *Z* 1866, 648; Deninger, *J pr* [2] 42, 553) Needles— $H_2A'_2H_2SO_4$ needles, m sol water.

Ethyl ether EtA' Plates

Methyl derivative $C_6H_4(OMe)(NH_2)CO_2H$.

Amido amic acid [181°] S 125 at 100° Formed by reducing $C_6H_4(OMe)(NO_2)CO_2H$ (Zimin, *A* 92, 827, Cahours, *A Ch* [3] 53, 322)— AgA' curdy pp— $HA'HCl$ — $H_2A'_2H_2PtCl_6$ — $HA'HNO_3$ — $H_2A'_2H_2SO_4$ —Ethers MeA' — $(Me_4')_2H_2PtCl_6$ reddish prisms— EtA' — $EtA'HCl$ — $(EtA')_2H_2PtCl_6$ brownish-red prisms.

Oxy-amido-benzoic acid **Methyl derivative**

$C_6H_4(OMe)(NH_2)(CO_2H)$ [4 2 1] Formed from $C_6H_4Br(OMe)(NH_2)CO_2H$ by treatment with zinc and HCl (Balbiano, *G* 14, 247). It melts at 204°.

Oxy-di-amido-benzoic acid

$C_6H_4(OH)(NH_2)CO_2H$ [2 3 5 1] Formed by reducing $C_6H_4(OH)(NO_2)CO_2Me$ with HI and P (Saytzeff, *A* 133, 321). Small needles, sl sol cold water— $HA'HCl_2$ — $HA'_2H_2I_2aq$ — $HA'_2H_2SO_4$ aq dimetric prisms, sl sol water.

Di-oxy-amido benzoic acid **Di-methyl derivative** $C_6H_4(NH_2)(OMe)_2CO_2H$ Formed with evolution of CO_2 by reduction of nitro-hemic acid $C_6H_4(NO_2)(OMe)_2(CO_2H)$, with tin and HCl (Grune, *B* 19, 2305)— $A'HCl$ white needles.

Di-oxy-amido benzoic acid **Di-methyl derivative** [4 3 x 1] $C_6H_4(OMe)_2(NH_2)CO_2H$ *Amido veratric acid* Formed by reducing nitro veratric acid (Tiemann a Matsumoto, *B* 9, 942, 11, 135) Tables *Ethyl ether* EtA' [89°]

Di-oxy-amido-benzoic acid **Di-methyl derivative** $C_6H_4(OMe)_2(NH_2)CO_2H$ [5 3 4 1] [182°] Got by reduction (Meyer, *M* 8, 432). Six sided prisms (from alcohol)— $CuA'_2 \cdot 2aq$ — $HA'HCl$ needles, m sol cold water.

Di oxy-amido-benzoic acid **Acetyl-methylene derivative** of the *Nitris* $C_6H_4(O_2CH_2)(NHAc)CN$ [216°] Formed from the oxim of amido piperonal, Ac_2O , and $NaOAc$ (Haber, *B* 24, 626). Yellow needles (from chloroform).

Reference—BROMO OXY AMIDO BENZOIC ACID

DI-OXY-AMIDO-BENZOIC ALDEHYDE

Oxim of the methylene derivative $C_6H_4(O_2CH_2)(NH_2)CHNOH$ [175 5°] Got by reducing the oxim of *o*-nitro piperonal with ammonium sulphide (Haber, *B* 24, 625). Yellow plates. Yields a di acetyl derivative [188°].

OXY-AMIDO-BENZYLAMINE **Methyl derivative**

$C_6H_4(OMe)(NH_2)CH_2NH_2$ [1 2 4] Formed from $C_6H_4(OMe)(NO_2)CH_2NHAc$, tin, and $HClAq$ (Goldschmidt a Polonowska, *B* 20, 2412)— $B'HCl$ needles— $B'_2H_2PtCl_6$ plates.

Di-acetyl derivative [185°] Needles

α OXY- β AMIDO-BUTYRIC ACID $C_4H_7NO_3$, *ie* $CH_3CH(NH_2)CH(OH)CO_2H$ S 4 at 15°. Formed by heating β -methyl glycidic acid in sealed tubes with NH_3 aq at 100° (Pavloff, *Bl* [2] 43, 115, Melkoff, *J R* 16, 525). Prisms, with sweet taste.

Oxy-amido-isobutyric acid S 55 at 15°. Formed from α -methyl-glycidic acid and NH_3 .

OXY-AMIDO CINNAMIC ACID

Methyl derivative

[5 2 1] $C_6H_4(NH_2)(OMe)CHCHCO_2H$. [189°]. Formed by reduction of nitro-methoxy-cinnamic

acid with FeSO_4 and NH_3 (Schnell, *B* 17, 1884). Colourless needles $\sqrt{}$ sol alcohol and ether, almost insol cold water. An aqueous solution of the ammonium salt gives pps with AgNO_3 , CuSO_4 , $\text{Pb}(\text{OAc})_2$, and ZnSO_4 .

Anhydride $\text{C}_6\text{H}_3(\text{NH}_2) < \begin{smallmatrix} \text{O} & \text{CO} \\ \diagdown & \diagup \\ \text{CH} & \text{CH} \end{smallmatrix} \text{Amido-coumarin}$ [170°] (Frapolli a Chiozza, *A* 95, 253), [161°] (Taege, *B* 20, 2110). Got by reduction of nitro coumarin— $\text{B}_2\text{H}_6\text{PtCl}_6$.

Di-oxy-amido cinnamic acid *Methylene derivative*.

$\text{CH}_2 < \begin{smallmatrix} \text{O} \\ \diagdown \\ \text{O} \end{smallmatrix} > \text{C}_6\text{H}_3(\text{NH}_2) \text{CH CH CO}_2\text{H}$. [207°]

Formed by reducing the nitro-acid with NH_3 and hot aqueous FeSO_4 (F M Perkin, *C. J* 59, 158). Brownish needles, $\sqrt{}$ sol HOAc .

DI OXY-AMIDOETHYL BENZOIC ACID

Methylene derivative $\text{C}_{12}\text{H}_{11}\text{NO}_4$, $\text{v.e. C}_6\text{H}_5(\text{O} \cdot \text{CH}_2)(\text{CH}_2 \text{CH}_2 \text{NH}) \text{CO}_2\text{H}$. *Amido ethylpyrperonylcarboxylic acid* [182°] Formed, together with hemipic acid, by boiling anhydro berberic acid with water (W H Perkin, jun, *C. J* 57, 1055). Needles, sl sol alcohol, m sol cold water— $(\text{HA}')_2\text{H}_2\text{SO}_4$ 2aq [203°] Colourless prisms— $\text{HA}'\text{HCl}$ — $\text{HA}'\text{H}_2\text{C}_2\text{O}_4$ [203°]— $(\text{HA}')_2\text{H}_2\text{PtCl}_6$ [222°]— $\text{HA}'\text{H}_2\text{AuCl}_3$.

Di-benzoyl derivative $\text{C}_{22}\text{H}_{19}\text{NO}_6$ [150°]

Anhydride $\text{CH}_2 < \begin{smallmatrix} \text{O} \\ \diagdown \\ \text{O} \end{smallmatrix} > \text{C}_6\text{H}_4 < \begin{smallmatrix} \text{O} \\ \diagdown \\ \text{O} \end{smallmatrix} \text{CH}_2$

Formed by heating the acid, and, along with its ψ opianate and ψ opianic acid by the action of alkalis on berberal. It is also a product of the oxidation of berberine with KMnO_4 . Yields the compound $\text{C}_{10}\text{H}_7\text{BrNO}_3$ [240°]—Opianate $\text{B}'\text{C}_6\text{H}_5(\text{OMe})_2\text{CO}_2\text{H}_2$ [182°]— ψ Opianate $\text{C}_6\text{H}_5\text{NO}_3$ [149°] Needles, sl sol cold water. Yields berberal when heated.

OXY AMIDO GLUTAMIC ETHER $\text{C}_8\text{H}_{11}\text{N}_2\text{O}_4$

$\text{v.e. CO}(\text{NH}_2) \text{CH}_2 \text{C}(\text{OH})(\text{NH}_2) \text{CH}_2 \text{CO}_2\text{Et}$ [86°] Formed from acetone dicarboxylic ether and conc NH_3Aq (Stokes a Von Pechmann, *B* 19, 2694). Needles, sl sol cold water, insol alkalis. FeCl_3 gives a red colour. Dilute HClAq yields a body melting at 61° turned purple by FeCl_3 . Nitrous acid yields a nitroso derivative [178°]. Boiling alkaline carbonates yield glutazone (*v. Di OXY AMIDO PYRIDINE*).

OXY AMIDO-HEPTOIC ACID $\text{C}_8\text{H}_{11}\text{NO}_4$, $\text{v.e. CMe}_2(\text{NH}_2) \text{CH}_2 \text{CMe}(\text{OH}) \text{CO}_2\text{H}$

Amido trimethylbutylactic acid [210°] Formed by the action of boiling baryta water on its anhydride which is obtained by the action of boiling conc HClAq upon the product of the union of HCy with diacetoneamine (Heintz, *A* 189, 231, 192, 329, Weil, *A* 232, 208). Prisms (from water), insol alcohol and ether. Neutral to litmus. Yields its anhydride when heated—Salts $\text{CuC}_6\text{H}_7\text{NO}_4$ 2aq minute greenish blue prisms— $(\text{HA}')_2\text{H}_2\text{SO}_4$ — $\text{HA}'\text{HCl}$ crystalline.

Anhydride $\text{CMe}(\text{OH}) < \begin{smallmatrix} \text{CO} & \text{NH} \\ \diagdown & \diagup \\ \text{CH}_2 & \text{CMe}_2 \end{smallmatrix} \text{Di oxy- tri-methyl-pyrrole}$ Prisms (by sublimation) Melts above 180° .

OXY-AMIDO HYDRO ISATIN *v. ISATIN*

OXY-AMIDO-IMIDO-DI PHENYL SUL.

PHIDE $\text{C}_{12}\text{H}_9\text{N}_2\text{SO}$ $\text{v.e. N} < \begin{smallmatrix} \text{C}_6\text{H}_4(\text{NH}_2) \\ \diagdown \\ \text{O}-\text{C}_6\text{H}_4 \end{smallmatrix} \text{S}$.

Thionolins Formed by adding H_2S and FeCl_3 successively to an aqueous solution of *p*-

amido phenol hydrochloride (Bernthsen, *A* 280, 202). Yellowish brown plates or needles with green lustre (from alcohol).

OXY-AMIDO-DI-ISATIN DIAMIDE ISATIN DI-OXY-DI AMIDO-TETRAMETHENYL

Di-benzoyl derivative $\text{C}(\text{NHBz}) \text{C}(\text{OH}) \text{C}(\text{OH}) = \text{C}(\text{NHBz})$

[138°] Formed by heating hippuric ether with NaOEt , or with Na , at 160° (Rugheimer, *B* 21, 3325, 22, 114). Needles, m sol alcohol, $\sqrt{}$ e sol benzene. FeCl_3 colours its alcoholic solution violet. Decomposed by acids into benzoic acid and di amido acetone. Hydr xylamine does not affect it. Methyl alcohol and gaseous HCl form a body $(\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_2?)$ crystallising in plates [200°].

Oxy-tetra amido-pentamethenyl hydride

$\text{CH}(\text{OH}) < \begin{smallmatrix} \text{C}(\text{NH}_2) & \text{C}(\text{NH}_2) \\ \diagdown & \diagup \\ \text{C}(\text{NH}_2) & \text{C}(\text{NH}_2) \end{smallmatrix} \text{Tetra amido pentol}$

Formed from the tetra oxim of leuconic acid SnCl_4 , and HClAq (Nietzki a Rosemann, *B* 22, 923)— B^{14}HCl octahedra— $\text{B}^{14}(\text{H}_2\text{SO}_4)_2$ aq.

Tetra oxy-tetra-amido octomethenyl

Tetra benzoyl derivative $\text{C}_{24}\text{H}_{18}\text{N}_8\text{O}_8$, $\text{v.e. C}(\text{OH}) < \begin{smallmatrix} \text{C}(\text{NHBz}) & \text{C}(\text{OH}) & \text{C}(\text{NHBz}) \\ \diagdown & \diagup & \diagdown \\ \text{C}(\text{OH}) & \text{C}(\text{OH}) & \text{C}(\text{NHBz}) \end{smallmatrix} > \text{C}(\text{OH})$

A product of the action NaOEt on hippuric ether (Rugheimer, *B* 22, 1962). Small yellow needles. Does not melt below 270° — $\text{BaC}_2\text{H}_3\text{N}_2\text{O}_4$ pp.

Anhydride $\text{C}_8\text{H}_8\text{N}_4\text{O}_4$

OXY-AMIDO-METHYL-ANTHRAQUINONE

$\text{C}_{12}\text{H}_{11}\text{NO}_4$, $\text{v.e. C}_6\text{H}_4\text{Me}(\text{OH})(\text{NH})\text{O}$. Formed by heating chrysophanic acid with NH_3Aq at 200° (Liebermann, *A* 183, 218). Brown plates.

Oxy-di-amido-methyl-anthraquinone

$\text{C}_{12}\text{H}_{11}\text{N}_2\text{O}_5$, *Di amido chrysophanic acid* Formed by heating chrysophanic acid with excess of NH_3Aq at 150° . With AcO it yields $\text{C}_{12}\text{H}_{11}\text{AcN}_2\text{O}_5$ crystallising from chloroform in lustrous violet needles.

OXY DIAMIDO METHYL-DIPHENYL

Ethyl derivative

$\text{C}_6\text{H}_4(\text{NH}_2) \text{C}_6\text{H}_4\text{Me}(\text{OEt})(\text{NH}_2)$ [1 2 5 4] [107°] Formed from the hydrazo derivative $\text{C}_6\text{H}_4\text{NH NH C}_6\text{H}_4\text{Me}(\text{OEt})$ by dissolving in cold HClAq (Noelting a Werner, *B* 23, 3263). Needles, $\sqrt{}$ sl sol water.

Oxy di amido methyl diphenyl [3 4 1]

$\text{C}_6\text{H}_4\text{Me}(\text{NH}_2) \text{C}_6\text{H}_4(\text{OH})(\text{NH}_2)$ [1 3 4] [177°] Formed by the action of water at 180° on the sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2) \text{C}_6\text{H}_4(\text{OH})(\text{NH})\text{SO}_3\text{H}$ [1 3 4 6], got by reducing the dye from diazotised *o* toluidine and *p* phenol sulphonic acid (Weinberg, *B* 20, 3174). Plates, $\sqrt{}$ sl sol water.

Ethyl derivative

$\text{C}_6\text{H}_4\text{Me}(\text{NH}_2) \text{C}_6\text{H}_4(\text{OEt})(\text{NH}_2)$ [117 5°] Formed in like manner from $\text{C}_6\text{H}_4\text{Me}(\text{OEt})(\text{NH})\text{SO}_3\text{H}$, which yields $\text{HA}'\text{HCl}$ 4aq and BaA' 8aq.

OXY-AMIDO-METHYL QUINOLINE

$\text{C}_8\text{H}_7(\text{OH})(\text{NH}_2)\text{MeN}$ Formed by reducing nitro (*Py* 1)-oxy (*Py* 3) methyl quinoline (Conrad a Limpach, *B* 20, 950). Prisms, decomposing at 225° without melting— $\text{B}'\text{HCl}$ aq.

OXY AMIDO NAPHTHALENE v. AMIDO-NAPHTHOL

(1,2,3)-Di oxy amido naphthalene

$\text{C}_6\text{H}_4 < \begin{smallmatrix} \text{C}(\text{OH}) & \text{C}(\text{OH}) \\ \diagdown & \diagup \\ \text{N} & \text{C}(\text{NH}_2) \end{smallmatrix} \text{Di-oxy naphthylamine}$ Obtained by reduction of nitro (β) naphtho-

quinone (Korn, *B* 17, 906) Reduces cold AgNO_3 . Fe_2Cl_6 gives a blue black pp.

(2,2',1)-di oxy amido naphthalene

$\text{C}(\text{OH})\text{CH}=\text{C}(\text{NH}_2)\text{C}(\text{OH})$. Formed by reducing the (a) oxim of (2') oxy (β) naphthoquinone with SnCl_4 (Clausius, *B* 23, 521) — B^{HCl} needles, turning blue in air

Di-oxy-amido-naphthalene Got by reducing amido (a)-naphthoquinone (Graebe & Ludwig, *A.* 154, 320) Tables, v. e sol water Blackens in moist air

Tri-oxy amido naphthalene

$\text{C}_6\text{H}_4\text{C}(\text{OH})\text{C}(\text{NH}_2)\text{C}(\text{OH})$ Formed by reducing nitro oxy (a) naphthoquinone with SnCl_4 (Kehrmann, *B* 21, 1780, *J pr* [2] 40, 179) Monoclinic crystals Cold conc HNO_3 appears to form $\text{C}_6\text{H}_4\text{C}(\text{CO})\text{C}(\text{NO})\text{CO}$ crystallising in red dish yellow needles Yields a tetra acetyl derivative [145°]

OXY AMIDO NAPHTHALENE SULPHONIC ACID v AMIDO NAPHTHOL SULPHONIC ACID

Oxy di amido naphthalene sulphonic acid $\text{C}_6\text{H}_4(\text{NH}_2)_2(\text{OH})(\text{SO}_3\text{H})$ [α 4' 14] The hydrochloride B^{HCl} is formed by reducing di-nitro naphthol sulphonic acid with SnCl_4 and HCl (Nietzki & Zubelen, *B* 22, 455) It crystallises in colourless needles

OXY m AMIDO NAPHTHOIC ACID $\text{C}_{10}\text{H}_7(\text{OH})(\text{NH})\text{COH}$ Formed by reducing the nitro acid (Schmitt & Burkard, *B* 20, 2700) Decomposes above 200°

Acetyl derivative [185°]

Oxy p amido naphthoic acid Got by reducing $\text{C}_6\text{H}_4(\text{SO}_3\text{H})\text{N}^-\text{C}_{10}\text{H}_7(\text{OH})\text{COH}$ with tin and HCl (S & B) Decomposes above 200°

Acetyl derivative [195°].

Oxy amido naphthoic acid

$\text{C}_{10}\text{H}_7(\text{OH})(\text{NH}_2)(\text{CO}_2\text{H})$ [1 4 2 ?] [above 200°] Formed from (a) oxy naphthoic acid by combining it with diazobenzene chloride and warming the product with SnCl_4 and HCl (Nietzki & Gutermann, *B* 20, 1275) Crystalline powder, insol water Decomposes above 230° into CO_2 and (a) amido (a) naphthol

OXY AMIDO (a)-NAPHTHOQUINONE

$\text{C}_6\text{H}_4\text{C}(\text{CO})\text{C}(\text{NH}_2)\text{C}(\text{OH})$ Amido-naphthalic acid

Formed by reduction from nitro oxy naphthoquinone (Diehl & Merz, *B* 11, 1319) and from di nitroso di oxy naphthalene (Kostanecki, *B* 22, 1346) Formed also by oxidising tri-oxy amido-naphthalene with aqueous FeCl_3 (Kehrmann, *B* 21, 1781) Red prisms, sl sol water Its alkaline solutions are blue — BaA_2 : violet pp — AgA' : grey pp

Acetyl derivative $\text{C}_{10}\text{H}_7\text{O}_2(\text{OH})(\text{NHAc})$ [220°] Formed from $\text{C}_{10}\text{H}_7(\text{OAc})_2(\text{NHAc})$ and KOHAq (Kehrmann & Weichardt, *J pr* [2] 40, 182) Yellow needles, insol water — KA' : blue-black needles

Oxym $\text{C}_6\text{H}_4\text{C}(\text{CO})\text{C}(\text{NH}_2)\text{C}(\text{OH})$. Greenish flocculent pp — B^{HCl} yellow needles.

Acetyl derivative of the oxym

$\text{C}_6\text{H}_4\text{C}(\text{CO})\text{C}(\text{NHAc})\text{C}(\text{OH})$ Golden needles, sl sol alcohol Decomposes at 190°–200°.

OXY DIAMIDO DIPHENYL $\text{C}_{12}\text{H}_{10}\text{N}_2\text{O}$ i.e.

[4 1] $\text{C}_6\text{H}_4(\text{NH}_2)_2\text{C}_6\text{H}_4(\text{NH}_2)(\text{OH})$ [1 4 2] [185°] Formed by the action of water at 180° on the hydrochloride of its sulphonic acid, which is got by reducing $\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4(\text{OH})\text{SO}_3\text{H}$ with SnCl_4 at 80° (Weinberg, *B* 20, 3173, Noeltling & Werner, *B* 23, 3256) Plates, sl sol water — $\text{HA}'\text{H}_2\text{SO}_4$ insol water — $\text{HA}'\text{HCl}$ — $(\text{HA}')_2\text{H}_2\text{PtCl}_6\text{aq}$ sl sol water

Ethyl derivative

$\text{C}_6\text{H}_4(\text{NH}_2)_2\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})$ [135°]. Needles, sl sol water — $\text{HA}'\text{H}_2\text{SO}_4$ prisms

Di-oxy-di-amido-diphenyl Di-ethyl-derivative

[4 3 1] $\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})$ [1 4 3] Di-ethoxy benzidine [117°] Formed from [2 1] $\text{C}_6\text{H}_4(\text{OEt})\text{NH NH C}_6\text{H}_4(\text{OEt})$ [1 2] and conc HClAq (Mohlau, *J pr* [2] 19, 381) Needles or plates, sol hot water — B^{HCl} — $\text{B}^{\text{H}_2\text{SO}_4}$ — $\text{B}^{\text{H}}\text{PtCl}_6$ — $\text{B}^{\text{H}}\text{H}_2\text{SO}_4$ needles, sol hot water

Di oxy di amido diphenyl

[3 4 1] $\text{C}_6\text{H}_4(\text{NH}_2)(\text{OH})\text{C}_6\text{H}_4(\text{NH}_2)(\text{OH})$ [1 3 4] [above 300°] Formed by reducing di nitro di-oxy diphenyl (Kunze, *B* 21, 3332, Schutz, *B* 21, 3531) Needles or plates AcO yields the di-acetyl derivative AcCl forms the di ethenyl derivative [195°] — B^{HCl} needles — $\text{B}^{\text{H}_2\text{SO}_4}$

Di-acetyl derivative

$\text{C}_{12}\text{H}_8(\text{OH})(\text{NHAc})_2$ [210°] Needles, sol alkalis, insol acids

Tetra-acetyl derivative $\text{C}_{12}\text{H}_6\text{Ac}_4\text{N}_2\text{O}_2$ [225°] White needles (K)

Di oxy-tetra amido diphenyl

$\text{C}_6\text{H}_4(\text{NH}_2)_2(\text{OH})\text{C}_6\text{H}_4(\text{NH}_2)(\text{OH})$ Formed from tetra nitro di oxy diphenyl (Kunze) Colourless needles or silvery plates, turning blue in air AcCl converts it into a compound $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_2$ — B^{HCl} 4aq — $\text{B}^{\text{H}}\text{H}_2\text{SO}_4$ white needles

Tetra acetyl derivative

$\text{C}_{12}\text{H}_8(\text{NHAc})_2(\text{OH})_2$ [280°] Got by boiling the hexa acetyl derivative with NaOHaq

Hexa acetyl derivative

$\text{C}_{12}\text{H}_8(\text{NHAc})_2(\text{OAc})_2$ [300°] Formed from the base and boiling AcO

Tetra oxy di amido diphenyl

$\text{C}_6\text{H}_4(\text{OH})_2(\text{NH})\text{C}_6\text{H}_4(\text{OH})\text{NH}_2$

Tetra-methyl derivative

$\text{C}_{12}\text{H}_8(\text{OMe})_2(\text{NH}_2)_2$ [210°] Formed by molecular change from tetra methoxy hydrazobenzene under the influence of acids (Baessler, *B* 17, 2123) Silky white needles, v sol chloroform, CS_2 , hot alcohol, and hot benzene, sl sol water and ligroin — B^{HCl} small white, easily soluble needles — $\text{B}^{\text{H}}\text{Cl}_2\text{PtCl}_6$ yellow pp The di-acetyl derivative forms white needles [251°], sol hot alcohol, benzene, chloroform, and CS_2

Tetra-ethyl derivative

$\text{C}_{12}\text{H}_8(\text{NH}_2)_2(\text{OEt})_2$ [129°] Formed, in like manner, from the hydrazo-compound got by reducing the di ethyl ether of nitro hydroquinone with powdered zinc and alcoholic potash (Nietzki, *B* 12, 39) Leaflets — $\text{B}^{\text{H}}\text{Cl}_2$ — $\text{B}^{\text{H}}\text{H}_2\text{PtCl}_6$ yellow crystalline pp

Tetra-oxy tetra-amido-diphenyl Tetra-acetyl derivative $\text{C}_{12}\text{H}_8(\text{NHAc})_4(\text{OH})_4$ White needles, formed by reduction of the corresponding quinone $\text{C}_6\text{H}_4(\text{NHAc})_2(\text{OH})_2\text{O}_2$ [268°] which is formed by oxidation of tri-acetyl tri-amido phenol (Bamberger, *B* 16, 2403)

• OXY-*o*-AMIDO-PHENYL-ACETIC ACID*Hydrazide acid**Acetyl derivative*

$C_6H_4(NHAc)CH(OH)CO_2H$ [142°] Got by reducing acetyl isatic acid with sodium amalgam in presence of acetic acid (Suida, *B* 11, 586) Needles, v sol water

Anhydride v Di oxindole

p-Oxy-*o*-amido-phenyl acetic acid *Methyl derivative* $C_6H_4(OMe)CH(NH)CO_2H$ [225°] Formed from anisic aldehyde by successive treatment with HCy, alcoholic NH_3 , and HCl (The mann & Köhler, *B* 14, 1979). Needles (from dilute alcohol) — CuA' , blue amorphous pp

Di-oxy o amido-phenyl-acetic acid *Methyl-ene derivative* $CH_2O_2C_6H_4CH(NH_2)CO_2H$ [210°] Formed from piperonal by successive treatment with HCy, alcoholic NH_3 , and HCl (Lorenz, *B* 14, 794) Needles, sl sol water

OXY-AMIDO-PHENYL-ACRIDINE v CHERYSPHENOL**OXY-AMIDO DI PHENYL-AMINE**

$C_6H_5NH C_6H_4(OH)(NH_2)$ [134°] [135°] Formed by reducing nitroso-oxy di phenyl amine (Köhler, *B* 21, 910) Plates, v sol chloroform

OXY-AMIDO-PHENYL CARBAMICETHERS

Formed from the nitro compounds (Köhler, *J pr* [2] 29, 263)

[431] $C_6H_4(OEt)(NH_2)NHCO_2Et$ [88°] Small needles — $B'HCl$ [156°] Needles

[432] $C_6H_4(OEt)(NH_2)NHCO_2Et$ Needles — $B'HCl$ [238°] Six sided plates, sol water

$C_6H_4(OEt)(NH_2)NHCO_2Et$ Small needles, rapidly oxidising in air — $B'HCl$ [233°] Needles

OXY-AMIDO-DI-PHENYL-METHANE v. AMIDO BENZYL-PHENOL

Oxy di amido-tri-phenyl-methane Methyl derivative $C_6H_4(OMe)CH(C_6H_5NH_2)_2$ Formed by heating anisic aldehyde with aniline and $HClAq$ (Mazzara & Possetto, *G* 15, 57) Crystalline crust (containing C_6H_5) melting at 65°

Di-oxy-tri-amido-tri-phenyl-methane

Di-methyl derivative $C_6H_4(NH_2)CH(C_6H_5NH_2)OMe_2$ [183°] Obtained by reduction of the di methyl derivative of nitro di-amido-di-oxy tri-phenyl methane (Fischer, *B* 15, 681) Plates or tables Yields on oxidation 'rosaniline,' a bluish red colouring matter with blue fluorescence

OXY-AMIDO-PHENYL-METHYL-PYRAZOLE

$C_6H_4N_2O$ *ie* $C_6H_4N_2COCH(NH_2)Me$ Formed by reducing the nitro compound (Knorr, *A* 238, 189) Rapidly oxidised by air — $B'HCl$

OXY DI-AMIDO PHENYL-METHYL-PYRIMIDINE

$C_{11}H_8N_4O$ [232°–240°] Formed from $C_6H_5CH=N C(OH)Me$ by nitration and reduction (Pinner, *B* 20, 2364) Golden needles, sol $NaOHaq$ — $B'H_2PtCl_4$ — $B'H_2I_2$ prisms

OXY-DI-AMIDO-PHENYL NAPHTHALENE

Ethyl derivative [214] $C_{10}H_6(OEt)(NH_2)C_6H_4NH_2$ [14] [72°] Formed by reducing $C_6H_5N_2C_6H_4OEt$ in alcoholic solution with $SnCl_2$ and HCl (Wernberg, *B* 20, 3177) White flakes — $B'HCl$ — $B'H_2SO_4$, sl sol water.

OXY-AMIDO-PHENYL PROPIONIC ACID

$C_6H_4CH(NH_2)CH(OH)CO_2H$ [190°] (P) Formed from sodium phenyl glycidate and NH_3 , (Plöchl, *B* 16, 2822, Erlenmeyer, jun, *B* 22, 1482) Decomposes at 221° (E)

o Oxy-*o*-amido phenyl propionic acid.

Anhydride $C_6H_4CH_2CH(OH)NHCO$. *Oxyhydro-*

carbostyryl [198°] Got by reducing the product of the nitration of *o*-oxy phenyl propionic acid (Erlenmeyer & Lipp, *A* 219, 229) White plates (from alcohol) Sl sol ether, v² sol hot water

o Oxy-*p*-amido-phenyl-propionic acid

$C_6H_4(NH_2)CH_2CH(OH)CO_2H$ [189°] Got by reducing the nitrate of nitro oxy phenyl-propionic acid (Erlenmeyer & Lipp, *A* 219, 227) Slender needles (containing $\frac{1}{2}$ aq) from dilute (93 p c) alcohol More sol alcohol or ether than tyrosine Readily soluble in alkalis or acids Unlike tyrosine, its solution is acid and it does not give Piria's reaction Boiled with $Hg(NO_3)_2$ it forms a yellow flocculent pp, which, on adding HNO_3 , turns red $HA'HCl$ V sol. water or alcohol, without decomposition

p Oxy-*p* amido phenyl propionic acid v.**TYROSINE***o*-Di-oxy-*o*-amido phenyl propionic acid

$C_6H_4(NH_2)CH(OH)CH(OH)CO_2H$ [218°] Produced in the reduction of *o* nitro cinnamic acid by tin and $HClAq$ (Morgan, *J* 1877, 788) Yellow needles (from alcohol) Its solutions fluoresce green

Di oxy amido propionic acid Anhydride of the methylene derivative

$CH_2<O>C_6H_4<NHCOCH_2CH_2$ 'Ethylamidopiperonyl *o* carboxylic anhydride' [235°] Formed by reducing $(CH_3O)_2C_6H_4(NO_2)CHCHCO_2Et$ in alcoholic solution with tin and gaseous HCl (F M Perkin, *C J* 59, 159) Crystalline pp

OXY-AMIDO PHENYL PYRAZOLE CARB- OXYLIC ACID

Benzoyl derivative $NPh<COCHNHBz>N=C O_2H$ [185°–190°] Formed from its ether and $NaOH$ (Wilschusen, *B* 24, 1261) Yellowish needles, sl sol water

Ethyl ether EtA' [195°] Formed by boiling the phenyl hydrazide of benzoyl amido-oxalacetic ether with $HOAc$ Yellow crystals

OXY m-AMIDO PHENYL-PYROTARTARIC ACID

Anhydride $C_{11}H_8N_4O_{12}$ *ie* $C_6H_4(NH_2)CH<CH(CO_2H)>CO_2CH_2$ *Amidophenyl-*

paraconic acid Formed by reducing the corresponding nitro compound (Salomonson, *R T C* 6, 18) — $B'HCl$ prisms — $B'H_2PtCl_4$. The isomeric oxy *p* amido phenyl pyrotartaric anhydride yields a similar hydrochloride

(B 2) **OXY-*p*-AMIDO-(Py 3)-PHENYL-**

QUINOLINE $C_6H_4CH(OH)CH_2CH_2CH_2NH_2$ $CH=CHON C_6H_4NH_2$

[294°] Formed by passing oxygen over a mixture of (B 2)-oxy-quinoline hydrochloride, aniline hydrochloride, aniline, and platinised asbestos at 220° (Weidel & Georgievitch, *M* 9, 146) Needles (from amyl alcohol), sl sol. alcohol and ether — $B'HCl$ $\frac{1}{2}$ aq — $B'H_2SO_4$ $\frac{1}{2}$ aq

Acetyl derivative $C_{11}H_{10}Ac_2N_2O$. Scales.

(Py 412) Oxy amido phenyl-isoquinoline

$C_{17}H_{12}N_2O$ i.e. C_6H_5 $\begin{matrix} \text{C(NH)} \text{CPh} \\ | \\ \text{C(OH)N} \end{matrix}$. Amido iso-
benzal pthalimidine [c 190°] Formed by
redn of the nitro-derivative with P and HI
(Gabriel, B 19, 833) Fine yellow needles
v sol acetic acid and hot alcohol

DI-OXY-DI AMIDO-DI-PHENYL SUL-

PHONE $C_{17}H_{12}N_2SO_4$ i.e. $SO_2(C_6H_4(NH_2)OH)_2$
Formed by reducing the nitro-compound (Anna-
heim, B 7, 436, 8, 1063) Crystals (from
water) Alcoholic isomyl nitrite forms golden
plates of $C_{17}H_{12}N_2SO_4$ Salts— $B''H_2Cl_2$ 2aq—
 $B''H_2L_2$ 2aq— $B''H_2SO_4$ 2aq thick prisms—
 $C_2H_5Me_2N_2SO_4H_2$ Forms long needles—
 $C_{17}H_{12}Et_2N_2SO_4H_2$ needles

OXY-DI-AMIDO-DIPHENYL SULPHONIC

ACID [41] $C_{12}H_8(NH_2)_2C_6H_4(OH)SO_3H$
[1436] Prepared by reducing the azo-compound
 $C_6H_5N=N_2C_6H_4(OH)SO_3Na$ with aqueous
 $SnCl_2$ (Weinberg, B 20, 3172, Feer & Muller,
C C 1888, 1358) Needles, v sol water— $B'HCl$
transparent crystals

Ethyl derivative

$C_6H_4(NH_2)_2C_6H_4(NH_2)(OEt)SO_3H$ Got in like
manner Needles— $B'HCl$ 2aq needles, v sol
water

OXY-AMIDO-DIPHENYL DISULPHONIC

ACID $C_6H_4(NH_2)(SO_3H)C_6H_4(OH)(SO_3H)$
Formed from benzidine disulphonic acid by the
diaz reaction (Limpriht, A 261, 315) Light-
yellow crystalline mass, v e sol water, insol
ether— BaA'' 8aq reddish-yellow crystals

OXY-AMIDO PHENYL TOLYL KETONE

$C_{17}H_{12}NO_2$ i.e. $C_6H_4(NH)CO C_6H_4Me(OH)$ or
 $C_6H_4(OH)CO C_6H_4Me(NH_2)$ A product of the
action of water at 270° on commercial rosaniline
(Liebemann, B 16, 1927) Small colourless
needles, sol acids and alkalis

Di-benzoyl derivative [193°] Needles

DI OXY-AMIDO-PHTHALIC ACID Methyl
derivative of the anhydride

$C_6H_4(OMe)(OH)(CO_2H) \begin{matrix} \text{CO} \\ | \\ \text{NH} \end{matrix}$ [4321] Nor-
methylazoopropionic acid [175°] Formed by

reducing $C_6H_4(NO_2)(OMe)(OH)(CHO)CO_2H$ with
conc $SnCl_2$ and HCl (Elbel, B 19, 2307)
Colourless needles, nearly insol ether Yields
an acetyl derivative $C_6H_4NO_2(OMe)(OAc)$ [198°],
and a di acetyl derivative [105°]

Di-methyl derivative of the anhy-
dride v Amido hemipic acid, vol 11 p 672

DI-OXY-AMIDO-PHTHALIDE Di-

methyl derivative v Amido MECONIN (p
198) and Amido ψ MECONIN (p 199)

 α -OXY β AMIDO PROPIONIC ACID

$CH(NH)CH(OH)CO_2H$ Amido lactic acid
b 15 at 20° Formed from $CHClCH(OH)CO_2H$
and conc NH_4Aq (Melikoff, C C 1881, 354, B
13, 958, 1266, Erlenmeyer, B 13, 1077) Mono-
clinic prisms— $B'HCl$ needles

OXY AMIDO-ISOPROPYL BENZOIC ACID

$OMe_2(OH)C_6H_4(NH_2)CO_2H$ [421] [158°] Got
from the nitro-acid (Widman, B 19, 271)
Prisms Yields amido-propenyl benzoic acid
on boiling with $HClAq$

Acetyl derivative [174°] Tables

Exo oxy amido isopropyl benzoic acid
 $OMe_2(OH)C_6H_4(NH_2)(CO_2H)$ [431] Does not

melt below 270° (Widman, B 16, 2571) Its
acetyl derivative is not melted at 280°

OXY-AMIDO PYRIDINE $C_6H_4N(OH)(NH_2)$
[214°] Got by reducing oxy comazine (Krippen-
dorff, J pr [2] 32, 162) Pyramids (containing
aq), v e sol hot water— $B'HCl$ — $B''H_2PtCl_4$

Di-oxy-amido-pyridine $NH \begin{matrix} \text{CO} CH_2 \\ | \\ \text{CO} CH_2 \end{matrix} C NH$

or $N \begin{matrix} \text{C(OH)CH} \\ | \\ \text{C(OH)CH} \end{matrix} C NH_2$ Glutazime [c 300°].

Formed by boiling β -oxy- β amido glutamic ether
 $CO_2EtCH_2C(OH)(NH_2)CH_2CONH_2$ with aque-
ous Na_2CO_3 (Stokes & Von Pechmann, B 19,
2694, 20, 2655, Am 8, 375) Rectangular
plates, m sol hot water, almost insol hot alcoh-
ol Gives a deep red colour with $FeCl_3$, turning
dark green on warming

Reactions—1 Hot $HClAq$ yields tri-oxy-
pyridine—2 Bromine in excess forms
 CBR_3 , $CO CBR_2$, $CONH_2$ [c 148°]—3 By heating
with PCl_5 (6 to 7 pts) it is converted into a
mixture of tri chloro oxy-amido pyridine [282°]
and tetra chloro amido-pyridine [212°], together
with small quantities of di chloro di oxy amido-
pyridine [242°] and tri chloro amido pyridine
[158°]—4 Yields nitro glutazime [170°–180°]
and crystalline di nitro glutazime on treatment
with nitrous acid gas With $NaNO_2$ and acetic
acid there is formed the nitro nitrosamine
 $C_6H_4N_2O_2(NO_2)(NO)$ whence $NaC_6H_4N_2O_2$ crys-
tallising in yellow needles, which on warming
with $NaNO_2$ and $HOAc$ yields the di nitro-
nitrosamine salt $NaC_6H_4N_2O_2$, a scarlet powder
Salts— $B'HCl$ aq prisms, v sol alcohol—
 AgA' plates

Acetyl derivative $C_6H_4N_2H_2AcO_2$ [285°–
290°] Tables, not attacked by hydroxylamine.
— NH_4A' aq

Di benzoyl derivative $C_6H_4N_2Bz_2O_2$
[216°] Brownish plates, insol water

DI OXY AMIDO PYRIMIDINE CARBOXY-

LIC ACID $NH \begin{matrix} \text{CO NH} \\ | \\ \text{CO C(NH}_2) \end{matrix} C CO_2H$ Formed
by reducing the nitro acid (Behrend, A 240, 21)
Not affected by boiling potassium cyanate—
 KA' aq

Ethyl ether EtA' [260°] (Kohler, A
236, 32)

OXY AMIDO-PYROTARTARIC ACID

$CH_2C(OH)(CO_2H)CH(NH_2)CO_2H$ or
 $CH_2C(NH_2)(CO_2H)CH(OH)(CO_2H)$ Amido-
citramalic acid S 31 at 18° Formed from
oxoacetic acid and NH_4Aq at 100° (Melikoff
& Feldmann, A 253, 92) Monoclinic prisms—
 $B'HCl$ prisms, v sol water

DI OXY AMIDO-PYRROLE Benzoyl de-
rivative $N \begin{matrix} \text{CH} \\ | \\ \text{C(OH)CH} \end{matrix} NHbz$ [2005°].

Got by heating at 140° the product of the action
of $NaOEt$ on hippuric ether (Rugheimer, B 22,
1957) Plates (from $MeOH$), v sol warm water

OXY-AMIDO-QUINIZINE-CARBOXYLIC

ACID ? $C_{19}H_{12}N_2O_2$ Anhydride of amido oxal-
acetic acid phenyl hydrazide Formed by warm-
ing the phenyl hydrazide of amido-oxalacetic
acid (vol 1 p 169) with conc H_2SO_4 White
glistering plates Insol hot water and ether,
v sl sol hot alcohol Dissolves in alkalis and
in conc H_2SO_4 Reduces Fehling's solution on
gently warming Mercuric salts are reduced in

Erythro - oxyanthraquinone $C_{14}H_8O_4$, *s.s.*
 $C_6H_4 \begin{array}{c} \text{CO C C(OH) CH} \\ \text{CO C CH=CH} \end{array}$ Mol. w 224 [191°]

Formation—1 By fusing *o*-bromo-anthraquinone with KOH at 150° (Pechmann, B. 12, 2127)—2 Together with its isomeride by heating phenol with phthalic anhydride and H_2SO_4 (Baeyer & Caro, B. 7, 968)—3 By the action of nitrous acid on *o*-amido anthraquinone (Roemer, B. 15, 1798)—4 By passing nitrous acid gas into an alcoholic solution of di-amido anthraquinone or (β) oxy amido anthraquinone (Von Perger, J pr [2] 18, 148)—5 Together with three isomeric di-oxy anthraquinones, by heating a mixture of benzoic acid (120 grms) and *m*-oxy-benzoic acid (60 grms) with 1200 grms of H_2SO_4 and 120 grms of water for 10 hours at 180°–200° (Liebemann & Kostanecki, B. 19, 829)—6 By oxidation of oxy-anthranol dihydride (Liebemann, A. 212, 20)

Properties—Orange feathery needles (from alcohol), insol water, sol ether and benzene. Yields alizarin on fusion with KOH. Insol cold baryta-water, but boiling baryta yields a violet salt. Insol NH_4Aq , sol $HOAc$. Its ethereal solution shaken with baryta water forms a violet pp, while the isomeric oxyanthraquinone gives a red solution. KOHAq dissolves it with difficulty, forming a brown solution. May be sublimed at 140° in a current of gas.

Acetyl derivative $C_{14}H_8AcO_4$ [176°–179°]

Oxy-anthraquinone $C_6H_4 \begin{array}{c} \text{CO C CH C(OH)} \\ \text{CO C CH CH} \end{array}$

[302°]

Formation—1 A by product in the preparation of alizarin by fusing anthraquinone sulphonic acid with KOH or NaOH (Liebemann, B. 4, 108, 5, 868, A. 160, 141, Simon, B. 14, 464). Occurs also in the product of the dry distillation of sodium anthraquinone sulphonate (A. G. & W. H. Perkin, C. J. 47, 680)—2 Obtained also from *m*-bromo anthraquinone by careful potash fusion (Graebe & Liebemann, A. 212, 25, Suppl. 7, 290)—3 By the action of nitrous acid on *m*-amido anthraquinone.

Properties—Yellow needles (by sublimation). Readily soluble in excess of baryta water. Its alkaline solution is reddish brown. Potash-fusion yields alizarin. HIAq reduces it to anthrol and anthracene hexahydride. Sol NH_4Aq , forming a reddish yellow liquid— $Ba(C_{14}H_8O_4)_2 \cdot Ba(C_4H_9O_2)_2 \cdot aq$.

Acetyl derivative [158°]. Small needles. Formed by acetylation and also by oxidation of the acetyl derivative of anthrol.

Ethyl ether $C_{14}H_8O_4(OEt)$ [135°]. Sol alcohol. Very difficult to saponify (Liebemann & Hagen, B. 15, 1798).

Di-oxy-anthraquinone

$C_6H_4 \begin{array}{c} \text{CO C C(OH) C(OH)} \\ \text{CO C CH=CH} \end{array}$ Alizarin Mol. w.

240 [290°]. S 034 at 100° (Plessy & Schutzenberger, C. R. 43, 167). Occurs in madder, the root of *Rubra tinctoria*, which contains its glucoside $C_{22}H_{20}O_{14}$ (ruberythric acid), and the glucosides of purpurin, purpurin carboxylic acid, purpuroxanthin, and purpuroxanthin carboxylic acid (Rohbquet & Colin, A. Ch. [2] 34, 225, Runge, J pr 5, 362, Schunck, A. 66, 174, 201, 81, 336, 87, 344, P. M. [4] 5, 410, 495, 12, 200, 270, J pr. 59, 465, Roehleider, A. 80, 321, 82,

205, Debus, A. 66, 351; Wolff & Strecker, A. 75, 1, Wartha, B. 3, 545, 673, Willigk, A. 82, 339, Rosenstiehl, A. Ch. [5] 18, 235, C. R. 88, 1194, Wurtz, C. R. 96, 465, Liebemann, B. 20, 2241, Bergami, B. 20, 2247).

Formation—1 By fusing di-bromo-anthraquinone with potash (Graebe & Liebemann, Z. [2] 11, 516, A. Suppl. 7, 300)—2 By fusing anthraquinone sulphonic acid with potash (Perkin, C. J. 23, 133, B. 9, 281). The yield may be improved by addition of $KClO_4$ —3 By heating pyrocatechin with phthalic anhydride and H_2SO_4 at 140° (Baeyer & Caro, B. 7, 972).

Purification—1 By repeated solution in NaOHAq and ppn by CO_2 , the pp being decomposed by HCl (Liebemann & Troschke, B. 8, 379)—2 Crude commercial alizarin, a mixture of alizarin, flavo purpurin, and isopurpurin, is fractionally sublimed when the alizarin comes over from 100° to 160°, and a mixture of flavo purpurin and isopurpurin from 160° to 170°, the crystals of these two bodies can be distinguished in the sublimate with a microscope and can be separated by means of benzene, in which isopurpurin is only slightly soluble, but the flavo purpurin very soluble (Schunck & Römer, B. 13, 41).

Properties—Red trimetric needles, ∇ sol alcohol and ether. Sometimes crystallises in golden scales (containing 2aq (Schunck). Its solutions in alkalis and alkaline carbonates are purple. $BaCl_2$ and $CaCl_2$ give purple pps in these solutions. Alumina decolourises its alcoholic solution forming a red lake. Salts of Mg, Fe, Cu, and Ag give purple pps in the ammoniacal solution.

Reactions—1 Yields phthalic acid on oxidation with HNO_3 —2 Distillation with zinc dust yields anthracene (G. & L.)—3 Zinc dust and ammonia reduce it to di-oxy anthranol—4 Aqueous ammonia at 200° gives oxy amido anthraquinone, di-amido anthraquinone, and other bodies (Von Perger, J pr [2] 18, 129).

Salts— CaA^+aq — BaA^+aq (dried at 100°)

— PhA^+ violet brown pp

Di-acetyl derivative [160°] (P.), [179°–183°] (Baeyer, B. 9, 1232). Pale yellow crystals (Perkin, C. J. 26, 21).

Methyl ether $C_{14}H_8O_4(OH)(OMe)$. From alizarin, KOH, and MeI (Schunck, C. N. 27, 171).

Di-ethyl ether $C_{14}H_8O_4(OEt)$. Got by heating alizarin with K_2SO_4 and KOH at 170° (Habermann, M. 5, 238). Needles.

Bromo alizarin *v* vol 1 p 599

Chloro alizarin *v* vol 11 p 102

Nitro alizarin *v* NITRO DI OXY ANTHRAQUINONE

Amido alizarin ∇ DI OXY AMIDO ANTHRAQUINONE

Alizarin blue $C_{17}H_8NO_4$, *s.s.*

$C_6H_4 \begin{array}{c} \text{CO C} \\ \text{CO C C(OH) C(OH) C N=CH} \end{array}$ [270°]

Formed by heating (β) nitro alizarin (1 pt) with glycerin (1½ pts) and H_2SO_4 (5 pts) at 107°–200° (Prudhomme, Bl. [2] 28, 62, Auerbach, C. J. 35, 799, Graebe, A. 201, 333, B. 12, 1416). Brown needles. Alkalis form a blue solution, but excess of alkali throws it down again. Dyes chromium acetate mordant blue. Yields $C_{17}H_8NO_4(OH)NH_2$ [255°]. Gives anthraquinol-

ine when distilled with zinc dust —B'HCl—
B'HOAc— $C_6H_5(NO_2)_2OH$ [245°]—

$Ba_2OC_6H_4NO_2$, $\frac{1}{2}$ eq greenish-blue pp

Di-acetyl derivative $C_{11}H_8O_4$, [225°]

Di-benzoyl derivative [244°]

Alizarin blue S $C_{17}H_{11}NO_5(SO_2Na)_2$ Prepared by dissolving alizarin-blue in a cold concentrated solution of $NaHSO_3$ (Brunck & Graebe, *B* 15, 1783) Reddish brown crystalline powder V sol water, sl sol 95 p c of alcohol At 60° it begins to decompose into its constituents

Isolizarin occurs in madder that has been heated with HClAq or dilute H_2SO_4 (Rochleder, *B* 3, 292) Its alkaline solutions are blood red, and it forms a red solution with baryta water It does not dye mordants

p **Di-oxy-anthraquinone**

$C_6H_4 \begin{matrix} \diagup CO C C(OH) CH \\ \diagdown CO C C(OH) CH \end{matrix}$ **Quinizarin** [195°]

Formed by heating hydroquinone or *p* chloro phenol with H_2SO_4 and phthalic anhydride at 140° (Grinna, *B* 6, 506) Red needles (from alcohol) Its alkaline solutions are blue Yields anthracene on distillation with zinc dust Its ethereal solution shows greenish yellow fluorescence Baryta gives a bluish violet lake Oxidised by MnO_2 and H_2SO_4 at 140° to purpurin (Bayer & Caro, *B* 8, 152)

Reactions —1 HI (S G 17) and a little red

P give a dihydride, $C_6H_4 \begin{matrix} \diagup C(OH) \\ \diagdown C(OH) \end{matrix} C_6H_4(OH)_2$,

which forms golden plates or needles (from alcohol) It forms with NaOH a yellow solution, turned blue by air $SnCl_2$ and HCl also reduce quinizarin to this dihydride (Liebermann, *A* 212, 11) —2 A longer treatment with HI forms hydroquinizarol, $C_{11}H_{12}O_2$ It forms orange needles (from alcohol) This body is probably $C_6H_4 \begin{matrix} \diagup CH(OH) \\ \diagdown CH_2 \end{matrix} C_6H_4(OH)_2$ —3 Conc HI (S G 19) and red P after an hour's boiling reduce quinizarin to oxy anthranol dihydride (*q* v)

Di-acetyl derivative [200°] Prisms

Ethyl ether $C_{11}H_8O_4(OH)(OEt)$ [151°]

Di-ethyl ether $C_{11}H_8O_4(OEt)_2$ [177°]

Yellow needles (Liebermann, *B* 21, 1168)

m **Di-oxy-anthraquinone**

$C_6H_4 \begin{matrix} \diagup CO C C(OH) CH \\ \diagdown CO C CH = C(OH) \end{matrix}$ **Purpurazanthin**

Xanthopurpurin [265°] Occurs, together with its carboxylic acid, in madder (Schützenberger, *Bl* 4, 12) May be got by reducing purpurin with HIAq or with $SnCl_2$ and NaOH Formed also by dissolving P in a hot alkaline solution of purpurin (Rosenstiehl, *C R* 79, 764), by the action of nitrous acid on purpuramide (di-oxy amido anthraquinone) (Liebermann & Fischer, *B* 8, 974), and, together with anthrachrysone, by heating a mixture of *s*-di-oxy benzoic acid (1 pt), benzoic acid (5 pts), and H_2SO_4 at 105°–110° (Noah, *B* 19, 332)

Properties —Yellow needles, sol alcohol, HOAc, and benzene, insol water May be sublimed Its alkaline solution is red Its barium salt is easily soluble Gives purpurin on fusion with KOH Nitric acid oxidises it to phthalic acid Reduced by HI and P to a dihydride, which dyes alumina mordants like quercitron (Rosenstiehl, *A Ch* [5] 18, 224, *C R* 79, 764) Yields anthracene on distillation with zinc-dust

Vol. III

NH_3Aq at 150° yields brown needles of $C_{11}H_8O_4(OH)(NH_2)$ (Liebermann, *A* 183, 217)

Acetyl derivative $C_{11}H_8O_4(OAc)_2$ [184°]

Di-methyl ether [180°] (Plath, *B* 9, 1204)

Di-ethyl ether $C_{11}H_8O_4(OEt)_2$ [170°].

(*B* 1, 4') **Di-oxy-anthraquinone**

$CH CH = C CO C C(OH) CH$ **Anthraflavin**
 $CH C(OH) C CO C CH = CH$

[280°] Formed in small quantity (2 g), together with anthraflavic acid (30 g) and *m*-'benzdioxyanthraquinone' (5 g), by the action of H_2SO_4 on *m*-oxy benzoic acid (100 g) (Schunck & Römer, *B* 11, 1176, 1616) Formed also by potash fusion from anthraquinone (*p*) disulphonic acid (Liebermann & Dehnat, *B* 12, 1287), and by the action of nitrous acid on the di amido anthraquinone Obtained by reduction of di nitro anthraquinone [above 300°] (Römer, *B* 16, 369)

Properties —Yellow tables, insol water, sl sol alcohol, HOAc, ether, and CS_2 , v sol benzene Forms oxyanthraflavin on fusion with KOH Almost insol baryta water, Na_2CO_3 , and NH_3Aq , sol KOHAq Its solution in H_2SO_4 is cherry red with scarlet fluorescence Its Ca and Ba salts are crimson and insoluble

Acetyl derivative $C_{11}H_8O_4(OAc)_2$ [244°]

Got by oxidising (*p*) di oxy anthracene with CrO_3 in HOAc Yellow needles

Di-oxy-anthraquinone $C_{11}H_8O_4$, **Anthraflavic acid** [above 330°] S (95 p c alcohol) 118 at 10° (Rosenstiehl, *Bl* [2] 29, 401, 434) A by product in the preparation of alizarin, being formed by fusing anthraquinone (*a*)-disulphonic acid with KOH (Schunck, *B* 4, 360, 8, 1628, 9, 379, 679, Perkin, *C J* 24, 1109, 26, 19, 29, 851) Formed also from *m*-oxy benzoic acid and H_2SO_4 (*v supra*) Radiating yellow needles (from alcohol), insol ether and benzene, sl sol HOAc Its solution in H_2SO_4 is yellow Its solution in alkalis is yellowish red Its Ba and Ca salts are sl sol water It does not dye mordanted cotton Potash fusion forms flavopurpurin Distillation with zinc dust forms anthracene Boiling with zinc-dust and NH_3Aq forms $C_{11}H_8O_2$, whence $C_{11}H_7(OAc)$, [165°] (Liebermann, *B* 21, 445)

Salts — Na_2 5aq sl sol water — BaA 7aq reddish brown needles

Di-acetyl derivative $C_{11}H_8O_4(OAc)_2$ [229°]

Di-benzoyl derivative $C_{11}H_8O_4(OBz)_2$ [275°]

Di-methyl ether $C_{11}H_8O_4(OMe)_2$ [248°]

Di-ethyl ether [232°] Yellow needles

Di-oxy anthraquinone $C_{11}H_8O_4$ [above 330°]

Isoanthraflavic acid Occurs in crude commercial alizarin, being formed by fusing anthraquinone (*p*) disulphonic acid with potash (Schunck & Römer, *B* 9, 379, 15, 1041, Perkin, *C J* 29, 851) Yellow needles (containing aq), almost insol benzene and ether, sl sol HOAc and alcohol It dissolves in cold baryta-water and in KOHAq with dark red colour Does not possess tinctorial properties Its solution in H_2SO_4 is red Yields anthrapurpurin on fusion with KOH — BaA 7aq red needles, v sol aq

Di-acetyl derivative [c 195°] Crystals.

Di-ethyl ether [194°] Yellow needles

X X

(B. 1, 1' or 3')-Di-oxy-anthraquinone $C_{14}H_8(OH)_2$, $C_{14}H_8O_2$, *Chrysazin* [192°]. Formed by eliminating amidogen from di oxy-tetra-amido-anthraquinone (hydrochrysazimide) (Liebemann & Giesel, *B* 8, 1643, 9, 329, *A* 183, 184) Formed also by fusing anthraquinone χ disulphonic acid with potash (Liebemann & Dehnst, *B* 12, 1287) Golden laminae or reddish-brown needles, m sol alcohol and HOAc. Insol cold NH_4Aq and Na_2CO_3Aq Its solution in KOHAq is yellowish red, and that in H_2SO_4 is red Potash fusion yields oxychrysazin, and *o*- and *m*-oxy-benzoic acid Yields anthracene when distilled with red hot zinc dust Baryta- and lime water give red pps Does not dye mordanted cotton

Di-acetyl derivative [232°] Prepared by oxidising di-acetyl-chrysazol $C_{14}H_8(OAc)_2$ with CrO_3 (Liebemann, *B* 12, 186)

Di-oxy-anthraquinone $C_{14}H_8O_2$, *Isochrysazin* [175°-180°] Formed, together with *m*-benzodioxanthraquinone, by the action of nitrous acid and alcohol on the dye $C_{22}H_{14}N_2O_6$, got from *o* di nitro anthraquinone and H_2SO_4 (Lütschütz, *B* 17, 897) Deep red needles (from alcohol), readily sublimed Its solutions in NH_4Aq and KOHAq are violet red, that in H_2SO_4 is reddish-yellow Its Ba salt is insoluble It does not dye mordants

Di-acetyl derivative [160°-165°] Needles

Di oxy-anthraquinone $C_{14}H_8O_2$, '*m*-Benzodioxanthraquinone' [293°] A product of the action of H_2SO_4 on *m*-oxy benzoic acid (Schunck & Römer, *B* 11, 969) Formed also as above Yellow needles, insol water and CS_2 , sol alcohol, HOAc, ether, and benzene Its alkaline solution is yellow Gives purpurn by potash-fusion Its solution in H_2SO_4 is brownish-yellow When freshly ppt it dissolves in hot baryta-water, and on cooling the Ba salt separates in red needles, which, after drying, are insoluble Has no tinctorial power

Di-acetyl derivative [199°] Needles

Di-oxy-anthraquinone $C_{14}H_8O_2$, *Franguluc acid* [264°] Obtained, together with glucose, by hydrolysing frangulin which occurs in the bark of *Rhamnus Frangula* (Faust, *A* 165, 229) Orange needles (containing 14aq), sl sol hot water, m sol alcohol Its solution in KOHAq is cherry red Its ammoniacal solution gives a red pp with $BaCl_2$ Distillation over zinc dust gives anthracene

Di-acetyl derivative [184°] Prisms

Di oxy anthraquinone

$C_{14}H_8 \begin{matrix} \diagup CO \ C \ CH \ C(OH) \\ \diagdown CO \ C \ CH \ C(OH) \end{matrix}$. *Hystazarin* [282°]

Formed by heating pyrocatechin (*5g*) with phthalic anhydride (*68g*) and H_2SO_4 (*75g*) at 145° for 5 hours (Liebemann & Scholler, *B* 21, 2508, 22, 683) Orange yellow needles (from acetone), almost insol benzene, v sol alcohol, ether, and HOAc Its solution in KOHAq is blue, that in NH_4Aq is violet, and that in H_2SO_4 blood-red The Ba salt is blue, the Ca salt violet and insol water It dyes mordants slightly Yields anthracene on distillation with zinc-dust

Di-acetyl derivative [207°]. Needles

Ethyl ether $C_{14}H_8O_2(OH)(OEt)$. [284°-

240°] Yellow needles, forming a crimson solution in alkalis

Di-ethyl ether $C_{14}H_{10}O_2(OEt)_2$, [160°-163°]. From hystazarin, KOH, and EtI Yellow needles

Eleven di oxy anthraquinones have been described, but ten only are indicated by theory

Tri-oxy-anthraquinone

$C_{14}H_5 \begin{matrix} \diagup CO \ C \ C(OH) \ C(OH) \\ \diagdown CO \ C \ C(OH) \ CH \end{matrix}$ *Purpurn* [253°]

Occurs in madder root, probably as glucoside (Colin & Robiquet, *A Ch* [2] 84, 244, Gauthier de Claubry & Persoz, *A Ch* [2] 48, 69, 51, 110, Runge, *A Ch* [2] 63, 282, Schiel, *A* 60, 74, Debus, *A* 66, 351, 86, 117, Wolff & Strecker, *A* 75, 1, Rochleder, *A* 80, 321, 82, 205, Stenhouse, *Pr* 12, 633, 13, 145, Schützenberger, *J* 1864, 542, *Bl* [2] 4, 12) Formed by the action of MnO_2 and H_2SO_4 at 150° on alizarin (De La lande, *C R* 79, 669) and on quinzarin (Baeyer & Caro, *B* 8, 152), and also by heating tri bromo-anthraquinone with H_2SO_4 at 200° (Diehl, *B* 11, 184) It may be separated from alizarin by repeatedly dissolving in boiling alum solution and ppg by acid Orange prisms containing aq (from dilute alcohol) or dark-red anhydrous needles (from absolute alcohol) May be sublimed Sl sol boiling water, forming a yellow liquid Its ethereal solution is yellow and shows two absorption bands (Stokes, *C J* 12, 220, Vogel, *B* 9, 1641) Its solution in H_2SO_4 is rose red and shows three absorption bands Aqueous KOH, Na_2CO_3 , and NH_3 yield purple red solutions Almost insol alcoholic potash Baryta-water forms an insoluble purple lake Its alkaline solution is oxidised in daylight by the air becoming yellow (unlike alizarin) the product containing phthalic acid (Schunck & Römer, *C J* 31, 665, Dralle, *B* 17, 376) Boiling alum forms a pink solution with yellow fluorescence Leadacetate gives in an alcoholic solution a dark-crimson pp, soluble in excess, forming a crimson liquid with three absorption bands (the lead compound of alizarin is insol alcoholic lead acetate) Dyes cotton, mordanted with alumina, red

Reactions —1 Yields anthracene on heating with zinc dust —2 Forms some quinzarin when heated in sealed tubes at 300° —3 Phosphorus and NaOHAq reduce it to purpuroxanthin —4 Nitric acid oxidises it to phthalic acid —5 Aqueous ammonia forms brown purpuramide $C_{14}H_5O_4(NH_2)(OH)_2$

Acetyl derivative $C_{14}H_5O_2(OAc)_2$, [198°] (*L*), [200°] (*S* & *R*) Yellow needles

Ethyl ether $C_{14}H_5O_2(OEt)_2$, Red crystals

Tri oxy anthraquinone $C_{14}H_5O_3(OH)_2$, *Anthrapurpurn* *Isoapurpurn* [above 330°] A by product in the preparation of artificial alizarin, being formed by fusing anthraquinone (*8*) disulphonic acid with potash (Perkin, *C J* 25, 659, 26, 425, 29, 851, Caro, *B* 9, 682) Formed also by potash-fusion from isanthraflavic acid, from *m* benzodioxanthraquinone (Schunck & Römer, *B* 9, 679, 11, 972), and from (a) di bromo anthraquinone (Perkin, *C J* 37, 557) Orange needles (from alcohol), v sol hot alcohol, sl sol hot water and ether Conc H_2SO_4 forms a red solution, potash, NH_4Aq , and Na_2CO_3Aq give a violet solution. Sl sol hot baryta-water, forming

a violet solution Alcoholic lead acetate gives a purple pp, sol excess It colours mordants

Reactions—1 *Nitric acid* gives no phthalic acid—2 Aqueous ammonia at 100° forms an unstable blue dye, decomposed by HCl or KOH with regeneration of anthrapurpurin—3 Aqueous ammonia at 170° forms anthrapurpuramide $C_{12}H_8O_4(OH)_2(NH_2)$ which does not dye mordants (Perkin, *C J* 83, 216)

Tri-acetyl derivative [222°] Yellow scales

Tri-benzoyl derivative [185°] Crystals

Mono ethyl ether $C_{12}H_8O_4(OH)(OEt)$ [265°] Orange red needles (Liebermann & Jellinek, *B* 21, 1170)

Di-ethyl ethers $C_{12}H_8O_4(OH)(OEt)_2$ [162°] and [170°] Yellow needles (L a J)

Tri-oxy-anthraquinone $C_{12}H_6O_6$ *Flavopurpurin* [above 330°] Formed by potash fusion from anthraflavic acid and from anthraquinone (a) disulphonic acid Purified by means of its lead salt (S a R, C, Liebermann, *B* 21, 441, 2524) Golden needles (from alcohol), v sol. cold alcohol Its solution in conc H_2SO_4 is red, that in KOHAq is purple, becoming red on dilution Sl sol baryta water, forming a red solution Its solution in NH_4Aq and Na_2CO_3Aq is yellowish red Alcoholic lead acetate forms a reddish brown pp, v sl sol excess On heating with phenyl cyanate at about 160° it forms $C_{12}H_8O_4(O CO NHPh)_2$ crystallising in yellowish plates (Tesmer, *B* 18, 2610)

Di-acetyl derivative [238°] Golden plates

Tri acetyl derivative [196°] Yellow needles

Di-benzoyl derivative [210°] Needles

Ethyl ether $C_{12}H_8O_4(OH)(OEt)$ V sol ether

Di-ethyl ether [209°] Needles

Tri oxy anthraquinone

$C_{12}H_6O_6 \begin{cases} CO C(OH) C(OH) \\ CO C CH= C(OH) \end{cases}$ *Anthragallol* [310°] (Cahn, *B* 19, 2335) Formed by heating a mixture of benzoic acid, gallic acid, and H_2SO_4 at 70° (Seuberlich, *B* 10, 38) Formed also from pyrogallol, phthalic anhydride, and H_2SO_4 . Orange needles (by sublimation), nearly insol water Its alkaline solution is green Dilute HNO_3 forms phthalic acid Distillation over zinc dust gives anthracene Dyes alumina mordants brown Alcoholic lead acetate ppts violet brown $C_{12}H_6O_4Pb_2O_4$ Boiling alcoholic NH_3 forms anthragallolamide $C_{12}H_6O_4(NH_2)(OH)_2$ crystallising in black needles with green reflex HCl and HOAc form $C_{12}H_6O_4$, whence $C_{12}H_6O_4$, [205°] (L)

Tri-acetyl derivative [173°] Needles

Ethyl ether $C_{12}H_8O_4(OH)(OEt)$ [175°]

From the K salt and EtI at 80° The Pb salt and EtI at 220° yields an isomeride [245°]

Di-ethyl ether [134°] Formed from the K salt (L a J) The Pb salt yields an isomeride [198°]

Tri-oxy anthraquinone $C_{12}H_6O_6$ *Oxychrysaem* Formed by potash-fusion from chrysaem and from anthraquinone ρ and χ disulphonic acids (Liebermann, *A* 183, 191, 12, 1889). Probably identical with oxyanthrarufin Red needles (from alcohol). Its alkaline solutions are blue.

Baryta-water gives a blue insoluble pp Dyes mordants

Tri-acetyl derivative [193°] Yellow needles

Tri-oxy-anthraquinone

$C_{12}H_6(OH)C_6O_4C_6H_2(OH)_2$ *Oxyanthrarufin*. Prepared by fusing anthrarufin with KOH (Liebermann & Boeck, *B* 11, 1617) Red needles (by sublimation) Its alkaline solutions are blue. Dyes mordants like alizarin

Tetra-oxy anthraquinone $C_{12}H_4O_8$ *t.e.*

$C(OH) CH C(O) C(O) CH= C(OH) CH C(OH) C(O) C(O) C(OH) CH$ *Anthrachry-one* Mol w 272 Formed by heating *s* di-oxybenzoic acid alone or with H_2SO_4 (Barth & Senhofer, *A* 164, 109, Noah, *B* 19, 754) Silky needles (containing 2aq), not melted at 360° V. sol alcohol, v sl sol water and ether Yields anthracene on distilling with zinc-dust Its solution in KOHAq is reddish-yellow—Ba($C_{12}H_4O_8$), 11aq red needles

Tetra-acetyl derivative [253°] Needles.

Tetra-oxy-anthraquinone $C_{12}H_4O_8$ *Oxyppurpurin* Formed by heating purpurin with KOH at 240° (Diehl, *B* 11, 185) Brown nodules, not melted at 290° Almost insol alcohol Its alkaline solution is brownish red. Its acetyl derivative melts above 240°

Tetra-oxy-anthraquinone

$CH C(OH) C(O) C(O) C(OH) C(OH) CH C(OH) C(O) C(O) CH= CH$ *Quinalizarin*. [above 275°] Obtained by heating its di-methyl ether with HOAc and HCl at 200° Formed also by heating alizarin with H_2SO_4 at 210° (Graebe, *B* 23, 3739) Long red needles, sol HOAc, sl sol alcohol Dyes mordants well Its solution in H_2SO_4 is blue The Ba and Ca salts are insol water Yields anthracene on distillation with zinc dust

Tetra-acetyl derivative [201°] Needles.

Di-methyl ethyl [225°–230°] Obtained by heating hempic acid $C_6H_3(OMe)_2(CO_2H)_2$ [6 5 2 1] with hydroquinone and H_2SO_4 at 130° (Liebermann & Wense, *B* 20, 864, *A* 240, 298) Minute brownish red plates Forms a bluish-violet solution in alkalis and a blue solution in H_2SO_4 . Does not dye. Yields $C_{12}H_4O_4(OMe)_2(OAc)_2$ [211°]

Tetra-oxy-anthraquinone $C_{12}H_4O_8$ *Rufin*

opin Formed by heating opianic acid with H_2SO_4 at 180° (Liebermann & Chojnacki, *B* 4, 194, *A* 162, 322) Yellowish red needles, sl sol boiling water, m sol hot alcohol Its solution in KOHAq is violet red, that in NH_4Aq is reddish-brown, and is ppd by $BaCl_2$ and $CaCl_2$. Yields anthracene on distilling with zinc dust. Conc H_2SO_4 gives a violet red solution Dyes alumina mordants brownish red—Ba($C_{12}H_4O_8$), aq.

Tetra-oxy-anthraquinone $C_{12}H_4O_8$ (a) *Oxyanthragallol* [above 350°] Formed, together

with the (β)-isomeride and rufigallol acid, by heating pyrogallol with *m*-oxy-benzoic acid and H_2SO_4 at 150° (Noah, Liebermann & Kostanecki, *A* 240, 270) Golden needles (from alcohol) or red needles (from benzene) Conc. H_2SO_4 forms a violet solution KOHAq gives a green solution Insol baryta-water Dyes mordants

Tetra-acetyl derivative [209°].

Tetra-oxy-anthraquinone $C_{12}H_4O_8$ (β) *Oxyanthragallol*. [above 380°] Formed as above.

Red needles (from alcohol), insol benzene. Conc H_2SO_4 gives a brownish yellow solution KOHAq forms a green solution Dyes mordants

Tetra-acetyl derivative [189°]

Of the two oxyanthraquinones one should have the hydroxyls in the position 1,2,3,2', and the other in 1,2,3,4'

Penta-oxy-anthraquinone

$\text{C}(\text{OH})\text{CH}(\text{C})\text{CO}\text{C}(\text{OH}) = \text{C}(\text{OH})\text{CH}(\text{C}(\text{OH}))\text{CO}\text{C}(\text{OH})\text{C}(\text{OH})$ Formed by heating gallic acid with *s*-di oxy benzoic acid H_2SO_4 for 15 minutes at 165° (Liebemann & Noah, *B* 19, 751, *A* 240, 273) Small yellowish-red plates (by sublimation), not melted at 360° V sol hot alcohol, sl sol ether, nearly insol benzene and hot water Its solution in KOHAq is green, that in H_2SO_4 is brownish red Dyes mordant fabrics

Penta-acetyl derivative [229°]

Needles

Hexa oxy-anthraquinone

$\text{C}(\text{OH})\text{C}(\text{OH})\text{C}(\text{CO})\text{C}(\text{CH}) = \text{C}(\text{OH})\text{C}(\text{OH}) = \text{CH}(\text{C})\text{CO}\text{C}(\text{OH})\text{C}(\text{OH})$ *Rufgallisch acid* Formed by heating gallic acid with H_2SO_4 (Robiquet, *A* 19, 204, Wagner, *C* 1861, 47, Löwe, *J* pr 107, 296, Jaffé, *B* 3, 694, Widman, *B* 9, 856, Klobulowski & Nöltung, *B* 8, 819, 9, 1256, 10, 880) Red crystals (containing 2aq), v sl sol alcohol and ether Its solution in conc KOHAq is blue, becoming violet red on dilution Conc H_2SO_4 forms a red solution Baryta-water forms a blue insoluble salt Dyes fabrics, mordanted with alumina, brown, with iron salts, black

Reactions —1 Yields anthracene on heating with *conc*-*acid* —2 Nitric acid gives no phthalic acid —3 Boiling HIAq and P form minute needles of $\text{C}_{14}\text{H}_{10}\text{O}_4$ —4 *Potash-fusion* yields *m*-oxy benzoic acid, γ -oxy-isophthalic acid, and an anhydride of hexa-oxy-diphenyl $\text{C}_{20}\text{H}_{10}\text{O}_{11}$ 4sq, crystallising in colourless needles (Mahn, *A* 141, 346, Schreder, *M* 1, 432)

Hexa-acetyl derivative Needles

Chloro-acetyl derivative $\text{C}_{14}\text{H}_9\text{ClO}_6$

Needles

Tri-ethyl ether [195°] Orange needles

Tetra-methyl ether [c 220°] Needles

Tetra-ethyl ether [above 180°] Red needles

Hexa-ethyl ether $\text{C}_{14}\text{H}_{20}(\text{OEt})_6$ [c 140°] Orange needles, sol hot alcohol

References —Bromo-, Chloro-, and Nitro-OXYANTHRAQUINONE and OXY AMIDO ANTHRAQUINONE

OXY-ANTHRAQUINONE CARBOXYLIC

ACID $\text{C}_6\text{H}_4\text{C}(\text{CO})\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{H}$ [260°]. Prepared by fusing anthraquinone carboxylic acid with caustic soda (Hammerschlag, *B* 11, 83) Orange needles (by sublimation) Yields phthalic acid on oxidation with HNO_3 Its Ba salt is a blue pp Its alkaline solutions are purple

(*erythro*)-Oxy-anthraquinone-carboxylic acid [238°] Formed by heating (*erythro*)-oxy-methyl-anthraquinone with H_2SO_4 , a portion of the quinone probably oxidising the methyl of the rest (Birukoff, *B* 20, 2488) Long yellow needles V sol boiling water Heated to about 270° it loses CO_2 and gives (*erythro*)-oxy-anthra-

quinone. The Ca and Ba salts are sparingly soluble

Di oxy-anthraquinone carboxylic acid

$\text{C}_6\text{H}_4(\text{OH})\text{C}_6\text{H}_3(\text{CO}_2\text{H})\text{CO}_2\text{H}$ *Alizarin carboxylic acid* [305°] Formed by soda-fusion from the sulphonic acid got by heating anthraquinone carboxylic acid with H_2SO_4 (Hammerschlag, *B* 11, 86) Dull-red powder or red needles (by sublimation), v sol aqueous NaOAc Decomposed by heat into CO_2 and alizarin Its alkaline solutions are purple Gives a red lake with alumina Nitric acid oxidises it to trimellitic acid — $\text{Ba}_2(\text{C}_{12}\text{H}_6\text{O}_6)_2$ blue pp

Di oxy-anthraquinone carboxylic acid

$\text{C}_{12}\text{H}_6\text{O}_6$ *Munjistin Purpuranthric acid* [231°] Occurs in madder (Schunck & Römer, *B* 10, 172, *C* J 81, 666, 83, 422) and in munjeet or East Indian madder (Stenhouse, *Pr* 12, 633, 13, 86, 145) Golden scales (from HOAc), split up at 233° into CO_2 and purpuranthrin M sol boiling water and alcohol Its alkaline solutions are red Conc H_2SO_4 forms an orange solution Dilute nitric acid oxidises it to phthalic acid Fuming HNO_3 gives a di nitro-derivative Dyes fabrics, mordanted with alumina, orange, with iron mordants, brownish red Forms a red insoluble Ba salt Yields purpurin when boiled for a long time with conc KOHAq Ammonia at 100° forms purpurin amide Br in HOAc forms di bromo-purpuranthrin [231°]

Tri-oxy-anthraquinone carboxylic acid

$\text{C}_{12}\text{H}_6\text{O}_7$ *Purpurin carboxylic acid Pseudopurpurin* [220°] Occurs in madder (Schutzenberger & Schiffrt, *Bl* 4, 13, Rosenstiehl, *C* R 84, 561, Liebemann, *B* 10, 1618) Red plates, almost insol water and alcohol Split up by heat, or by boiling with water, potash, or alcohol into CO_2 and purpurin Its alkaline solution is orange-red Does not dye mordanted fabrics unless the water is free from CaCO_3 (difference from purpurin) Bromine water yields bromo-purpurin [275]

OXY-ANTHRAQUINONE SULPHONIC

ACID $\text{C}_6\text{H}_4\text{C}_6\text{H}_4(\text{OH})(\text{SO}_3\text{H})$ [1 6 2 3 or 4] *Erythro oxy anthraquinone sulphonic acid* Formed from *o* amido anthraquinone sulphonic acid by the action of nitrous acid (Litschütz, *B* 17, 900) Yellow plates, v sol water, alcohol, and ether Its alkaline solution is red On fusion with potash it gives alizarin — AgA' yellow needles

Anhydride $\text{C}_{12}\text{H}_6\text{O}_2\text{SO}_2$ Grey needles, insol water, alcohol, and ether, sl sol HOAc Requires to be heated with alkalis before yielding the acid

Oxy anthraquinone sulphonic acid Formed by sulphonating erythro oxy anthraquinone at 130° Sol water and alcohol, insol ether Its alkaline solution is reddish yellow Baryta gives a blood red pp, crystallising from hot water BaCl_2 gives a similar yellow pp Lead acetate gives a yellowish-brown pp, sol hot water Gives neither alizarin nor purpurin on potash fusion

m-Oxy-anthraquinone sulphonic acid

$\text{C}_{12}\text{H}_6\text{O}_7(\text{SO}_3\text{H})$ Formed by heating *m*-oxy-anthraquinone with H_2SO_4 at 120° (Von Perger, *J* pr [2] 18, 176) Crystals (from alcohol), m. sol cold water, insol ether Its alkaline solu-

tion is reddish brown Lead acetate gives a brownish yellow, and lime-water a brown, pp Yields alizarin sulphonic acid on fusion with potash at 180° — $\text{BaCl}_2 \cdot \text{H}_2\text{SO}_4$ orange crystals

When (a)- or (β)-anthraquinone disulphonic acid is fused with moist potash, a mixture of an anthraquinone disulphonic acid, oxyanthraquinone sulphonic acid, and tri oxy-anthraquinone is got The mono sulphonic acid is obtained by stopping the fusion as soon as the blue colour begins to turn violet (Graebe & Liebermann, *A* 160, 139) According to Von Perger (*J pr* [2] 18, 168) it is doubtful whether the product is not a di oxy-anthraquinone sulphonic acid The acid prepared from (α)-anthraquinone disulphonic acid gives on fusion with potash anthraflavic acid and flavo-purpurin, and is therefore isomeric with that from (β) anthraquinone disulphonic acid, which gives isanthraflavic acid and anthra purpurin on potash fusion

Di-oxy anthraquinone sulphonic acids

$\text{C}_{14}\text{H}_2\text{O}_2(\text{OH})_2(\text{SO}_3\text{H})$ Pure alizarin heated with strong H_2SO_4 at 120° forms at least three sulphonic acids On adding water two sulphonic acids dissolve and another remains on the filter as a brown mass The latter dissolves in alkalis, forming a cherry red liquid It is slightly soluble in water, but is slowly decomposed by boiling water, regenerating alizarin Of the two sulphonic acids which are readily soluble, the one that is formed in greatest quantity is the most soluble, and it is decomposed by potash fusion at 200° without forming either alizarin or purpurin The other sulphonic acid is formed in very small quantity, but by potash fusion it is converted at 140° into purpurin, the mass becoming crimson (Von Perger, *J pr* [2] 18, 173)

Di-oxy-anthraquinone sulphonic acid

$\text{C}_{14}\text{H}_2\text{O}_2(\text{OH})_2\text{SO}_3\text{H}$ *Quinizarin sulphonic acid* Formed in small quantity in the preparation of quinizarin from hydroquinone, phthalic anhydride, and H_2SO_4 (Liebermann, *A* 212, 11) Its Na salt forms a deep orange solution, turned deep blue by alkalis It does not dye mordants

OXY-AZELAIC ACID $\text{C}_8\text{H}_8(\text{OH})(\text{CO}_2\text{H})_2$

[91°] Formed by the action of NaOHAq upon the product of the action of Br and a little red P upon azelaic acid (Bujard & Hell, *B* 22, 68) Nodules (from water or ether)— $\text{BaA}'' \frac{1}{2}\text{aq}$ S 256 at 18° — $\text{CaA}'' \frac{1}{2}\text{aq}$ S 65 at 20° — $\text{ZnA}'' \frac{1}{2}\text{aq}$ S 623 at 20° — $\text{SrA}'' \frac{1}{2}\text{aq}$ — $\text{MgA}'' \frac{1}{2}\text{aq}$ — $\text{CdA}'' \frac{1}{2}\text{aq}$ — $\text{CuA}'' \frac{1}{2}\text{aq}$ — $\text{PbA}'' \frac{1}{2}\text{aq}$ — AgA''

OXY-AZO- compounds v Azo-compounds

OXY-AZOPHENINE $\text{C}_{10}\text{H}_7\text{N}_3\text{O}$ [197°]

Formed by heating nitroso *m*-oxy-diphenylamine with aniline and aniline hydrochloride on the water bath (O Fischer & Hepp, *B* 20, 2481, Kohler, *B* 21, 910) Needles (from toluene), sol alcoholic NaOH, insol NaOHAq Conc. H_2SO_4 forms a reddish-brown solution.

DI-OXY-BEHENIC ACID $\text{C}_{22}\text{H}_{40}(\text{OH})_2\text{O}_2$

[127°] (H), [138°] (H & G) Formed by boiling oxy-erucic acid with potash (Haussknecht, *A* 143, 53), or by oxidising erucic acid with alkaline KMnO_4 (Irwantsoff, *J R* 21, 13, *J pr* 39, 884; Hazura & Grüssner, *M* 9, 947) Plates (from alcohol), insol water and ether With Pb , it gives iodobehenic acid reduced by zinc and

HCl to behenic acid NaA' grains, sl. sol water— BaA'_2 insoluble pp

ISO-DI OXY-BEHENIC ACID $\text{C}_{22}\text{H}_{40}(\text{OH})_2\text{O}_2$ [99°] Formed by oxidising brassic acid with alkaline KMnO_4 (Grüssner & Hazura, *M* 10, 197) Minute plates, insol water and ligroin, v sol hot alcohol

DI-OXY-BEHENIC ACID $\text{C}_{22}\text{H}_{40}\text{O}_2$ [91°]

Formed by oxidising behenic (benolic) acid with fuming HNO_3 (Haussknecht, *A* 143, 48) Yellowish scales (from alcohol)— AgA' white pp

OXYBENZALDEHYDE v OXYBENZOIC ALDEHYDE

HYDE

OXYBENZAMIDE v Amide of OXYBENZOIC ACID

O-OXY-BENZAMIDINE Ethyl ether $\text{C}_8\text{H}_7(\text{OEt})\text{C}(\text{NH})\text{NH}_2$ A product of the action of alcoholic HCl, followed by alcoholic NH_3 , on $\text{C}_8\text{H}_7(\text{OEt})\text{CN}$ (Pinner, *B* 23, 2952) The hydrochloride $\text{B} \cdot \text{HCl}$ [218°] crystallises in short hexagonal columns, v sol water

p Oxy benzamidine Ethyl ether The hydrochloride $\text{C}_8\text{H}_7(\text{OEt})\text{C}(\text{NH})\text{NH}_2\text{Cl}$ [260°] is formed by the action of alcoholic NH_3 on the hydrochloride of ethyl p oxy benzimidio-ether It is converted by acetoacetic ether and NaOHAq into ethylated dioxy phenyl methyl pyrimidine $\text{C}_8\text{H}_7(\text{OEt})\text{C} \begin{smallmatrix} \text{N}^{\text{CM}} \\ \text{C}(\text{OH}) \end{smallmatrix} \text{CH}$

OXY-BENZENE v PHENOL

Di-oxy-benzene v HYDROQUINONE, PYROCAT-CHIN, and RESORCIN

u-Tri-oxy-benzene $\text{C}_6\text{H}_3(\text{OH})_3$ [124°] *Oxy hydroquinone* [140.5°] Formed, together with hexa oxy diphenyl, by fusing hydroquinone (1 pt) with moist NaOH (9 pts) (Barth & Schreder, *M* 4, 176, 5, 589) Monoclinic plates (from ether), $a b c = 75.1101$, $\beta = 91^\circ 46'$ v e sol water, alcohol, ether, and HOAc, almost insol chloroform and benzene Its alkaline solution rapidly becomes brown through absorption of oxygen FeCl_3 gives a transient bluish green colour H_2SO_4 forms a green solution becoming cherry-red on warming Bromine forms $\text{C}_6\text{Br}_3(\text{OH})_3$ [206°] Nitric acid yields greyish blue crystals of oxyquinhydrone

Tri-acetyl derivative $\text{C}_6\text{H}_3(\text{OAc})_3$ [96°]

Methyl ether $\text{C}_6\text{H}_3(\text{OMe})(\text{OH})_2$ [24.1°] [84°] Got by reducing the methyl ether of oxyquinone with aqueous SO_2 (Will, *B* 21, 606) Colourless plates Turned yellow by FeCl_3 , being reconverted into $\text{C}_6\text{H}_3(\text{OMe})_3$

Tri-methyl ether $\text{C}_6\text{H}_3(\text{OMe})_3$ (247°) Formed from the preceding ether, methyl iodide, and KOH (W) Obtained also from asarone $\text{C}_8\text{H}_7(\text{OMe})_2\text{CH}_2\text{CHMe}$ by oxidation to $\text{C}_6\text{H}_3(\text{OMe})_3\text{CO}_2\text{H}$ and distillation of this acid with lime (Rizsa & Butlerow, *J R* 1887, 1). Oil, volatile with steam

Mono-ethylether $\text{C}_6\text{H}_3(\text{OH})(\text{OEt})$ [148°] [112°] Formed by reduction of the ethyl ether of oxyquinone $\text{C}_6\text{H}_3(\text{OEt})_2\text{O}_2$ with SO_2 Colourless prisms Sublimes in fine plates v sol water, alcohol, and ether, m sol benzene Fe_2Cl_6 gives a dark brown colouration.

Tri-ethyl ether $\text{C}_6\text{H}_3(\text{OEt})_3$ [84°] Formed by ethylation of the preceding body. Long white glistening needles, v e sol. alcohol and ether, insol water, volatile with steam. This body is identical with that obtained from esculetin, which is therefore a derivative of

***m*-tri-oxy-benzene** (Will & Fukall, *B*, 20, 1133, Herzog & Zeisel, *M*, 10, 150)

Isomerides are described as PHLOROGLUCIN and PYROGALLOL.

***s*-Tetra-oxy-benzene** $C_6H_2(OH)_4$ [1 2 4 5] [α 218°]. Formed by reducing di-oxy-quinone with $SnCl_2$ (Nietzki, *B*, 21, 2377). Colourless plates, v sol water, alcohol, and ether. Its aqueous solution rapidly turns brown, and its alkaline solution is oxidised by air or by $FeCl_3$ to di-oxy-quinone.

Acetyl derivative $C_6H_2(OAc)_4$ [217°]. Colourless plates.

***Di*-methyl ether** $C_6H_2(OH)_2(OMe)_2$ [1 4 2 5] [166°]. Formed by reducing $C_6H_2O_2(OMe)_2$ with stannous chloride (Nietzki & Reichberg, *B*, 23, 1217). Colourless plates.

***Di*-ethyl ether** $C_6H_2(OH)_2(OEt)_2$ [1 4 2 5] [188°]. Got in like manner. Colourless needles (from hot water). Yields $C_6H_2O_2(OEt)_2$ on oxidation. Acetic anhydride forms the compound $C_6H_2(OAc)_2(OEt)_2$ [148°].

***Tetra*-ethyl ether** $C_6H_2(OEt)_4$ [143°]. Formed from $C_6H_2(OH)_2(OEt)_2$, alcoholic $NaOEt$ and $EtBr$ at 100° (Nietzki, *B*, 23, 1214). Colourless plates, smelling like anise. May be sublimed.

***u*-Tetra-oxy-benzene** ***Di*-methyl ether** $C_6H_2(OH)_2(OMe)_2$ [1 4 3 5] [158°]. Formed by reducing the corresponding $C_6H_2O_2(OMe)_2$ with Zn and $HClAq$, with $SnCl_2$, or with SO_2 (Hofmann, *B*, 8, 67, 11, 332, Will, *B*, 21, 609). Needles, reconverted into the quinone by $FeCl_3$. $HOAc$ forms an acetyl derivative [133°] which forms a green solution in H_2SO_4 . Ac_2O forms an acetyl derivative [128°] which does not give a green solution in H_2SO_4 . (H) Benzoyl chloride yields $C_6H_2(OMe)_2(OBz)_2$ [245°], v sl. sol alcohol.

***Tre*-methyl ether** $C_6H_2(OH)(OMe)_3$ [146°]. Formed, together with the *tetra*-methyl ether by the action of methyl iodide and KOH on the *di*-methyl ether. Needles (from alcohol).

***Tetra*-methyl ether** $C_6H_2(OMe)_4$ [47°]. [271°]. Plates (from ether). Yields $C_6Br_4(OMe)_4$ [76°].

***o*-Tetra-oxy-benzene** ***Di*-methyl ether** $C_6H_2(OH)_2(OMe)_2$. ***Di*-methyl apionol** [106°] [296°]. Formed by heating apionol acid $C_6H_2O_2(OMe)_2CO_2H$ with alcoholic potash, at 180° (Ciamician & Silber, *B*, 22, 119, 2482, 23, 2391). Insol water, sol alcohol, ether, and benzene. Its solution in KOH becomes brownish-red. Ferric chloride gives a violet-black colour. Lead acetate gives a gelatinous pp. $AgNO_3$ forms minute needles, quickly turning black. Yields a crystalline acetyl derivative [144°].

***Tetra*-methyl ether** $C_6H_2(OMe)_4$ [1 2 3 4] [31°]. White needles, v sol ether.

Hexa-oxy-benzene $C_6(OH)_6$ (so-called '*trihydrocarboxylic acid*' of Lerch). Long nearly colourless needles. Soluble in hot water, slightly soluble in cold water, alcohol, ether, and benzene.

Formation—1 By the action of dilute HCl upon freshly prepared carbonic-oxide potassium. 2 By reduction of tri-quinone C_6O_3 with stannous chloride.

Properties—Reduces $AgNO_3$ in the cold. Is oxidised by HNO_3 to benzené-tri-quinone. Gives a violet colouration with $FeCl_3$. The solution in aqueous Na_2CO_3 is readily oxidised by the air to tetra-oxy-quinone $C_6(OH)_4O_2$. By distillation with zinc dust it gives benzene and diphenyl. By evaporation in an open dish with dilute KOH it yields orcinic acid $C_6H_2O_4$.

Salt $C_6(OK)_6$. Formed by combination of CO with K at 80°, occurring as a by-product in the preparation of K (Laebig, *A*, 11, 182, Brodie, *A*, 113, 358, Lerch, *A*, 124, 20). Grey mass, becoming explosive on exposure to air.

Hexa-acetyl derivative $C_6(OAc)_6$ [203°], small colourless prisms, sl sol hot acetic acid, nearly insol alcohol, ether, and benzene (Nietzki & Benckiser, *B*, 18, 505, 1833).

OXY-BENZENE CARBOXYLIC ACID v Oxy BENZOIC ACID.

Oxy-benzene dicarboxylic acid v Oxy PHTHALIC, OXY-ISOPHTHALIC, and OXY TEREPHTHALIC ACIDS.

Tri-oxy-benzene carboxylic acid v GALLIC ACID.

Tri-oxy-benzene tri-carboxylic acid v PHLOROGLUCIN TRICARBOXYLIC ACID.

Di-oxy benzene tetra-carboxylic acid v HYDROQUINONE TETRA-CARBOXYLIC ACID.

DI OXY-BENZENE-DIQUINONE v Di OXY DIQUINONE.

OXY-BENZENE SULPHONIC ACID v PHENOL SULPHONIC ACID.

Di-oxy-benzene sulphonic acid $C_6H_2(OH)_2SO_3H$ [280°]. Formed by heating phenol β' -disulphonic acid with potash at 240° (Senhofer, *J*, 1879, 749). Crystallises from water in needles (containing aq). Coloured violet by $FeCl_3$. — BaA' , 7aq — ZnA' , 27aq — PbA' , 8aq long thin plates.

Isomerides HYDROQUINONE, PYROCATECHIN, and RESORCIN SULPHONIC ACIDS.

OXY-BENZENYL-AMIDO-PHENYL MER CAPTAN $C_{12}H_9NSO$ \approx $C_6H_4 \begin{smallmatrix} N \\ \diagup \diagdown \end{smallmatrix} C_6H_4OH$.

[129°]. Formed by heating salicylic aldehyde with *o*-amido phenyl mercaptan (Hofmann, *B*, 13, 1237). Needles — $B'HCl$ — Platinochloride B'_2H_2PtCl , pp.

***o*-OXY-BENZENYL-AMIDOXIM**

$C_6H_4(OH)C(NO)NH_2$. ***Salcenyl amidoxim*** [99°]. Formed from $C_6H_4(OH)CSNH_2$, hydroxylamine hydrochloride, and Na_2CO_3Aq (Spilker, *B*, 22, 2774). Colourless needles, v sol alcohol and ether, m sol hot water. Gives a greenish pp with $CuSO_4$, and a mirror with $AgNO_3$.

Reactions—1 Ac_2O forms the acetyl derivative and, on further digestion, the azoxim $C_6H_4(OH)C \begin{smallmatrix} N \\ \diagup \diagdown \end{smallmatrix} OMe$ [77°] which yields an acetyl derivative [74°].—2 Concentrated sulphuric acid at 150° yields the sulphonic acid $C_6H_4(SO_3H)(OH)C(NO)NH_2$, v sl sol cold water, insol alcohol.—3 $ClCO_2Et$ yields $C_6H_4(OH)C(NH_2)NOCO_2Et$ [96°] (Miller, *B*, 22, 2799).—4 *Succinic anhydride* forms, on melting, the azoxim $C_6H_4(OH)C(N_2O)CO_2H$, CO_2H [117°].—5. **Potassium cyanate** and HCl yield $C_6H_4(OH)C(NO)NHCO_2NH_2$ [148°].—6,

Phenyl cyanate forms by direct combination $C_6H_5(OH)C(NO_2)NHCO NHPh$ [119°]

Salts— $BHCl$ [175°] Ve sol water — $B_2H_4PtCl_6$ — $Na_2C_6H_4N_2O_2$ — $NaOCH_2N_2O_2$

Acetyl derivative
 $C_6H_5(OH)C(NO_2)NH_2$ [117°] White plates, sl sol water

Di acetyl derivative Formed from the Na salt and $AcCl$ Crystalline

Benzoyl derivative
 $C_6H_5(OH)C(NO_2)NH_2$ [173°] Needles, v. sol ether Yields $C_6H_5(OH)C \begin{smallmatrix} NO \\ N \end{smallmatrix} > CPh$ [128°], which forms a benzoyl derivative [120°]

Di-benzoyl derivative
 $C_6H_5(OBz)C(NO_2)NH_2$ [127°] Formed from the amidoxim, $NaOEt$, and $BzCl$ in ether Insolent crystals

Ethyl ether $C_6H_5(OH)C(NO_2)NH_2$ (278°) Formed from the amidoxim, alcoholic $NaOEt$, and EtI Oil By HCl and $NaNO_2$ it is converted into $C_6H_5(OH)C(NO_2)Cl$ (234°)

Methyl derivative
 $C_6H_5(OMe)C(NO_2)NH_2$ [123°] Formed from $C_6H_5(OMe)CN$ and alcoholic hydroxylamine (Miller, *B* 22, 2791) Needles (from hot water) Yields $BHCl$ [168°] With Ac_2O it yields

$C_6H_5(OMe)C \begin{smallmatrix} NO \\ N \end{smallmatrix} > CMe$ [68°] Aldehyde forms

$C_6H_5(OMe)C \begin{smallmatrix} NO \\ NH \end{smallmatrix} > CHMe$ [127 5°] $ClCO_2Et$ forms $C_6H_5(OMe)C(NH_2)NOCO_2Et$ [120°], which on heating becomes $C_6H_5(OMe)C \begin{smallmatrix} NO \\ NH \end{smallmatrix} > CO$ [208°]

Methyl-acetyl derivative
 $C_6H_5(OMe)C(NO_2)NH_2$ [106°] Formed from the oxim and $AcCl$ in chloroform Prisms

Methyl-benzoyl derivative
 $C_6H_5(OMe)C(NO_2)NH_2$ [148°] White granules, v sol alcohol

Methyl-ethyl derivative
 $C_6H_5(OMe)C(NO_2)NH_2$ [52°] Prisms, v sol. alcohol

Di ethyl derivative
 $C_6H_5(OEt)C(NO_2)NH_2$ (195° at 160 mm) Formed from the amidoxim, $NaOEt$, EtI , and alcohol Oil, miscible with alcohol and ether

m Oxy benzenyl amidoxim
 $C_6H_5(OH)C(NH_2)(NOH)$ [71°] Made by heating *m* oxy-benzonitrile with hydroxylamine hydrochloride and Na_2CO_3 (Clemm, *B* 24, 829) Groups of needles, v sol water

Di-benzoyl derivative
 $C_6H_5(OBz)C(NH_2)NOBz$ [162 5°] Crystals

Acetyl derivative
 $C_6H_5(OH)C(NH_2)NOAc$ [90°] Plates

Di-ethyl ether $C_6H_5(OEt)C(NH_2)NOEt$ [109°] Needles *p*-Oxy benzenyl-amidoxim [158°] Made in like manner (Krone, *B* 24, 834— $BHCl$ [179°])

Acetyl derivative [122 5°]

Benzoyl derivative [166°]

Di-benzoyl derivative [186°]

Di ethyl ether [84°]

***o*-OXY-BENZENYL-*o*-PHENYLENE-DI-**

AMINE $C_6H_5 \begin{smallmatrix} NH \\ N \end{smallmatrix} > COC_6H_5OH$ [223°] Formed by reducing the *o* nitro-anilide of salicylic acid with tin and HCl (Hübner a Mensching, *B* 18, 488; *A* 210, 345) Needles, v. sol. alcohol and

ether — $BHCl aq$ — $B_2H_4SO_4 aq$ sparingly soluble needles

***o*-OXY-BENZENYL-DI-UREA** $C_6H_5N_2O_2$ $1e$ $C_6H_5(OH)CH(NHCO NH_2)_2$ Formed from salicylic aldehyde and aqueous urea (Scheff, *A* 151, 199) Nodular groups of needles (containing aq) V sl sol water, sl sol alcohol, insol ether — $Cu(C_6H_5N_2O_2)_2$ Green pp

Ethyl ether $C_6H_5(OEt)CH(NH_2CO)_2 aq$ Crystals

By fusing salicylic aldehyde with urea there is formed $(C_6H_5(OH)CH)_2(N_2H_2CO)_2$

***p*-Oxy-benzenyl-di-urea** *Methyl ether* $C_6H_5(OMe)CH(NHCO NH_2)_2$ Formed from anisic aldehyde, an aqueous solution of urea, and a little $HOAc$ Yellow plates

DI-OXY-BENZYL *Di-methyl derivative* $C_6H_5(OMe)CO CO C_6H_5(OMe)$ *Anisil* [138°] Formed by oxidising anisoin with alkaline copper solution (Boesler, *B* 14, 327) Golden needles (from alcohol)

Hexa-oxy-benzil *Hexa-methyl derivative* $C_6H_5(OMe)_6 CO CO C_6H_5(OMe)_6$ [189°]

Formed by the action of sodium amalgam on an alcoholic solution of the tri methyl derivative of the amide of gallic acid (Marx, *A* 263, 253) Satiny needles, coloured bluish green by H_2SO_4

***p*-OXY-BENZIMIDO-ETHER** *Ethyl derivative* $C_6H_5(OEt)C(NH)(OEt)$ The hydrochloride is crystalline and is formed from $C_6H_5(OEt)CN$ and alcoholic HCl (Pinner, *B* 23, 2953)

***o*-OXY-BENZOIC ACID** $C_6H_5O_2$ $1e$ $C_6H_5(OH)CO_2H$ *Salicylic acid* Mol w 138 [156°] (Hübner, *A* 162, 74), [159° cor] (Beisert, *B* 23, 2244), [157° cor] (Dunstan a Bloch, *Ph* [3] 21, 429) S 09 at 0° (Ost, *J pr* [2] 17, 230), 15 at 0°, 225 at 15°, 7 925 at 100° (Bourgoin, *J Pharm Chim* [4] 30, 488, *C R* 87, 62), *H C* 734,990 (Berthelot a Recoura, *A Ch* [6] 13, 320), 729,500 (Stohmann, *J pr* [2] 40, 129) *H F* 106,000 (Von Rechenberg), 135,500 (S) Occurs in the blossoms of the meadow sweet (*Spiraea ulmaria*) (Löwig a Weidmann, *P* 46, 83), and in the leaves and stems of *Tulipa*, *Yucca*, and *Hyacinthus* (Griffiths, *C J Proc* 5, 122) Occurs as methyl ether in the oil of wintergreen (from *Gaultheria procumbens*) (Cahours, *A* 48, 60, Hartley, *C J* 53, 664) Methyl salicylate constitutes the essential oils of *Gaultheria punctata* and *G leuco carpa* (Köhler, *B* 12, 246)

Formation—1 By oxidation of *o*-oxy-benzyl alcohol (saligenin), and of *o*-oxy-benzoic aldehyde (salicylic aldehyde)—2 By potash-fusion from salicin, coumarin, indigo, *o*-oresol (Barth, *A* 154, 360), toluene *o*-sulphonic acid, *p*-chlorotoluene sulphonic acid (Vogt, *Z* [2] 5, 577), and other bodies—3 By heating cupric benzoate with water in sealed tubes for 3 hours at 180° (Smith, *Am* 2, 338), *cf* Ettinger, *A* 53, 83)—4 From *o*-amido-benzoic acid by the diazo-reaction (Hübner a Petermann, *A* 149, 129, *cf* Gerland, *A* 86, 147)—5 Together with *p*-oxy benzoic acid by heating phenol with $COCl_2$ and alcoholic potash (Tiemann a Reimer, *B* 9, 1235)—6 By oxidising *o*-tolyl sulphuric acid $C_6H_5MeO SO_3H$ with alkaline $KMnO_4$ (Heymann a Königs, *B* 19, 706)—7 By heating C_6H_5ONa with sodium carbonate in a current of carbonic oxide at 200° $PhONa + Na_2CO_3 + CO$

= $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Na} + \text{HCO}_2\text{Na}$ (Schroeder, *A* 221, 41) — 8 By oxidising toluene *o*-phosphonic acid with alkaline KMnO_4 (Heymann a Königs, *B* 19, 8806; — 9 By distilling sodium phenyl carbonate with NaOEt in a current of CO_2 (Hentschel, *J pr* [2] 27, 39) — 10 By heating phenyl ethyl carbonate with NaOPh at 200° in a current of hydrogen, PhOEt being also formed 11. Together with PhOEt by heating Ph_2CO , with NaOEt in a current of hydrogen (*H*)

Preparation — By passing CO_2 over sodium-phenol heated at 180° $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Na}$ being formed and phenol distilling over (Kolbe, *A* 115, 201, *J pr* [2] 10, 93) CO_2 is first absorbed, and this can also take place at a lower temperature, and the resulting sodium phenyl carbonate $\text{C}_6\text{H}_5\text{O CO}_2\text{Na}$ changes into the isomeric sodium salicylate $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Na}$ This change can take place at 130° The sodium salicylate reacts upon excess of sodium phenol at 180° , setting free phenol, which distils over, leaving basic sodium salicylate behind $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Na} + \text{PhONa} = \text{PhOH} + \text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Na}$ (R Schmitt, *J pr* [2] 31, 404, cf Baumann, *B* 11, 1910) Salicylic acid is set free by acidifying the basic sodium salicylate By using a measured quantity of CO_2 , starting the operation at a low temperature and finishing it at 130° , the formation of basic sodium salicylate may be avoided, so that half the phenol may be saved

Properties — Colourless needles (from hot water) or monoclinic prisms (from alcohol) Sublimes at 200° Volatile with steam FeCl_3 colours its aqueous solution violet, the colour not being removed by acetic acid Prevents pptn of copper sulphate ($\frac{1}{2}$ mol) by alkalis With albuminoids it forms compounds containing about 14 pc of the acid (Farsky, *C C* 1877, 148) Bromine-water yields a pp of $\text{C}_6\text{H}_2\text{Br}_2\text{O}$ in dilute aqueous solutions Iodine and potash give a red powder $\text{C}_6\text{H}_2\text{I}(\text{OI})\text{CO}_2\text{K}$ (Messinger a Vortmann, *B* 22, 2321) Antiseptic Antirheumatic

Reactions — 1 Split up into CO_2 and phenol when rapidly heated to 220° , at 250° diphenylene-ketone oxide $[\text{174}^\circ]$ is formed (Klepl, *J pr* [2] 28, 217) Conc HClAq at 150° decomposes it in like manner (Graebe, *A* 139, 143) Potash-fusion also gives phenol — 2 KMnO_4 oxidises it to formic acid and CO_2 — 3 *Chlorous acid mixture* acts in like manner — 3 *Chlorous* forms chloro-oxy-benzoic and di-chloro-oxybenzoic acids — 4 *Iodine* and HIO_3 give mono, di-, and tri-, iodo-oxy benzoic acids and tri-iodo-phenol — 5 *Nitrous acid* passed into its ethereal solution forms nitro- and diazo oxy-benzoic acids (Goldberg, *J pr* [2] 19, 368) — 6 PCl_5 forms $\text{C}_6\text{H}_4(\text{COCl})\text{O.PCl}_2$ (168° at 11 mm) This compound is partially decomposed on distillation, yielding *o*-chloro-benzoyl chloride Moist air converts it into $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{O.P}(\text{OH})_2$ Further treatment with PCl_5 at 170° forms $\text{C}_6\text{H}_4(\text{COCl})\text{OPCl}_2$ (179° at 11 mm) converted by water into $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{OP}(\text{OH})_2$ Excess of PCl_5 forms $\text{C}_6\text{H}_4\text{Cl CCl}_2$ (Couper, *A* 109, 370, Anschütz, *A* 228, 314, 239, 314, Chasanovitch, *B* 20, 1166) — 7 PCl_5 forms $\text{C}_6\text{H}_4\text{ClPO}_2$, which may be $\text{C}_6\text{H}_4\text{ClPO}_2$ It forms crystals $[\text{87}^\circ]$ (127° at 11 mm), and is sol ether, benzene, and CHCl_3 , but decomposed by water into salicylic and phosphorous acids (Anschutz a Emery, *A* 239, 301) It is converted by PCl_5 or free chlorine into $\text{C}_6\text{H}_4\text{Cl}_2\text{PO}_2$ (167° at 11 mm), *SG* $\frac{1}{2}$ 1557, whence water forms $\text{C}_6\text{H}_4(\text{OH})_2\text{PO}_2$ [142°] The chloride $\text{C}_6\text{H}_4\text{ClPO}_2$ takes up bromine forming $\text{C}_6\text{H}_4\text{OIBr}_2\text{PO}_2$ (*c* 187° at 12 mm) 8 *Aniline* at 210° produces aniline, phenol, and $\text{C}_6\text{H}_4(\text{OH})\text{CONPh}$ (Limppricht, *B* 22, 2906) — 9 *Cyanamide* and alcohol at 100° form urea and *o* oxy-benzoic ether — 10 *Benzamidine* forms a compound $\text{C}_{11}\text{H}_{11}\text{N}_3\text{O}$ (Pinner, *B* 23, 3824) — 11 *Glycerin* and gaseous HCl forms $\text{C}_6\text{H}_4(\text{OH})\text{CO OC}_2\text{H}_5\text{Cl}_2$ (44°), *SG* 1 331 (Gottig, *B* 24, 508), whence sodic salicylate at 180° – 200° forms crystalline $\text{C}_6\text{H}_4(\text{O CO C}_2\text{H}_5\text{OH})$, and $\text{CH}(\text{OBz})(\text{CH}_2\text{O CO C}_2\text{H}_5\text{OH})$, [95°] (Fritsch, *B* 24, 779) — 12 *Aceto-chlorhydratose* forms $\text{C}_6\text{H}_4\text{O}_3$, [185°], whence $\text{C}_2\text{H}_5\text{O}(\text{OAc})_2$, [111°] (Michael, *B* 15, 1922) — 13 *Phenol* and SnCl_4 at 120° yield *o* di oxy benzophenone [144°] (Michael, *Am* 5, 83) — 14 *Resorcin* at 200° forms tri oxy-benzophenone — 15 *Orcin* gives ' β ' oxy-methyl xanthone' $\text{C}_6\text{H}_4\text{C}(\text{O})\text{C}_6\text{H}_4\text{Me}(\text{OH})$ [285°] (Von Kostanecki a Nessler, *B* 24, 1895) 16 *Phloroglucin* forms iso euxanthone $\text{C}_6\text{H}_4\text{C}(\text{O})\text{C}_6\text{H}_4(\text{OH})_2$ [247°] — 17 When taken internally it is excreted as salicyluric acid or salicyl glycecoll $\text{C}_6\text{H}_5\text{NO}_2$ [*c* 160°] (Bertagnini, *Il Nuovo Cimento*, 1 363) — 18 With *camphor* it forms a compound $\text{C}_{14}\text{H}_{10}\text{O}_2$ [60°] ($[\alpha]_D = +27.3$ (in dilute alcohol) (Léger, *C R* 111, 110) — 19 $\text{K}_2\text{S}_2\text{O}_8$ (17 pts) added to a solution of salicylic acid (10 pts) and KOH (8 pts) in water (25 pts) forms the crystalline compound $\text{C}_6\text{H}_4(\text{CO}_2\text{K})\text{O}8\text{O}_2\text{K}$ (Baumann, *B* 11, 1914) — 20 A solution of salicylic acid and borax in water deposits crystals of $\text{C}_6\text{H}_4\text{NaBO}_3$, whence the corresponding salts $\text{NH}_4\text{A}'$, KA' , MgA' . 10aq and CaA' . 10aq (Jahns, *Ar Ph* [3] 12, 212) — 21 *Chloral* at 140° forms $\text{C}_6\text{H}_4\text{C}(\text{O})\text{CO CH Cl}$, [124°] (Wallach, *A* 193, 1)

Salts — $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Na}$ With POCl_3 it gives di phenylene ketone oxide $\text{C}_{10}\text{H}_6\text{O}_2$ [174°] The normal salt $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Na}$ is converted by POCl_3 into an isomeric body [91°] (R Richer, *J pr* [2] 23, 349, 28, 303) — NaHA' . Large crystals, sol alcohol (E Hoffmann, *Ar Ph* [3] 12, 226) — KA' . 2aq Decomposed at 210° into CO_2 , phenol, and disodium *p* oxy benzoate (Ost, *J pr* [2] 11, 392) In presence of excess of KOH the change does not take place The Na salt does not give *p* oxy benzoic acid when heated alone or with NaOH , but when heated in a current of CO_2 , at 300° it yields oxy-isophthalic and oxytrimelic acids — $\text{NH}_4\text{A}'$ — $\text{NH}_4\text{A}'$. 2aq monoclinic crystals — BaA' . 2aq Small needles, sl sol cold water — $\text{BaC}_6\text{H}_4\text{O}_2$. 2aq Needles, sl sol hot water — SrA' . 2aq — CaA' . 2aq Octahedra, v sol water, sol. alcohol — $\text{CaC}_6\text{H}_4\text{O}_2$. 2aq Crystalline powder, nearly insol water — MgA' . 4aq — ZnA' . 3aq *S* 5 at 20° Needles, sol alcohol (Vulpinus, *Ar Ph* [3] 14, 239) — ZnA' . 2aq (Maignac, *J* 1855, 485) — CdA' . 2aq — $\text{HgC}_6\text{H}_4\text{O}_2$ (Lajoux a Grandval, *J Ph* [5] 20, 5) — HgA' . — PbA' . 2aq — $\text{PbC}_6\text{H}_4\text{O}_2$. — *Oxy-salt*. $\text{Ph}_2\text{O}_4(\text{C}_6\text{H}_4\text{O}_2)_2$ — TlA' — $\text{Ti}_2\text{C}_6\text{H}_4\text{O}_2$ — $\text{BiO}_2\text{A}'$. Insoluble powder got by adding sodium salicylate to a solution of bismuth nitrate in glycerine

(Wolff, *Ph* [3] 14, 508) — AlA'_3 (Van der Velden, *J pr* [2] 15, 151) — FeA'_3 , brown pp., quickly becoming violet — $\text{MnA}'_3 \cdot 2\text{aq}$ — $\text{CuA}'_3 \cdot 4\text{aq}$ bluish-green needles, ν sol water and alcohol. — $\text{CuC}_2\text{H}_3\text{O}_3\text{aq}$ Insoluble — $\text{CuK}_2(\text{C}_2\text{H}_3\text{O}_3)_4\text{aq}$ green tables, ν sol water — $\text{CuBa}(\text{C}_2\text{H}_3\text{O}_3)_4\text{aq}$ (Pellizzari, *G* 14, 365) — AgA' monoclinic needles

Methyl ether $\text{C}_6\text{H}_5(\text{OH})\text{CO}_2\text{Me}$ Mol w 152 (224° cor) SG $\frac{1}{2}$ 1.197 SV 155.9 (Ramsay), 156.7 (Lossen, *A* 254, 64) HF 129.224 (Stohmann, *J pr* [2] 36, 353) Constitutes oil of wintergreen, oil of *Gaultheria punctata* and *leucocarpa*, and oil of birch (Kohler, *B* 12, 246, Pettigrew, *Ph* [3] 14, 167) PCl_5 yields $\text{C}_6\text{H}_5(\text{COCl})\text{OPOCl}_2$ (*u supra*) Phenyl cyanate at 160° forms $\text{C}_6\text{H}_5(\text{CO}_2\text{Me})\text{OCONHPh}$ [238°] (Snape, *C J* 47, 775) Hydroxylamine hydrochloride yields $\text{C}_6\text{H}_5(\text{OH})\text{CO}_2\text{NH}(\text{OH})$ [169°] (Jeaurenaud, *B* 22, 1273) Benzamide forms, on heating, phenyl benzoate and a compound $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}$ [256° cor] crystallising from chloroform in yellow needles (Guareschi, *A* 171, 143) Forms the crystalline salts $\text{C}_6\text{H}_5(\text{OK})\text{CO}_2\text{Me} \frac{1}{2}\text{aq}$ and $\text{BaA}'_3\text{aq}$

Ethyl ether EtA' (227°) HF 139.252 Oil (Gottig, *B* 9, 1473) With benzamidine hydrochloride it gives $\text{C}_6\text{H}_5\text{O}_3\text{C}_2\text{H}_4\text{NO}$ [120°], benzamidine salicylate $\text{C}_{11}\text{H}_{11}\text{N}_2\text{O}_3$ [202°], and a compound $\text{C}_{21}\text{H}_{21}\text{N}_3\text{O}$ [246°], whence $\text{C}_{21}\text{H}_{21}\text{AcN}_3\text{O}$ [141°] (Pinner, *B* 23, 2935)

Ethylene ether $\text{C}_2\text{H}_4\text{A}'_2$ [83°]

Propyl ether PrA' (239°) SG $\frac{1}{2}$ 1.021 HF 147.880

Isoamyl ether $\text{C}_5\text{H}_{11}\text{A}'$ (270°)

Phenyl ether PhA' *Salol* [42°] Formed by slowly adding POCl_3 (28 g) to a mixture of salicylic acid (60 g) with phenol (48 g) at 135° (Seiffert, *J pr* [2] 31, 472) Anti rheumatic The yield is good (99 g) Trimetric tablets (from alcohol, $a b c = 963.1 \ 697$ (Léger), insol water Its alcoholic solution is coloured violet by FeCl_3 , Conc NaOH forms solid $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Ph}$, but boiling NaOHaq saponifies it When heated for a long time to boiling it gives CO_2 , phenol, and diphenylene ketone oxide Dissolved in HOAc it is nitrated by HNO_3 to $\text{C}_6\text{H}_3(\text{NO}_2)_3(\text{OH})\text{CO}_2\text{Ph}$ [150°] and a di nitro-compound [183°] HNO_3 (SG 1.53) forms also $\text{C}_6\text{H}_3(\text{NO}_2)_3(\text{OH})\text{CO}_2\text{Ph}$ [100°] (Knebel, *J pr* [2] 42, 158)

Nitro-phenoxy ethyl ether

$\text{C}_6\text{H}_3(\text{NO}_2)_3\text{OC}_2\text{H}_4\text{A}'$ The *o* isomeride [106°] yields an acetyl derivative [80°] The *p* isomeride crystallises from alcohol in needles [131°] (Wagner, *J pr* [2] 27, 215)

Tolyl ethers $\text{C}_6\text{H}_4\text{MeA}'$ The *o*, *m*, and *p* compounds [35°], [74°], and [39°] are insol water, sl sol alcohol (Nencki, *C R* 108, 254)

Methyl derivatives $\text{C}_6\text{H}_5(\text{OMe})\text{CO}_2\text{H}$ [98.5°] SG $\frac{1}{2}$ 1.1801 μ_d 1.5521 R_{20} 64.59 (Brühl) S 5 at 20° Formed by saponifying its methyl ether, which is formed from oil of Wintergreen, KOme , and MeI (Cahours, *A* 92, 315) Monoclinic tables (from water) Its aqueous solution is not coloured by FeCl_3 . Yields the salts BaA'_3 , $\text{PbA}'_3\text{aq}$, and AgA'_3 , and the ethers MeA' (228°), EtA' (235°) (Fölsing, *B* 17, 486), and PhA' [59°] (Seiffert, *J pr* [2] 31, 474)

Ethyl derivatives $\text{C}_6\text{H}_5(\text{OEt})\text{CO}_2\text{H}$ [19.4°] Forms the salts CaA'_3 , BaA'_3 , $\text{PbA}'_3 \cdot 2\text{aq}$,

$\text{CuA}'_3(\text{OH})$, and AgA' (Kraut, *A* 150.1) and the ethers MeA' (245°) and EtA' (251°)

Isopropyl derivative $\text{C}_6\text{H}_5(\text{OPr})\text{CO}_2\text{H}$ Oil, forming the salts $\text{CaA}'_3 \cdot 2\text{aq}$, $\text{BaA}'_3\text{aq}$, and $\text{AgA}'_3 \cdot \frac{1}{2}\text{aq}$ and the ether MeA' (250°)

Allyl derivative $\text{C}_6\text{H}_5(\text{OC}_2\text{H}_5)\text{CO}_2\text{H}$ [113°] Forms the salt AgA' and the ether MeA' (245°) (Scichilone, *G* 12, 449).

Ethylene derivative $\text{C}_6\text{H}_5(\text{O C}_2\text{H}_4\text{CO}_2\text{H})_2$ [152°] Formed by saponification of its ethyl ether EtA' [97°], which is itself got by heating $\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{Et}$ with ethylene bromide at 130° Silky needles (from water) (Weddige, *J pr* [2] 21, 128)

Phenyl derivative $\text{C}_6\text{H}_5(\text{OPh})\text{CO}_2\text{H}$ [113°] (355°) Formed by adding Na to $\text{C}_6\text{H}_5(\text{OH})\text{CO}_2\text{Ph}$ at 300° (Graebe, *B* 21, 502), and also by the action of phenol on *o*-diazobenzoic acid (Gress, *B* 21, 982) Plates, ν sl sol hot water Heated with conc H_2SO_4 it yields diphenylene ketone oxide Heating with baryta forms diphenyl oxide [25°] Bromine water at 150° forms $\text{C}_6\text{H}_5\text{Br}_2\text{O C}_6\text{H}_5\text{CO}_2\text{H}$ [176°], whence AgA' and EtA' [57°] (Arbenz, *A* 257, 86) HNO_3 at 0° forms a di nitro-derivative [153°], which gives the salts $\text{BaA}'_3 \cdot 4\text{aq}$, $\text{CaA}'_3 \cdot 4\text{aq}$, and AgA'_3 , and the ethers MeA' [126°], EtA' [76°], and an amide [166°] The phenyl derivative of salicylic acid forms the salts $\text{NH}_4\text{A}'$, KA' , $\text{CaA}'_3 \cdot 2\text{aq}$, $\text{BaA}'_3\text{aq}$, and AgA'_3 , and the ether, MeA' and EtA' , boiling above 360°, and PhA' [109°]

Nitro-phenyl ethylene derivative $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{OC}_2\text{H}_4\text{O C}_6\text{H}_5\text{CO}_2\text{H}$ The *o*-acid [142°–148°] forms a crystalline ether EtA' [c 100°], and the *p* acid [132°] forms a similar ether EtA' [81°] (Wagner, *J pr* [2] 27, 214) The *o*-acid yields on reduction an amido acid [110°], forming $\text{C}_6\text{H}_3\text{NO}_2\text{HCl}$ [177°]

Benzyl derivative $\text{C}_6\text{H}_5\text{CH}_2\text{O C}_6\text{H}_5\text{CO}_2\text{H}$ [75°] Tables (Perkin, *A* 148, 27) — AgA'

Tolyl derivatives Occurs in natural salicylic acid (J Williams, *Ph* [3] 8, 785)

Acetyl derivative $\text{C}_6\text{H}_5(\text{OAc})\text{CO}_2\text{H}$ [118°] Formed from the acid and AcCl (Kraut, *A* 150, 9) Needles (from water), ν sl sol cold water Hydrolysed by alkalis, not by boiling water

Benzoyl derivative $\text{C}_6\text{H}_5(\text{OBz})\text{CO}_2\text{H}$ The crystalline methyl ether MeA' is formed from methyl salicylate and BzCl (Gerhardt, *A Ch* [3] 45, 104)

Amide $\text{C}_6\text{H}_5(\text{OH})\text{CONH}_2$ [139°] From the ethers and NH_3aq (Lumprecht, *A* 98, 258) Formed by the action of AcCl on *o*-oxy benzal oxim (Claisen, *A Stock*, *B* 24, 138) Plates and tables Gives saligenin on reduction with sodium amalgam (Hutchinson, *C J* 57, 957) With bromine water it yields $\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{CONH}_2$ [183°] (Spilker, *B* 22, 2769) When heated in a current of HCl it forms $(\text{C}_6\text{H}_5(\text{OH})\text{CO})_2\text{NH}$ [199°], which yields $(\text{C}_6\text{H}_5\text{O})_2\text{Nag}$ and $(\text{C}_6\text{H}_5\text{NO}_2)_3\text{HCl}$ — AgA' flocculent pp

Benzoyl derivative of the amide $\text{C}_6\text{H}_5(\text{OBz})\text{CONH}_2$ [200°] Needles, sl sol alcohol

Cumyl derivative of amide [200°] *Methyl derivatives of the amide* $\text{C}_6\text{H}_5(\text{OMe})\text{CONH}_2$ [129°] Prisms (from ether) (Grimaux, *Bl* [2] 18, 26) The homologous ethyl derivative [110°] (Lumprecht, *A*

98, 264) and isopropyl derivative are crystalline

Anilide $C_6H_5(OH)CONHPh$ [184°] Prisms (from dilute alcohol) (Wanstrat, *B* 6, 336, Kupferberg, *J pr* [2] 18, 442, Hübner a Meusching, *A* 210, 541) $FeCl_3$ colours its alcoholic solution violet. On heating with sulphur

it forms $C_6H_5\langle\begin{smallmatrix} N \\ S \end{smallmatrix}\rangle C_6H_5OH$ [129°] (Hofmann, *B* 18, 1237) Yields on nitration $C_6H_5(NO_2)(OH)CONHPh$ [224°] Forms the salts $KC_6H_4NO_2$, $2\frac{1}{2}aq$ and $TlO_2C_6H_4NO_2$.

Nitro-anilide $C_6H_5(OH)CO NHOC_6H_4NO_2$. The *o*-, *m*-, and *p*-varieties melt at 154°, 218°, and 230° respectively

***p*-Toluide** $C_6H_4(OH)NHC_6H_5$ [156°]

Piperidine $C_6H_5(OH)CONHC_6H_5$ [142°] Yellowish tables (Schotten, *B* 21, 2252)

Hydroxylamide $C_6H_5(OH)CONH(OH)$. [169°] Needles Yields $Pb(C_6H_5NO_2)_2 \cdot 4aq$ (Jeanrenaud, *B* 22, 1270)

Anhydride $O(C_6H_4CO_2H)_2$, **Disalicylic acid** Formed, together with salicylide, by the action of $POCl_3$ on dry sodium salicylate (Gerhardt, *A. Ch* [3] 87, 322) Amorphous mass, *v* sol alcohol and ether Gives no colour with $FeCl_3$. Dissolves unchanged in aqueous Na_2CO_3 . Boiling KOH aq converts it into salicylic acid An anhydride $C_{12}H_8O_5$, is formed by heating sodium salicylate (3 pts) with $POCl_3$ (1 pt) at 150° (Kraut, *A* 150, 13) It is insol cold alcohol A third anhydride $C_{12}H_8O_5$, is got by heating $C_6H_5(OAc)CO_2H$ at 200°–240° (Kraut) It is sol alcohol, and softens at 70°

Internal anhydride $C_6H_4O_2$ or $C_6H_4O_2 \cdot s$. $C_6H_5\langle\begin{smallmatrix} O \\ CO \end{smallmatrix}\rangle C_6H_5$, **Salicylide** [195°–200°]

Formed as above Nodular groups of plates (from alcohol) (Schiff, *A* 163, 220) Insol water, *sl* sol alcohol Not attacked by $AcCl$ Reconverted by potash into salicylic acid A resinous anhydride $C_{12}H_8O_5$, accompanying salicylide is still less soluble in alcohol

Nitrile $C_6H_5(OH)CN$. ***o*-Cyano-phenol** [98°] Formed by the action of P_2O_5 or P_2S_5 on the amide, and also from $C_6H_5(OH)CHNOH$ and Ac_2O (Miller, *B* 22, 2771, 2797, Tiemann, *B* 20, 3082, Meyer, *B* 20, 3289, cf Grimaux, *Bl* [2] 13, 26, Ahrens, *B* 20, 2953) Formed also from diazophenol chloride by Sandmeyer's reaction In most of these preparations it is accompanied by a small quantity of a substance melting at 195° Needles, *v* sol alcohol, *m* sol cold water Coloured violet by $FeCl_3$ Gives a white crystalline pp. with bromine water Gives a **methyl derivative** $C_6H_5(OMe)CN$ (256°), and an **ethyl derivative** $C_6H_5(OEt)CN$ (258°) which may be got from $C_6H_5(OEt)NH_2$ (Pinner, *B* 23, 2952) The **acetyl derivative** $C_6H_5(OAc)CN$ is an oil (258°) (Lach, *B* 17, 1572) while the **benzoyl derivative** $C_6H_5(OBz)CN$ [149°] is crystalline (Lamprecht, *A* 99, 250, Henry, *B* 2, 491)

Polynitrile $(C_6H_5(OH)CN)_n$ [296°–299°] Obtained by heating the amide to 270° (*L*) and as a by-product in preparing the nitrile (Miller, *B* 22, 2798) Yellow needles, *msol* alcohol, *sl* sol ether. Decomposed by HCl at 200° into CO_2 , phenol, and NH_3 .

***m*-Oxy-benzoic acid** $C_6H_5(OH)CO_2H$ [200°]. **S**. 37 at 0° (Ost), 9 at 18° (Fittica, *B* 11, 1208).

H F 111,000 (Von Rechenberg); 136,000 (Stohmann, *J pr* [2] 40, 129) **F C** 729,000

Formation —1 By the action of nitrous acid on amido benzoic acid (Gerland, *A* 91, 185, Graebe a. Schultzen, *A* 142, 350) —2 By fusing sulpho-benzoic acid with potash (Barth, *A* 148, 80) —3 By potash fusion from *m* chloro benzoic acid (Dembey, *A* 148, 222), *m* cresol, and even benzoic acid (Barth, *A* 154, 361, *M* 3, 802)

Properties —Nodular groups of needles (from water) May be distilled *V* sol boiling water and alcohol Volatile with steam Blackens when quickly heated to 300°, but gives no phenol When the acid (2 mols) is heated with baryta (3 mols) at 350° it forms no phenol unless the baryta is used in large excess (7 mols) (Klepl, *J pr* [2] 27, 159) It tastes sweet Its solutions are not coloured by $FeCl_3$. Iodine and KOH aq, followed by an acid, give a coffee-brown pp (Messinger, *B* 22, 2321) It is not acted upon by hydroxylamine

Reactions —1 **Bromine** (3 mols) forms tribromo-*m*-oxy benzoic acid, soluble in water (Werner, *Bl* [2] 46, 276) —2 **Sodium amalgam** reduces it, in acid solution, to *m* oxy benzoic alcohol —3 Conc H_2SO_4 forms, on heating, several di oxy anthraquinones (*q v*) When benzoic acid is also present, the two oxy anthraquinones are also formed —4 Heated with cinnamic acid and H_2SO_4 , it yields anthracoumarin $C_{12}H_8O_2$ [260°] (*v* CINNAMIC ACID, Reaction 14) —5 By nitration with dilute nitric acid, which takes place extremely readily, it yields a mixture of three nitro oxy-benzoic acids $C_6H_5(NO_2)(OH)CO_2H$ [4 3 1], [2 3 1], and [5 3 1] (Griess, *B* 20, 403) —6 PCl_5 forms the chloride $C_6H_5(COCl)OPOCl_2$ of *m*-carboxy phenyl phosphoric acid (*q v*) —7 The *K* salt heated with $K_2S_2O_8$ forms $SO_3K O C_6H_4 CO_2K$ [220°–225°] (Baumann, *B* 11, 1915) —8 When taken internally, it appears in the urine as oxybenzuroic acid $C_6H_5(OH)CO NH CH_3 CO_2H$, crystallising in needles (Baumann a. Herter, *H* 1, 260)

Salts. — NH_4A' needles, *v* sol cold water — CaA' , $3aq$ *m* sol water — BaA' , gummy — TlA' — $Tl_2C_6H_4O_2$ — PbA'_2 — CdA'_2 — CuA'_2 , *aq* green needles

Acetyl derivative $C_6H_5(OAc)CO_2H$ [127°]

Ethyl ether EtA' [72°] (282°) Tables (from water), nearly insol cold water Conc $NaOH aq$ forms crystalline $C_6H_5(ONa)CO_2Et$

Methyl derivative $C_6H_5(OMe)CO_2H$ [107°] Formed from its methyl ether, and also by oxidising OH , $C_6H_5(OMe)$ with $KMnO_4$ (Oppenheim a. Pfaff, *B* 8, 887) Formed also by the action of CO_2 and Na on $C_6H_5Br(OMe)$ (Körner, *Bull Acad Belg* [2] 24, 155) and by boiling the sulphate of *m*-diazobenzoic acid with $MeOH$ (Griess, *B* 21, 979) White needles, *v* *sl* sol cold water It forms the salts CaA'_2 , *aq* and AgA'_2 and the ether $C_6H_5(OMe)CO_2Me$ which is formed by heating *m*-oxybenzoic acid with KOH and MeI at 140°

Ethyl derivative $C_6H_5(OEt)CO_2H$ [137°] Formed from its ethyl ether $C_6H_5(OEt)CO_2Et$ (263°) (Hantz, *A* 153, 331) or by boiling the sulphate of diazo-benzoic acid with alcohol (Fittica, *B* 11, 1209, Griess, *B* 21, 979) Needles. Yields CaA'_2 , $2aq$, BaA'_2 , $2aq$, and AgA'_2 .

Allyl derivative $C_6H_4(OC_2H_5)CO_2H$ [148°] Colourless laminae Its ethyl ether is a thick pungent oil (284°) (Seichilone, *G* 12, 449)

Phenyl derivative $C_6H_4(OPh)CO_2H$ [145°] Formed by the action of phenol on the sulphate of *m*-diazobenzoic acid (Griess, *B* 21, 980) Needles, almost insol hot water Yields BaA' , 3:5aq

Amide $C_6H_4(OH)CONH_2$ [167°] Formed from the ether and conc NH_3 Aq (Schulerud, *J pr* [2] 22, 290) Thin plates (from water), sol alcohol and ether, insol chloroform

Anilide $C_6H_4(OH)CONHPh$ [155°] Needles, insol water (Kupferberg, *J pr* [2] 16, 442)

Nitrile $C_6H_4(OH)CN$ [82°] Formed by the diazo-reaction from $C_6H_4(NH_2)CN$ by displacing NH_2 by OH (Griess, *B* 8, 859) or from $C_6H_4(NH_2)OH$ by displacing amidogen by Cy (Ahrens, *B* 20, 2953) Plates (from water) with intensely sweet taste Its acetyl derivative $C_6H_4(OAc)CN$ [60°] is got by boiling *m*-oxybenzaloxim with Ac_2O (Clemm, *B* 24, 827)

Anhydride $C_6H_4O_2$ Formed, together with an anhydride $C_6H_4O_2$, [165°] by the action of $POCl_3$ at 45° on *m*-oxy benzoic acid (Schiff, *B* 15, 2588) Minute crystals, sol boiling alcohol

Tetra-hydrate $CH_2<\begin{smallmatrix} CO & CH_2 \\ CH & CH_2 \end{smallmatrix}>CHCO_2H$

Formed by warming the tetrahydrate of oxyterephthalic acid with water (Baeyer & Lutein, *B* 22, 2183) Mixes with water Forms the hygroscopic salt NaA' crystallising in slender needles Yields an oxim $C_6H_4NO_2$ [170°] and a phenyl hydrazide $C_6H_4N_2O_2$ [125°]

***p* Oxy benzoic acid** $C_6H_4(OH)CO_2H$ [213°] *S* 173 at 0° (Ost, *J pr* [2] 17, 230), *S* at 15° (Saytzeff) *H F* 113,000 (Von Rechenberg), 139,100 (Stohmann, *J pr* [2] 40, 130) *H C* 725,900

Formation—1 By heating anisic acid with conc $HIAq$ at 130° for 12 hours (Saytzeff, *A* 127, 129)—2 By the action of nitrous acid on *p* amido benzoic acid (*G Fischer*, *A* 127, 145) 3 By potash fusion from *p* sulpho benzoic acid (Remsen, *Z* [2] 7, 81, *A* 178, 281), anethol (Ladenburg, *A Suppl* 8, 87), anisic acid (Barth, *Sitz W* 54 [2] 633), gum benzoin, acaroid resin (Hlasiwetz & Barth, *A* 134, 265, 138, 61), tyrosine (Barth, *A* 136, 110, Ost, *J pr* [2] 12, 159), carthamin (Malin, *A* 136, 115), phloretic acid, *p* cresol, and even benzoic acid (Barth, *A* 152, 96, 154, 359, 164, 141, *M* 3, 802)—3 By passing CO_2 through C_6H_4OK dissolved in boiling phenol, or, better, by heating C_6H_4OK in a current of CO_2 at 170°–210° (Kolbe, *J pr* [2] 8, 336, 10, 89, 451, 11, 24, Ost, *J pr* [2] 11, 385, Hartmann, *J pr* [2] 16, 35) At 130°–150° the product is salicylic acid—4 The basic salt $C_6H_4(OK)CO_2K$ is formed, together with CO_2 and phenol, by heating potassium (but not sodium) salicylate at 220° *A* mixture of salicylic acid (1 mol) and excess of KOH (8 mols.) is not affected at 250°, but at 300° yields only K_2CO_3 and C_6H_4OK —5 Together with a smaller quantity of salicylic acid by heating phenol with alcoholic potash (or soda) and CCl_4 The reaction takes place less quickly in aqueous solution (Tiemann & Reimer, *B* 9, 1285; Hasse, *B* 10, 2186)

Properties—Monoclinic crystals (containing aq), $a b c = 1.370 : 1.102$, $\beta = 105^\circ 26'$ *V* sol. hot water, alcohol, and ether, sl sol chloroform (unlike salicylic acid) and CS_2 (unlike benzoic acid) Split up at 220° into CO_2 and phenol With iodine and potash it gives a pale-red pp., which becomes yellow on acidifying (Messinger & Vortmann, *B* 22, 2321) Not attacked by hydroxylamine With $FeCl_3$ it gives a yellow amorphous pp Excess of bromine water gives CO_2 and tri-bromo phenol

Reactions—1 *p*-Oxy benzoic acid (1 mol) is converted by PCl_5 (1 mol) into $C_6H_4Cl_2PO_2$, *z* $C_6H_4(COCl)OPOCl_2$ (176° at 14 mm) *S G* 1542 This chloride shows the following reactions (a) Water forms *p* carboxy-phenyl phosphoric acid $C_6H_4(CO_2H)OPO(OH)_2$ which forms plates [200°], *v* sol water, alcohol, and ether It is not decomposed by boiling aqueous KOH , but water at 160° forms phosphoric acid and *p*-oxy benzoic acid (b) Distillation under atmospheric pressure somewhat decomposes it (c) The chloride (1 mol) heated with PCl_5 (1 mol.) at 160° forms *p* chloro benzoyl chloride, $C_6H_4ClCOCl$ (Anschutz & Moore, *A* 239, 342) 2 On distillation half of it splits up into phenol and CO_2 , the rest yields several anhydrides—3 The *K* salt when distilled yields diphenylene oxide, di-phenylene-ketone oxide, and phenol (Goldschmidt, *M* 4, 127)—4 Yields 50 or 60 pc of the theoretical amount of phenol on fusion with $NaOH$ (Barth & Schreder, *B* 12, 1257)—5 The *Na* salt heated in a current of CO_2 at 290° yields salicylic acid (Kupferberg, *J pr* [2] 16, 424)—6 The *Ca* salt on dry distillation yields phenol, CO_2 , salicylic acid, oxyisophthalic acid, diphenylene oxide, and diphenylene ketone oxide—7 H_2SO_4 at 100° forms $C_6H_4(OH)(SO_3H)CO_2H$ (Klepl, *J pr* [2] 23, 196)—8 The *K* salt heated with $K_2S_2O_8$ forms $C_6H_4(COO.K)O SO_3K$ (Baumann, *B* 11, 1916)—9 Taken internally it appears in the urine as *p* oxy benzoic acid $C_6H_4NO_2$ [c 228°]

Salts— NaA' , 5aq very soluble efflorescent plates— $Na_2C_6H_4O_2$ — KA' , 3aq— NH_4A' aq long efflorescent prisms— CaA' , 4aq slender needles— BaA' , aq flat needles— BaA' , 2aq rhombohedra— $BaC_6H_4O_2$, sandy powder— TiA' — CdA' , 4aq— CdA' , 6aq— ZnA' , 8aq— PbA' , 2aq CuA' , 6aq— AgA' , 2aq

Acetyl derivative $C_6H_4(OAc)CO_2H$ [185°] By heating the acid with Ac_2O Silvery plates (from $CHCl_3$)

Methyl ether MeA' [117°] (283°). *H F* 138,800 Formed from the acid, KOH , and MeI (Ladenburg & Fitz, *A* 141, 250) Large tables (from ether), *v* sl sol hot water

Ethyl ether EtA' [112.5°] (*G*), [116°] (Hartmann) (298°) *H F* 147,690 Formed from the acid, alcohol, and HCl (Graebe, *A* 139, 134). Crystalline Yields solid $C_6H_4(ONa)CO_2Et$

Phenyl ether PhA' [176°] Present in the volatile product of the destructive distillation of *p* oxy-benzoic acid (Klepl, *J pr* [2] 28, 214) Trimetric tablets (from chloroform) Saponified by cold $NaOHAq$ With alcohol and HCl it yields phenol and *p* oxy benzoic acid The acetyl derivative $C_6H_4(OAc)CO_2Ph$ crystallises in long plates [84°]

Methyl derivative $C_6H_4(OMe)CO_2H$. *Anisic acid* Mol *w* 152 [184°]. (275°–280°).

S 04 at 18° H C p 895,200 H F 132,800 (Stohmann, *J pr* [2] 40, 181) Formed by oxidation of anise-camphor, and of oils of anise, fennel, and tarragon, being derived from the anethol contained therein (Cahours, *A Ch* [3] 2, 287, 14, 483, 23, 351, 25, 21, 27, 439, Laurent, *Rev scient* 10, 6, 362, Gerhardt, *A Ch* [8] 7, 292, Ladenburg, *A* 141, 241) Obtained also from its methyl ether, which is formed by heating *p* oxy benzoic acid (1 mol) with KOH (2 mols) and MeI (2 mols) at 120° (Ladenburg) It is a product of the oxidation of chics (Erdmann, *J pr* 71, 198) It is also produced by oxidising $C_6H_5Me(OMe)$ (Körner, *Bl* [2] 10, 468) and by boiling the sulphate of *p* diazobenzoic acid with MeOH (Griess, *B* 21, 979) Prepared by mixing basic potassic *p* oxybenzoate (got by heating potassic salicylate at 220°, or by adding KOH to a solution of *p* oxybenzoic acid) with a solution of $KMeSO_3$ and evaporating to dryness The residue is treated with HCl, and the anisic acid separated from undecomposed *p* oxybenzoic acid by solution in chloroform (E v Meyer a P Richter, *J pr* [2] 32, 429) Monoclinic prisms, m sol hot water Yields, on nitration, $C_6H_3(NO_2)_3OMe$, $C_6H_3(NO_2)_2OMe$, and $C_6H_2(NO_2)_2OMe$ HIAq converts it into MeI and *p*-oxy-benzoic acid (Graebe, *A* 139, 148) When taken internally it passes into the urine as anisuric acid (*q v*) $POCl_3$ forms the anhydride $C_6H_4O_2$ [99°] (Pisani, *A* 102, 284) PCl_5 forms crystalline $C_6H_3(OMe)COCl$ Forms the salts NH_4A' , KA' , NaA' , AgA' , BaA' , SrA' , aq , CaA' , aq , MgA' , aq , PbA' , aq , ZnA' , $3aq$, CdA' , $3aq$, $Pb(OH)A'$, Cr_2A' , $(OH)_2$, MnA' , $3aq$, CoA' , $3aq$, NiA' , $3aq$, CuA' , $3aq$, $CuA'(OH)$, and AgA' (Borrella, *G* 15, 303) Its ethers are MeA' [47°], (255°) and EtA' (c 253°) Its amide $C_6H_4(OMe)CONH_2$ [163°] is formed by the action of NH_3 on $C_6H_4(OMe)COCl$ It is also formed by passing cyanic acid vapour and dry HCl through $C_6H_4(OMe)$ containing $AlCl_3$, and by the action of $ClCONH_2$ and $AlCl_3$ on C_6H_4OMe dissolved in CS_2 (Gattermann, *A* 244, 62, *B* 23, 1197) It crystallises from water in needles or plates The anilide $C_6H_4(OMe)CONPhH$ [169°] is formed by the action of phenyl cyanate on anisole containing $AlCl_3$ (Leuchart a Schmidt, *B* 18, 2338) The nitrile $C_6H_4(OMe)CN$, [62°], (254°), is formed by heating the amide alone or with PCl_5 (Henry, *Z* [2] 6, 209, *B* 2, 667), and by heating $C_6H_4(OMe)CHNOH$ with $AcCl$ at 115° (Miller, *B* 22, 2791) It crystallises in needles, v sol alcohol and ether Hydroxylamine converts it into $C_6H_4(OMe)C(NH_2)NOH$ [123°]

Ethyl derivative $C_6H_4(OEt)CO_2H$ [195°] Formed from its ether EtA' (275°) which is got from *p*-oxy benzoic acid, KOH, and EtI (L a F) Got also by oxidising the ethyl derivative of phloretic acid with chromic acid mixture (Körner a Corbetta, *B* 7, 1781), and by boiling the sulphate of *p* diazo-benzoic acid with alcohol (Griess, *B* 21, 980) Needles Yields AgA' crystallising in needles The amide $C_6H_4(OEt)CONH_2$ [202°] (G), [206°] (P), is formed by the action of cyanic acid or $ClCONH_2$ on C_6H_4OEt in presence of $AlCl_3$ (Gattermann, *A* 244, 68, *B* 23, 1197), and by adding $NaOHAq$ to *p*-ethoxy-benzamidine hydrochloride (Pinner, *B* 28, 2954) The anilide $C_6H_4(OEt)CONPhH$ [170°] is formed by the action of phenyl cyanate

on phenetole in presence of $AlCl_3$ (L a S) The nitrile $C_6H_4(OEt)CN$ [69°] (258°), is got from $C_6H_4(OEt)NH_2$ by Sandmeyer's reaction (Pinner, *B* 23, 2953) It is volatile with steam

Ethylene derivative The amide $C_6H_4(OC_2H_4CONH_2)_2$ [280°] is formed by the action of $ClCONH_2$ on $C_6H_4(OPh)_2$ in CS_2 , in presence of $AlCl_3$ (Gattermann, *A* 244, 69)

Allyl derivative $C_6H_4OC_2H_4CO_2H$ [123°] Formed from its ether EtA' [109°] (260°) which is got by heating *p* oxy-benzoic ether with KOH and allyl iodide at 120° (Seichilone, *G* 12, 451)

Phenyl derivative $C_6H_4(OPh)CO_2H$ [160°] Obtained by the action of phenol on the sulphate of *p* diazo benzoic acid (Griess, *B* 21, 980), and also by the action of boiling alcoholic potash upon $C_6H_4(OPh)CO_2Ph$, a white sublimate [73°-78°] got by strongly heating *p* oxybenzoic in a current of hot CO_2 (Klepl, *J pr* [2] 28, 200)

Phenoxy-ethyl derivative $C_6H_4(OPh)OC_2H_4CO_2H$ [196°] Satiny needles (from alcohol) (Wagner, *J pr* [2] 27, 227) Its ether EtA' [81°] is crystalline

Nitro-phenoxy-ethyl derivative $C_6H_4(NO_2)OC_2H_4OC_2H_4CO_2H$ The *o*-compound [207°] forms an ether EtA' [103°] crystallising from alcohol in plates, and may be reduced to $C_6H_4(NH_2)OC_2H_4OC_2H_4CO_2H$ [155°] The *p*-isomeride [218°] forms a salt NaA' 3aq and an ether EtA' [181°] crystallising in minute needles

Amide $C_6H_4(OH)CONH_2$ [162°] Needles (containing aq) Forms the sodium compounds $C_6H_4(ONa)CONH_2$ and $C_6H_4(ONa)CONH_2Cl$ [206°] Yields *p* oxy benzyl alcohol on reduction with sodium amalgam (Hutchinson, *B* 24, 175)

Anilide $C_6H_4(OH)CONPhH$ [197°] Yellow plates, v sol alcohol

Piperidine $C_6H_4(OH)CONC_4H_{10}$ [210°] Prisms (from dilute alcohol) (Schotten, *B* 21, 2254)

Nitrile $C_6H_4(OH)CN$ *p*-Cyanophenol [113°] Formed by distilling ammonium *p* oxy benzoate with P_2O_5 (Hartmann) Formed also from *p* amido phenol by Sandmeyer's reaction (Ahrens, *B* 20, 2954), and by the action of NH_3 on *p*-oxy benzide Thin trimetric laminae, $a b c = 855 \ 12 \ 308$ M sol hot water Forms an acetyl derivative $C_6H_4(OAc)CN$, [57°], (266°), crystallising in white needles

Anhydride $C_6H_4O_2$ *p*-Oxybenzide Left in the retort after distilling *p*-oxy benzoic acid below 350° (Klepl, *J pr* [2] 25, 525, 28, 194) White amorphous powder, blackening at 350° without melting Insol alcohol Reconverted into *p* oxy-benzoic acid by boiling $KOHAq$, not attacked by NH_3 , or Na_2CO_3Aq Heated in sealed tubes with PCl_5 it yields $C_6H_4Cl_2CCl_2$

Anhydride $C_6H_4O_2$ *o*-Cyanophenol $CO_2H.C_6H_4.O.CO.C_6H_4.O$ [261°] A product of the action of heat on *p* oxy benzoic acid Minute needles, v sol alcohol Quickly converted by alkalis into *p*-oxy-benzoic acid Yields NaA' , BaA' , and $C_6H_4AcO_2$, [217°]

Anhydride $C_6H_4O_2$ *o*-Cyanophenol $CO_2H.C_6H_4.O.CO.C_6H_4.OH$ [280°] 8 (alcohol) 45 in the cold, 13 at 78° Accompanies *p* oxybenzide. Crystalline powder Con

verted by potash into *p* oxy benzoic acid Gives NaA' and $C_6H_5(OAc)_2$ [230°]

Anhydride $C_6H_4O_3$. Formed from the acid and $POCl_3$ (Schiff, *B* 15, 2588) Insoluble powder:

Di-oxy benzoic acid $C_6H_4O_4$, 1c
 $\lambda_{max}(OH)_2CO_2H$ [3 2 1] *Pyrocatechin carboxylic acid* Mol w 154 [204°] Formed in small quantity, together with protocatechuic acid by heating pyrocatechin (1 pt) with ammonium carbonate (4 pts) and water (5 pts) at 140° (A Miller, *C J* 41, 398, *A* 220, 116) Formed also by heating iodosalicylic acid with KOH Needles (containing 2aq), m sol water, v sol alcohol and ether $FeCl_3$ gives a blue colour not destroyed by excess, but changed to violet red by Na_2CO_3 Gives a flocculent ppt with $Pb(OAc)_2$ — BaA', 5aq prisms (S of BaA') 1 at 18°

Isomeride of PROTOCATECHUIC ACID

Di oxy benzoic acid $C_6H_4(OH)_2CO_2H$ [5 3 1] (a) *Resorcylic acid* [222°] (B a S), [233°] (B) Formed by fusing 3 di sulpho benzoic acid with potash (Barth a Senhofer, *A* 159, 222) Formed also from bromo sulpho benzoic acid by potash-fusion (Böttinger, *B* 8, 374) Prisms or needles (containing 1½ aq), m sol cold water Gives no colour with $FeCl_3$, Conc H_2SO_4 at 140° forms a red solution whence water ppts green flakes of anthrachrysone $C_{14}H_8O_4$ Yields resorcin on fusion with potash

Salts — NaA' aq — BaA', 4aq — CuA', 6½aq — CdA', 4½aq — AgA' aq crystalline pp

Ethyl ether EtA' [below 100°] Prisms

Methyl ether of the methyl derivative $C_6H_4(OH)(OMe)CO_2Me$ (315°) Formed, together with $C_6H_4(OMe)_2CO_2Me$ from 3 di oxy benzoic acid, MeI, and KOH (Meyer, *M* 8, 430) Oil

Di methyl derivative $C_6H_4(OMe)_2CO_2H$ [176°] Formed by methylation and also by oxidation of the di methyl ether of orcin (Tiemann a Streng, *B* 14, 2002) White needles, sol hot water — AgA' crystalline pp

Methyl ether of the di methyl derivative $C_6H_4(OMe)_2CO_2Me$ [81°] (298°) Four sided prisms (M)

Di ethyl derivative $C_6H_4(OEt)_2CO_2H$ [88°] Prisms Forms only $C_6H_4(OEt)_2CO_2Et$

Di oxy benzoic acid $C_6H_4(OH)_2CO_2H$ [4 2 1] (B) *Resorcylic acid* [205°] S 26 at 17° H F 188, 100 H Cp 676, 900 (Stohmann, *J pr* [2] 40, 132)

Formation — 1 From $C_6H_5Me(OH)(SO_3H)$ [1 2 4] by heating with KOH (Ascher, *A* 161, 11) 2 From toluene disulphonic acid by oxidation and potash fusion (Blomstrand, *B* 5, 1088, Fahlberg, *Am* 2, 196) — 3 By oxidation of its aldehyde or of umbelliferone (Tiemann a Reimer, *B* 12, 997, 13, 2358) — 4 By heating resorcin with ammonium carbonate and water at 125° (Brunner a Senhofer, *B* 13, 2356) — 5 By oxidising morin with HNO_3 (Benedict a Hazura, *M* 5, 170) — 6 By warming $C_6H_4(OH)_2CS_2H$ with acid (Lippmann, *M* 9, 306, 10, 620)

Preparation — 20 pts of resorcin are heated for an hour and a half with a solution of 100 pts of potassium or sodium hydric carbonate in 200 grms of water, the yield is 80 p.c of the resorcin (Bistrzycki a Kostanecki, *B* 18, 1984)

Properties — Crystallises from ether in needles (containing 8aq) and from water in

prisms (containing ¼aq, 1½aq, or 2½aq) Decomposes at its melting point into CO_2 and resorcin $FeCl_3$ colours its solution dark rose red Bleaching powder gives a violet tint, changing to brown By treating the acid with $C_6H_4(OH)_2CO_2H$ [5 2 1] and Ac_2O and distilling the product there is formed euxanthone $[4 \frac{1}{2}] C_6H_4(OH) < \overset{CO}{O} > C_6H_4(OH) [2 \frac{5}{2}]$ (Graebe, *B* 22, 1405)

Salts — KA' aq — BaA', 4aq — BaA', 7aq — CuA', 8aq — AgA'

o Methyl derivative

$C_6H_4(OH)(OMe)CO_2H$ [4 2 1] Formed by oxidising $C_6H_5(OAc)(OMe)CHO$ (Tiemann a Parisius, *B* 13, 2354) Crystalline Sol water. Gives no colour with $FeCl_3$

p Methyl derivative

$C_6H_4(OMe)(OH)CO_2H$ [4 2 1] [154°] S 7 at 20° Got by partial methylation of the acid (T a P), and also by the action of CO_2 on $C_6H_4(ONa)(OMe)$ at 215° (Korner a Bertoni, *Rendiconti d R Istit Lombardo*, 13, 741, *B* 14, 847) Needles, sol hot water Gives a reddish-violet colour with $FeCl_3$ — NaA' aq — KA' — BaA', 4aq — PbA', 2aq

Di-methyl derivative $C_6H_4(OMe)_2CO_2H$ [108°] Got by methylation (T a P) and by oxidation of the di methyl derivative of (B) methyl umbellie acid (Pechmann, *B* 16, 2126, 17, 2133) Needles, sl sol cold water — CuA', — PbA' — AgA' white pp

Di ethyl derivative $C_6H_4(OEt)_2CO_2H$ [99°] Got from the aldehyde (Tiemann a Lewy, *B* 10, 2215)

Di oxy benzoic acid $C_6H_4(OH)_2CO_2H$ [6 2 1] [c 147°] Formed, together with the (4, 2, 1)-isomeride, by heating resorcin with ammonium carbonate and water (B a S) Obtained also from the methyl derivative of the nitrile (Lobry de Bruyn, *R T C* 2, 205) Needles Decomposes on fusion into CO_2 and resorcin $FeCl_3$ gives a violet colour, changed to blue by excess. Bromine water gives tri bromo resorcin — BaA' aq — CuA', 8aq — AgA' crystalline pp

Di-methyl derivative $C_6H_4(OMe)_2CO_2H$ [179°] Tables (from alcohol)

Nitrile of the di-methyl derivative $C_6H_4(OMe)_2CN$ [118°] (310°) Formed from $C_6H_4(OMe)(NO_2)CN$ by boiling with MeOH and KOH Crystals Gives with nitric acid a nitro-compound $C_6H_4(NO_2)_2CN$ [111°] The corresponding nitriles $C_6H_4(OMe)(OEt)CN$ [66°] and $C_6H_4(OEt)_2CN$ [122°] crystallise from alcohol, the former in trimetric crystals, $abc = 796 \cdot 1 \cdot 1 \cdot 65$, and the latter in di metric crystals $a = 1 \cdot 565$ (Lobry de Bruyn, *R T C* 3, 383)

Di oxy benzoic acid $C_6H_4(OH)_2CO_2H$ [5 2 1]. *Genusic acid Hydroquinone carboxylic acid*. [197°]

Formation — 1 By fusing iodo salicylic acid [196°] or biomo salicylic acid with KOH (Laute-mann, *A* 120, 299; Bakowsky a Leppert, *B* 8, 789, Müller, *A* 220, 124, P F Frankland, *C J* 37, 750) — 2 From oxy amido-benzoic acid (Goldberg, *J pr* [2] 19, 371) — 3 By fusing genusin with potash (Hlawetz a Habermann, *A* 175, 66, Tiemann a Miller, *B* 14, 1988) — 4 By digesting $KHCO_3$ (4 pts) with hydroquinone (1 pt), and water (4 pts) (Senhofer a Sarlay, *M* 2, 448)

Properties—Needles or prisms, v sol water, alcohol, and ether. FeCl_3 colours its solution blue. Reduces Fehling's solution on heating. Split up on distillation into CO_2 and hydroquinone. Benzamidine forms a compound [266°] (Pinner, *B* 28, 2939).

Salts— NaA' , 5½ aq. Deliquescent prisms. KA' aq— CaA' , 7 aq— BaA' , 8. S 40 at 18°— PbA , 2 aq— CuA , 2½ aq.

Ethyl ether EtA' [75°] Crystals

m-Methyl derivative

$\text{C}_6\text{H}_4(\text{OH})(\text{OMe})\text{CO}_2\text{H}$ [251] [142°] S 17 at 10°, 9 at 100°. Formed by oxidising the acetyl-methyl derivative of gentisic aldehyde $\text{C}_6\text{H}_3(\text{OAc})(\text{OMe})\text{CHO}$ with KMnO_4 , and saponifying the product (Tiemann & Miller, *B* 14, 1997). Formed also by the action of CO_2 at 225° on $\text{C}_6\text{H}_4(\text{ONa})(\text{OMe})$ (Korner & Bertoni). Needles. Its solution is coloured blue by FeCl_3 .

Di-methyl derivative $\text{C}_6\text{H}_3(\text{OMe})_2\text{CO}_2\text{H}$ [76°] Formed by oxidising $\text{C}_6\text{H}_3(\text{OMe})_2\text{CHO}$. Needles— AgA' small white needles.

Tri-oxy-benzoic acid v GALLIC ACID

Tri-oxy benzoic acid $\text{C}_6\text{H}_2(\text{OH})_3\text{CO}_2\text{H}$

Tri-methyl derivative $\text{C}_6\text{H}_2(\text{OMe})_3\text{CO}_2\text{H}$ [109°] Formed by oxidising the tri methyl derivative of æsculetic acid (Will, *B* 16, 2113).

Tri-ethyl derivative $\text{C}_6\text{H}_2(\text{OEt})_3\text{CO}_2\text{H}$ [134°] Formed by oxidation of the tri ethyl derivative of (α) or (β) æsculetic acid with KMnO_4 (W). Slender needles.

Tri oxy-benzoic acid

$\text{C}_6\text{H}_2(\text{OH})_3\text{CO}_2\text{H}$ [4321] Mol w 170 [206°–220°] S 13 at 12.5° HF 231,300 HCp 633,700 (Stohmann). Formed, together with pyrogallol dicarboxylic acid, by heating pyrogallol with ammonium carbonate (Senhofer & Brunner, *M* 1, 474, Kostanecki, *B* 18, 3202, Schiff, *A* 245, 85). Needles (containing ½ aq), sol alcohol. FeCl_3 colours its dilute solution violet. Bleaching powder and nitric acid do the same. Lime and baryta water gives a bluish pp. Reduces ammoniacal AgNO_3 in the cold. H_2SO_4 does not form rufigallic acid (difference from gallic acid). POCl_3 forms an acid $\text{C}_6\text{H}_2\text{O}_3$, greatly resembling tannin. It is an astringent yellow powder and gives $\text{Ba}(\text{C}_6\text{H}_2\text{O}_3)_2$ and $\text{C}_6\text{H}_2\text{Ac}_2\text{O}_3$.

Salts— KA' aq— NaA' 2 aq— BaA' , 5 aq— CaA' , 4 aq— Pb , $\text{C}_6\text{H}_2\text{O}_3$, 1½ aq white flocculent pp. **Methyl ether** $\text{C}_6\text{H}_2(\text{OH})_2\text{CO}_2\text{Me}$ [152°] Needles (containing 2½ aq).

Tri-methyl derivative $\text{C}_6\text{H}_2(\text{OMe})_3\text{CO}_2\text{H}$ [99°] Crystals (Will, *B* 21, 2020).

Methyl ether of the tri methyl derivative $\text{C}_6\text{H}_2(\text{OMe})_3\text{CO}_2\text{Me}$ (281°) Oil.

Ethyl ether EtA' [102°] Colourless crystals (containing aq) melting at 86° when hydrated. FeCl_3 gives a greenish-brown colour (Will & Albrecht, *B* 17, 2100, Schiff, *A* 245, 40).

Tri-ethyl derivative $\text{C}_6\text{H}_2(\text{OEt})_3\text{CO}_2\text{H}$ [100°] Formed by oxidation of the tri ethyl derivative of daphnetic acid with KMnO_4 (Will, *B* 17, 1088, 2099). Silky needles, sl sol cold water— BaA' — AgA' . Gives $\text{C}_6\text{H}_2(\text{OEt})_3$ when heated.

Ethyl ether of the tri-ethyl derivative $\text{C}_6\text{H}_2(\text{OEt})_3\text{CO}_2\text{Et}$. Oil. Formed by ethylating the acid.

Tri oxy benzoic acid $\text{C}_6\text{H}_2(\text{OH})_3\text{CO}_2\text{H}$.

Phloroglucin carboxylic acid. Formed by boiling phloroglucin (1 pt) with KHCO_3 (4 pts) and water (4 pts) (Will & Albrecht, *B* 17, 2103, 18, 1323). Colourless crystals (containing aq), sol alcohol and ether. Split up by boiling water into CO_2 and phloroglucin. FeCl_3 gives a transient blue colour. Alcohol and HCl yields CO_2 and the diethyl ether of phloroglucin. On heating with POCl_3 it gives an isomeride of tannin, which is, however, not very astringent and gives no colour with FeCl_3 (Schiff).

Tri methyl derivative?

$\text{C}_6\text{H}_2(\text{OMe})_3\text{CO}_2\text{H}$ **Asaronic acid** [144°] (300°) Formed by oxidising asarone on heating aqueous KMnO_4 (Butlerow & Rizza, *J R* 19, 3). Needles. On distillation with lime it yields $\text{C}_6\text{H}_2(\text{OMe})_3$ (246°).

References—BROMO, BROMO-NITRO, CHLORO, CHLORO IODO, CHLORO NITRO, IODO, and IODO NITRO OXY BENZOIC ACIDS.

O OXY-BENZOIC ALDEHYDE $\text{C}_6\text{H}_4\text{O}_2$ v

$\text{C}_6\text{H}_4(\text{OH})\text{CHO}$ **Salicylic aldehyde** Mol w 122 [c –20°] (1965°) SG 2 11671 (Bruhl) μ_D 1.5960 R_D 54.53 Occurs in the blossom of the meadow sweet (*Spiraea ulmaria*) (Etting, *A* 35, 247) and in *Crepis fetida* (Wicke, *A* 91, 374).

Formation—1 By oxidation of saligenin or salicin (Piria, *A* 30, 153)—2 In the products of the dry distillation of guinic acid (Wohler, *A* 51, 146)—3 By mixing chloroform (15 pts), phenol (10 pts), NaOH (20 pts), and water (35 pts), at 50°, boiling with inverted condenser, distilling off excess of chloroform, acidifying and distilling with steam (Tiemann & Reimer, *B* 9, 423, 824).

Properties—Liquid, with pleasant odour, v sl sol water, miscible with alcohol and ether. Turns red in air. Added to 'Vermouth' and other liqueurs. Produces epileptic convulsions in dogs (Laborde & Magnan, *J Ph* [5] 16, 448). FeCl_3 colours its aqueous solution violet. Does not reduce Fehling's solution. Combines with KHSO_4 forming $\text{C}_6\text{H}_4\text{O}(\text{OH})\text{SO}_3\text{K}$ crystallising in needles (Bertagnini, *A* 85, 193).

Reactions—1 Yields o oxy benzoic acid on oxidation—2 Sodium amalgam reduces it to saligenin (Beilstein & Reinecke, *A* 128, 179)—3 Heated with ZnCl_2 and HOAc it forms red amorphous $\text{C}_6\text{H}_4\text{O}_3$, insol water, which dissolves in alkalis with violet red colour but is insol acids. It yields amorphous $\text{C}_6\text{H}_4\text{AcO}_3$ (Bourquin, *B* 17, 502)—4 Ac_2O (2 mols) at 180° forms $\text{C}_6\text{H}_2(\text{OAc})_2\text{CH}(\text{OAc})$, [100°] which splits up on distillation into Ac_2O and $\text{C}_6\text{H}_2(\text{OAc})_3\text{CHO}$ (255°). On treatment with soda the compound $\text{C}_6\text{H}_2(\text{OAc})_2\text{CH}(\text{OAc})_2$ yields $\text{C}_6\text{H}_2(\text{OH})_2\text{CH}(\text{OAc})_2$, [104°] (Barbier, *C R* 90, 87)—5 **Acetyl chloride** yields 'disalicyl aldehyde' $\text{C}_6\text{H}_4\text{O}_3$, [180°]. The same body is formed by the action of BrCl , succinyl chloride, and PCl_5 (Osahours, *A* 78, 228, Perkin, *A* 145, 299, Zwenger, *A Suppl* 8, 42). It crystallises from alcohol in long needles, and is converted by Br in HOAc to $\text{C}_6\text{H}_2\text{Br}_2(\text{OH})\text{CHO}$, [166°], together with $\text{C}_6\text{H}_2\text{Br}(\text{OH})\text{CHO}$ [105°] and $\text{C}_6\text{H}_2\text{Br}_2(\text{OH})\text{CHO}$ [88°] (Bradley, *B* 22, 1134). 6 **Zinc dust** and HOAc form $\text{C}_6\text{H}_2\text{O}_3$, crystallising in needles [82°] (Tiemann, *B* 19, 357)—7 **Bromine** forms $\text{C}_6\text{H}_2\text{Br}_2(\text{OH})\text{CHO}$ and $\text{C}_6\text{H}_2\text{Br}_2\text{O}$ (Werner, *Bi* [2] 46, 277)—8. **Cyanogen**

bromide forms crystalline $C_6H_5NO_2$ (Cahours, *A* 108, 322)—9 *Ammonium cyanide* and alcohol form $C_6H_5N_3O_2$ [143°] and $C_6H_5N_3O_2$ [168°] (Haarmann, *B* 6, 841)—10 *Sodium succinate* and acetic anhydride form, on heating, dicoumarin $C_6H_5 \cdot O \cdot CO \cdot CO \cdot O$ $\begin{array}{c} \diagup \\ \text{CH} \end{array} \begin{array}{c} \diagdown \\ \text{CH} \end{array} \begin{array}{c} \diagup \\ \text{CH} \end{array} \begin{array}{c} \diagdown \\ \text{CH} \end{array} \cdot C_6H_5$ (Fittig, *B* 18, 2523)—11 *Thioglycolic acid* and zinc chloride form $C_6H_5(OH)CH(SCH_2CO_2H)_2$ [148°] (Bongartz, *B* 21, 480)—12 Gaseous or alcoholic ammonia gives rise to 'hydrosalicylamide' $C_6H_5(OH)CHNCH(C_6H_5OH)NCHC_6H_5OH$ which forms yellow crystals [145°] (Etting, *A* 35, 249, Herzfeld, *B* 10, 1270) It is insoluble in water, soluble in cold alcohol, and is decomposed by boiling acids and alkalis into NH_3 and *o*-oxybenzoic aldehyde. It is converted by alcoholic ammonium sulphide into crystalline $C_{12}H_{11}N_2SO_2$, and by HCl and HCl into two isomeric crystalline 'hydrocyanals' $C_6H_5N_3O_2$ (Beilstein, *A* 136, 170) Hydrosalicylamide forms the salts $FeC_{12}H_{11}N_2O_2NH_4$ and $Cu_2(C_{12}H_{11}N_2O_2)_2 \cdot 2NH_3$ —13 *Methylamine* gas forms $C_6H_5(OH)CHNMe$ an oil [229°], resolved by acids and alkalis into NH_3 and salicylic aldehyde (Dennstedt & Zimmermann, *B* 21, 1553)—14 *Ethylamine* forms the homologous C_6H_5NO (237°)—15 *Aniline* forms $C_6H_5(OH)CHNPh$ [50.5°] (Schischkoff, *C* 45, 272, Emmerich, *A* 241, 344) It forms a crystalline compound with HCl *p*-Nitroaniline forms the compound $C_6H_5(NO_2)NCHC_6H_5OH$ [115°]—16 *Di-methyl-p-phenylene diamine* forms in like manner $C_6H_5(OH)CHN(C_6H_5NMe_2)$ [134°] (Nuth, *B* 18, 573) Di-methylaniline and $ZnCl_2$ form $C_6H_5(OH)CH(C_6H_5NMe_2)_2$ —17 *Benzidine* in weak alcoholic solution forms the compound $C_{12}H_{11}NCHC_6H_5OH$, crystallising from benzene in colourless needles [260°] Di-amido ditolyl forms the homologous $C_{12}H_{12}NCHC_6H_5OH$ [202°] (Schiff & Vanni, *A* 258, 374)—18 *Ethylene diamine* forms $C_6H_5NCHC_6H_5OH$ [126°] (Mason, *B* 20, 271)—19 *Ethylene aniline* forms $C_6H_5(NPh)CHC_6H_5OH$ [116°] (Moos, *B* 20, 733)—20 *p*-Toluidine gives rise to $C_6H_5MeNCHC_6H_5OH$ [100°] (Jaillard, *Z* 1865, 440)—21 *Phenylene m-diamine hydrochloride* yields $C_6H_5(NCHC_6H_5OH)_2$, forming crystalline $B_2H_2PtCl_4$ (Schiff, *A* 253, 329) Tolyene *m*-diamine yields homologous $C_6H_5NCHC_6H_5OH$ [109°]—22 *Tolyene o-diamine* forms a compound $C_{12}H_{12}N_2O_2$ [106°–110°] and azurine $C_{12}H_{12}N_2O_2$ [250.5°] which exhibits blue fluorescence in alkaline solution (Ladenburg, *B* 11, 596)—23 (8) *Naphthylamine* reacts forming $C_{10}H_7NCHC_6H_5OH$ [121°] (Emmerich, *A* 241, 351)—24 *Urea* in aqueous solution gives crystalline $(NH_2CO)_2CHC_6H_5OH$ whence $Cu(C_6H_5N_3O_2)_2$ (Schiff, *A* 151, 199)—25 *m*-Amido-benzoic acid forms the compound $CO_2H \cdot C_6H_4NCHC_6H_5OH$ [190°] which forms an amide [186°] (Schiff, *A* 210, 114)

Salts— $KC_6H_5O_2$, aq yellow tables *S* (alcohol) 5 (Michael, *Am* 1, 309)— $NaHA' \cdot \frac{1}{2}aq$ — $BaA' \cdot 2aq$ — $Pb(OH)A'$ — CuA' , brownish green crystals
Acetyl derivative $C_6H_5(OAc)CHO$ [37°] (253°) Formed from $C_6H_5(ONa)CHO$ in ether by adding Ac_2O (Perkin, *A* 148, 208, 150, 82)
Butyryl derivative $C_{12}H_{11}O_2$ (260°–270°). Oil

Benzoyl derivative $C_6H_5(OBz)CHO$ Oil
Glucoside *v* HELICIN

Methyl derivative $C_6H_5(OMe)CHO$ [35°] (238°). Formed from $C_6H_5(ONa)CHO$, MeI, and MeOH (Perkin, *A* 145, 302, *C* 55, 550, Voswinckel, *B* 15, 2024) Thick prisms, nearly insoluble in water, soluble in alcohol, very soluble in ether. Alcoholic HCl and H_2S form the (8) thioaldehyde $C_{12}H_{12}S_2O_2$ [224°] While at -10° the (a)-isomeride $C_{12}H_{12}S_2O_2$ [157°] is formed (Baumann & Fromm, *B* 24, 1446) Alcohol and colourless ammonium sulphide yield $C_{12}H_{12}S_2O_2$ [85°–88°] When KCy followed by HCl is added to the ethereal solution of $C_6H_5(OMe)CHO$ there is formed $C_6H_5(OMe)CH(OH)CN$ [71°] whence alcoholic NH_3 at 70° yields $(C_6H_5(OMe)CHCy)_2NH$ [123°], and alcoholic aniline at 100° gives $C_6H_5(OMe)CH(NHPh)CN$ [61°] (V) Ethylene diamine at 120° forms crystalline $C_{12}H_{12}(NCHC_6H_5OMe)_2$

Ethyl derivative $C_6H_5(OEt)CHO$ [7°] (249°) (Göttig, *B* 10, 8, Perkin, *A* 145, 306, *C* 55, 551) With alcoholic NH_3 it yields crystalline $N_2(CHC_6H_5OEt)_2$, which is converted by heating at 165° into an amorphous isomeride yielding crystalline $B_2H_2PtCl_4$ (Perkin, *A* 145, 308) Forms with aniline only $C_{12}H_{12}(OEt)CHNPh$ (Schiff, *A* 150, 195), and with ethyl aniline only $C_{12}H_{12}(OEt)CH(NEtPh)_2$ Aqueous urea forms crystalline $C_{12}H_{12}N_2O_2$, aq

Isobutyl derivative $C_6H_5(OC_4H_9)CHO$ (265°) Oil (Baumann & Fromm, *B* 24, 1448) Alcoholic HCl and H_2S form the (a) [142°] and (8) [163°] isomerides $C_{12}H_{12}S_2O_2$. Ammonium sulphide yields $C_{12}H_{12}S_2O_2$ [52°–56°]

Benzyl derivative $C_6H_5(OC_6H_5)CHO$ [46°]

Derivatives of *o*-oxybenzoic orthoaldehyde

$C_6H_5(OH)CH(OAc)_2$ [104°] Formed from the aldehyde and Ac_2O at 150° (Perkin, *A* 146, 371°) Tables (from alcohol) $C_6H_5(OAc)CH(OAc)_2$ [101°] Needles (from alcohol)

$C_6H_5(OMe)CH(OAc)_2$ [75°] Prisms $C_6H_5(OEt)CH(OAc)_2$ [89°] Prisms, insoluble in Aq

Oxim $C_6H_5(OH)CHNOH$ [57°] White crystals, resolved by warm HCl aq into its components (Lach, *B* 16, 1782, 17, 1572) Ac_2O converts it into acetyl-*o*-oxybenzonitrile. The compound $NHPhCO \cdot O \cdot C_6H_5$, $CHNO \cdot CO \cdot NHPh$ [115°] is formed by phenyl cyanate (Goldschmidt & Schulthess, *B* 22, 3102)— $B'HCl$ — $C_6H_5(ONa)CHNO \cdot Na_3aq$ small pearly scales

Derivatives of the oxim

$C_6H_5(OMe)CHNOH$ [92°] With phenyl cyanate it yields $C_6H_5(OMe)CHNO \cdot CO \cdot NHPh$ [105°] (Goldschmidt, *B* 23, 2741)

$C_6H_5(OMe)CHNOEt$ Oil

$C_6H_5(OEt)CHNOEt$ Oil

$C_6H_5(OH)CHNO \cdot C_6H_5$ The (a) isomeride [63°] is formed from *o*-oxybenzoic aldehyde and (a) benzyl-hydroxyamine, while the (8) isomeride [100°] is obtained by using (8) benzyl-hydroxyamine (Beckmann, *B* 23, 3319)

Phenylhydrazide $C_6H_5(OH)CHN \cdot NHPh$ [143°] Colourless needles (from alcohol) (Fischer, *B* 17, 575, Rossing, *B* 17, 3003). Yields $C_6H_5(OAc)CHN \cdot NaOPh$ [138°], which forms a crystalline dibromide converted by boiling alcohol into $C_6H_5Br_2(OAc)CHN \cdot NHPh$ [168°], which

yields $C_6H_5Br(OAc)CHN_2AcPh$ [158°] and $C_6H_5Br(OH)CHN_2HPh$ [148°]

m-Oxy-benzoic aldehyde $C_6H_4(OH)CHO$ [81] [104°] (240°) Formed by reduction of *m* oxy-benzoic acid in acid solution by sodium-amalgam (Sandmann, B 14, 969) Obtained also by oxidation and diazotisation from *m* amido-cinnamic acid (Luff, B 22, 294) Prepared from *m*-nitro-benzoic aldehyde by reduction and treatment of the amido compound with nitrous acid (Tiemann & Ludwig, B 15, 2043) Needles (from water) Excess of Ac_2O forms $C_6H_4(OAc)CH(OAc)_2$ crystallising in plates [76°]

Acetyl derivative $C_6H_4(OAc)CHO$ (263°)

Formed from the K salt and Ac_2O Oil

Methyl derivative $C_6H_4(OMe)CHO$ (230°)

Oxim $C_6H_4(OH)CHNOH$ [87.5°] Soft silky needles (Clemm, B 24, 826)

Phenyl hydrazide

$C_6H_4(OH)CHN_2HPh$ [181°] Prisms, ν sol alcohol (Rudolph, A 248, 102)

p-Oxy-benzoic aldehyde $C_6H_4(OH)CHO$ [4.1] [115°] Formed by heating its methyl derivative with $HClAq$ at 200° (Bucking, B 9, 527) Prepared, together with the *o*-isomeride, by the action of chloroform and alkalis on phenol (Tiemann & Reimer, B 9, 824, 10, 63)

Properties — Needles (from water), ν sol alcohol and ether Not volatile with steam $FeCl_3$ gives a slight violet tint to its aqueous solution Reduces ammoniacal $AgNO_3$ With $NaHSO_3$ it forms the crystalline compound $C_6H_4(OH)CH(OH)SO_3Na$ [112°]

Reactions — 1 Potash fusion forms *p* oxy-benzoic acid — 2 Sodium amalgam and water reduce it to $C_6H_4(OH)CH(OH)CH(OH)C_6H_4(OH)$ [222°] and the isomeric di-oxy isohydrobenzoin [198°] which forms the crystalline derivative $C_6H_4(OH)_2(C_6H_4OAc)_2$ [192°] (Herzfeld, B 10, 1268, Tiemann, B 19, 354) — 3 Bromine ppts $C_6H_5Br(OH)CHO$ [181°] and, when in excess, forms $C_6H_5Br(OH)CHNOH$ (Werner, Bl [2] 46, 278) — 4 Boiling Ac_2O (3 pts) forms $C_6H_4(OAc)CH(OAc)_2$ [94°] (Tiemann & Herzfeld, B 10, 64, Barbier, C R 90, 37) — 5 Heating with $HOAc$ and $ZnCl_2$ forms red amorphous $C_{10}H_8O_3$, which gives a violet solution in alkalis (Bourquin, B 17, 503) — 6 Ammonia forms an oily compound — 7 Aniline in ethereal solution forms $C_6H_4(OH)CHNPh$ [191°] — 8 *p* Toluidine yields the compound $C_6H_4(OH)CHNC_6H_5$ [218°] — 9 *Di-methyl-phenylene-diamine* gives rise to crystalline $C_6H_4(OH)CHNC_6H_4NMe_2$ decomposing at 240° (Nuth, B 18, 574) — 10 (β)-Naphthylamine forms $C_6H_4(OH)CHNC_{10}H_7$ [220°] (Emmerich, A 241, 356)

Acetyl derivative $C_6H_4(OAc)CHO$ (260°) (Barbier, Bl [2] 33, 52, C R 90, 37, (265°) (T & H) Formed from $C_6H_4(OK)CHO$ and Ac_2O Oil

Methyl derivative $C_6H_4(OMe)CHO$ **Anisic aldehyde** Mol ν 136 (248°) SG 1.228 Formed, together with anisic acid, by oxidation of anethol or oil of anise (Cahours, A Ch [3] 14, 484, 23, 354, Rossel, A 151, 25) Formed also by distilling calcium anisate with calcium formate (Piria, A 100, 105) and by methylation of *p*-oxy-benzoic aldehyde (T & H) Oil, forming with H_2SO_4 a crimson solution, turned violet on heating With $NaHSO_3$ it forms crystalline $C_6H_4NaSO_3$ aq (Bertagnini, A. 85,

268) **Reactions** — 1 Alcoholic potash forms the corresponding alcohol and acid — 2 Alcoholic HCl and H_2S form $C_6H_5S_2O_3$ [183°] and, at -10°, an isomeride [127°] (Baumann & Fromm, B 24, 1442) Alcoholic H_2S forms the thio-aldehyde [75°-77°], while alcoholic ammonium sulphide forms a polymeric thioanisic aldehyde [92°] and the disulphide $(C_6H_4(OMe)CH)_2S_2$ (B' & F) — 3 Sodium amalgam forms two 'hydrazones' $C_6H_4(OMe)CH(OH)CH(OH)C_6H_4(OMe)$, melting at 172° and 125° (Samosadsky, Z 1867, 678, 1868, 643) Boiling dilute H_2SO_4 converts the isomeride [172°] into $C_6H_5H_2O_3$ [95°] (Rossel, A 151, 36) Zinc and hydrochloric acid form $C_6H_4(OMe)CH(OH)$ and crystalline $C_6H_4O_3$ [215°] — 4 Aqueous HCy (28 p) forms $C_6H_4(OMe)CH(OH)CN$ [68°], which yields $C_6H_4(OMe)CH(OH)CO_2H$ on saponification (Tiemann & Friedlander, B 14, 1976) — 5 Alcoholic KCy yields anisoin — 6 Succinic acid yields $C_6H_4(OMe)CHCH_2CO_2H$ and $C_6H_4(OMe)CHCH_2C(CO_2H)CHC_6H_4OMe$ (Fit tig, B 18, 2523) — 7 Di thio glycol gives rise to $C_6H_4(OMe)CHS_2C_6H_5$ [65°] (Easbender, B 21, 1476) — 8 Aqueous ammonia produces 'anishydramide' $N(CH_2C_6H_4OMe)_2$ [120°] converted at 170° into crystalline 'anisine' $C_6H_4N_2O_3$, which forms the salts $BHCl$ aq and $B_2H_4PtCl_4$ (Bertagnini, A 88, 128) — 9 Ethylene aniline forms $C_6H_4(NCH_2C_6H_4OMe)_2$ [111°] (Mason, B 20, 272) — 10 Aniline gives rise to crystalline $C_6H_4(OMe)CHNPh$ — 11 Ethylene aniline forms $C_6H_4(OMe)CH(NPh)_2$ C_6H_4 [164°] (Moos, B 20, 733) — 12 *o* Toluidine reacts, forming $C_6H_4(OMe)CHNC_6H_4Me$ [32°] The *p* isomeride [92°] is also crystalline (Steinhart, A 241, 340) — 13 Phenylene-*di*-methyl-*p* diamine forms $C_6H_4(OMe)CHNC_6H_4NMe_2$ [148°] (S, cf Nuth, B 18, 574) — 14 Toluylene-*o* diamine hydrochloride forms $C_{12}H_{12}N_2O_3$ [152°-156°] (Ladenburg, B 11, 1660) — 15 (β) Naphthylamine yields $C_6H_4(OMe)CHNC_{10}H_7$ [98°] — 16 Acetamide at 120°-180° forms $C_6H_4(OMe)CH(NHAc)$ [180°] (Schuster, A 154, 80) — 17 Benzamide gives $C_6H_4(OMe)CH(NHBz)_2$ [192°] — 18 Urea forms crystalline $C_6H_4(OMe)CH(NHCO NH)_2$ and $C_{10}H_{12}N_2O_3$ — 19 Carbamic ether and HCl give $C_6H_4(OMe)CH(NHCO_2Et)$ [172°]

Oxim $C_6H_4(OH)CHNOH$ [65°] Formed from the aldehyde and hydroxylamine (Lach, B 16, 1785) White needles Converted by Ac_2O and by $AcCl$ into $C_6H_4(OH)CN$ Yields $C_6H_4(ONa)CHNONa3aq$

Methyl derivative of the oxim $C_6H_4(OMe)CHNOH$ (a) - Isomeride [62°] Formed from anisic aldehyde and hydroxylamine (Westenberger, B 16, 2993, Goldschmidt & Polonowska, B 20, 2407, 22, 3102, 23, 2163; Beckmann, B 21, 768, 23, 1687, Miller, B 22, 2790) White plates, ν sol hot water Tastes sweet Heated with Ac_2O and HCl it gives $C_6H_4(OMe)CN$ [81°] $NaOEt$ and benzyl chloride yield the (a) benzyl ether [46.5°] Ac_2O forms $C_6H_4(OMe)CHNOAc$ [48°] (Hantzsch, B 24, 41), crystallising in prisms Phenyl cyanate forms $C_6H_4(OMe)CHNOCONHPh$ [82°] $NaOMe$ and MeI form $C_6H_4(OMe)CHNOMe$ [43°] (246°) — (b) - Isomeride [130°] Ppd as hydrochloride by passing HCl into an ethereal solution of the (a) isomeride Slender needles Has no taste. With $NaOEt$ and benzyl chloride it yields the

(8)-benzyl ether [107°] The acetyl derivative $C_6H_5(OMe)CHNOAc$ [64°] is converted by Na_2CO_3 aq into the nitrate [60°]

Phenyl-hydrazide $C_6H_5(OH)CHN.HPh$ [178°] Tufts of needles (Rudolph, A 248, 102)

Phenyl-hydrazide of the methyl derivative $C_6H_5(OMe)CHN.HPh$ [121°]

c Di-oxy benzoic aldehyde m Methyl derivative $C_6H_5(OMe)(OH)CHO$ [3 3 1] (264°-268°) Formed, together with vanillin, by the action of chloroform on a solution of guaiacol in dilute NaOH (Tiemann & Koppe, B 14, 2020) Liquid, volatile with steam, sol alcohol, ether, and benzene, nearly insol water $FeCl_3$ colours its alcoholic solution violet

Di-oxy benzoic aldehyde $C_6H_5(OH)_2CHO$ [4 2 1] (8) *Resorcylic aldehyde* [135°] Formed by the action of chloroform and NaOH aq on resorcin (Tiemann & Lewy, B 10, 2212) Needles (from water), v sol water, alcohol, and ether $FeCl_3$ colours the aqueous solution reddish-brown Readily resinsified

o Methyl derivative $C_6H_5(OH)(OMe)CHO$ [4 2 1] [153°] Formed, together with the *p* methyl derivative, by the action of chloroform and NaOH on $C_6H_5(OH)(OMe)$ [1 3] (Tiemann & Parrissius, B 13, 2365) Colourless plates, sl sol. water Gives white crystalline pps with ammoniacal $AgNO_3$, and with $Pb(OAc)_2$ Yields an acetyl derivative $C_6H_5(OAc)(OMe)CHO$ [86°]

p Methyl derivative $C_6H_5(OMe)(OH)CHO$ [4 2 1] [63°] Formed by partial methylation of the aldehyde White plates, nearly insol water $FeCl_3$ colours its alcoholic solution reddish violet Gives pps with ammoniacal $AgNO_3$, and lead acetate

Di-methyl derivative $C_6H_5(OMe)_2CHO$ [68°] Obtained by methylation, and also by oxidation of the di-methyl derivatives of (a) and (8) umbellic acid with $KMnO_4$ (Will, B 16, 2117) Needles (from dilute alcohol)

Di-ethyl derivative [72°]

Phenyl hydrazide $C_6H_5(OH)CHN.HPh$ [c 158°] Needles (Rudolph, A 248, 104)

Di-oxy benzoic aldehyde

$C_6H_5(OH)_2CHO$ [5 2 1] *Genticic aldehyde* [99°] Formed by boiling hydroquinone with chloroform and aqueous (18 p c) NaOH (Tiemann & Muller, B 14, 1986) Flat yellow needles, v sol water Gives a transient blue colour with $FeCl_3$ Yields gentisic acid on fusion with potash Alcoholic aniline forms the amide $C_6H_5(OH)CHNPh$, crystallising in red needles

m Methyl derivative

$C_6H_5(OMe)(OH)CHO$ [5 2 1] [4°] (248°) V D (H=1) 75.7 (obs) Formed from methyl hydroquinone $C_6H_5(OH)(OMe)$ [1 4], chloroform, and NaOH aq Liquid, volatile with steam, sl sol water Gives a bluish green colour with $FeCl_3$ Aniline yields $C_6H_5(OMe)(OH)CHNPh$ [59°], crystallising in red needles The acetyl derivative $C_6H_5(OMe)(OAc)CHO$ [68°] crystallises in needles, and is converted by boiling Ac_2O into $C_6H_5(OMe)(OAc)CH(OAc)$

Di-methyl derivative $C_6H_5(OMe)_2CHO$ [51°] Volatile with steam Not coloured by $FeCl_3$

m-Ethyl derivative

$C_6H_5(OEt)(OH)CHO$ [5 2 1] [52°] (230°) Yellow prisms, nearly insol water Coloured violet by $FeCl_3$ Yields $C_6H_5(OEt)(OAc)CHO$ [69°], (c 285°)

VOL. III

Di-ethyl derivative $C_6H_5(OEt)_2CHO$ [80°] (c 283°) Needles (T & M, Hantzsch, J pr [2] 22, 468)

Di-oxy-benzoic aldehyde

$C_6H_5(OH)_2CHO$ [4 3 1] v *PROTocatechuic aldehyde*

Tri-oxy benzoic aldehyde Tri-ethyl derivative $C_6H_5(OEt)_3CHO$ [4 3 2 1] [70°] Formed by oxidising the tri-ethyl derivative of daphnetic acid with $KMnO_4$ (Will & Jung, B 17, 1088)

Tri-oxy benzoic aldehyde Tri-ethyl derivative $C_6H_5(OEt)_3CHO$ [95°] Formed by oxidation of the tri-ethyl derivative of (a) or (8) ascouletic acid with alkaline $KMnO_4$ (Will, B 16, 2112) Large crystals, insol water

Tri-oxy benzoic aldehyde Tri-methyl derivative $C_6H_5(OMe)_3CHO$ [114°] Formed by oxidation of asarone (Butlerow & Rizza, J R 19, 3) Needles, v sol hot water

References—Bromo-, Chloro-, and Iodo OXY BENZOIC ALDEHYDE

m-OXY-BENZOPHENONE $C_6H_5CO C_6H_5(OH)$ [116°] Formed by the action of nitrous acid upon *m* amido-benzophenone (Geigy & Koenigs, B 13, 2402) Needles

p Oxy-benzophenone $C_6H_5CO C_6H_5OH$ [1 4] *p-Benzoyl phenol* Formed by heating phenol with $BzCl$ and $ZnCl_2$ (Grucarevitch & Merz, B 6, 1245) Obtained also from *p* amido benzo phenone by the diazo reaction (Doebner & Weiss, B 14, 1840, A 210, 275) Needles or plates

Acetyl derivative [81°] Needles (from alcohol) (Doebner & Stackmann, B 10, 1970)

Benzoyl derivative [113°]

Methyl derivative $C_6H_5CO C_6H_5OMe$ [62°] Four sided prisms (Rennie, C J 41, 227) Possesses two oxims $C_6H_5C(NO) C_6H_5OMe$, a stable oxim [116°] yielding $BHCl$, an acetyl derivative [53°], and a benzyl ether [74°], and an unstable oxim [140°], which yields $BHCl$ [124°], an acetyl derivative [135°], and a benzyl ether [60 5°] (Schafer, A 264, 158, Hantzsch, B 24, 53)

Ethyl derivative $C_6H_5CO C_6H_5OEt$ [39°] (above 300°) Formed from C_6H_5OEt , benzoyl chloride, and $AlCl_3$ (Gattermann, Ehrhardt, & Marsch, B 23, 1206)

Di-oxy benzophenone $CO(C_6H_5OH)_2$ [60°] (c 335°) Formed by heating diphenylene ketone oxide with alcoholic potash at 180° (Richter, J pr [2] 28, 273, Graebe & Feer, B 19, 2607) Prisms or plates (from ligroin) —KHA" yellow crystals (from alcohol) —K₂A" crystals, v e sol water

Acetyl derivative $C_6H_5AcO_2$ [96°] (G & F), [85°] (R) Prisms (from alcohol)

Benzoyl derivative $C_6H_5BzO_2$ [104°]

Methyl derivative $C_6H_5MeO_2$ [69°]

Di-methyl derivative $C_6H_5Me_2O_2$ [98°] (R), [104°] (G & F) Prisms Forms the oxim $C(NO)H(C_6H_5OMe)_2$ [188°]

Di-ethyl ether $C_6H_5Et_2O_2$ [109°] Needles (from dilute alcohol) Yields the phenyl hydrazide $C(N.HPh)(C_6H_5OEt)_2$ [114°]

Oxim $C(NO)H(C_6H_5OH)_2$ [99°]

Phenyl-hydrazide $C(N.HPh)(C_6H_5OH)_2$ [152°]

op-Di-oxy-benzophenone

$[2 1] C_6H_5(OH)CO C_6H_5(OH)$ [1 4] [144°] Formed by heating salicylic acid with phenol

Y Y

and SnCl_4 at 120° (Michael, *B*, 14, 656, *Am* 5, 83) Large yellow plates, sl sol water — $\text{Ag}_2\text{A}''$ aq

Acetyl derivative $\text{C}_{15}\text{H}_{11}\text{Ac}_2\text{O}_2$ [88°]

Di-p-oxy-benzophenone $\text{CO}(\text{C}_6\text{H}_4\text{OH})_2$ [210°]

Formation — 1 From $\text{CH}_3(\text{C}_6\text{H}_4\text{OBz})_2$ by oxidation and saponification (Gail, *A* 194, 834)

2 By fusing phenol-phthalein with potash (Baeyer a Burkhardt, *B* 11, 1299, *A* 202, 126)

3 By heating aurin with water at 240° (Caro a. Graebe, *B* 11, 1348), or rosaniline with water at 270° (Liebermann, *B* 6, 951, 11, 1435) —

4 By the action of HNO_3 on di-*p*-amido-benzophenone (Staedel a Sauer, *B*, 11, 1747)

Properties — Long needles, m sol hot water On treatment with PCl_5 followed by phenol and H_2SO_4 it yields aurin Bromine forms $\text{C}_{15}\text{H}_7\text{Br}_2\text{O}_2$ [214°]

Acetyl derivative $\text{C}_{15}\text{H}_{11}\text{Ac}_2\text{O}_2$ [148°]

Benzoyl derivative $\text{C}_{15}\text{H}_7\text{Bz}_2\text{O}_2$ [182°]

Methyl derivative $\text{C}_{15}\text{H}_{11}\text{Me}_2\text{O}_2$ [144°]

Needles (Bösler, *B* 14, 328) Yields $\text{C}_{15}\text{H}_{11}\text{Br}_2\text{O}_2$ [181°] and an oxim [133°]

Ethyl derivative $\text{C}_{15}\text{H}_{13}\text{Et}_2\text{O}_2$ [147°]

Di-ethyl derivative $\text{C}_{15}\text{H}_{13}\text{Et}_2\text{O}_2$ [147°] (Gail, [181°] (Gattermann, *B* 22, 1181)

(8) *Di-oxy-benzophenone* $\text{C}_{15}\text{H}_{10}\text{O}_2$ [162°]

Formed from di-nitro benzophenone [149°] by reduction and application of the diazo reaction (Staedel a Sauer, *B* 18, 836) Needles

Acetyl derivative $\text{C}_{15}\text{H}_9\text{Ac}_2\text{O}_2$ [90°]

Benzoyl derivative $\text{C}_{15}\text{H}_5\text{Bz}_2\text{O}_2$ [102°]

Di-oxy-benzophenone $\text{C}_6\text{H}_4\text{CO C}_6\text{H}_4(\text{OH})_2$ [145°] Formed from di benzoyl pyrocatechin, BzCl , and ZnCl_2 (Doebner, *A* 210, 261) Needles (containing 1/2 aq)

Benzoyl derivative $\text{C}_{15}\text{H}_5\text{Bz}_2\text{O}_2$ [95°]

Di oxy benzophenone $\text{C}_6\text{H}_4\text{CO C}_6\text{H}_4(\text{OH})_2$

Benzoresorcin [144°] Formed from resorcin, BzCl , and ZnCl_2 at 120° (Doebner a Stachmann, *B* 11, 2270) Needles, sol hot water

Benzoyl derivative $\text{C}_{15}\text{H}_5\text{Bz}_2\text{O}_2$ [141°]

Tri oxy benzophenone

$\text{C}_6\text{H}_4(\text{OH})\text{CO C}_6\text{H}_4(\text{OH})_2$ [124] [133°] Formed by heating salicylic acid with resorcin at 200° (Michael, *B* 14, 658), or by heating oxy diphenylene ketone oxide with NaOH at 270° (Graebe, *A* 254, 291) Plates, sl sol water

Tetra-oxy-benzophenone

$\text{CO}(\text{C}_6\text{H}_4(\text{OH})_2)_2$ [125], [202°] is EUXANTHONIC ACID (*q* v)

Hexa-oxy-benzophenone $\text{CO}(\text{C}_6\text{H}_4(\text{OH})_3)_2$

Anhydride $\text{C}_{15}\text{H}_3\text{O}_6$ *Anhydropyrogallolketone* Formed by fusing gallein with alkalis (Buchka, *A* 209, 270) Brown powder

Acetyl derivative $\text{C}_{15}\text{H}_3\text{Ac}_3\text{O}_6$ [237°]

p OXY-BENZOPHENONE o-CARBOXY-

LIC ACID *Methyl derivative* $\text{C}_{15}\text{H}_9\text{O}_4$ *o* $\text{C}_6\text{H}_4(\text{OMe})\text{CO C}_6\text{H}_4\text{CO}_2\text{H}$ *Anisole phthalic acid* [148°] Formed by the action of phthalic anhydride (50 g) on anisole (150 g) in presence of AlCl_3 (80 g) (Nourissou, *B* 19, 2103) Colourless crystals (from toluene) Split up by potash-fusion into benzoic and *p*-oxy benzoic acids Yields a bromo-derivative [198°] Conc H_2SO_4 forms *m* oxy-anthraquinone Distillation with zinc dust gives anthracene — NaA'' — KHA'' — CaA'' , 2aq — BaA'' , 4aq white needles — AgA''

Di oxy benzophenone carboxylic acid

$\text{C}_6\text{H}_4(\text{OH})_2\text{CO C}_6\text{H}_4\text{CO}_2\text{H}$ [200°] Got by fusing

fluorescein with NaOHAq (Baeyer, *A* 183, 23) Crystals (containing aq)

DI-OXY-BENZOPHENONE SULPHONIC

ACID $\text{C}_6\text{H}_4(\text{OH})_2\text{CO C}_6\text{H}_4\text{SO}_3\text{H}$ Formed by heating $\text{C}_6\text{H}_4(\text{SO}_2\text{NH}_2)\text{CO}_2\text{H}$ with resorcin (Remsen, *Am* 9, 5, 872, 11, 73) Small plates (containing 2aq) — BaA'' — $\text{NH}_4\text{A}''$

OXY-BENZOYL ACETIC ACID $\text{C}_6\text{H}_4\text{O}_4$ *o*

$\text{C}_6\text{H}_4\text{CO OH}(\text{OH})\text{CO}_2\text{H}$ [125°] Formed from nitroso benzoyl-acetic ether $\text{Bz C}(\text{NOH})\text{CO}_2\text{Et}$ and NaOHAq (Baeyer a Perkin, *B* 16, 2183, *C* 7, 245) Small prisms (from water) — AgA''

OXY-BENZOYL BROMIDE *Methyl deri-*

vative $\text{C}_6\text{H}_4(\text{OMe})\text{COBr}$ Formed from anisic aldehyde by cautious treatment with bromine (Cahours, *A* *Ch* [8] 14, 486) Silky crystals, resolved by KOHaq into potassium anisate and potassium bromide

p-OXY-BENZOYL CHLORIDE *Methyl*

derivative $\text{C}_6\text{H}_4(\text{OMe})\text{COCl}$ (262°) *SG* 1 261 Formed from anisic acid and PCl_5 (Cahours, *A* *Ch* [3] 23, 351) Oil, converted by water into anisic acid

p OXY BENZURIC ACID $\text{C}_6\text{H}_4\text{NO}_2$ *o*

$\text{C}_6\text{H}_4(\text{OH})\text{CO NH CH}_2\text{CO}_2\text{H}$ [c 228°] Occurs in the urine of dogs to which *p* oxy benzoic acid or hydro *p* coumaric acid has been administered (Baumann a Herter, *H* 1, 260, Schotten, *H* 7, 26) Prisms, m sol water

OXY DIBENZYL v OXY DI PHENYL ETHANE

o OXY-BENZYL ALCOHOL $\text{C}_6\text{H}_4\text{O}_2$ *o*

$\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OH}$ *Salgenin* Mol w 124 [82°] *S* 7 at 22° *S* (benzene) 19 at 18°

Formed by the hydrolysis of salicin (Prins, *A* 56, 37), by reducing *o* oxy benzoic aldehyde with sodium amalgam (Beilstein, *A* 128, 179), and by heating phenol with CH_2Cl_2 and aqueous NaOH at 100° (Greene, *Am* 2, 19) Tables, v e sol hot water FeCl_3 gives a blue colour Dilute H_2SO_4 forms saliretin $\text{C}_{15}\text{H}_{14}\text{O}_4$ or $\text{C}_{15}\text{H}_{12}\text{O}_5$, a yellowish powder, insol water (Gerhardt, *A* *Ch* [3] 7, 215, Beilstein, *A* 117, 84, Kraut, *A* 156, 124) On heating with glycerin at 100° it forms saliretone $\text{C}_{15}\text{H}_{12}\text{O}_4$ [121.5°] crystallising from water (Giacosa, *J* *pr* [2] 21, 221)

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{OH}$ (248°) *SG* 23 1120 (Cannizzaro a Kerner, *B* 5, 436)

Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{CH}_2\text{OH}$ (265°) Solidifies at 0° (Botsch, *M* 1, 621)

m Oxy-benzyl alcohol [3 1] $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OH}$

[67°] (c 300°) A product of the action of sodium-amalgam on *m* oxy benzoic acid in acid solution (Van der Velden, *J* *pr* [2] 15, 163) White mass, v sol hot water FeCl_3 gives a violet colour

Acetyl derivative $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OAc}$

[55°] (295°–302°) Crystalline, v sl sol water

Di acetyl derivative $\text{C}_6\text{H}_4(\text{OAc})\text{CH}_2\text{OAc}$ (c 290°). Oil, sl alcohol and ether

p Oxy-benzyl alcohol $\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{OH}$

[110°] Prepared by slowly adding 40 pts of 8 p sodium amalgam to a solution of 1 pt para-oxy benzaldehyde in 10 pts water and 5 pts alcohol, kept slightly acid with H_2SO_4 (Biedermann, *B*, 19, 2378). Thin white needles v. sol water, alcohol, and ether, sl sol benzene and chloroform, nearly insol ligroin Dissolves in conc H_2SO_4 with a splendid violet colour.

Mono-acetyl derivative

$C_6H_5(OH)CH_2OAc$ [84°], small yellowish needles, v sol al ohol and ether, sl sol water

Di acetyl derivative

$C_6H_5(OAc)CH_2OAc$ [75°], small needles, v sol alcohol and ether, nearly insol water

Methyl derivative $C_6H_5(OMe)CH_2OH$
Anisic alcohol Mol w 198 [45°] Formed, together with anisic acid, by mixing anisic aldehyde with alcoholic potash (Cannizzaro, A 98, 188, 137, 246, G 2, 61) Obtained also by methylation (Biedermann, B 19, 2376) White needles $HClAq$ forms only $C_6H_5(OMe)CH_2Cl$ whence $NaOMe$ forms the compound $C_6H_5(OMe)CH_2OMe$ (226°)

Di-oxy benzyl alcohol *Ethyl derivative* $C_6H_5(OEt)(OH)CH_2OH$ [52 1] [84°] Formed by adding 5 pc sodium amalgam to the corresponding aldehyde suspended in water The product is acidified and shaken with ether (Hantzsch, J pr [2] 22, 475) Large thick tablets, changing at 100° into a brown amorphous mass Acids also resinify it

Di oxy-benzyl alcohol $C_6H_5(OH)_2CH_2OH$ [43 1] **Methyl derivative** $C_6H_5(O)_2CH_2OH$ [43 1] *Vanillyl alcohol* [115°] Formed by the action of sodium-amalgam on vanillin (Tiemann, B 8, 1125, 9, 415) Formed also by the action of emulsion on the glucoside $C_6H_5(OC_6H_4O_2)(OMe)CH_2OH$ [120°], a crystalline body (containing aq) prepared by reduction of glucosyl vanillin (Tiemann B 18, 1595) Prisms, v sol alcohol

Methylene derivative

$C_6H_5(O_2CH_2)CH_2OH$ *Piperonyl alcohol* [51°] Got by reducing piperonal $C_6H_5(O_2CH_2)CHO$ with sodium amalgam and hot water (Fittig a Remsen, A 159, 138) Long crystals, m sol hot water

Reference — CHLORO OXY BENZYL ALCOHOL

OXY BENZYL AMINE $C_6H_5(OH)CH_2NH_2$ [125°] Formed by heating its methyl derivative with $HClAq$ at 150° (Goldschmidt a Ernst, B 23, 2744) and by the action of dilute H_2SO_4 and zinc dust on $C_6H_5(OH)CH_2NHNH_2C_6H_5COH$ (Tiemann, B 23, 3017) Groups of white needles (from ether) Readily sublimates Ferric chloride colours its solution deep violet blue — $B'HCl$ — $B'H_2PtCl_2$, 2aq [197°] Golden needles

Acetyl derivative $C_6H_5(OH)CH_2NHAc$ [140°] Colourless needles, sol alkalis

Methyl derivative $C_6H_5(OMe)CH_2NH_2$ (224° at 724 mm) Formed by reducing the oxim $C_6H_5(OMe)CH_2NOH$ in alcoholic solution with sodium amalgam and $HOAc$ (Goldschmidt a Ernst, B 23, 2742) Liquid, v sol water Yields $C_6H_5(OMe)CH_2NHAc$ [97°] — $B'HCl$ [150°] — $B'H_2PtCl_2$, 2aq [187°] Golden plates

p Oxy benzylamine $C_6H_5(OH)CH_2NH_2$, aq [95°] Formed from p amido benzylamine, $NaNO_2$, and HCl (Salkowski, B 22, 2143) Plates — $B'HCl$ — $B'H_2PtCl_2$, 2aq flat needles

Methyl derivative $C_6H_5(OMe)CH_2NH_2$, (222°) (S), (235°) (G a P) Formed by reducing hydroanisamide in alcoholic solution with sodium amalgam (Steinhart, A 241, 335) Obtained also by reduction from the oxim $C_6H_5(OMe)CH_2NOH$ (Goldschmidt a Polonowski, B 20, 2407) Liquid, sol water, volatile with steam — $B'HCl$ [280°] — $B'HHgCl_2$, aq [300°] Scales — $B'H_2PtCl_2$ [210°] Bright

yellow needles Absorbs CO_2 from the air, forming a compound crystallising in needles [110°] (cf Cannizzaro, A 117, 240)

Acetyl derivative $C_6H_5(OMe)CH_2NHAc$ [96°]

Di-oxy di-benzyl amine $NH(CH_2C_6H_5)_2$, [170°] Formed by reducing hydrosulcalyamide in alcoholic solution with sodium amalgam (Emmerich, A 241, 349) Needles, v sl sol water Gives an oily nitrosamine — $B'H_2PtCl_2$

Di p-oxy di-benzyl amine *Di-methyl derivative* $(C_6H_5(OMe)CH_2)_2NH$ [34°] Formed by the action of $C_6H_5(OMe)CH_2Cl$ on alcoholic ammonia, and also by reducing $(C_6H_5(OMe)OH)_2N_2$ White needles Yields a nitrosamine [80°] — $B'HCl$ [243°]. Flat prisms. — $B'H_2PtCl_2$, 2aq

O OXY BENZYL-ANILINE

$C_6H_5(OH)CH_2.NPhH$ *Phenyl-o amido cresol* [106°] Formed by reducing o oxybenzylidene-aniline with sodium amalgam (Emmerich, A 241, 344) Needles or plates, sl sol water Its nitrosamine is oily — $B'HCl$ [181°] — $B'H_2PtCl_2$ [184°] M sol water

p-Oxy benzyl aniline [208°] Formed in like manner (E) White needles — $B'H_2PtCl_2$

Methyl derivative $C_6H_5(OMe)CH_2.NPhH$ [65°] Formed by reducing $C_6H_5(OMe)CH_2NPh$ (Steinhart, A 241, 337) Prisms Gives a nitrosamine [104°] — $B'HCl$ [163°] — $B'H_2PtCl_2$

DI OXY DI BENZYL BENZENE

$C_6H_5(CHPh)_2$ [171°] Formed by reducing $C_6H_5(COPh)_2$ with sodium amalgam (Wehnen, B 9, 310) Satiny needles (from dilute alcohol) Yields $C_{20}H_{16}AcO_2$ [97°] and $C_{20}H_{16}Ac_2O_2$ [144°]

OXY o BENZYL BENZOIC ACID $C_6H_5O_2$, s.e. $C_6H_5CH(OH)C_6H_5CO_2H$ *Benzhydryl carb-oxylic acid* — KA' amorphous — Baa' . From the anhydride and baryta

Anhydride $C_6H_5CH<\overset{O}{\underset{O}{C}}>CO$ [115°]

Formed by reducing o benzoyl benzoic acid with zinc and HCl (Rotering, J 1875, 596) White insoluble powder

Ezo Oxy m-benzyl-benzoic acid

Formed by reducing m benzoyl benzoic acid with sodium amalgam (Senff, A 220, 242) Satiny needles in hemispherical groups (from hot water). Reduced by $HIAq$ at 170° to m benzyl-benzoic acid — NaA' 4aq — CaA' 5aq — AgA' aq

Oxy-p benzyl-benzoic acid [165°] Formed by reducing p benzoyl benzoic acid (Zincke, A. 161, 102) Needles (from hot water) — NH_4A' — NaA' — KA' — CaA' 5aq — BaA' — AgA' pp

Methyl ether MeA' [110°] Prisms

Ethyl ether EtA' Oil

Oxy benzyl-benzoic acid

$C_6H_5CH_2C_6H_5(OH)CO_2H$ [140°] Formed from benzyl phenol, sodium, and CO_2 (Paterno a Fileti, G 3, 287) Needles (from water), sl sol hot water — AgA' curdy pp, sl sol hot water

DI-OXY BENZYL ETHYL KETONE CARB-OXYLIC ACID *Methylene derivative*

$C_6H_5(O_2CH_2)CH_2CO_2C_6H_5CO_2H$ *Paperketonic acid* [84°] Formed by heating di bromo-piperhydronic acid with aqueous Na_2CO_3 (Weinstein, A 237, 38) Silky needles (from OS_2) — CaA' — AgA' flocculent pp

OXY-BENZYLIDENE-ACETONAMINE a. **ACETONAMINE**

o-OXY-BENZYLIDENE-m-AMIDO-BENZOIC ACID $C_8H_7(OH)CHN(C_6H_4)CO_2H$ [190°]
Formed from salicylic aldehyde and aqueous *m*-amido-benzoic acid (Schriff, *A* 210, 114)
Yellowish needles, *v* *e* sol alcohol

Amide $C_{11}H_9N_3O_2$ [186°] Converted by boiling benzoic aldehyde into crystalline $C_{11}H_9N_3O_2$, whence Ac_2O yields $C_{11}H_9Ac_2N_3O_2$ [220°] The glucosyl derivative of the amide $C_{11}H_{11}O_6$, $C_6H_4CHN(C_6H_4)CONH_2$ [113°] is formed by the action of helicin on *m*-amido-benzamide

Di-oxy-benzylidene-o-amido-benzoic acid
 $C_8H_7(OH)CHN(C_6H_4)(OH)CO_2H$ [5 2 1] [245°]
Formed from oxy amido benzoic acid and salicylic aldehyde. Needles, *v* *e* sol alcohol

DI-OXY-BENZYLIDENE DI-AMIDO-DI-PHENYL $C_{12}H_9N_2[CH(C_6H_4)OH]_2$ [145°] Formed from di-*o*-amido-diphenyl and salicylic aldehyde (Reuland, *B* 23, 3012) Yellow plates

o OXY-BENZYLIDENE-ANILINE
 $C_8H_7(OH)CHNPh$ [51°] *v* Oxy-benzoic ALDEHYDE The *p* isomeride melts at 191°

OXY-BENZYLIDENE ANTHRONE *Ethyl ether* $C_8H_7 \left\langle \begin{smallmatrix} C(Ph OEt) \\ CO \end{smallmatrix} \right\rangle C_6H_4$ [173°]

Formed from bromo benzylidene anthrone and $NaOEt$ (Bach, *B* 23, 2529) Yellow plates, *v* sol ether

OXY - BENZYLIDENE - DICARBAMIC ETHER *Methyl derivative* $C_{11}H_{13}N_2O_4$ *vs* $C_6H_4(OMe)CH(NHCO_2Et)_2$ [172°] Formed from anisic aldehyde and carbamic ether (Bischoff, *B* 7, 1078) Needles (from dil alcohol)

DI-o-OXY-BENZYLIDENE-ETHYLENE-DIAMINE $C_{11}H_{11}N_2O_2$ *vs* $C_6H_4(NCH_2C_6H_4OH)_2$ [126°] Formed from ethylene diamine and *o*-oxy-benzoic aldehyde (Mason, *B* 20, 271) The dimethyl derivative [c 113°] and its *p* isomeride $C_6H_4(NCH_2C_6H_4OMe)_2$ [111°] are both crystalline

o-OXY-BENZYLIDENE-MALONIC ACID *Methyl derivative* $C_8H_7(OMe)CH(CO_2H)_2$ [178°] Formed by heating a mixture of malonic acid, $C_6H_4(OMe)CHO$, and $HOAc$ at 100° (Stuart, *C* J 53, 142)

OXY-BENZYLIDENE NAPHTHYLAMINE
 $C_{12}H_9(OH)CHNC_6H_4$, The *o* [121°] and *p* [220°] compounds are formed from (8) naphthylamine and the corresponding oxy benzoic aldehydes (Emmerich, *A* 241, 350)

o-OXY-BENZYLIDENE DITHIOGLYCOLLIC ACID $C_8H_7(OH)CH(SCH_2CO_2H)_2$ [148°] Formed from *o*-oxy-benzoic aldehyde, thioglycollic acid, and $ZnCl_2$ (Bongartz, *B* 21, 478)

o OXY-BENZYLIDENE p TOLUIDINE
 $C_8H_7(OH)CHNC_6H_4$ [100°] (Jaillard, *J* 1865, 428, *v* OXY-BENZOIC ALDEHYDE)

OXY BENZYLIDENE DI UREA
 $C_8H_7(OH)CH(NH.CO NH_2)_2$, *v* *o*-OXY-BENZOIC ALDEHYDE

OXY-BENZYL-MALONIC ACID *Ethyl derivative* $C_8H_7CH(OEt)CH(CO_2H)_2$ [c 120°] Formed from benzylidene malonic acid and cold alcoholic KOH (Claisen a Crismer, *A* 213, 141) Crystalline. Split up at 120° into alcohol and benzylidene malonic acid [192°] — K_2A — Ag_2A

Isomeride *v* BENZYL-TARTRONIC ACID

OXY BENZYL-METHYL-ETHYL-PYRIMIDINE

INE $CH_2Ph C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle OEt$ [193 5°]

Formed from phenyl acetamidine hydrochloride, ethyl-acetoacetic ether, dilute (10 p c) $NaOH$, and alcohol (Pinner, *B* 22, 1623) Needles, *m* sol water, *v* *e* sol alcohol

Di-oxy-benzyl-methyl-ethyl pyrimidine

$CH(OH)Ph C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle OEt$ [148°–152°]

Formed from oxy phenyl acetamidine, acetoacetic ether, and $NaOHAq$ (Pinner, *B* 23, 2951)

OXY BENZYL METHYL-PYRIMIDINE

$CH_2Ph C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle CH$ [175°] Formed from phenyl acetamidine, acetoacetic ether, alcohol, and dilute (10 p c) $NaOH$ (Pinner, *B* 22, 1622) Prisms, *m* sol hot water

Oxy-benzyl-di methyl pyrimidine

$CH_2Ph C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle CMe$ [181°] Formed from phenyl acetamidine, methyl acetoacetic ether, and $NaOHAq$ (P) *M* sol water

Oxy-di-benzyl-methyl-pyrimidine

$CHPh C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle CCH_2Ph$ [192°] Formed from phenyl acetamidine, benzyl acetoacetic ether, and $NaOHAq$ (P) Needles, *insol* water

Di-oxy-benzyl-methyl-pyrimidine $C_{11}H_{11}N_2O_2$, *vs* $CH(OH)Ph C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle CH$ [216°]

Formed from oxy-phenyl acetamidine, $NaOHAq$ and acetoacetic ether in the cold (Pinner, *B* 23, 2949) Long needles, *v* *sl* sol water, *sl* sol alcohol, sol acids and alkalis — B/HCl [217°] Needles — $B/C_6H_5(NO_2)_2OH$ [175°] $AgC_6H_5N_2O_2$ white pp

Acetyl derivative

$CH(OAc)Ph C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle CH$ [170°] Formed by boiling with Ac_2O Yields $AgC_6H_5N_2O_2$, B/HCl [188°], and $B/C_6H_5(NO_2)_2OH$ [160°]

Benzoyl derivative $C_{11}H_9BzN_2O_2$, [205°–208°] — B/HCl [240°] From the base and $BzCl$

Di-oxy-benzyl methyl pyrimidine [233°] Got from potassium methyl-uracil and benzyl chloride (Hagen, *A* 244, 1)

Di-oxy benzyl-di methyl pyrimidine

$CH(OH)Ph C \left\langle \begin{smallmatrix} N CMe \\ N C(OH) \end{smallmatrix} \right\rangle CMe$ [155°] Formed from oxy phenyl-acetamidine, $NaOHAq$, and methyl-acetoacetic ether (Pinner, *B* 23, 2951) — $B/HOAc$ needles — $AgC_6H_5N_2O_2$ white pp

OXY - BENZYL - (8) NAPHTHYLAMINE

The following compounds have been prepared by reducing the products of the action of (8) naphthylamine on the corresponding aldehydes (Steinhart, *A* 241, 341, Emmerich, *A* 241, 352) —

1 2] $C_6H_4(OH)CH_2NHC_6H_4$, [147°] — B/HCl [189°]

[1 2] $C_6H_4(OMe)CH_2N(NO)C_6H_4$, [165°]

[1 2] $C_6H_4(OMe)CH_2NH C_6H_4$, [92°] (223°)

[1 4] $C_6H_4(OH)CH_2NHC_6H_4$, [117°]

[1 4] $C_6H_4(OH)CH_2N(NO)C_6H_4$, [142°]

[1 4] $C_6H_4(OMe)CH_2NHC_6H_4$, [101°] — B/HOL

[195°] — B/HCl — *Nitrosamine*

$C_6H_4(OMe)CH_2N(NO)C_6H_4$, [138°]

OXY-BENZYL-ISOPHTHALIC ACID *Benz-hydryl-isophthalic acid Anhydride*

$C_6H_5CH<\begin{smallmatrix} C_6H_5(CO_2H) \\ CO \end{smallmatrix}>$. [207°]. Formed by the action of zinc and HClAq on benzoyl isophthalic acid (Zincke, *B* 9, 1763) Needles (from dilute alcohol) —BaA', 2½ aq —AgA' pulverulent pp. —EtA' [115°] An isomeric acid, obtained by reduction of benzoyl terephthalic acid, forms $Ca(C_{11}H_9O_4)_2$ 8 aq (Weber, *J* 1878, 408)

p-OXY-BENZYL-PHTHALIMIDINE

Formed from the amido compound by the diazo reaction (Hafner, *B* 23, 344) Red needles Converted by conc HClAq at 150° into a base $C_6H_5NO_2$

OXY BENZYL PYRIDINE TETRAHYDRIDE

done [118°] Formed by distilling δ amido α-benzyl valeric acid (Aschan, *B* 23, 3696) Pearly plates (from hot water) $B'O_2H_2(NO_2)_2 \cdot OH$ [97°] Crystals, sl sol water

Nitrosamine $C_6H_5(NO)NO$ [62 5°]

OXY BENZYL PYRIMIDINE CARBOXYLIC

Formed from phenyl acetamidine, oxalacetic ether, and (10 p c) NaOHAq (Finner, *B* 22, 1627) Prisms, v sl sol water

OXY BENZYL PYROTARTARIC ACID

$C_6H_5CH(OH)CH(CO_2H)CHMeCO_2H$ Phenylhomotartaric acid Formed from benzoic aldehyde, sodium pyrotartrate, and Ac_2O at 125° (Penfield, *A* 216, 119, Fittig a Liebmann, *A* 255, 257) The acid splits up, at the moment of liberation, into water and anhydride — $CaC_{11}H_9O_4$ 3 aq —BaA' 2 aq —AgA'

Anhydride C_6H_5O Phenylhomoparaconic acid [177°] Plates (from water) — $AgC_{11}H_9O_4$ crystals, m sol water —BaA' 2 aq. —CaA'

Isomeride

$C_6H_5CH(OH)CMe(CO_2H)CH_2CO_2H$ Formed together with the preceding acid Its salt $BaC_{12}H_{10}O_4$ is got by heating the anhydride with baryta water —CaA' aq —AgA' bulky flocculent pp

Anhydride $CHPh<\begin{smallmatrix} CMe(CO_2H) \\ O CO CH_2 \end{smallmatrix}>$. [124 5°] Yields $Ba(C_{12}H_{10}O_4)_2$, CaA', 2 aq, and AgA'

DI-OXY-BENZYL-QUINOLINE CARB-

OXILYIC ACID Ethyl derivative

$C_6H_5<\begin{smallmatrix} CO \\ N \end{smallmatrix}>C(C_6H_5)(CO_2H) \quad [147^\circ]$ Formed by reducing benzyl o nitro benzoyl malonic ether (Bischhoff, *B* 22, 386)

OXY BENZYL SUCCINIC ACID $C_{11}H_9O_4$ 1 e $PhCH(OH)CH(CO_2H)CH_2CO_2H$ Its salts are formed by warming the anhydride with bases — $CaC_{11}H_9O_4$ —BaA' 2 aq —AgA'

Ethyl ether

Phenyl-paraconic acid [99°] Formed by heating sodium succinate with benzoic aldehyde and Ac_2O (Fittig a Jayne, *A* 216, 108, 256, 63) Needles (from water), converted by NaOEt into

phenylitaconic acid. Yields $Ca(C_{11}H_9O_4)_2$ 2 aq, BaA', 2 aq, and AgA', and the ether EtA' (252° at 25 mm)

p OXY-BENZYL-THIOCARBIMIDE

$C_6H_5(OH)CH_2NCS$ From p oxy benzylamine, CS_2 , and $HgCl_2$ (Salkowski, *B* 22, 2144) Liquid, sol alkalis

p-OXY-BENZYL-THIO-UREA Methyl derivative $C_6H_5(OMe)CH_2NHCSNH_2$ [95°] (Goldschmidt a Polonowska, *B* 20, 2409)

Di oxy di benzyl-thio urea $C_6H_5(OMe)CH_2NHCSNH_2$ Di methyl derivative $C_6H_5(OMe)CH_2NHCSNH_2$ [150°]

o OXY BENZYL p TOLUIDINE $C_{11}H_9NO$ 1 e $C_6H_5(OH)CH_2NH C_6H_4Me$ [116°] Formed by reducing o oxy benzylidene p toluidine in alcoholic solution with sodium amalgam (Emmerich, *A* 241, 346) Crystals Yields the methyl derivative $C_6H_5(OMe)CH_2NH C_6H_4Me$ [110°] and a tetra nitro derivative [168°] —B'HCl [147°] — $B'_2H_2PtCl_4$ reddish yellow needles

p Oxy benzyl p toluidine [186°] Yields $B'_2H_2PtCl_4$ and $C_6H_5(OMe)CH_2NH C_6H_4Me$ [68°], whence B'HCl [160°], $B'_2H_2PtCl_4$ and the nitrosamine $C_6H_5(OMe)CH_2N(NO) C_6H_4Me$ [108°]

p oxy benzyl o toluidine Methyl derivative [55°] Triangular plates (Steinhart, *A* 241, 340) Yields an oily nitrosamine

o-OXY-BENZYL-UREA $C_6H_5N_2O_4$ 1 e $C_6H_5(OH)CH_2NH CO NH_2$ [170°] Formed by warming o oxy benzylamine hydrochloride with potassium cyanate (Goldschmidt a Ernst, *B* 23, 2745) Prisms, v sol hot water

Methyl derivative

p Oxy benzyl-urea Methyl derivative [167°] Needles (Goldschmidt a Polonowska, *B* 20, 2409)

δ OXY α BENZYL-VALERIC ACID

$CH_2(OH)CH_2CH_2CH(CH_2Ph)CO_2H$ Formed from nitroso oxy benzyl pyridine tetrahydride and NaOHAq (Aschan, *B* 23, 3697). Liquid, m sol hot water

γ Oxy β-benzyl-valeric acid

$CH_2CH(OH)CH(CH_2Ph)CH_2CO_2H$ [76°] Formed by carefully adding dilute HCl to its Ca salt obtained from the lactone (Erdmann, *A* 254, 217) Prisms (containing aq) Melts at 56° when hydrated HClAq converts it into the lactone. — $Ca(C_{11}H_9O_4)_2$ 4 aq —CaA', 6 aq

Got by reducing benzyl acetyl propionic acid [99°] with sodium amalgam, and boiling the product with dilute H_2SO_4 . Large crystals

DI-OXY-BUTANE $CH_3(OH)CH_2(OH)$

n-Butylene glycol Mol w 90 (192°) SG 1.0189 Obtained from α-di-bromo-*n*-butane by boiling with baryta water (Grabowsky a Saytzeff, *A* 179, 325). Liquid, v sol water. Yields glycollic and glyoxylic acids on oxidation

Di-oxy-butane $C_4H_{10}O_2$ 1 e $CH_3(OH)CMe_2OH$ Isobutylene glycol (178°) SG 1.139 Formed from the bromide and K_2CO_3 (Nevolé, *C* R 83, 65, 146) and by the action of HClAq on isobutyl alcohol (Lwoff, *Bl* [2] 43, 112) Formed also in the alcoholic fermentation of sugar (Henninger a Sanson, *C* R 95, 91, 106, 208) Does not form an acetal with aldehyde (Loebert, *A* Ch, [6] 16, 58).

Di-oxy-butane $\text{CHMe}(\text{OH})\text{CHMe}(\text{OH})$ (184°)

Formed by heating *s*-butylene oxide with water at 100° (Eiltekoft, *J R* 14, 372) Liquid

Di-oxy-butane $\text{CHMe}(\text{OH})\text{CH}_2\text{CH}_2\text{OH}$ (*B*-

Butylene glycol. (207°) SG \pm 1.0259 Formed by reduction of a dilute, slightly acid, solution of aldol by sodium-amalgam (Kekulé, *B* 5, 56, *A* 162, 810, Wurtz, *C R* 97, 478) Thick liquid, miscible with water Ac_2O at 100° forms $\text{C}_4\text{H}_8(\text{OAc})_2$ (207°) SG \pm 1.055 HIAq yields $\text{C}_4\text{H}_8\text{I}_2$ SG \pm 2.291

Di-oxy-butane $\text{C}_4\text{H}_8(\text{OH})_2$ (184°) SG \pm 1.048 Obtained, *via* $\text{C}_4\text{H}_8(\text{OAc})_2$ (c 200°), from the crude $\text{C}_4\text{H}_8\text{Br}_2$ got from fusel oil (Wurtz, *A Ch*. [3] 55, 452) Liquid, miscible with water

Di-oxy-butane $\text{CH}_2(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2(\text{OH})$ *Tetramethylene glycol* (204°) SG 1.011 Formed by the action of dilute H_2SO_4 on tetramethylene diamine $\text{C}_4\text{H}_{10}(\text{NH}_2)_2$ (Dekkers, *R. T C* 9, 101)

Tri-oxy-butane

$\text{CH}_2\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}_2(\text{OH})$ *Butenylglycerol* (178° at 27 mm) Formed from crotonic aldehyde by reduction, addition of bromine, and boiling the resulting $\text{CH}_3\text{CHBrCHBrCH}_2\text{OH}$ with water (Lieben & Zeisel, *M* 1, 832) Thick liquid with sweet taste Ac_2O yields $\text{C}_4\text{H}_8(\text{OAc})_3$ (262°) Yields $\text{C}_4\text{H}_8(\text{OH})_3\text{Cl}$, $\text{C}_4\text{H}_8(\text{OH})\text{Cl}_2$, and $\text{C}_4\text{H}_8\text{OCl}_2$ (Zikes, *M* 6, 348)

Tri-oxy-butane $\text{C}_4\text{H}_8\text{O}_3$ (240° at 18 mm) Formed from isobutyl iodide by chlorinating and heating the resulting tri-chloro butane with water at 170° (Prunier, *Bl* [2] 42, 261, *C R* 99, 193) Yields nearly solid $\text{C}_4\text{H}_8(\text{OAc})_3$

Tetra-oxy-butane *v* **ERYTHRITE**

OXY-BUTANE TRICARBOXYLIC ACID $\text{CMe}(\text{OH})(\text{CO}_2\text{H})\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$

Lactone $\text{C}_4\text{H}_6\text{O}_4$ Formed by heating acetosuccinic ether with KCy and HCl (Rach, *A* 284, 36) At 180° it yields pyrocinchonic anhydride — BaA'' . — CaA'' — $\text{Ca}_2(\text{C}_4\text{H}_6\text{O}_4)_n$ — $\text{Ba}_2(\text{C}_4\text{H}_6\text{O}_4)_n$

Di-oxy-butane tetra-carboxylic ether $\text{CH}(\text{CO}_2\text{Et})_2\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{CO}_2\text{Et})_2$ Formed by the action of malonic ether on glyoxal in presence of conc ZnCl_2 Aq (Polonowsky, *A* 246, 2) Oil, not volatile with steam

Tetra oxy butane tri carboxylic acid $\text{CO}_2\text{HCH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{O}(\text{OH})(\text{CO}_2\text{H})_2$ [147°] Formed by oxidation of levulose carb-oxylic acid by dilute HNO_3 (Dull, *B* 24, 848) — $\text{K}_2\text{HA}''$ Large prisms — $\text{Ca}_2\text{A}''$, 6aq

OXY-BUTANE PHOSPHONIC ACID

$\text{O}_2\text{HCH}(\text{OH})\text{PO}(\text{OH})_2$ [168°] Formed from isobutyric aldehyde by successive treatment with PCl_3 and water (Fossek, *M* 5, 640) Trimetric crystals, $a b c = 97.1394$

OXY-ISOBUTANE SULPHONIC ACID $\text{CMe}(\text{OH})\text{CH}_2\text{SO}_3\text{H}$ Formed from ammonium sulphite solution and isobutylene bromide or $\text{CH}_3\text{Br CMe}_2\text{OH}$ (Guareschi & Garzino, *Ann. chim. farm.* [4] 6, 110, 9, 96) — BaA' , 1½aq — NaA' plates (from alcohol)

DI-OXY BUTYL-BENZENE $\text{C}_{10}\text{H}_{18}\text{O}_2$ *s.s* $\text{C}_4\text{H}_9\text{CH}(\text{OH})\text{C}_2\text{H}_5\text{CH}_2\text{OH}$ (200°) Formed by the action of sodium-amalgam on an alcoholic solution of $\text{C}_4\text{H}_9\text{CO}_2\text{C}_2\text{H}_5\text{CHO}$ which is got from phenyl propyl ketone by successive treatment with CrO_3Cl_2 and water (Burcker, *C R* 94, 220). Syrup. Forms only $\text{C}_{10}\text{H}_{18}(\text{OAc})_2$

ISOBUTYL o-OXY BENZOIC ACID

$\text{C}_4\text{H}_9(\text{C}_2\text{H}_5)(\text{OH})\text{CO}_2\text{H}$ [421] Formed from $\text{C}_4\text{H}_9(\text{C}_2\text{H}_5)\text{ONa}$ and CO_2 at 140° (Dobrzycki, *J pr* [2] 86, 391) Needles — CaA' , 6aq — BaA' , 2aq needles, v sol water

Ethers MeA' [54°] (266°) — EtA' (276°) Oil — $\text{C}_4\text{H}_9\text{A}'$ [68°] Formed from the acid, phenol, and POCl_3 Converted by long boiling into $\text{C}_{11}\text{H}_{18}\text{O}_2$ [158°]

DI OXY-BUTYLENE $\text{C}_4\text{H}_8(\text{OH})_2$ *Crotonylene glycol* (197°) SG \pm 1.0616, \pm 1.0465 Obtained by the action of boiling baryta on its formyl derivative which is formed when erythrite is distilled with formic acid (Henninger, *B* 5, 1060, *A Ch* [6] 7, 215) Liquid, sol water Yields $\text{C}_4\text{H}_8(\text{OAc})_2$ (208°)

DI-OXY-DI BUTYL DIKETONE

Anhydride $\begin{array}{c} \text{CH}_2 \quad \text{CH}_2 \\ \diagdown \quad \diagup \\ \text{O} \end{array} > \text{C} < \begin{array}{c} \text{CH}_2 \quad \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{O} \end{array} \text{CHMe}$

Di methyl-oxetone (169.5° V) SG \pm 0.978 Formed, together with CO_2 , by heating its carb

oxylic acid $\begin{array}{c} \text{CH}_2 \quad \text{CH}(\text{CO}_2\text{H}) \\ \diagdown \quad \diagup \\ \text{O} \end{array} > \text{C} < \begin{array}{c} \text{CH}_2 \quad \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{O} \end{array} \text{CHMe}$ (divalonic acid) [130°] which is got by the action of NaOHAq at 90° on 'divalolactone,' the product of the action of NaOHAq on valerolactone (Fittig, 256, 128) Liquid Volatile with steam

OXY BUTYL MALEIC ACID *Lactone*

$\text{CHPr} < \begin{array}{c} \text{C}(\text{CO}_2\text{H})_2 \\ \diagup \quad \diagdown \\ \text{O} \end{array} > \text{CH}$ *Propaconic acid*

[124°] Formed by distilling the bromide of propyl itaconic acid with steam, the acid remains behind and is extracted with ether (Fittig, *A* 256, 108) — Needles — BaA'

OXY BUTYL MALONIC ACID $\text{C}_4\text{H}_8\text{O}_4$ *s.s* $\text{C}_4\text{H}_9\text{C}(\text{OH})(\text{CO}_2\text{H})_2$ [110°–114°] Obtained from $\text{C}_4\text{H}_9\text{CCl}(\text{CO}_2\text{Et})_2$ and KOHAq (Conrad & Bischoff, *B* 13, 600, 14, 617, Guthzeit, *A* 209, 237) Deliquescent mass, v e sol water

DI OXY ISOBUTYL METAPYRAZOLE

$\text{C}_4\text{H}_7\text{N}_2\text{O}_2$ *s.s* $\begin{array}{c} \text{C}_4\text{H}_7\text{CH} - \text{N} \\ | \quad \diagup \\ \text{C}(\text{OH}) \quad \text{N} \end{array} > \text{C}(\text{OH})$ [210°]

Obtained by boiling with dilute HCl the product ($\text{C}_4\text{H}_7\text{CH}(\text{CN})\text{NHCO}_2\text{NH}_2$) of the action of urea upon valeric aldehyde-cyanhydrin Small white needles M sol alcohol and hot water, sl sol cold water Dissolves readily in alkalis (Pinner & Lufschütz, *B* 20, 2356)

OXY BUTYL SUCCINIC ACID The salts are got by the action of bases on the anhydride $\text{Ca}(\text{C}_4\text{H}_7\text{O}_4)_2$ 5aq — BaA'' 2aq — AgA'' *Anhydride* $\text{CHPr} < \begin{array}{c} \text{CH}(\text{CO}_2\text{H})_2 \\ \diagup \quad \diagdown \\ \text{O} \end{array} > \text{CH}_2$ *Propyl paraconic acid* [73.5°] Formed by heating butyric aldehyde with sodium succinate and Ac_2O (Schmidt, *A* 255, 68) Needles (from ligroin) Yields heptenoic acid and oxy heptenoic lactone on distillation — $\text{Ca}(\text{C}_4\text{H}_7\text{O}_4)_2$ 2aq — BaA' , — AgA' . *Ethyl ether* EtA' (c 214° at 96 mm)

Oxy-isobutyl-succinic acid *Salts.* — $\text{Ba}(\text{C}_4\text{H}_7\text{O}_4)_2$ 2aq — $\text{Ag}_2\text{A}''$

Anhydride Formed, like the preceding isomeric, using isobutyric aldehyde (Zanner, *A* 255, 86) — $\text{Ba}(\text{C}_4\text{H}_7\text{O}_4)_2$ 3aq — CaA' 2aq — AgA'

OXY-BUTYRAMIDINE $\text{C}_4\text{H}_9\text{N}_2\text{O}_2$ *s.s* $\text{CMe}(\text{OH})\text{C}(\text{NH})\text{NH}_2$ The crystalline hydrochloride is formed from oxy-butyrimido-ethyl ether and NH_3 (Pinner, *B* 17, 2009) It is v. e. sol water

α-OXY-*n*-BUTYRIC ACID $C_4H_7O_3$, 18
 $CH_3CH(OH)CO_2H$, Mol w 104 [43°] Formed by the action of moist Ag_2O upon bromo-*n*-butyric acid (Naumann, *A* 119, 115, Friedel & Machuga, *A* 120, 279), and by the action of HCl and HCl on propionic aldehyde (Prachibiteck, *B* 9, 1312) Formed also by reduction of ethylglyoxylic acid Deliquescent crystals Yields propionic acid on oxidation (Markownikoff, *A* 176, 309, Ley & Popoff, *A* 174, 81) — CaA' , 6aq ZnA' , 2aq S 2.35 at 18° — AgA' prisms

Ethyl ether EtA' (167° 1 V) SG 2 1.004, 12 995 (Schreiner, *B* 12, 177, *A* 197, 21). Yields ethyl glyoxylic ether on oxidation (Aristoff & Demjanoff, *C* 1887, 1157) Acetyl derivative $CH_3CO(OAc)CO_2Et$ (198°) (Gal, *A* 142, 373) Butyryl derivative (215°)

Methyl derivative $CH_3CO(OMe)CO_2H$ Formed from its Me and Et ethers which are made by the action of $NaOMe$ on bromo butyric ether (Duvillier, *C* 86, 47, 1026, 87, 981, 88, 598, *A* *Ch* [5] 17, 528) Liquid, sol water — AgA' — MeA' (150°–155° 1 V) — EtA' (160°) (D), (148° 1 V) (Schreiner, *A* 197, 16)

Ethyl derivative $CH_3CO(OEt)CO_2H$. Formed from its ether, which is made from bromo butyric ether and $NaOEt$ Liquid, v sol water — KA' — BaA' — AgA' — MeA' (157°) — EtA' (168°–174°) (D), (169° 1 V) (S)

Methyl derivative of the amide $CH_3CO(OH)CONH_2$ [78°] Formed from $CH_3CO(OH)CO_2Me$ and alcoholic NH_3 (D) Slender needles, v sol water

Ethyl derivative of the amide $CH_3CO(OEt)CONH_2$ [69°] Laminæ, sol water **β-Oxy-*n*-butyric acid**

$CH_3CH(OH)CH_2CO_2H$ Occurs in urine and blood of diabetic patients (Kulz, *Zeit Biol* 20, 165, 23, 329, Munkowski, *Er* 24, 153, Stadelmann, *Zeit Biol* 32, 456, Wolpe, *C* 1887, 277, Hugouenq, *Bl* [2] 47, 645, Deichmuller, Szymanski, *A* Tollens, *A* 228, 92) Formed by reducing acetoacetic acid with sodium amalgam (Wislicenus, *A* 149, 205), and from propylene chlorhydrin by successive treatment with KCy and KOH (Markownikoff, *A* 153, 237) Obtained also by oxidising aldol with moist Ag_2O (Wurtz, *C* 76, 1165) Thick syrup, volatile with steam Decomposes at 130° into water and (α)-crotonic acid When prepared from urine it is levorotatory, $[α]_D = -23.4$ — NaA' very deliquescent needles — ZnA' — CuA' — AgA'

Ethyl derivative $CH_3CH(OEt)CH_2CO_2H$ (c 215°) Formed by the action of HCl on the nitrile, which is formed by combining allyl cyanide with alcohol (Pinner, *B* 12, 2057)

Amide $CH_3CH(OEt)CH_2CONH_2$ [71°]

γ-Oxy-*n*-butyric acid $CH_3CH(OH)CH_2CH_2CO_2H$ Obtained by the action of boiling lime- or baryta water upon its lactone, which is formed by treating succinyl chloride, dissolved in $HOAc$ and ether, with sodium-amalgam (Saytzeff, *B* 6, 1255, *A* 171, 270, *J* pr [2] 25, 66, *Bl* [3] 37, 540) Formed also from $CH_3BrCH_2CH_2OH$ by successive treatment with alcoholic KCy and potash (Fruhling, *M* 8, 700), and by boiling oxy-ethyl-acetoacetic ether with conc baryta-water (Ochanlaroff, *A* 226, 825) Liquid, which volatilises in the cold Volatile with steam Sol water. Forms the

lactone slowly in the cold, more quickly on heating Chromic acid mixture oxidises it to succinic acid — KA' deliquescent tufts — NaA' — ZnA' (dried at 100°) — BaA' (dried at 110°) dendritic mass (from alcohol)

Lactone $CH_3CH_2CH_2CO$ (206°). SG

§ 1 1441, 1/2 1 1286 CE (0° to 16°) 00086 **Butyrolactone** Formed as above Formed also by heating the lactonic acid of γ oxy ethyl malonic acid at 120° (Röder, *A* 227, 22), and by heating γ chloro butyric acid at 200° (Henry, *C* 101, 1158) Mobile liquid, miscible with water, but separated therefrom by K_2CO_3 . May be converted into *n*-butyric acid by successive treatment with HI and sodium amalgam

α-Oxy isobutyric acid $(CH_3)_2C(OH)CO_2H$ **Acetonic acid** **Butylactic acid** [79°] (212°)

Formation —1 From acetone, HCl , and $HClAq$ (Stadeler, *A* 111, 320) —2 From bromo isobutyric acid and moist Ag_2O or Na_2CO_3Aq (Markownikoff, *A* 146, 339, 153, 228, 251, Fittig, *A* 200, 70) —3 From dimethyl oxalate by treatment with $ZnMe$, followed by water (Frankland & Duppa, *A* 133, 80, 135, 25) —4 By oxidising isobutyric acid with alkaline $KMnO_4$ (R Meyer, *A* 219, 240) —5 By oxidising di oxy pentane (amylene glycol) with diluted HNO_3 (Wurtz, *A* 107, 197) —6 By heating acetone chloroform with water at 180° (Willgerodt, *B* 15, 2807, *Bl* [2] 89, 157) Hygroscopic needles, v sol water, alcohol, and ether Volatile with steam Sublimes at 50° Yields acetone and acetic acid on oxidation Phenyl hydrazine at 160° forms a ψ-phenyl hydrazide [152°] converted by nitrous acid into a nitrosamine [98°] (Reissert & Kayser, *B* 22, 2926)

Salts — BaA' — ZnA' , 2aq hexagonal plates, sl sol water S 6 at 15° — AgA' stellate groups of nacreous scales S 7

Ethyl ether EtA' (151°)

Ethyl derivative $(CH_3)_2C(OEt)CO_2H$ (180°) SG § 1 0211, 1/2 1 0101 Formed from CMe_2BrCO_2H and $KOEt$ (Hell & Waldbauer, *B* 10, 449) — BaA' , aq — PbA' , aq — ZnA' — AgA' plates in sol water — EtA' (155°)

Isopropylidene derivative $C_6H_{12}O_4$ SG SG (197° uncor) VD 120.3 (calc 124) Formed by the action of KOH (8 mols) on acetone chloroform (2 mols) and acetone (1 mol), or upon a mixture of chloroform (1 mol) and acetone (2 mols) (Willgerodt, *B* 20, 2445, Engel, *C* 104, 688) Liquid, converted into oxy isobutyric acid by heating with water — CaA' 1/2 aq — BaA' 1/2 aq — PbA' (W), PbA' 2aq (E) — ZnA' aq small scales (W), ZnA' 2aq (E).

Nitrile v ACETONE CYANHYDRIN, vol i p 31 **Anhydride** $C_4H_4O_3$, s.s. $O(CMe_2CO_2H)_2$

Diethyl lacto acid A product of the action of alcoholic potash on chloro isobutyric acid (Balbiano, *J* 1873, 704, 1880, 789) Amorphous, v sol water — NaA' deliquescent

α,β-Di-oxy-butyric acid

$CH_3CH(OH)CH(OH)CO_2H$ [80°]. Formed by boiling bromo-oxy butyric acid with water (Kolbe, *J* pr [2] 25, 390), and by heating β-methylglycidic acid with water at 100° in sealed tubes (Melikoff, *J* R. 18, 526, *B* 21, 2055). Mass of slender needles, v sol water, not volatile with

steam.—AgA' needles Gives a silver mirror when boiled with water.

Ethyl ether EtA' (c 228°) Liquid.

Anhydride v. METHYL-GLYCIDIC ACID

γ-Di-oxy-butyric acid

$\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ *Butylglyceric acid* Formed from $\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{Cl}$ by successive treatment with KOy and dilute HNO_3 (Hanriot, *A Ch* [5] 17, 106) Formed also by warming its anhydride with water (Melikoff, *B* 15, 2587) Thick liquid, v sol water, alcohol, and ether —BaA', amorphous

Anhydride $\text{CH}_2\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$ *Butylglycidic acid* Formed from (8) crotonic acid by successive treatment with HOCl and alcoholic potash Mobile liquid Unites with HCl, forming chloro oxy butyric acid [99°] The ether $\text{C}_2\text{H}_5\text{EtO}$, (145°–150°), SG 215 9931 is formed by the action of sodium amalgam on a mixture of epichlorhydrin and chloroformic acid (Kelly, *B*, 11, 2225)

Di-oxy-isobutyric acid $\text{CH}_2(\text{OH})\text{CMe}(\text{OH})\text{CO}_2\text{H}$ [100°] Formed from a methyl glycidic acid (q v) by warming with water at 100° (Melikoff, *J R* 15, 535) Prisms, v sol water —KA' 3aq small prisms

Tri-oxy-isobutyric acid $(\text{CH}_2(\text{OH}))_2\text{C}(\text{OH})\text{CO}_2\text{H}$ [116°] Formed from glycerose by successive treatment with HCl and HCl (Fischer a Tafel, *B* 22, 106) Prisms (from alcohol), insol benzene HIAq followed by zinc dust yields isobutyric acid —CaA', 4aq —PbA', aq needles, sl sol hot water

A tri-oxy-butyric acid is also formed in the oxidation of gallic acid and tannin by dilute HNO_3 (Böttinger, *A* 257, 248)

References —Bromo- and Chloro-oxybutyric acids.

β-OXY-*n*-BUTYRIC ALDEHYDE v. ALDOL.

α-OXY-ISOBUTYRIC ALDEHYDE

$\text{CMe}_2(\text{OH})\text{CHO}$ (c 90°) Obtained by boiling with HOAc the compound $\text{C}_{11}\text{H}_{22}\text{O}$, formed by the action of NaOC_2H_5 on iodoform (Gorboff, *J pr* [2] 41, 243) Mobile liquid, oxidised by Ag_2O to oxy-isobutyric acid [79°] Forms with water a hydrate [c 70°] Polymerises on standing, forming prisms [c 65°] v sol water

Di-isobutyl derivative of oxyisobutyric orthoaldehyde $\text{CMe}_2(\text{OC}_2\text{H}_5)_2\text{CH}(\text{OH})(\text{OC}_2\text{H}_5)$ (125°) SG 2 9041 One of the products of the action of iodoform (or iodine) on NaOC_2H_5 . Oil, with bitter taste Converted by HOAc into isobutyl acetate and oxyisobutyric aldehyde

OXY BUTYRIC IMIDO-ETHYL ETHER $\text{CMe}_2(\text{OH})\text{C}(\text{NH})\text{OEt}$ The hydrochloride $\text{C}_2\text{H}_5\text{NO}_2\text{HCl}$ is formed from acetone, HCl, alcohol, and HCl (Pinner, *B* 17, 2009) It is crystalline

OXYBUTYROCYNAMINE v GUANIDO BUTYRIC ACID

OXY-CAFFEINE v. CAFFEINE

OXY-CAMPHOR v. CAMPHOR and CAMPHOLENIC

OXY-CAMPHORAMIC ACID v. CAMPHORIC ACID

OXY-CAMPHORIC ACID v. CAMPHORIC ACID.

OXY-CAMPHORIC ANHYDRIDE v. CAM-

PHANIC ACID

OXY-CAMPHORONIC ACID v. CAMPHORONIC ACID.

OXY CAPROIC ACID v Oxy-HEXOIC ACID

OXYTRICARBALLYLIC ACID *Methyl derivatives* $\text{C}_2\text{H}_5(\text{OMe})(\text{CO}_2\text{H})_3$ Formed by heating $(\text{C}_2\text{H}_5)_3\text{C}(\text{OMe})\text{CO}_2\text{H}$ with dilute HNO_3 (Schatzky, *J R* 17, 85) Syrup —CaH₂A', 3aq —BaH₂A', 2aq

OXY-CARBOSTYRIL v Di OXY-QUINOLINE

OXY-CARBOXYLIC ACID v BENZENE TRI-QUINONE

OXY-*o* CARBOXY-PHENYL-ACETIC ACID

$\text{CO}_2\text{H}\text{C}_6\text{H}_4\text{CH}(\text{OH})\text{CO}_2\text{H}$ Formed from $\text{CO}_2\text{H}\text{C}_6\text{H}_4\text{CO}\text{CO}_2\text{H}$ and sodium amalgam (Scherks, *B* 18, 381) Quickly changes, when set free, to the anhydride (phthalide carboxylic acid) [149.5°]

Oxy-carboxy-di-phenyl acetic acid

$\text{C}_6\text{H}_5(\text{CO}_2\text{H})\text{CPh}(\text{OH})\text{CO}_2\text{H}$ [c 80°] Formed by warming benzil *o* carboxylic acid with alkalis (Graebe, *B* 21, 2003) —KA' 2aq

Di-oxy-di-carboxy-phenyl acetic acid *Triethyl-ether* $\text{C}_2\text{H}_5(\text{OH})_2(\text{CO}_2\text{Et})_2\text{CH}\text{CO}_2\text{Et}$ [98°] Formed from acetone dicarboxylic ether and sodium (Cornelius a Pechmann, *B* 19, 1448) Needles (from alcohol), insol water

γ-OXY-*o* CARBOXY-PHENYL-BUTYRIC ACID *Lactone* $\text{C}_{11}\text{H}_{12}\text{O}_4$ [121°] Formed by reducing the anhydride of carboxy benzoyl propionic acid with sodium amalgam (Roser, *B* 17, 2773) —Ag $\text{C}_{11}\text{H}_{12}\text{O}_4$ —Ag $\text{C}_{11}\text{H}_{12}\text{O}_4$

An isomeric lactone [140°] is obtained by reducing phthalyl propionic acid (Gabriel a Michael, *B* 11, 1681) —Ba $\text{C}_{11}\text{H}_{12}\text{O}_4$ —Ba $(\text{C}_{11}\text{H}_{12}\text{O}_4)_2$ —Ag $\text{C}_{11}\text{H}_{12}\text{O}_4$

OXY-CARBOXY-PHENYL-PROPIONIC ACID *Lactone* $\text{C}_{10}\text{H}_{10}\text{O}_4$

$\text{C}_6\text{H}_5\text{CH}(\text{CO})\text{CH}_2\text{CO}_2\text{H}$ Formed by reducing

phthalyl acetic acid with sodium amalgam, and acidifying (Gabriel a Michael, *B* 10, 1558, 2200) Needles (containing aq) Yields Ag $\text{C}_{10}\text{H}_{10}\text{O}_4$, Ag $\text{C}_{10}\text{H}_{10}\text{O}_4$, and Ba $\text{C}_{10}\text{H}_{10}\text{O}_4$ 2aq

Tri oxy-carboxy-phenyl propionic acid

Lactone $[4\frac{1}{2}] \text{C}_6\text{H}_5(\text{OH})_2\text{CH}(\text{CO})\text{CH}_2\text{CO}_2\text{H}$

[228°] Formed by reducing its di methyl derivative (meconic acetic acid) with HI and P (Liebermann a Kleemann, *B* 19, 2293) Tables Gives a blue colour with FeCl₃

Ethyl ether EtA' [c 131°] Crystalline

OXYCHRYSOQUINONE v CHRYSOQUINONE

OXYCINCHENE v CINCHENE

OXYCINCHONIDINE v CINCHONIDINE

OXY-CINNAMIC ACID v COUMARIC ACID

α-Oxy cinnamic acid $\text{C}_6\text{H}_5\text{CH}(\text{CO}_2\text{H})\text{CO}_2\text{H}$

Formed in small quantity in the preparation of the isomeric phenylglycidic acid by the action of alcoholic potash on $\text{C}_6\text{H}_5\text{CHBrCH}(\text{OH})\text{CO}_2\text{H}$ (Plöchl, *B* 16, 2821) Readily decomposes, yielding phenyl-acetic aldehyde and di-oxy-phenyl propionic acid

Phenyl derivatives

$\text{C}_6\text{H}_5\text{CH}(\text{COPh})\text{CO}_2\text{H}$ [180°] Formed by heating sodium phenoxy-acetate with benzoil aldehyde and Ac_2O (Oghaloro, *O J*, 40, 276) Prisms —AgA' prisms (from water)

(8, 2, 1)-Di-oxy-cinnamic acid

$[8\frac{2}{2}]\text{C}_6\text{H}_5(\text{OH})_2\text{CHCHCO}_2\text{H}$

Anhydride $\text{C}_6\text{H}_5(\text{OH})_2\text{CHCHCO}_2\text{H}$ *m-Oxy-*

coumarin [280°-285°] Formed by heating pyrocatechin with ihalic acid and H_2SO_4 (Bezari, *B* 15, 34) Needles, sl sol cold water Reduces salts of Au, Cu, and Ag

(4, 3, 1) Di-oxy-cinnamic acid *v* **CAFFEIC ACID**

(5, 2, 1)-Di-oxy cinnamic acid
[5 2 1] $C_6H_4(OH)_2CH CH CO_2H$

Anhydride [5 1] $C_6H_4(OH) < \begin{smallmatrix} CH & CH \\ & O & CO \end{smallmatrix}$

[250°] Formed by heating a mixture of hydroquinone, malic acid, and H_2SO_4 (Pechmann & Welsh, *B* 17, 1648) Needles, v sol alcohol Yields an acetyl derivative [147°] crystallising in needles The methyl derivative [108°] is got from [5 2 1] $C_6H_4(OMe)(OH)CHO$ by boiling with Ac O and NaOAc (Tiemann & Muller, 14, 1996)

o Methyl derivative

[5 2 1] $C_6H_4(OH)(OMe)CH CH CO_2H$ [180°] Obtained from $C_6H_4(NH_2)(OMe)CH CH CO_2H$ by the diazo reaction (Schnell, *B* 17, 1387) Crystals

Di-methyl derivative

$C_6H_4(OMe)_2CH CH CO_2H$ [143°] Obtained by methylating the *o* methyl derivative Needles Yields di methyl gentisic aldehyde on oxidation with $KMnO_4$

(4, 2, 1) Di oxy-cinnamic acid *v* **UMBELLIC ACID**

ap di oxy cinnamic acid Phenyl-methyl derivative $C_6H_4(OMe)CH C(OPh)CO_2H$ [200°] A product of the action of anisic aldehyde and Ac_2O on sodium phenoxy acetate (Valentini, *G* 14, 147) Rectangular tablets, sol hot alcohol —MeA' [100°] Laminæ

Anhydride of the phenyl derivative $C_{11}H_{10}O_3$ [113°] Formed from salicylic aldehyde, Ac_2O , and sodium phenoxy acetate (Ogliaro, *C* 1887, 1164) Yellow prisms, v sl sol hot water

Tri oxy cinnamic acid *v* **ÆSCULETIC ACID** and **DAPHNETIN**

Tetra-oxy cinnamic acid *Di methyl methylene ether* $C_6H_4(O_2CH_2)(OMe)_2CH CH CO_2H$ [196°] Formed from apiole aldehyde, Ac_2O , and NaOAc (Camician & Silber, *B* 22, 2485) Small yellow needles (from hot alcohol), sl sol ether and hot water

OXY-CINNAMIC ALDEHYDE *v* **COUMARIC ALDEHYDE**

Di-oxy cinnamaldehyde *Methyl derivative* *v* **FERULIC ALDEHYDE**

OXY-CINNOLINE

$C_8H_7N_2O$ *vs* $C_8H_7N < \begin{smallmatrix} C(OH) & CH \\ & N \end{smallmatrix}$ [225°] Formed by heating its carboxylic acid at 260° (Richter, *B* 16, 681) Small prisms, v sol alcohol and ether, sl sol water May be sublimed Sol Na_2CO_3 Aq —B' H_2PtCl_6 small prisms

Oxy-cinnoline carboxylic acid

$C_8H_7N < \begin{smallmatrix} C(OH) & C & CO_2H \\ & N \end{smallmatrix}$ [c 265°] Formed from *o* diazo phenyl propionic acid by heating with water at 70° Colourless needles or scales, sol HCl Aq, sl sol alcohol, nearly insol water

OXY-CITRAGONIC ACID $C_6H_8O_4$ *vs*

$O < \begin{smallmatrix} CMe & CO_2H \\ & CH & CO_2H \end{smallmatrix}$ [162°] Formed from citraconic acid by successive treatment with HCl and alkalis (Morawski, *J pr* [3] 10, 69, 11,

480, Scherko, *A* 227, 233, Michael, *J pr* [2] 40, 171, Melikoff & Feldmann, *A* 263, 89) Prisms (containing aq) Hot water converts it into propionic aldehyde and CO_2 With HBr it forms C_6H_5BrO , [156°] HCl yields, in like manner, CO_2H $CClMe$ $CH(OH)CO_2H$ [162°]

Salts — $(NH_4)A'$ — $(NH_4)HA'$ — KHA' — BaA'' 4aq — SrA'' 4aq — PbA'' 4aq

Ethyl ether EtA' (255°) S G § 1 1376; § 2 11167 CE (0°-22°) 0008507

OXY-CITRIC ACID $C_6H_8O_7$ *vs*

$C_6H_4(OH)_2(CO_2H)_2$ Occurs in beetroot (Lippmann, *B* 16, 1078) Formed from asconitic acid by successive treatment with HCl and lime-water (Pawolleck, *A* 178, 150) Deliquescent mass, v *e* sol water —Salts BaA''' , 5aq — Ca_2A''' , 9aq — Ca_3A''' , 10aq — $Cd_4(C_6H_4O_7)_2$, 6aq — $Cu_4(C_6H_4O_7)_2$, 2aq — EtA''' oil with bitter taste.

OXYCOBALTIMINES *v* vol II p 224

OXYCOMENIC ACID *v* **COMENIC ACID**

OXY CONICEINE *v* **CONINE**

OXY-COPAIVIC ACID *v* **COPAIVIC ACID**

OXY COUMARIC ACID *v* **DI OXY CINNAMIC ACID**

OXY-COUMARILIC ACID *v* **COUMARILIC ACID**

OXY-COUMARIN *v* *Anhydride of Di-oxy-cinnamic acid and UMBELLIFERONE*

Di-oxy coumarin *v* **DAPHNETIN**

OXY COUMARONE *v* **COUMARONE**

β OXY CROTONIC ACID *Methyl derivative* $CH_3C(OMe)CH CO_2H$ [128 5°] Formed from β chloro crotonic acid and NaOMe (Friedrich, *A* 219, 327, 334) Crystals, insol water

Ethyl derivative $CH_3C(OEt)CH CO_2H$ [137 5°] Formed from $CH_3CClCH CO_2Et$ and alcoholic potash Prisms, v sl alcohol and ether —KA' plates —KA' 3aq needles —EtA' [30°] Decomposed by dilute H_2SO_4 into acetone, CO_2 , and alcohol

Phenyl derivative $CH_3C(OPh)CH CO_2H$ [150°] Formed by heating sodium β chlorocrotonate or β chloro isocrotonate with NaOPh (Autenrieth, *A* 254, 240) Crystals, v sl sol hot water Yields $CH_3C(OPh)CH_2$ (162°) on heating

The above compounds may be viewed as derivatives of acetoacetic acid (*q* v)

β Oxy-isocrotonic acid This acid is not known in free state, for, like the preceding isomeride, it would at once change to acetoacetic acid

Methyl ether of the methyl derivative $CH_3C(OMe)CH_2CO_2Me$ (175°) S G § 1 0235 Formed from $CH_3CClCH_2CO_2Me$ and NaOMe (Enke, *A* 256, 205)

Methyl ether of the ethyl derivative $CH_3C(OEt)CH_2CO_2Me$ [12°] (195°) S G § 1 999

Ethyl ether of the ethyl derivative $CH_3C(OEt)CH_2CO_2Et$ [29°] (195° cor) Formed from β chloro isocrotonic ether and NaOEt (Koll, *A* 249, 324) Plates

Propyl derivative of the methyl ether $CH_3C(OPr)CH_2CO_2Me$ (280°) S G 961

Isobutyl derivative of the methyl ether $CH_3C(OOC,H)CH_2CO_2Me$ (258°) S G 980

α -Oxy-isocrotonic acid *Nitrile* $CH_3CHCH(OH)CN$ Formed from acrolein,

KCy, and HOAc (Lobry de Bruyn, *R. T. C.* 4, 223) Oil

Isomerides *v* OXY METHACRYLIC ACID and ACETOACETIC ACID

OXYCUMENE *v* CUMENOL

Di-oxy cumene *Di-methyl derivative* $C_6H_4(C_2H_5)(OMe)_2$ (246°) Formed by the action of sodium on an alcoholic solution of $C_6H_5(C_2H_5)(OMe)$ (268°), which is got by boiling the isomeric methyl ether of eugenol with alcoholic potash (Ciamician a Silber, *B.* 23, 1164) Colourless oil

m-Di-*o*-oxy ψ -cumene

$C_6H_5(CH_3)(CH_2OH)_2$ [4 3 1] [77°] Formed by boiling *m* di *o* bromo ψ cumene with aqueous Na_2CO_3 . V sol water and alcohol, sl sol ether (Hjelt a Gadd, *B.* 19, 867)

Isomeride *v* HYDRO- ψ -CUMOQUINONE

Tri-oxy-cumene. *Di-methyl derivative* $C_6H_5(C_2H_5)(OMe)_3(OH)$ (278°) Formed by reduction of iso-apiol (Ciamician a Silber, *B.* 23, 2286) Thick liquid, sol KOH aq.

Isomeride *v* PROPYL PYROGALLOL

OXY-CUMIDINE *v* AMIDO CUMENOL.

OXY *n*-CUMINIC ACID

$C_6H_5Pr(OH)CO_2H$ [3 2 1] [94°] Formed from *o*-propyl phenol, Na, and CO_2 (Spica, *J.* 1878, 585) —BaA', 2aq —PbA', 2aq —AgA' pp

Oxy *n* cuminic acid

$C_6H_5Pr(OH)CO_2H$ [5 2 1] [98°] Formed from *p*-propyl phenol, Na, and CO_2 (Spica) Coloured violet by $FeCl_3$ —BaA', 3aq —PbA', 2aq —AgA'

Oxy-cuminic acid $C_6H_5Pr(OH)CO_2H$ [4 2 1] [93°] *Formation* —1 By fusing carvacrol with potash (Jacobsen, *B.* 11, 1063) —2 By fusing isocymene sulphonic acid with potash (Jacobsen, *B.* 12, 432) —3 From amido cuminic acid by the diazo-reaction (Widman, *B.* 19, 270)

Properties —Flat needles or leaflets. Converted by HCl at 190° into *m* propyl phenol [26°] (228° i V) $FeCl_3$ gives a reddish violet colour. Yields CaA', and BaA'.

Oxy cuminic acid $C_6H_5Pr(OH)CO_2H$ [4 3 1] [141°] *Formation* —1 From amido cuminic acid (Cahours, *A. Ch.* [3] 53, 338, Lippmann a Lange, *B.* 13, 1662) —2 Among the products got from thymol by potash fusion (Barth, *B.* 11, 1571) —3 By oxidation of potassium cumyl-sulphate $C_6H_5MePr O SO_3K$ [1 4 3] or cumyl-phosphate $C_6H_5MePr O PO_3K_2$ [1 4 3] with alkaline $KMnO_4$, and saponification of the resulting sulphate or phosphate (Heymann a Königs, *B.* 19, 3306)

Properties —Slender needles, sl sol cold water. Not attacked by conc HCl aq at 200°

Salts —NaA' 2aq — $Na_2C_6H_5O_3$ 1aq —BaA' 2aq —CdA' 2aq —AgA' white pp

Ethyl ether EtA' [75°] Prisms

Ethyl derivative $C_6H_5Pr(OEt)CO_2H$ [140°] Crystalline powder —CdA' —AgA'

Oxy *o* cuminic acid $C_6H_5Pr(OH)CO_2H$ [3 2 1] [72°] Formed, together with $C_6H_5Pr(OH)(CO_2H)_2$ [295°], from isopropyl-phenol, Na, and CO_2 (Filet, *G.* 16, 126) Colourless needles $FeCl_3$ colours it violet

Oxy-*o*-cuminic acid $C_6H_5Pr(OH)CO_2H$ [5 2 1]. [121°] Obtained from *p*-isopropyl-phenol, sodium, and CO_2 (Paterno, *J.* 1878, 806) Formed also by fusing *m*-isocymenol with KOH (Jesurun, *B.* 19, 1415) Flat needles $FeCl_3$ colours its solution deep bluish-violet. —CaA' 2 —BaA' 2 —AgA'.

An isomeride [166°–170°] is got by fusing isocymene sulphonic acid with potash (Jacobsen, *B.* 12, 433)

Oxy ψ -cuminic acid

$C_6HMe_3(OH)CO_2H$ [6 5 3 2 1] [181°] Formed from sodium ψ cumenol and CO_2 (Krohn, *B.* 21, 884) Needles, v sol ether

Oxy ψ -cuminic acid

$C_6HMe_3(OH)CO_2H$ [1 3 4 5 6] [148°] Formed by fusing durenol with potash (Jacobsen a Schnapauff, *B.* 18, 2844) Small needles, nearly insol cold water HCl aq at 200° yields ψ cumenol [93°] —CaA' 2aq prisms, sl sol cold Aq

Di-oxy ψ cuminic acid

$C_6HMe_3(OH)_2CO_2H$ [6 4 3 5 2 1] [210°] Formed by reducing ψ cumoquinone carboxylic acid with zinc dust and aqueous NaOH (Nef, *B.* 18, 3498, A 237, 13, C J 53, 428) Needles, m sol hot water. Reduces ammoniacal $AgNO_3$. Its alkaline solution turns violet in air

Ethyl ether EtA' [109°] Needles

OXY- ψ CUMINIC ALDEHYDE $C_{10}H_{12}O_2$ *ie* $C_6HMe_3(OH)CHO$ [6 5 3 2 1] [106°] A product of the action of chloroform and NaOH aq upon ψ cumenol (Auwers, *B.* 17, 2976) Needles

DI-OXY DI ψ CUMYL $C_{18}H_{20}O_2$ *ie*

$C_6HMe_3(OH)C_6HMe_3(OH)$ [173°] Formed in the preparation of ψ cumenol from ψ cumidine by the diazo reaction, and also by oxidation of ψ -cumenol with dilute HNO_3 (Auwers, *B.* 17, 2982, 18, 2659) Crystals. Yields a di bromo derivative [187°] and a di methyl derivative [126°]

a OXY CUMYL-ACETIC ACID $C_{11}H_{14}O_3$ *ie*

$C_6H_5PrCH(OH)CO_2H$ [158°] Formed from cuminic aldehyde, HCy, and HCl (Raab, *B.* 8, 1148) Needles —BaA' 4aq —PbA' 2

Oxy di cumyl acetic acid

$(C_6H_5C_2H_5)_2C(OH)CO_2H$ [120°] Formed from $C_6H_5C_2H_5CO CO C_6H_5C_2H_5$, by potash-fusion (Boesler, *B.* 14, 326) Needles —BaA'

OXY-CUMYL-ACRYLIC ACID $C_{11}H_{14}O_3$ *ie* $C_6H_5(C_2H_5)(OH)CHCHCO_2H$ The (4, 2, 1) acid [176°] and the (4, 3, 1) isomeride [206°] are formed by the diazo reaction from the corresponding amido-acids. Both are crystalline (Widman, *B.* 19, 268, 417)

DI OXY DI CUMYL PYRAZINE DICARB OXYLIC ACID

[1 4 3] $CO_2H.C_6H_5Pr.N < \begin{smallmatrix} C(OH) & OH \\ CH & C(OH) \end{smallmatrix} > N.C_6H_5Pr.CO_2H$ [3 4 1]

Formed by boiling $CH_2Cl.CO.NH.C_6H_5Pr.CO.Me$ with alcoholic potash (Abenius, *J. pr.* [2] 40, 440) Insoluble powder —EtA' [193°]

OXYCYANONINE *v* CYANONINE

OXYCYANETHINE *v* CYANETHINE

OXY CYCLOPIN $C_{11}H_{16}O_{11}$ A glucoside in Cape Tea split up by dilute acids into oxy cyclopico acid $C_{11}H_{16}O_{12}$ and glucose (Greenish, *Ph.* [3] 11, 569)

DI-OXY DIGUMYL $C_{26}H_{30}O_2$ *ie*

$C_6H_5Me(C_2H_5)(OH)C_6H_5Me(C_2H_5)(OH)$ [165 5°] Formed by oxidising thymol with iron alum (Dianin, *J. R.* 14, 136) Prisms or tables (containing aq), v sol alcohol

OXY CUMYL-ACRYLIC ACID $C_{11}H_{14}O_3$ *ie* [2 5 6 1] $C_6H_5Me(C_2H_5)(OH)CHCHCO_2H$ The anhydride [53°] [220°–230°] is formed by heating thymol with malic acid and H_2SO_4 (Fechmann a. Welsh, *B.* 17, 1647)

The isomeride (2, 5, 4, 1)-acid 280° is formed from thymolic aldehyde, NaOAc, and Ac_2O

(Kotek, *B* 16, 2104) It yields a crystalline methyl derivative [141°]

DI OXY-DI CYMYL-ETHANE $C_{22}H_{40}O_2$, *s.e.* $CH_3CH(C_6H_5, OH)_2$ [185°] Formed from thymol, paraldehyde, chloroform, and $SnCl_4$ (Steiner, *B* 11, 287) Needles (from benzene). Yields $C_6H_5(OEt)_2$ and $C_6H_5(OAc)_2$ [100°]

DI OXY-DI CYMYL-ETHYLENE $CH_2C(C_6H_5, OH)_2$ [171°] Formed, together with the preceding body, from $CCl_4CH(C_6H_5, OH)_2$ by boiling with alcohol and zinc-dust (Jaeger, *B* 7, 1198, *C* *J* 31, 263) Oxidised by alkaline K_2FeO_4 to $C_6H_5O_2$ [215°] and $C_6H_5O_2$ [215°].

DI OXY DI CYMYL SULPHIDE $(C_6H_5MePr(OH))_2S$ [153°] (Tassinari, *G* 17, 83)

DI OXY DECANE $C_{10}H_{20}O_2$ *Decylene glycol* *Diamylene glycol* The diacetyl derivative, formed from di bromo decane and $AgOAc$, yields on saponification with KOH the anhydride $C_{10}H_{18}O$ (diamylene oxide) (Bauer, *J* 1862, 450)

Di-oxo-decane $CMePr(OH)CMePr(OH)$ *Methyl propyl pinacone* (c 223°) Formed from methyl *n* propyl ketone, water, and Na (Friedel, *J* 1869, 513) Dilute H_2SO_4 converts it into the pinacol $C_{10}H_{20}O$ (185° uncor) (Szymanski, *B* 19, 1532) The isomeric $CEt_2(OH)CEt_2(OH)$ [28°] is formed in like manner from di ethyl-ketone (Schramm, *B* 16, 1594)

Tetra oxy-decane Anhydride $\langle CMe(OH)CH_2CMe \rangle O$ (270°) Formed from $\langle CMe(OH)CH_2CMe \rangle O$ (270°) Formed from $(CH_3CO)_2CH_2$ and sodium amalgam in presence of a dilute acid (Combes, *A Ch* [6] 12, 230) Liquid, v sl sol water

γ OXY DECOIC ACID *Lactone* $C_{10}H_{18}O_2$, *s.e.* $C_6H_5CH \langle \begin{smallmatrix} CH_2CH_2 \\ OCO \end{smallmatrix} \rangle$ (281° uncor) Formed from bromo decanoic acid and Na_2CO_3 (Schnee gans, *A* 227, 92) Yields $Ba(C_{10}H_{17}O_2)_2$ aq and $AgC_{10}H_{17}O_2$

Oxy decanoic acid $CH_3PrCH(OH)CHPrCO_2H$ [120°] Formed from isovaleric ether and Na (Wohlbruck, *B* 20, 2332) Needles, v sol hot water— BaA'_2 — AgA'_2 $AgOH$ amorphous.

Oxy decanoic acid $C_{10}H_{18}O_2$, *s.e.* $C_6H_5CH(OH)CH(C_6H_5)CO_2H$ [120°] Formed by the action of alcoholic potash at 110° on $C_6H_5CH(OEt)CH(C_6H_5)CO_2Et$, which constitutes half the product of the action of sodium on isovaleric ether (Hantzsch, *A* 249, 64)

DI OXY-DECYLENE *Di-valeryl-derivative* $C_6H_5C(O)COC_6H_5$ $C(O)COC_6H_5$ C_6H_5 (155°–165° at 12 mm) (Klinger & Schmutz, *B* 24, 1275)

DI-OXY-DODECANEC $CEtPr(OH)CEtPr(OH)$ (255°) Formed from ethyl propyl ketone, water, and Na (Oechsner de Coninck, *Bl* [2] 25, 10) Liquid The isomeric 'methyl butyl pinacones' $CHMeEtCMe(OH)CMe(OH)CHMeEt$ (249°) and $CMe, CMe(OH)CMe(OH)CMe$ [69°] are prepared in like manner (Wishoenus, *A* 219, 810, Friedel & Silva, *J* 1873, 340)

TRI-OXY-DODECANEOIC ANHYDRIDE $C_{12}H_{22}O_5$, *s.e.* $\begin{smallmatrix} CH_2CH_2 \\ CHEtO \end{smallmatrix} \rangle C \langle \begin{smallmatrix} CH_2CHEt \\ COO \end{smallmatrix} \rangle$ *Di-hexolactone* (above 800°) Formed from oxy-hexanoic lactone and $NaOEt$ (Fittig, *A* 256, 135). Liquid, sl sol water

DI-OXY-DODECINENE $C_{12}H_{20}O_2$, *s.e.* $C_6H_5CH_2CMe(OH)CMe(OH)CH_2C_6H_5$ (266°).

SG § 963 *CE* (0°–24°) 00082 Formed from allyl acetate (Kablukoff, *J R* 1887, 518)

OXY-DODECOIC ACID $(C_6H_5)_2C(OH)CO_2H$ *Diamoxalic acid* [122°] Formed from oxalic ether, isomyl iodide, and zinc (Frankland & Duppa, *A* 142, 8) Yields EtA' (262°) and C_6H_5A' (280°–290°)

OXY-DURYL-ACETIC ACID [64321] $C_6HMe, CH(OH)CO_2H$ [156°] Formed from tetra methyl-phenyl glyoxylic acid, alcohol, and sodium-amalgam (Claus & Foecking, *B* 20, 3100, *J pr* [2] 33, 232) Prisms— NaA'_2 aq— CaA'_2 8aq— BaA'_2 8aq v sol water The isomeric (5, 4, 3, 2, 1)-acid [160° uncor] yields KA'_2 4aq, BaA'_2 3aq, and CaA'_2 2aq

DI-OXY-ENNANE $C_9H_{18}O_2$, *s.e.* $PrCH(OH)CH(OH)CH_2Pr$ [80°] (232°) Formed by the action of alcoholic potash on a mixture of isobutyric aldehyde and valeric aldehyde (Fossek, *M* 5, 120, Swoboda, *M* 11, 384) Prisms (from water) On boiling with dilute H_2SO_4 it yields a pinacol $C_9H_{18}O_2$ (274°) Cold conc H_2SO_4 forms $C_9H_{16}O$ (150°)

Di acetyl derivative $C_9H_{16}O_4$ (242°) **OXY-ENNENOIC ACID** $C_9H_{16}O_3$ *Oxy vinyl-iso heptonic acid* Found among the products got by passing CO over $NaOAc$ mixed with sodic iso amylate at 180° (Poetsch, *A* 213, 78) Thick honey yellow oil, not volatile with steam— $C_6H_5NaO_2$ 8aq

Methyl ether $C_9H_{16}MeO_2$ (c 250°) **OXY-ENNOIC ACID** $CP_2(OH)CH_2CO_2H$ Formed by oxidising $CP_2(OH)C_6H_5$ with $KMnO_4$ (Schirokoff, *J pr* [2] 23, 197) Syrup, sl sol hot water— CaA'_2 aq— BaA'_2 aq S (of BaA'_2) 93 at 20°— PbA'_2 S 16 at 195°— AgA' prisms

Oxy ennoic acid $PrCH_2CH_2CEt(OH)CO_2H$ Crystalline— BaA'_2 — AgA'

Ethyl ether EtA' (225°) *SG* 12 940 A product of the action of isomyl iodide and zinc on oxalic ether (Frankland & Duppa, *A* 142, 6, Beilstein, *Bn* 1, 529)

OXY ERUCIC ACID $C_{22}H_{42}O_2$ Formed from di bromo behenic acid $C_{22}H_{42}Br_2O_2$ and moist Ag_2O (Haussknecht, *A* 143, 51) Oil, forming amorphous salts

OXY ETHANE PHOSPHONIC ACID $C_2H_5PO_2$, *s.e.* $CH_3CH(OH)PO(OH)_2$ [76°] Formed from aldehyde (4 mols) and PCl_3 (1 mol), followed by cold water (Fossek, *M* 7, 32) Crystals decomposing at 120°— CaA'

OXY ETHANE SULPHONIC ACID *s.e.* *ETHIONIC ACID*

Oxy ethane disulphonic acid $C_2H_5(OH)(SO_3H)_2$ Formed, together with ethane tri-sulphonic acid, by boiling tri-bromo ethane with a saturated solution of ammonium sulphite (Monari, *B* 18, 1347)— Na_2A' 3½aq— $(NH_4)_2A'$ ½aq— BaA' 2aq very soluble powder

Oxy-ethane disulphonic acid $SO_3HCH_2CH(OH)SO_3H$ Formed from is ethionic acid and H_2SO_4 at 100° (Meves, *A* 143, 196, Engelhardt & Latschnoff, *Z* 1868, 271)— KA' ½aq needles, v sol water

OXY-ETHENYL-AMIDO-PHENYL-MERCAPTAN C_6H_5NSO , *s.e.* $C_6H_5 \langle \begin{smallmatrix} N \\ S \end{smallmatrix} \rangle CH_2OH$ [175°] Prepared by heating chloro-acetic acid with amido-phenyl-mercaptan (Hofmann, *B* 18,

1284) Long fine needles Insol water, sol. alcohol and caustic alkalis

DI-OXY-ETHENYL-*o*-PHENYLENE DIAMINE $C_8H_8N_2O_2$ [above 280°] Obtained by reduction of *o*-nitro oxaniline acid with SnCl₂ (Aschan, B. 18, 2939) Sublimes in plates Sol acetic acid, sl sol water, alcohol, and ether, insol benzene, ligroin, and chloroform It has weak acid properties, forming unstable salts —BaA₂ 2aq white crystalline pp

OXY-ETHYL-ACETOACETIC ETHER

$CH_3COCH(CO_2H)CH_2CH_2OEt$ Formed from acetoacetic ether, NaOEt, and glycol chlorhydrin (Chanlaroff, A. 226, 326) Liquid, yielding γ -oxy butyric acid on boiling with baryta and alcohol

Oxy-di-ethyl-acetoacetic ether *Methyl derivative* $CH_3(OMe)COCEt_2CO_2Et$ (c 188°) Formed, together with an oil $C_8H_{11}O_2$ (c 131°) by the action of NaOMe on chloro di-ethyl-acetoacetic ether (James, A. 231, 240)

Di-oxy-di-ethyl-acetoacetic ether *Di-methyl derivative* $CH(OMe)_2COCEt_2CO_2Et$ (c 195°) Formed together with the compound $CH(OMe)_2COCHEt_2$ (184°), by the action of NaOMe on $CHCl_2COCEt_2CO_2Et$

OXY-ETHYL DIALLYLAMINE

$(C_2H_5)_2NCH_2CH_2OH$ (197°) Formed from di-allylamine and CH_2ClCH_2OH (Ladenburg, B. 14, 1879) Liquid base

OXY-ETHYL-*p*-AMIDO-BENZOIC ACID $CH_2OHCH_2NH_2C_6H_4CO_2H$ (187°) Formed from *p*-amido-benzoic acid and ethylene oxide (Ladenburg, B. 6, 129) Prisms, sl sol cold water —HA/HNO₃ crystals

OXY-ETHYL-*o*-AMIDO-PHENOL

$CH_2(OH)CH_2NH_2C_6H_3OH$ (290°–310°) Formed from *o*-amido phenol and glycol chlorhydrin (Knorr, B. 22, 2095) Liquid, sol water Successive treatment with fuming HCl and NaOHAq forms the anhydride $C_8H_7O_2<NHCH_2$ (268°)

Methyl derivative

$CH_2(OH)CH_2NH_2C_6H_3OMe$ (305° i V) Formed from *o*-anisidine

OXY-ETHYL-AMIDO-QUINOLINE DIHYDRIDE *v* **HYDRAZIDO-PHENYL-PROPIONIC ACID**

OXY-ETHYL-AMINE $CH_2(OH)CH_2NH_2$ *Amido ethyl alcohol* Formed by the action of ammonia on ethylene oxide or on glycol chlorhydrin (Wurtz, C. R. 49, 898, 53, 338) Formed also by the action of conc H_2SO_4 on bromo-ethyl phthalimide, by the action of HNO₃ on vinylamine, and by the action of AgNO₃ (2 mols) on bromo ethylamine hydrobromide (1 mol) (Gabriel, B. 21, 569, 2666)

Salts —B'HCl [below 100°] —B'₂H₂PtCl₂ —B'HBz hygroscopic crystals —B'HNO₃ [55°] —B'₂C₆H₄(NO₂)₂OH [159°] Yellow needles (from alcohol)

Picrate of the acetyl derivative $CH_2(OH)CH_2NHAcC_6H_4(NO_2)_2OH$ [169°] (Gabriel, B. 22, 2222)

Benzoyl derivative $CH_2(OH)CH_2NHBz$ —B'HBz [148°] —B'₂H₂PtCl₂ —Picrate. [195°] Crystalline pp

Phenyl derivative $CH_2(OPh)CH_2NH_2$ (229°). Formed from phenyl oxyethyl phthalamic acid and conc HClAq (Schmidt, B. 22, 8256). Yields an acetyl derivative [78°] and a

benzoyl derivative [98°] (Schreiber, B. 24, 189). —B'HCl [215°] —B'₂C₆H₄(NO₂)₂OH —Platinichloride B'₂H₂PtCl₂ golden needles

p-Tolyl derivative (243°) Yields a benzoyl derivative [134°] and B'HC [240°], B'₂H₂PtCl₂, and B'₂C₆H₄N₂O

Oxy-tri-ethyl-amine $C_6H_5NO_3$ Formed from $NEt_3CH_2CH_2OH$ (161°) NO from NEt_3H and glycol chlorhydrin (Ladenburg, B. 14, 1878, 15, 1144) Liquid, miscible with water

Cinnamoyl derivative

$NEt_3CH_2CH_2OOCOC_6H_5$ Formed from the cinnamate of the base and dilute HCl Yields B'HAuCl₄ and B'₂C₆H₄(NO₂)₂OH

Ethyl-chloride $NEt_3ClCH_2CH_2OH$ Prisms (Wurtz, A. Suppl. 7, 88) —Gold salt $C_6H_5NOAuCl$ golden plates

Di-oxy-ethyl-amine *Di-ethyl derivative* $CH_2(NH_2)CH(OEt)_2$ *Amido alcohol* (162°) Formed from chloro acetal and alcoholic NH₃ (Wohl, B. 21, 616, Wolff, B. 21, 1482) Colourless liquid, v e sol water —B'₂H₂PtCl₂ hexagonal plates, sl sol cold alcohol

Di-oxy-di-ethyl-amine $NH(CH_2CH_2OH)_2$ Formed from ethylene oxide or $ClCH_2CH_2OH$ and ammonia (Wurtz) —B'₂H₂PtCl₂ tables

Tri-oxy tri-ethyl-amine $N(CH_2CH_2OH)_3$ A product of the action of ethylene oxide on ammonia (Wurtz) With glycol chlorhydrin it yields $N(OH)(CH_2CH_2OH)_2$ Both are syrupy

Tetra-oxy-di-ethyl-amine *Tetra-ethyl derivative* $NH(CH_2CH_2OEt)_2$ (260°) S 14 Formed from chloro acetal and NH₃Aq at 130° (Wolff, B. 21, 1484) —B'₂H₂PtCl₂ [121°]

***o*-OXY-ETHYL AMINE *acv* - TRI SULPHONIC ACID** $C_6H_5NS_3O_6$ *v* $CH_3C(HO)(SO_3H)CH(SO_3H)NH(SO_3H)$ The sodium salt Na_3A''' 3aq is formed by shaking nitroso acetone $CH_3COCH(NOH)$ with a 30 p c solution of sodium bisulphite, and crystallises out on standing as a crystalline powder consisting of white needles It is v sol water, insol alcohol

By warming with dilute acids it is split up into methyl-glyoxal (pyruvic aldehyde) CH_3COCHO , sodium sulphate, NH₃, and SO₂ (Pechmann, B. 20, 2543)

OXY-ETHYL-ANILINE $NHPhCH_2CH_2OH$ (286°) SG 2 1 110 Formed from aniline and ethylene oxide (Demole, B. 6, 1024, Ladenburg, B. 6, 181, Knorr, B. 22, 2092) Liquid, with strong reducing properties —B'₂H₂PtCl₂ red dish brown crystals

o **Oxy-di-ethyl-aniline** $C_6H_5NEtO_2CH_2OH$ (268°) Formed from ethyl aniline and ethylene chlorhydrin at 100° (Laun, B. 17, 677) Heavy oil

Di-oxy-di-ethyl-aniline $NPh(CH_2CH_2OH)_2$ (above 350°) Formed from the preceding and glycol chlorhydrin Treatment with HClAq at 170°, followed by cold caustic soda solution, yields $NPh<\begin{smallmatrix} C_6H_5 \\ C_6H_5 \end{smallmatrix}>O$ [58°] (270°). The compound

$NPh<\begin{smallmatrix} C_6H_5 \\ C_6H_5 \end{smallmatrix}>O_2$ [67°] is formed by the action of alcoholic AgNO₃ on the corresponding sulphur compound (Holzmann, B. 20, 1640)

OXY-ETHYL-BENZENE *v* **ETHYL PHENOL** *Di-oxy-ethyl-benzene* $C_6H_5CH_2CH_2OH$ *Styrolene alcohol* [68°] (278° i V) Formed from styrene dibromide and boiling aqueous K₂CO₃ (Zincke, A. 216, 298). Needles (from

benzene ligroin) Converted by boiling dilute H_2SO_4 into oily $\text{C}_8\text{H}_{10}\text{O}$ (260° at 50 mm)

Di-acetyl derivative $\text{C}_8\text{H}_8\text{Ac}_2\text{O}_2$ (274° i.v.)

Di benzoyl derivative [97°] Needles *Di-oxy-ethyl benzene* $\text{C}_8\text{H}_8\text{Et}(\text{OH})_2$ [134] (295°) Formed from *p* ethyl phenol sulphonic acid by potash fusion (Sempotowski, *B* 22, 2667) Coloured green by FeCl_3

Di-oxy-tri ethyl-benzene $\text{C}_8\text{H}_6\text{Et}_3(\text{OH})_3$ [185°] Formed by the action of HCl on $\text{C}_8\text{H}_6\text{Et}_3(\text{OEt})(\text{OH})$ (165° uncor at 20 mm) which is a product of the action of alcoholic potash and EtI on resorcin (Herzig & Zeisel, *M* 11, 306) White needles (from dilute alcohol) Yields $\text{C}_8\text{H}_6\text{Et}_3(\text{OEt})(\text{OAc})$ [65°] crystallising in monoclinic prisms

OXY-ETHYL BENZOIC ACID $\text{C}_8\text{H}_8\text{O}_2$ *s.s.* $\text{C}_8\text{H}_7\text{Et}(\text{OH})(\text{CO}_2\text{H})$ [120°] Formed from sodium *o*-ethyl phenol and CO_2 (Beilstein & Kuhlberg, *A* 156, 213) Coloured violet by FeCl_3

Oxy-ethyl benzoic acid [112°] Formed in like manner from sodium phlorol (Oliveri, *G* 13, 267) Needles (from water) — BaA^1 , aq scales β *Oxy ethyl benzoic acid*

$\text{CH}_3\text{CH}(\text{OH})\text{C}_6\text{H}_4\text{CO}_2\text{H} - \text{AgA}^1$ needles *Anhydride* $\text{C}_8\text{H}_6\text{O}_2$ (276°) V D 74 (obs) Formed by reducing acetophenone carboxylic acid with sodium amalgam and acidifying (Gabriel & Michael, *B* 10, 2205) Crystalline at 0°

Tri oxy-ethyl-benzoic acid Methylene derivative $\text{CH}_3\text{CH}(\text{O})\text{C}_6\text{H}_4(\text{CH}_2\text{CH}_2\text{OH})\text{CO}_2\text{H}$ 'α *Oxyethylperonylcarboxylic acid*' [146°] Formed from the corresponding amido-acid $\text{CH}_3\text{O}\text{C}_6\text{H}_4(\text{C}_6\text{H}_4\text{NH})\text{CO}_2\text{H}$ (Perkin, jun, *C* 57, 1021) Crystals Converted at 120°-130° into the anhydride $\text{C}_{10}\text{H}_8\text{O}_4$ [127°] — $\text{AgC}_{10}\text{H}_8\text{O}_4$, — $\text{KA}^1 - \text{NH}_4\text{MeA}^1$ crystals

TRI OXY TRI-ETHYL BORATE $\text{B}(\text{OC}_2\text{H}_4\text{OH})_3$, [162°] Formed from BCl_3 and glycol (Counciler, *J pr* [2] 18, 392) Deliquescent crystals

DI OXY ETHYL-BUTYL GLYOXALINE $\text{C}_8\text{H}_8\text{CH}(\text{CO})\text{NEt}$ [135°] (295°) Formed from isobutyl hydantoin, KOH , and EtBr (Pinner, *B* 22, 685) Silky needles

OXY-ETHYL CARBAMIC ACID Anhydride $\text{CH}_3\text{OCH}(\text{NH})\text{CO}$ [91°] Formed from β bromo ethyl-amine and Ag_2CO_3 (Gabriel, *B* 21, 568) Flat crystals (from alcohol), v sol water

OXY-ETHYL CONIINE v CONIINE

DI-OXY ETHYLENE DIQUINOLINE OCTO-HYDRIDE $\text{C}_{20}\text{H}_{18}\text{N}_4\text{O}_2$ *s.s.* $\text{OHCH} - \text{OCH}_2\text{CH}_2\text{CH}_2\text{OCH}(\text{OH})\text{O} - \text{NCH}_2\text{CH}_2\text{N} - \text{OCH}(\text{OH})\text{CH}$ [233°] Formed by heating oxy-quinoline tetrahydride with ethylene bromide (Kohn, *C* 49, 509) Small silky prisms

DI-OXY-ETHYLIDENE-DI-NAPHTHOQUINONE $\text{C}_8\text{H}_6\text{CH}(\text{CO})\text{C}(\text{OH})\text{CO} - \text{CO} > \text{C}_8\text{H}_6$ *Phenyl hydrazide*

$\{\text{C}_{10}\text{H}_7(\text{OH})\text{O}(\text{N}_2\text{HPh})\}_2\text{CHMe}$ [258°] Got by heating the phenyl hydrazide of oxy (α) naphthoquinone with alcohol and aldehyde at 100°

(Zincke & Thielen, *B* 21, 2205) Small red needles, v sl sol alcohol

TETRA OXY-TETRA ETHYLIDENE-PHOSPHONIUM CHLORIDE $(\text{CH}_3\text{C}(\text{OH}))_4\text{PCl}$ [112°] Formed from aldehyde, PH_3 , and HCl (Messenger & Engels, *B* 21, 328) Dimetric crystals, with unpleasant smell, v sol alcohol, insol ether Decomposed by water The corresponding $(\text{CH}_3\text{C}(\text{OH}))_4\text{PBr}$ [88°] is also crystalline The iodide $(\text{CH}_3\text{C}(\text{OH}))_4\text{PI}$ [65°] is formed from aldehyde and phosphonium iodide (Girard, *A Ch* [6] 2, 11)

DI-OXY-ETHYLIDENE-METAPYRAZOLE

$\text{CH}_3\text{CH}(\text{C}=\text{N})\text{C}(\text{OH})\text{CH}(\text{C}=\text{N})\text{CH}_3$ or $\text{CH}_3\text{CH}(\text{C}=\text{N})\text{CO} - \text{OC}(\text{NH})\text{CH}_3$ *Ethylidene-metapyrasolone*

Formed by heating chloro-crotonyl-urea, $\text{CH}_3\text{CH}(\text{C}=\text{N})\text{CO}\text{NH}\text{CO}\text{NH}_2$, to its melting-point, HCl being evolved Needles M sol. hot water (Pinner & Lifschutz, *B* 20, 2350)

α OXY-ETHYL MALONIC ACID $\text{CET}(\text{OH})(\text{CO}_2\text{H})_2$ *Ethyltartronic acid* [98°] Prepared by saponification of chloro-ethyl malonic ether with baryta water (Conrad, *B* 14, 618) Decomposes at 180° into α-oxy-butyric acid and CO_2

β Oxy-ethyl malonic acid $\text{CH}_3\text{CH}(\text{OH})\text{CH}(\text{CO}_2\text{H})_2$ Formed from ethylidene malonic acid and baryta water (Kommenos, *A* 218, 163) Syrup — AgA^1 amorphous

γ Oxy ethyl malonic acid $\text{CH}_3(\text{OH})\text{CH}_2\text{CH}(\text{CO}_2\text{H})_2$ — BaA^1 1½ aq Got by boiling the lactonic acid with baryta — AgA^1

Lactonic acid $\text{CH}_3\text{CH}(\text{CO}_2\text{H})\text{O} - \text{CO}$

Formed by boiling bromo ethyl malonic acid with water (Röder, *A* 227, 19) Obtained also by boiling vinaconic acid with diluted H_2SO_4 — BaA^1

DI-OXY DI-ETHYL OXIDE

$\text{O}(\text{CH}(\text{OH})\text{CH}_3)_2$ Alkoyl derivatives of this body are formed by the action of sodium salts on di chloro di ethylether (Geuther, *A* 226, 223, 245, 101)

Formyl derivatives (c. 180°) SG 11 1134

Acetyl derivative $\text{O}(\text{CH}(\text{OAc})\text{CH}_3)_2$ (192°) SG 11 1071, 22 1067 Colourless liquid, slowly decomposed by water into aldehyde and acetic acid

Propionyl derivative (c 218°) SG 22 1037

Butyryl derivative (c 238°) SG 22 994

Benzoyl derivative $\text{C}_8\text{H}_8\text{O}_2$ Needles *Succinyl derivative* $\text{O}(\text{CMeH})_2\text{C}_4\text{H}_4\text{O}_2$ *Di-methyl ether* $\text{O}(\text{CH}(\text{OMe})\text{CH}_3)_2$ (127°) SG 11 958 Formed from *aa* di-chloro-di-ethyl oxide, MeOH , and NaOMe Oil decomposing on standing into di methyl acetal and aldehyde

Di-ethyl ether (153° cor) SG 14 891

Di-propyl ether (184° cor) SG 14 895

Di-isobutyl ether (175° cor) SG 14 879

Di-isoamyl ether (227°) SG 14 874

DI-OXY-DI-ETHYL-DIPHENYL Di-ethyl ether [341] $\text{C}_6\text{H}_5\text{Et}(\text{OEt})\text{C}_6\text{H}_5\text{Et}(\text{OEt})$ [134]

[120° cor]. Formed from di amido di-ethyl-di-phenyl, alcohol, and nitrous acid (Schultz, *B* 17, 475) White plates, sl sol cold alcohol

Tetra-oxy-ethyl-diphenyl Tetra-acetyl derivative $C_{12}H_8Et(OAc)_4$ [138°] Formed from the tetra-ethyl derivative by successive treatment with $HIAg$ and Ac_2O (Herzig, *M* 11, 418) Needles (from alcohol)

Tetra-ethyl derivative $C_{12}H_8Et(OEt)_4$ [92°] A product of the action of EtI and alcoholic potash on tetra oxy diphenyl (Herzig, *M* 11, 417) Plates, v sol alcohol

OXY-ETHYL-PHTHALIMIDE $C_{10}H_8NO_4$ i.e. $C_6H_4(CO)_2NCH_2CH_2OH$ [127°] Formed from bromo-ethyl phthalimide and $KOHAc$ (Gabriel, *B* 21, 571) Needles or plates, sol hot water

Phenyl derivative $C_6H_4(CO)_2NCH_2CH_2OPh$ [180°] Formed from $PhOC_6H_4Br$ and potassium phthalimide (Schmidt, *B* 22, 3255) On warming with potash it yields the acid $C_{10}H_8NO_4$ [125°]

p-Tolyl derivative [135°] Crystals Yields a di nitro derivative [88°] (Schreiber, *B* 24, 190)

OXY ETHYL PIPERIDINE $C_7H_{13}NO$ i.e. $C_4H_8NCH_2CH_2OH$ (199°) Formed by heating piperidine with ethylene chlorhydrin (Ladenburg, *B* 14, 1876) Liquid, sol water — B^*HauCl , plates

Phenyl acetyl derivative $C_{11}H_{11}NO_2$ Oil, formed by heating phenylacetic acid with oxyethyl piperidine and HCl — B^*HauCl , [c 100°] — B^*HI — B^*HI , Brown needles

Benzoyl derivative $C_{11}H_{11}NO_2$ — B^*HI — $B^*H_2PtCl_6$, silky needles

Oxy-ethyl-piperidine $C_8H_{10}(C_2H_5OH)_2N$ [32°] (227°) Formed by reducing oxy-ethyl pyridine with sodium amalgam (Ladenburg, *B* 22, 2586) Hygroscopic mass Yields an oily nitrosamine — $B^*H_2PtCl_6$ [158°] Large crystals

OXY ETHYL PYRIDINE $C_7H_7NCH_2CH_2OH$ (179° at 25 mm) SG ± 1.111 Formed from (a) methyl pyridine and formic aldehyde (Ladenburg, *B* 22, 2584) Syrup, v sol water, not volatile with steam Yields vinyl pyridine on distillation — $B^*H_2PtCl_6$ [170°] prisms, m sol cold water

An isomeride $C_7H_7N(CH(OH)CH_3)$ is got by distilling barium a oxy pyridyl propionate (Hardy a Calmels, *Bl* [2] 48, 280)

Oxy-di-ethyl pyridine $NC_2H_5Et(C_2H_5OH)_2$ (148° at 18 mm) Formed from methyl ethyl-pyridine (aldehyde collidine) and formic aldehyde at 165° (Prausnitz, *B* 23, 2725) Oil — $B^*H_2PtCl_6$ [159°] Red cubes

OXY-ETHYL-PYRIDINE TETRAHYDRIDE $CH_3CH_2COCH_2CH_2CH_2CH_2NH$ [68°] Formed by heating β -amido heptonic acid at 220° (Aschan, *B* 23, 3694) Plates, smelling like conine

OXY-ETHYL-PYRIDINE CARBOXYLICACID $NC_2H_5Et(OH)CO_2H$ Formed from comanic acid and ethylamine (Ost, *J pr* [2] 29, 380) Prisms (containing jag), v sol water

Di oxy-ethyl-pyridine carboxylic acid $NC_2H_5Et(OH)CO_2H$ [c 210°] Formed from ethylamine and comenamic acid (Meunel, *J pr* [2] 32, 178) Prisms (containing jag) Coloured violet by $FeCl_3$. Reduces ammoniacal $AgNO_3$, Ac_2O at 160° forms acetyl ethyl pyromecanic

acid $C_7H_7NO_3$, whence boiling water forms $C_7H_7NO_3$ [166°]

Ethyl ether EtA' [115°] Needles (from water) — $EtA' \cdot HCl$ — $Ba(C_2H_5Et.NO)_2$, needles

OXY ETHYL-QUINAZOLINE DIHYDRIDE $C_8H_8 \begin{matrix} CH_2 \\ \diagup \quad \diagdown \\ NH \quad CO \end{matrix} \begin{matrix} CH_2 \\ \diagup \quad \diagdown \\ NH \quad CO \end{matrix}$ Benzylene ethyl urea [95°]

Formed from oxy-tolyl-ethyl thio-urea, alcohol, and HgO (Soderbaum a Widman, *B* 22, 2937). Needles (from alcohol) — $B^*H_2PtCl_6$, [c 205°] — B^*HauCl , golden scales

(Py 3 4) **OXY-ETHYL QUINOLINE**

$C_8H_8 \begin{matrix} CH \quad CH \\ \diagup \quad \diagdown \\ NH \quad CO \end{matrix}$ Ethyl pseudo carbostyryl

[55°] Formed together with (Py 3) ethoxy quinoline by the ethylation of carbostyryl (Py 3 oxy quinoline) (Friedlander a Weinberg, *B* 18, 1528) Glistening white needles Sl sol water, v sol other solvents Scarcely volatile with steam Dissolves in strong HCl

(Py 1, 3) Di oxy (Py 2)-ethyl quinoline Formed from chloro oxy ethyl quinoline and HCl (Rügheimer a Schramm, *B* 21, 301) Prisms, v e sol alcohol

DI OXY-ETHYL ISOQUINOLINE

$C_8H_8 \begin{matrix} CH_2 \quad CO \\ \diagup \quad \diagdown \\ CO \quad NH \end{matrix}$ [105°] Formed by distilling o carboxy phenyl acetic acid with ethyl amine (Pulvermacher, *B* 20, 2493) Needles, v sol alcohol With diazobenzene chloride it yields $C_8H_8ONEt \cdot N_2Ph$ [139°]

Di-oxy di ethyl-isoquinoline

$C_8H_8 \begin{matrix} CH_2 \quad CO \\ \diagup \quad \diagdown \\ CO \quad NH \end{matrix}$ [144°] Formed from di oxy isoquinoline (vol 1 p 706) $NaOEt$ and EtI (P) White plates With alcoholic potash and EtI it produces di-oxy tri ethyl-isoquinoline

$C_8H_8 \begin{matrix} CH_2 \quad CO \\ \diagup \quad \diagdown \\ CO \quad NH \end{matrix}$ [50°] (309°)

(Py 8, 2) **OXY ETHYL-QUINOLINE DIHY**

DRIDE $C_8H_8 \begin{matrix} CH_2 \quad CH_2 \\ \diagup \quad \diagdown \\ NH \quad CO \end{matrix}$ Ethylhydrocarbo

styryl [88°] Formed from phenyl valeric acid by nitration and reduction (Baeyer a Jackson, *B* 13, 119) Crystals Occurs also in an unstable modification [76°] PCl_5 gives chloro ethyl quinoline and $C_{11}H_{11}NO$ [168°]

(B 2) Oxy (Py 4) ethyl quinoline tetrahydryde **Methyl derivative** C_8H_7NO **Ethylthalline** (287°) Formed from thallin and EtI (Skraup, *M* 6, 779) Thick liquid — B^*HCl — B^*EtI [133°] — $(B^*EtCl) \cdot PtCl_6$, orange needles

(B 4) Oxy-(Py 4) ethyl-quinoline tetrahydryde $CH \quad CH \quad CH_2 \quad CH_2$ [76°] Prepared by heating (B 4) oxy quinoline tetrahydryde with EtI or $EtBr$ (O Fischer, *B* 16, 717, Fischer a Renouf, *B* 17, 756, Fischer a Kohn, *B* 19, 1044, *O J* 49, 608) Monoclinic prisms or tables, sol alcohol and ether, sl sol water $FeCl_3$ colours its alcoholic solution brown

— B^*HCl **Kaurne A** Trimetric prisms, $a, b, c = 595.1, 957$, v sol water Febrifuge — B^*EtI [160°] Prisms (from alcohol)

Ethyl ether C_8H_7NO [88°] (270°). Formed from the ethyl ether of (B 4) oxy quinoline tetrahydryde and $EtBr$ at 180° Silky plates, insol water — B^*EtI . [187°] Prisms — $B^*Et \cdot PtCl_6$, [188°]

Acetyl derivative $C_{11}H_{11}AcNO$ [64°].

(B. 1) Oxy (*Py* 4) ethyl-quinoline tetrahy-
 dride $\begin{array}{c} \text{CH C(OH) C CH}_2\text{CH}_2 \\ \text{CH CH—C NEtCH}_2 \end{array}$. [73°] Formed
 by ethylating the corresponding oxy-quinoline
 tetrahyrdr (Riemerschmid, *B* 16, 724) Crys-
 tals, sol alcohol—B/HCl aq

(Py 3) OXY-(Py 2) ETHYL-QUINOLINE-
DIHYDRIDE (Py 2) CARBOXYLIC ETHER
CH₃ CH₂ CO₂ E⁺

$$(\text{?})\text{C}_6\text{H}_4 \begin{cases} \text{CH}_2\text{CEtCO}_2\text{Et} \\ | \\ \text{N}-\text{C}(\text{OH}) \end{cases} \cdot \quad [114^\circ] \quad \text{Obtained}$$

by reduction of *o* nitro benzyl ethyl-malonic ether with zinc and acetic acid (Lellmann & Schleich, *B* 26, 440) Colourless silky needles

OXY-ETHYL SUCCINIC ACID *C₆H₁₀O₈
—BaA''3aq —CaA''3aq —Ag₂A'' *Anhydride*

$$\text{C}_6\text{H}_5\text{O}_4 \text{ i.e. } \text{CHMe} \left\langle \begin{array}{c} \text{O CO CH}_2 \\ \text{CH}(\text{CO}_2\text{H}) \end{array} \right\rangle \quad \text{Methyl}$$

paraconic acid [84°] Formed from aldehyde, succinic acid, and Ac_2O (Fittig & Frankel, A 255, 17) Small plates $-\text{BaA}'$, $3\frac{1}{2}\text{aq}$ $-\text{CaA}'$, $2\frac{1}{2}\text{aq}$ $-\text{AgA}'$

Reference — TRI CHLORO OXY-ETHYL-SUCCINIC ACID

DI OXY DI ETHYL SULPHIDE

$\text{S}(\text{CH}_2\text{CH}_2\text{OH})_2$. Formed from ethylene chlorhydrin and aqueous K_2S (V Meyer, *B* 19, 3259)
Syrup With PCl_5 it yields $\text{S}(\text{C}_2\text{H}_4\text{Cl})_2$, whence K_2S yields insoluble $\text{C}_2\text{H}_4\text{S}_2$. A soluble $\text{C}_2\text{H}_4\text{S}_2$ is formed from $\text{C}_2\text{H}_4(\text{SNa})_2$ and ethylene bromide

OXY ETHYL *p* TOLUENE C_8H_9NO *re*
 $C_8H_7NHCH_2CH_2OH$ [37°] (287°) Formed
 from *p*-toluidine and ethylene oxide (Demole,
B 7, 635, *A* 173, 123) Crystals, sol
 water — $B'H_2PtCl_4$ [148°] — $B'H_2SO_4$ [111°] —
 $B'H_2C_2O_4$ [122°]

Di-oxy di-ethyl *p* toluidine $C_7H_7N(C_2H_4OH)_2$
(339°) —B' H_2PtCl_4 .

OXY-ETHYL UREA *p*-Tolyl-derivative
 $\text{NH}_2\text{CO NH C}_6\text{H}_4\text{OC}_2\text{H}_5$, [158°] Formed from
 tolyloxyethylamine hydrochloride and potassium
 cyanate solution at 100° (Schreiber, *B* 24, 193)

OXY-FLAVOLINE v **FLAVENOL**

OXY-FLUORENE CARBOXYLIC ACID

$\text{C}_6\text{H}_4\text{CO}_2\text{H} \xrightarrow{\text{C}_6\text{H}_5(\text{CO}_2\text{H})} \text{CH}(\text{OH})$ [203°] Formed by reducing diphenylene ketone carboxylic acid with zinc dust and ammonia (Graebe, *A* 247, 283). Crystals (from hot water or benzene).

OXYGEN O (Older names were *vital air*, *pure air*, *dephlogisticated air*) At w 15.96 (v *infra*) Mol w 31.92 Boils -181.4° at 740 mm (Olszewski, *W* 31, 58) Has not been solidified (v *infra*) SG (liquid, compared with water at 4°) 899 at -130° (Wroblewski, *W* 20, 860), 7555 at -129.6° , 8788 at -139.3° , 8544 at -137.5° , 8772 at -139.4° , 1124 $^\circ$ at -181.4° [=b p] (Olszewski, *M* 5, 124, *W* 31, 58), Wroblewski (*Lc*) gives SG for temperature from -118° to -200° as $=1.212 + 0.0428T - 0.000529T^2$; where T = absolute temperature SG (gaseous, at 3000 atmos. referred to water $=1$) 1.1054 (Amagat, *C R* 107, 522) Critical temp c -113° , critical pressure c 50 atmos VD 15.96 (v *infra*) S.H.p (equal weight of water = 1) 21751 from 18° to 207° (Regnault, *Acad* 26, 1), S.H.v (equal wt of water = 1) 1551 (Clausius, *Mechan. Wärmetheorie*, 1, 62) CE (21° to 98° at 760 mm) 0086748 (Jolly, *P. Jubelbd* 82) S 04399 at 0° . 04286 at 0° . 03802 at 10° . 03415 at

15°, -0.3103 at 20°, 0.2616 at 30° (Winkler, B. 22, 1764, S is given for each degree from 0° to 30°, and the results are compared with those of Bunsen) S (alcohol, 0° to 24°) 23897 (Carus, A 94, 184, cf Timofejeff, Z P C 6, 141) Compressibility coefficient = 0.0025 at 1000–1500 atmos, 0.0016 at 1500–2000 atmos, 0.00115 at 2000–2500 atmos, 0.00091 at 2500–3000 atmos (Amagat, C R 107, 522) O exhibits several very different emission spectra under different conditions, for measurements of lines v B A 1884 432 The absorption spectrum of O at pressures up to 90 atmos has been examined by Laveing Dewar (P M [5] 26, 286, Pr 46, 222), for the absorption spectrum of liquid O v Olzsewski, W A B 95 [2nd part], 257 (cf L a D Pr 46, 422, Janssen, C R 101, 649, 102, 1332, Egoroff, C R 101, 1143)

Occurrence.—Uncombined in the atmosphere, of which it forms one fifth by volume. Compounds of O are very numerous, and occur in enormous quantities. O forms eight-ninths of water by weight, and about one half of silica, alumina, and chalk, which are the three most plentiful constituents of the solid earth, almost every widely distributed rock or mineral contains O, the principal exceptions being rock salt, fluorspar, blende, galena, and pyrites. As O is slightly sol in water, this gas is found uncombined in all natural waters. O is a constituent of all living tissues, according to Wurster (*B* 21, 1525), O_2H_2 occurs in the juices of plants. According to H. Draper, O occurs in the sun (*Am S* [3] 14, 89, cf J O Draper, *ibid* 16, 256).

O was prepared for the first time by Priestley, in 1774, by heating HgO , a year later the gas was discovered by Scheele. Lavoisier was the first to recognise the importance of the discovery of O, and to study its chemical properties.

References to older memoirs on Oxygen — Priestley, 'Experiments and Observations on different kinds of Airs' [London, 1775-1777], 2, 29, 3, 1, Priestley, 'Experiments and Observations relating to various branches of Natural Philosophy' [London, 1779], 1, 192, Scheele, 'Abhandlungen von der Luft und dem Feuer' [Upsala & Leipzig, 1777], also *Crells Annal* 1785, 2, 229, 291, Lavoisier's memoirs appeared in *Acad* from 1774 to 1788, Berzelius, *Lehrbuch der Chemie* [3rd ed 1838, 1, 5. 46

Formation—The processes wherein O is formed may be divided into groups I *From air*—1 BaO is heated in air to dull redness, when BaO₂ is formed, the pressure is decreased, and the BaO₂ is heated, when O is evolved, and BaO remains—2 Hg is heated in air at c 300° when HgO is slowly formed, on strongly heating HgO, O and Hg are produced—3 MnO₂ is heated with NaOH in air, Na₂MnO₄ and H₂O are produced ($4\text{NaOH} + 2\text{MnO}_2 + \text{O}_2 = 2\text{Na}_2\text{MnO}_4 + 2\text{H}_2\text{O}$), the product is heated to dull redness in steam, when NaOH, Mn₂O₃, and O are formed ($2\text{Na}_2\text{MnO}_4 + 2\text{H}_2\text{O} = 4\text{NaOH} + \text{Mn}_2\text{O}_3 + 3\text{O}$), by again passing air over the residue, Na₂MnO₄ is reformed (Tessie du Motay, *D P J* 186, 230)—4 When air is pressed into water, more O than N is dissolved, by reducing pressure on the water O and N are evolved, by pressing the evolved gases again

into water, again reducing pressure, and pressing the gases into a fresh quantity of water, and repeating these processes eight times, nearly pure O (about 2.3 p c N) is obtained (Mallet, *D P J.* 199, 112). For details of the methods for obtaining O from air *see* DICTIONARY OF APPLIED CHEMISTRY II *From Oxides*—5 Several metallic oxides give off O when heated, *eg* HgO , MnO_2 , PbO_2 , Au_2O_3 , Bi_2O_3 .—6 When water is electrolysed, O separates at the positive electrode.—7 O is obtained by passing a mixture of H_2O and Cl through a red hot tube, the issuing gas is passed through NaOH to absorb HCl and excess of Cl .—8 When steam is passed over CuCl_2 at $100^\circ\text{--}200^\circ$ an oxychloride of Cu is formed which is reduced to CuCl_2 at $c\ 400^\circ$ with evolution of O (Vogel, *W J* 1861 177, Mallet, *C R* 64, 226, 66, 349).—9 O is obtained by the reaction of $\text{H}_2\text{O}_2\text{Aq}$ with Ag_2O ($\text{Ag}_2\text{O} + \text{H}_2\text{O}_2 = \text{H}_2\text{O} + 2\text{Ag} + \text{O}_2$).—10 MnO_2 , PbO_2 , CrO_3 , BaO_2 , Bi_2O_3 , and other metallic peroxides yield sulphates, H_2O , and O when heated with conc H_2SO_4 .—11 CO_2 is decomposed by fresh parsley, mint, and other green plants, when the plant is placed in water charged with CO_2 and exposed to direct sun light III. *From compounds other than oxides*.—12 KClO_3 is heated, either alone or mixed with MnO_2 or Fe_2O_3 ,—13 CaCl_2O_2 is heated, when CaCl_2 and O are formed, or dry Cl is passed over CaO heated to redness.—14 Conc HNO_3 is dropped into a red hot Pt flask, $2\text{HNO}_3 = \text{H}_2\text{O} + \text{O} + 2\text{NO}_2$.—15 Conc H_2SO_4 is dropped on to red-hot Pt, or on to red-hot bricks, the gases produced are passed through milk of lime, $\text{H}_2\text{SO}_4 = \text{H}_2\text{O} + \text{SO}_2 + \text{O}$ (Deville a Debray, *C R* 51, 822).—16 By strongly heating dry ZnSO_4 , O and SO_2 are evolved and ZnO remains (D a D, *lc*).—17 $\text{Ba}(\text{NO}_3)_2$ yields O, mixed with N, when strongly heated.—18 A mixture of O and N, containing about 60 p c O is obtained by heating NaNO_3 with two parts dry ZnO (*v* Pepper, *C N* 6, 218).—19 Conc H_2SO_4 is heated with $\text{K}_2\text{Cr}_2\text{O}_7$ or KMnO_4 , sulphates of K and Cr (or Mn) and H_2O are formed and O is evolved.—20 A fairly conc solution of bleaching powder is heated with addition of a small quantity of a salt of Co, Co_2O_3 is formed (by the action of the CaO on the Co salt), and this is probably oxidised to CoO_2 , which is again reduced to Co_2O_3 with evolution of O (Winkler, *J pr* 98, 340, Fleitmann, *A* 134, 64, Reinsch, *Z* [2] 2, 31, Böttger, *J pr* 95, 309, 375, Stolba, *J pr* 97, 309). A modification of this process consists in passing Cl into warm thick milk of lime containing a little Co_2NO_2 (W, *lc*).

Preparation.—1 Pure KClO_3 , which has been fused, is well mixed with c half its weight of pure dry MnO_2 , and the mixture is heated in a flask of hard glass to $c\ 210^\circ\text{--}220^\circ$. As the O thus obtained contains a little Cl , the gas is passed through NaOH or milk of lime. It is then dried by H_2SO_4 , and passed in a rapid stream through a glass tube heated to redness. After a time the stream of O may be allowed to slacken, and the glass tube need not be kept hot. The rapid stream of O, passing through the hot tube, washes out the last trace of air, which very obstinately adheres to glass at ordinary temperatures (Houzeau, *C R* 70, 89). Any

ozone present is also decomposed. The small quantity of air which adheres to the glass may also be removed, according to Illosva (*Bl* [3] 2, 734), by passing the O over Pt foil at $280^\circ\text{--}250^\circ$, or Pt black at $c\ 250^\circ$, whereby combination of O with the N present occurs, with formation of nitrites and nitrates, which may be absorbed in NaOH Aq. The Pt loses the power of inducing the combination of N and O after a time, but regains this power when heated in a stream of H at $c\ 250^\circ$ (*I, lc*). If the O is required quite dry, it is passed through conc boiled H_2SO_4 , and then over a long layer of P_2O_5 . Regarding the part played by MnO_2 and other substances in causing O to be evolved from KClO_3 at temperatures lower than that at which this salt gives off O when heated alone, *v* Hornsby, *Ph* 15, 352, Witt, *ibid* 411, 503, Brown, *ibid* 469, Wiederhold, *P* 116, 171, 118, 186, Baudrimont, *J Ph* [4] 14, 81, 161, Krebs, *Z* 6, 243, Mills a Donald, *C J* 41, 18, Mills a Stevenson, *C J* 41, 23.—2 Pure MnO_2 is heated to full redness in a hard glass tube, the gas is passed through milk of lime to absorb CO_2 , then over Pt black at $c\ 250^\circ$ to cause combination of N (which is generally present) with O, then through NaOH Aq to absorb nitrites and nitrates produced, and the O is then dried by conc H_2SO_4 , CaCl_2 , and P_2O_5 . It is difficult to obtain O by this method quite free from every impurity.—3 Böttger (*J pr* 103, 316, 107, 48) says that pure O is obtained by gently heating KMnO_4 , or by the reaction of dilute HNO_3 Aq, S G c 1 064 with a mixture of PbO_2 and BaO .—4 Fairly pure O may be obtained in a regular stream, at the ordinary temperature, by compressing into small cylinders a mixture of two parts BaO , one part MnO_2 , and one part CaSO_4 , and acting on these, in a Kipp's apparatus, with HCl Aq, S G 12, diluted with an equal volume of water (Neumann, *B* 20, 3058).

Properties.—A colourless, odourless, tasteless gas. Condensed to a liquid at very low temperatures and great pressures. Liquid O is bright blue when viewed in layers 30–40 mm thick (Olszewski, *W* 42, 663). Pictet supposed that O was solidified when pressure was suddenly reduced, and the liquid was allowed to issue into the air (*C R* 86, 37), but, according to more recent experiments by Wroblewski a Olszewski (*C R* 100, 350, 979), solid O has not been obtained. Light appears bluish when observed through liquid O, or through a column of the gas very strongly compressed (Livinge a Dewar, *P M* [5] 26, 286). One litre O at 0° and 760 mm weighs 1.424488 grms at the latitude of 45° , multiplying mean result of Regnault (*Acad* 21, 158) and Jolly (*W* 6, 520) for weight of one litre H by mean S G of O, referred to H, obtained by Scott and Rayleigh (*v N* 37, 418). The atomic volume of O

($\frac{\text{At weight}}{\text{S G of liquid}}$) is c 14 (*v* Wroblewski, *C R* 102, 1010). The atomic volume of O in compounds varies according to the number of atoms with which the O is directly united, and perhaps to a small extent according to the nature of these atoms. Kopp gives 12.2 for O \cdot and 7.8 for O $\cdot\cdot$ (*v* SPECIFIC VOLUMES, vol iv p 498). The effect of the atom of O on the magnetic rotatory

power of O compounds is not yet determined with certainty (Perkin, *C J* 45, 558, v *PHYSCAL METHODS*, section *Optical*). O is absorbed by molten Ag or Pt, and given off again as the metal solidifies. O is also absorbed by charcoal. One vol cocoa nut charcoal absorbs c 18 vols O at 0° and 760 mm. (Hunter, *P M* [4] 29, 116, v also *Saussure, G A* 47, 113). According to Angus Smith (*Pr* 28, 322), the vol of O absorbed by C is eight times that of H under the same conditions. O absorbed by charcoal brings about oxidation of H_2S , PH_3 , C_2H_4O , &c, fairly rapidly (Calvert, *C J* [2] 5, 293, cf *CARBON*, vol 1 p 686).

O is the most negative of the elements except F. It combines directly with all elements except F, Cl, Br, I, Au, and Pt. At least one binary compound of O with each element, except F and Br, is known. Compounds containing O exhibit the same diverse properties. The oxides of the positive elements, as a class, are basic, and those of the negative elements are acidic (v *OXIDES*, p 658, *ANHYDRIDES*, vol 1 p 267, *BASE*, vol 1 p 445). O is a constituent of the greater number of acids, the compounds of O with H and non metallic elements are acids. When H is combined with one of the less positive metals and a relatively large quantity of O, the compound so produced is generally an acid (v *ACIDS*, vol 1 p 47). The process of combining O with another element or with a compound is called oxidation (v *OXIDATION*, p 657, cf *DEOXIDATION*, vol 1 p 377). When the process is attended with the production of so much heat that the products become self luminous, it is called combustion (v *COMBUSTION*, vol 1 p 241, cf *FLAME*, vol 1 p 549). O is more closely related chemically to S, Se, and Te than to the other elements. It belongs to Group VI, which contains the even series elements O, Cr, Mo, W, and U, and the odd series elements S, Se, and Te (v *CHROMIUM GROUP OF ELEMENTS*, vol 1 p 168, and *OXYGEN GROUP OF ELEMENTS*, this vol *infra*). O exhibits allotropy, the allotropic modification is called *Ozone* (v art *OZONE*).

Atomic weight of oxygen—The value 16.01 was obtained by Berzelius and Dulong in 1819, by burning H by CuO and weighing the water formed (4 *Ch* 15 386). In 1842 Dumas by the same method, arrived at the number 15.98 (4 *Ch* [3] 8, 189). In the same year, Lrdmann & Marchand conducted very carefully a series of five experiments by the same method, their mean result was 16.005. Ostwald (*Lehrbuch der Allgemeinen Chemie*, 1, 43) shows that the value 15.84 is obtained from Stas's experiments on the ppn of NH_4Cl by Ag. In 1805 Gay-Lussac & Humboldt (*G A* 20, 38) determined the ratio in which H and O combine, by volume, to be 2:1. Using the values for SG of these gases obtained by Biot & Arago, the atomic weight of O became 15.1. If Regnault's more accurate determinations of SG of H and O are made use of, and it is assumed that H and O combine in the ratio 2:1 by volume, then the atomic weight of O becomes 15.964. In recent years Scott has made a series of direct determinations of the relative densities of H and O (*Pr* 1897 898, *B A* 1887 668; *Pr* 42, 896, *N* 87, 439). Keiser (*B* 20, 2828, *Am* 10, 249) caused Pd to occlude H, and then drove out the

H over hot CuO, and weighed the water produced. In this way a direct weighing of the H burnt was obtained. Keiser's final value for O was 15.9492. Cooke & Richards (*Am* 10, 81) weighed H in a large balloon, and then burnt it to H_2O , they obtained $O=15.953$. Lord Rayleigh, in 1888, pointed out a source of error in all experiments wherein a gas is weighed by pumping the air out of a glass globe, and thus allowing the gas to enter (the error is due to the shrinkage of the globe when evacuated). From his own experiments, Rayleigh gave $O=15.884$ (*Pr* 43, 356), and applying his correction to Scott's most carefully determined values (*Pr* 42 396), he obtained the value $O=15.912$. Cooke & Richards applied Rayleigh's correction to their experimental data, and arrived at the conclusion that $O=15.869$ (*Am* 10, 191). The mean of the results obtained by directly weighing H and then burning it to H_2O is 15.888. The most probable value obtained by weighing H by occluding it in Pd, driving out by heat, and weighing Pd before and after, is 15.9492. The mean of the values obtained by burning H to H_2O , weighing O by loss of weight of CuO, and determining H by difference between weights of H_2O and O, is 15.992. For a criticism of the methods and results up to 1885, v Ostwald's *Lehrbuch der Allgemeinen Chemie*, 1, 41. As the atomic weights of many elements are determined by directly referring them to O, some chemists take the atomic weight of O as 16 (H thus becomes a little more than 1). Most chemists at present take $O=15.96$, which is the value used in this Dictionary.

Reactions and Combinations—The reactions and combinations of O are too many to be described here, it must suffice to indicate them in a general way. Reference should be made to the various elements and compounds for details. 1. All non metals, except F, Br, Cl, and I, combine directly with O, compounds of all, except F and Br, with O are known. 2. All metals, except Au and Pt, combine directly with O, compounds of all with O are known. 3. Many lower oxides are changed to higher oxides by heating in O, e.g. BaO , Bi_2O_3 , NO , P_2O_3 , PbO , FeO , many other lower oxides form higher oxides when O is produced in contact with the lower oxides (cf *OXIDATION*, p 657, and *OXIDES*, p 638). 4. Innumerable compounds are decomposed by O, with formation of more oxidised compounds, e.g. NH_4Aq , H_2S , PbS , and $Na_2S_2O_3Aq$, with many compounds O combines directly, e.g. P_2O_3 , HNO_3Aq , SO_2Aq , NO .

Certain oxidations do not occur when very dry O is heated with the substance to be oxidised after it has been thoroughly dried (v *CARBON*, vol 1 p 687, *Carbon monoxide*, vol 1 p 690, v also *PHOSPHORUS*, *SULPHUR*).

Detection of free oxygen—Uncombined O changes an alkaline pyrogallol solution to dark brown, white indigo becomes blue, NO combines with O to form red brown NO_2 , easily soluble in water, $CrCl_3Aq$ rapidly absorbs O, changing from blue to green (for preparation of $CrCl_3Aq$, v *NITROGEN*, *Preparation* No 1, p 557). M M P M

OXYGENATED WATER An older name for *HYDROGEN DIOXIDE* (q v, vol 1 p 722).

OXYGEN GROUP OF ELEMENTS *Oxygen, sulphur, selenium, and tellurium*. Oxygen was Z Z

prepared by Priestley in 1774; sulphur has been known from early times, selenium was discovered by Berzelius in 1817, tellurium was found by Klaproth, in 1798, in gold ore from the *Siebergberge*. The name oxygen was given by Lavoisier to express the fact that many compounds of this element are acidic, the word sulphur is supposed to be derived from *sal* = salt and *rip* = fire (burning salt or stone), the name tellurium is derived from *tellus* = the earth, selenium received its name from *σεληνη* = the moon, because of its association with and likeness to tellurium. The following table presents some of the chief properties of the four elements.—

The elements S, Se, and Te show very distinct resemblances in their chemical properties. All form hydrides MH_2 , which are gases at ordinary temperatures, SH_2 and SeH_2 in water reddens litmus, and react as very weak acids. TeH_2 is not acidic, these hydrides are decomposed by heat, stability in this respect decreasing as at w of M increases. These hydrides are produced by passing H over molten S, Se, or Te, also by reacting on various sulphides, selenides, and tellurides, with dilute acids. The hydride of O, viz OH_2 , is analogous in composition, and is formed similarly to those of S, Se, and Te, OH_2 is neutral H_2O , and H_2S , are also similar in composition and many pro-

<i>Atom weight</i>	18.3	16	17.5	20
<i>Spec grav (approx)</i>				
<i>Occurrence and preparation</i>	Very large quantities of O occur uncombined in air, O is a constituent of almost all rocks and minerals, and also of all living organisms, it forms 8ths of water. By heating various compounds, chiefly oxides of metals, and in many other ways.	In large quantities in Sicily, Spain, &c., sulphides and other S compounds are common minerals, S compounds are found in many living organisms. Prepared by refining crude sulphur, also by roasting various sulphides in absence of air.	Uncombined in very small quantities, compounds of Se with S, Fe, Cd, Hg, Pb, &c., occur very sparingly. By passing SO_2 into H_2SeO_4 aq., also by adding HCl aq. to $KSeCN$ aq.	Uncombined, also in combination with Au, Pb, S, Sb, Bi, &c., but in very small quantities. From solution of a salt of H_2TeO_4 , by passing in SO_2 , or by Zn.
<i>Physical properties</i>	A colourless, odourless gas, bluish when much compressed, condensed to a colourless liquid, appearing blue in thick layers, at great pressures and low temperatures, has not been solidified.	A yellow, brittle crystalline, solid, also a plastic semi-fluid, amorphous mass. Very bad conductor of electricity.	A red-grey, lustrous crystalline, solid, also an amorphous, vitreous, grey-black solid. The amorphous form is a very bad conductor of electricity, the crystalline form conducts fairly, and conductivity increases when exposed to sunlight.	A lustrous, white, metal like, crystalline, brittle, solid, also as an amorphous powder. Bad conductor of electricity.

	OXYGEN	SULPHUR	SELENIUM	TELLURIUM
<i>Chemical properties</i>	Combines directly with all elements except F, Cl, Br, I, Au, and Pt, oxides are known of all elements except F and Br. Compounds exhibit very different properties. O is a constituent of most acids, and of all alkalis. Compound with H, OH ₂ , is a neutral oxide, H ₂ O ₂ is a peroxide.	Combines directly with most elements. Sulphides are basic, or acidic, or neutral, according to nature and relative quantity of element combined with S. S is a constituent of several acids. H ₂ S is feebly acidic.	Compounds with several elements are known, they resemble sulphides. H ₂ Se is very feebly acidic. H ₂ SeO ₃ and H ₂ SeO ₄ are much weaker acids than H ₂ SO ₃ and H ₂ SO ₄ .	Combines with several elements (compounds not studied very fully). Binary compounds resemble those of Se. H ₂ Te is not acidic. TeO ₂ and TeO ₃ do not form acids by acting with water, but these oxides are obtained by heating the acids H ₂ TeO ₃ and H ₂ TeO ₄ .

perties. Se₂H₂ and Te₂H₂ have not been prepared. Binary compounds of S, Se, and Te with metals are analogous in composition to the metallic oxides. Chlorides of the form MCl₂ are known, M = O, S, Se, Te, no compound of S, Se, or Te analogous to O₂Cl₂ is known, nor has a compound of O and Cl analogous to SCl₂, SeCl₂, and TeCl₂ been obtained. The stability of the chlorides towards heat increases in passing from O to Te. The oxides of S, Se, and Te—MO₂ and MO₃—are acidic (SeO₃ is not known), acidity decreasing rapidly as at w of M increases, TeO₃ is scarcely acidic, but a corresponding acid H₂TeO₄ exists, TeO₃ combines with some strong anhydrides to form compounds of the type of salts. The oxyacids H₂MO₃ and H₂MO₄ are analogous in composition, but the acids of S are very much stronger than those of Se or Te, those acids yield oxychlorides, MOCl₂ and MO₂Cl₂, by reacting with PCl₅. Many other oxyacids of S are known.

The elements of the O family exhibit allotropy, O and S in a very marked way, Se less markedly, and Te only slightly. The allotropic forms of O exist as gases, their molecular formulæ are O₂ and O₃, the allotropic forms of S, Se, and Te are known with certainty only as solids. It is doubtful whether molecules of S or Se, other than S₂ and Se₂, exist as gases through any considerable range of temperature, the only molecule of Te existing as a gas is Te₂. The mol w of S in solution is certainly greater than S₂, and probably varies according to the solvent.

The elements S, Se, and Te form the odd-series members of Group VI, of which group O forms the first even series member, the other even series members are Cr, Mo, W and U. All the members of Group VI are characterised by forming acidic oxides MO₃, as the at w increases these oxides become less acidic. Only the odd series members, and O, form hydrides. All form chlorides MCl₄, the stability of which towards heat increases from O to U, the higher members also form several other stable chlorides. Group VI falls into two families, (i) S, Se, Te, (ii) Cr, Mo, W, U, O is the typical element of the group (*cf.* CHEMISTRY GROUP OF ELEMENTS, vol ii p 188, v. also OXYGEN, SULPHUR, SELENIUM, TELLURIUM). α-OXY-GLUTARIC ACID

CO₂H CH(OH) CH₂ CH₂ CO₂H *Glutaric acid* [73°] ? (M) Formed from amido glutaric acid and HNO₂ (Ritthausen, *J pr* 103, 239, Markownikoff, *A* 182, 348) Occurs in beetroot molasses (Lippmann, *B* 15, 1156) Readily yields the lactic acid—CaA''₂aq—MgA''₂aq—PbA''₂aq—ZnA''₂aq—AgA''₂aq

Lactic acid C₃H₅O₃, s.e.

CH₃—CO—CH₂—CH₂—CO₂H [50°] Very hygroscopic needles (Wolff, *A* 260, 126)—CaA''₂aq—BaA''₂aq—ZnA''₂aq Yields glutaric acid [98°] on reduction by HI.

β-Oxy-glutaric acid Methyl derivative CO₂H CH₂—CH(OMe)—CH₂—CO₂H Formed by oxidising di-allyl-carbinol with 5 p.c. solution of KMnO₄ (Ryabinin, *J pr* [2] 23, 274) Extracted with ether (*v* OXYTARTARIC ACID)

Salts—CaA'' (at 100°) Syrup, covered by crystalline crusts—BaA''—AgA'' Prisms

αβ-Di-oxy glutaric acid

CO₂H CH₂—CH(OH)—CH(OH) CO₂H [156°] Formed by boiling glutaric acid-di bromide with water and CaCO₃. Needles (from water), or six sided tables (from alcohol). V e sol. water, v sol alcohol. Its Ca salt is easily soluble (Kiliani, *B* 18, 2517)

γ-Di-oxy glutaric acid

CO₂H CH(OH) CH₂—CH(OH) CO₂H Formed by heating the di-oxy-propane tri-carboxylic acid, which is obtained by oxidising isosaccharic acid with HNO₃. Colourless prisms V e sol water, v sol alcohol, sl sol ether. Its Ca salt is sparingly soluble (Kiliani, *B* 18, 2516)

Tri-oxy-glutaric acid C₅H₄O₇ [127°] Formed from arabinose or sorbin by oxidation with HNO₃ (SG 12) (Kiliani, *B* 21, 3006, 3276)—KA'' monoclinic plates

OXYGUANIDINE Obtained by boiling cyanamide with alcoholic hydroxylamine hydrochloride (Prætorius a Seidler, *J pr* [2] 19, 399). —(ON₂H₂)₂·PtCl₄ ruby-red prisms

OXY-HÆMOGLOBIN *v* HÆMOGLOBIN.

OXYHALOID COMPOUNDS Compounds of F, Cl, Br, or I, with O and another element. Oxyhaloid compounds of non-metals are often formed by reacting with PCl₅, PBr₅, or PI₅ on oxyacids, e.g. SO₂Cl₂ from SO₂(OH)₂; they are also produced sometimes by heating together an

oxide and chloride, *eg* BOCl by heating B_2O_3 with BCl_3 , sometimes the halogen is directly combined with an oxide, *eg* COCl and NOCl by combining CO and NO with Cl , and BOCl_2 by heating Cl with B_2O_3 mixed with C . Metallic oxyhaloid compounds are formed by decomposing the haloid compounds of the metals by water or steam, by heating together oxides and haloid compounds, and in some cases by the incomplete *ppn* of haloid compounds in solution by alkali. Non metallic oxyhaloid compounds are decomposed by water to haloid acids and other oxides or oxyacids of the non metal present. Some metallic oxyhaloid compounds are also decomposed by hot water to haloid acids and metallic oxides, in this respect the oxyfluorides are the most stable, and the oxyiodides, as a class, are more stable than the oxybromides and oxychlorides. The oxyhaloid compounds of H are acids. All elements form one or more oxy haloid compounds. A metal which readily forms many oxyhaloid compounds generally forms one or more oxides with acidic reactions, and is otherwise more or less non metallic in its chemical properties. M M P M

DI-OXY-HENDECIOIC ACID $\text{C}_{11}\text{H}_{22}(\text{OH})_2\text{O}_2$ [85°] Formed by the oxidation, in alkaline solution, of hendecenoic acid derived from castor oil (Hazura a Grussner, *M* 9, 952). Needles, sol hot water.

OXY HENICOSOIC ACID
 $\text{C}_{10}\text{H}_{20}(\text{CH}_2\text{OH})(\text{CO}_2\text{H})$ [103.5°] Occurs in the soda soap from carnauba wax (*q v*). Crystalline powder (from petroleum), sl sol alcohol, m sol isobutyl alcohol (whence it separates as a jelly) (Starcke, *A* 223, 310). As its alcoholic solution is not *ppd* by acetate of Mg , Cu , or Pb , it is possibly a lactone $\text{C}_{10}\text{H}_{20}\langle\frac{\text{CH}_2}{\text{CO}}\rangle\text{O}$. Heated with soda lme it splits off H_2 , forming a dibasic acid $\text{C}_{10}\text{H}_{18}(\text{CO}_2\text{H})_2$ [90°].

PENTA OXY HEPTANE The only anhydride $\text{C}_6\text{H}_{10}(\text{OH})_5\text{O}$ is formed by the action of HOCl followed by KOH on di allyl carbinol (Reformatsky, *J R* 21, 295). The acetyl derivative $\text{C}_6\text{H}_{11}(\text{OAc})_5$ (169.5°) S G \pm 919 is described by Saytzeff (*A* 185, 129).

OXY-HEPTANE PHOSPHONIC ACID
 $\text{C}_6\text{H}_{11}\text{PO}_4$, *ie* $\text{C}_6\text{H}_{11}\text{CH}(\text{OH})\text{PO}(\text{OH})_2$ [185°] Formed from α -naphthol and PCl_5 followed by water (Fossek, *M* 7, 27). Monoclinic tables $a b c = 1.844 \ 1.957$, $\beta = 74^\circ$ — CaA'' .

The compound $\text{C}_6\text{H}_{11}\text{CH}(\text{OH})_2\text{PO}(\text{OH})_2$ [160°] is formed by heating α -naphthol with hypophosphorous acid (Ville, *C R* 109, 72). It yields the salts BaA'_3 , 3aq , PbA'_3 , 3aq , KA'_4 , 4aq , and $(\text{C}_6\text{H}_{11}\text{CH}(\text{OAc}))_2\text{PO}_2\text{H}$ [94°].

OXY-HEPTENOIC ACID
 $\text{CHMe}(\text{OH})\text{CH}(\text{C}_6\text{H}_5)\text{CO}_2\text{H}$ Formed from allyl-acetoacetic ether and sodium amalgam (Zeidler, *A* 187, 45). Syrup, miscible with water — BaA'_2 — $\text{Zn}(\text{OHA})'$.

Oxy-heptenoic acid Nitrile
 $\text{CHEt} \cdot \text{CMe} \cdot \text{CH}(\text{OH}) \cdot \text{CN}$ Formed from methyl-ethyl-acrolein and HCy (Johanny, *M* 11, 401). Converted by hydrochloric acid into the amide $\text{CHEt} \cdot \text{CMe} \cdot \text{CH}(\text{OH}) \cdot \text{CONH}_2$ [101°]. The nitrile yields an oily acetyl derivative (114° at 22 mm), γ sol ether.

Oxy-heptenoic lactone *v* MESITONIC ACID

OXYHEPTIC ACID $\text{C}_7\text{H}_{14}\text{O}_2$, aq ? [185°] **A** product of the action of bromine, followed by alcoholic potash on isobutyl acetoacetic ether (Demarcay, *C R* 86, 1135). Pearly scales (from water). Yields $\text{C}_7\text{H}_{14}\text{O}(\text{OEt})\text{NH}_2$? [87°].

α -OXY-HEPTOIC ACID $\text{C}_7\text{H}_{14}\text{O}_3$, *ie* $\text{Pr} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{CH}(\text{OH}) \cdot \text{CO}_2\text{H}$ [60°] (Helms, *B* 8, 1167), [65°] (Lay, *J R* 9, 141). Formed by heating aqueous potassium bromo heptoate at 140° Prisms — MeA' [160°–165°].

Amide [147°] Hexagonal tables
 α Oxy heptoic acid $\text{C}_7\text{H}_{14}\text{CH}(\text{OH})\text{CO}_2\text{H}$ [60.5°] Formed from its ether, EtA' (203°), which is produced, as well as the ethyl derivative thereof $\text{C}_7\text{H}_{11}\text{CH}(\text{OEt})\text{CO}_2\text{Et}$ (c 224°) by the action on oxalic ether of zinc and isoamyl iodide at 100°, followed by water (Frankland a Duppa, *Pr* 14, 191). Scales — BaA'_2 — CuA'_2 .

β Oxy-heptoic acid
 $\text{CHMe} \cdot \text{CH}(\text{OH}) \cdot \text{CMe} \cdot \text{CO}_2\text{H}$ [112°] The chief product of the action of sodium on isobutyric ether (Hantzsch, *A* 249, 60). Silky needles, m sol water, volatile with steam — BaA'_4 , 4aq .

Ethyl derivative of the ethyl ether
 $\text{Pr} \cdot \text{CH}(\text{OEt}) \cdot \text{CMe}_2 \cdot \text{CO}_2\text{Et}$ (181° cor) Oil.

β Oxy heptoic acid $\text{CHMe}(\text{OH})\text{CMe} \cdot \text{EtCO}_2\text{H}$
Formed by reducing $\text{CH}_2 \cdot \text{CO} \cdot \text{CMe} \cdot \text{CO}_2\text{Et}$ with sodium amalgam (Saur, *A* 188, 266). Syrup, γ sol water — $\text{CuC}_6\text{H}_{11}\text{O}_2$ — $\text{AgC}_6\text{H}_{11}\text{O}_2$ plates, m sol hot water.

β Oxy-heptoic acid $\text{CMePr}(\text{OH})\text{CH} \cdot \text{CO}_2\text{H}$
Formed by oxidising $\text{CMePr}(\text{OH})\text{C}_2\text{H}_5$ with KMnO_4 (Semljantzin, *J pr* [2] 23, 267). Syrup — CaA' (at 100°) — BaA'_2 — AgA' prisms.

β Oxy-heptoic acid $\text{CHEt}_2(\text{OH})\text{CH}_2 \cdot \text{CO}_2\text{H}$ [39°] Formed by oxidising $\text{CHEt}_2(\text{OH})\text{C}_2\text{H}_5$ with KMnO_4 (Schrokooff, *J pr* [2] 23, 201). Thin needles — $\text{LiA}' \cdot \text{aq}$ — $\text{CaA}'_2 \cdot \text{aq}$ — $\text{BaA}'_2 \cdot 2\text{aq}$ — $\text{PbA}'_2 \cdot 2\text{aq}$ S 6 at 19° — $\text{CuA}'_2 \cdot 5\text{aq}$ — AgA' .

γ Oxy-heptoic acid
 $\text{CHPr}(\text{OH})\text{CH}_2 \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$ Syrup — BaA'_2 — AgA' curdy *pp*.

Lactone $\text{Pr} \cdot \text{CH} \cdot \langle \frac{\text{CH}_2}{\text{CO}} \rangle$ (235° γ V)

Formed by the action of HI and P on the hexa oxy heptoic acid obtained from dextrose (Kiliani, *B* 18, 3066, 19, 1128). Obtained also from propyl paraconic acid $\text{Pr} \cdot \text{CH} \cdot \langle \frac{\text{CH}(\text{CO}_2\text{H})}{\text{O} \cdot \text{CO}} \rangle$, CH_2

by distilling, converting the resulting $\text{CHPr} \cdot \text{CH} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$ into γ bromo heptoic acid, and boiling this with water (Fittig, *B* 20, 3180, *A* 255, 76).

An isomeric lactone (220° cor) is obtained in like manner from levulose.

γ Oxy-isheptoic acid
 $\text{CHPr}(\text{OH})\text{CH}_2 \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$ Very unstable — BaA'_2 — AgA' .

Lactone $\text{C}_6\text{H}_{11}\text{O}_2$ (225° uncor) S 3 in the cold. Formed from γ bromo isheptoic acid and also by distilling isopropyl paraconic acid (Fittig a Zanner, *A* 255, 94). Liquid, volatile with steam.

γ Oxy-heptoic acid — BaA'_2 — AgA'
Lactone $\text{C}_6\text{H}_{11}\text{O}_2$ [11°] (220° γ V) S 83 at 0°. Formed from tetrachloric acid and cold $\text{HBr} \cdot \text{aq}$ (Fittig a Kraft, *A* 208, 86). Liquid.

γ -Oxy-heptoic acid Lactone
 $\text{CHMe} \cdot \langle \frac{\text{CH}_2}{\text{O} \cdot \text{CO}} \rangle \cdot \text{CMe}_2$ [52°] (86° at 15 mm).

Formed by reducing β -acetyl valeric acid with

$\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2(\text{OH})$ *Heptylene*
δ-glycol (235° at 710 mm) S G at 0° = 9809
Prepared by reduction of aceto butyl alcohol
 $\text{CH}_3\text{COCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$ with sodium-

Iso-oxy-hexic acid [187°] Formed in like manner from isopropyl-acetoacetic ether (D). Reduced by Zn and H_2SO_4 to $C_7H_{15}O_4$ (?) [113°]

Yields $C_6H_{11}O_2(NH_2)_2$ (?) [240°] and another amide $C_6H_9O_2(NH_2)(OEt)_2$ (?) [95°]

DI-OXY-HEXINENE or DI-OXY-HEXYLENE

α -OXY-HEXIC ACID $C_6H_{10}O_3$ *Leucic acid* Mol w 182 [73°] Formed by the action of nitrous acid on leucine (Strecker, *A* 68, 55, Thudichum, *C J* 14, 807, Waage, *A* 118, 297) Needles, v sol water, alcohol, and ether — BaA'_2 , silky laminae (from hot alcohol) — CaA'_2 , — CoA'_2 , — CuA'_2 , — ZnA'_2 , aq S 33 at 16°, 5 at 100° — ZnA'_2 , 2aq (Körner, *G* 13, 356) — AgA' crystalline pp

An isomeric or identical oxy hexoic acid [62°] is formed by the action of Na_2CO_3 on bromohexoic acid got from fermentation hexoic acid (Jehssoff, *J R* 12, 367, *Bn* 1, 523) It yields the salts CaA'_2 , BaA'_2 , MgA'_2 , 2aq, ZnA'_2 , 2aq (S 14 at 16°, 21 at 100°), CuA'_2 , and AgA' It forms a crystalline amide [142°]

α -Oxy-hexoic acid $CEt_2(OH)CO_2H$ [80°] S. 35 at 17.5° Formed from its ether which is got from oxalic ether by the action of $ZnEt_2$, followed by water (Frankland, *Pr* 12, 896, Frankland & Duppa, *Pr* 13, 140, *A* 135, 26, Geuther, *Z* 1867, 705, Fittig, *A* 200, 21) Trichmic crystals, v sol water, alcohol, and ether Yields di-ethyl ketone on oxidation — NH_4A' — BaA'_2 — BaA'_2 , 5aq — ZnA'_2 S 33 at 16° — CuA'_2 — AgA' aq needles

Methyl ether MeA' (165°) SG 165 987

Ethyl ether EtA' (175°) VD 5 24 (calc 553) SG 187 961 Oil Formed from $COClCO_2Et$ and $ZnEt_2$ (Henry, *B* 5, 949)

Isoamyl ether (225°) SG 13 983

Nitrile $CEt_2(OH)CN$ Formed from $COEt_2$ and HCy (Tiemann & Friedlander, *B* 14, 1974) Oil

α -Oxy-hexoic acid $CH_2PrCH(OH)CO_2H$ [56°] Got by saponification of its nitrile, which is formed from isovaleric aldehyde and HCy (Erlenmeyer & Sigel, *B* 7, 1109, Ley, *B* 10, 231) Formed also by heating isobutyl tartaric acid at 180° (Guthzeit, *A* 209, 239) Plates — ZnA'_2 , 2aq S 12 at 16°

Nitrile Oil, lighter than water

β Oxy-hexoic acid $CHMe(OH)CHEtCO_2H$ Formed from methyl acetoacetic ether and sodium-amalgam (Waldschmidt, *A* 188, 240) Syrup — NaA' — CuA'_2 — AgA' plates

α Oxy-hexoic acid $CMe_2CH(OH)CO_2H$ [68°] Formed by reducing tri methyl pyruvic acid with sodium amalgam (Glucksmann, *M* 10, 780) Monoclinic crystals — AgA'

β Oxy-hexoic acid $CHEt(OH)CHMeCO_2H$ Formed by reducing propionyl propionic acid (Hantzsch & Wohlbruck, *B* 20, 1320) — NaA'

γ -Oxy-*n*-hexoic acid

$CHEt(OH)CH_2CH_2CO_2H$ The salts are formed by the action of bases on the lactone The free acid quickly changes to lactone — CaA'_2 — BaA'_2 — AgA'

Lactone $C_6H_{10}O_3$ *ee* $CHEt \begin{smallmatrix} \diagup CH_2 \\ \diagdown O-CO \end{smallmatrix}$

(220°) **Formation** — 1 By boiling with water the bromo-hexoic acid formed by the union of hydrosorbic acid with HBr (Fittig, *B* 13, 955, *A* 208, 67) — 2 By heating glutamic acid with HI and P (Kiliani & Kleiman, *B* 17, 1800) — 3 By reduction of metasaccharin with HI

(Kiliani, *B* 18, 642) — 4 By warming hydrosorbic acid with dilute (1:1) H_2SO_4 (Fittig, *A* 256, 184)

Properties — Liquid, m sol water Volatile with steam Its aqueous solution becomes turbid when heated to 40°, but clear again at 80° K_2CO_3 separates it from the solution HI and P reduce it to *n*-hexoic acid

Amide $CHEt(OH)CH_2CH_2CONH_2$ [74°] Formed by heating the lactone with alcoholic NH_3 at 100° Prisms, v sol water and alcohol, sl sol ether

γ -Oxy-isohexoic acid

$OMe_2(OH)CH_2CH_2CO_2H$ Crystalline, but very unstable — BaA'_2 (at 100°) — AgA'

Lactone $C_6H_{10}O_3$ (207° i V) Formed from terebic acid by distillation, by successive treatment with HBr and water, or by boiling with dilute H_2SO_4 (Fittig & Bredt, *A* 200, 58, 259, Geisler, *A* 208, 43, Erdmann, *A* 228, 181) Formed also by oxidising isohexoic acid with $KMnO_4$ (Bredt, *A* 208, 59) Liquid, v sol water Neutral in reaction Its aqueous solution becomes turbid at 35°, clear again at 80° Yields on oxidation with HNO_3 the acid $C_6H_9O_4$ [68°], whence $CaC_6H_9O_4$, 7aq and $AgC_6H_9O_4$ Boiling $NaOEt$ forms an anhydride $C_6H_8O_3$ [106°], whence $HClAg$ forms $C_6H_8O_3$ (209°)

γ Oxy-hexoic acid $CH_2(OH)CH_2CHEtCO_2H$ Formed from $CH_2COCEt(CH_2CH(OH)CO_2Et$ by boiling with baryta water (Chanlaroff, *A* 226, 335) Thick liquid, changing to the lactone on boiling its solution $Ba(C_6H_9O_3)_2$ crystals (from alcohol) — CaA'_2 — AgA' , needles (from water)

Lactone $CH_2 \begin{smallmatrix} \diagup CH_2CHEt \\ \diagdown O-CO \end{smallmatrix}$ (215°) SG

12 1035 Liquid, m sol cold water

γ Oxy hexoic acid

$CHMe(OH)CH_2CHMeCO_2H$ Formed by reduction with sodium amalgam from β acetyl isobutyric acid derived from a bromo propionic ether and sodium acetoacetic ether (Fittig & Gottstein, *A* 216, 30) Formed also by reducing saccharin or isosaccharin with HI and P (Liebermann & Scheibler, *B* 16, 1821, Kiliani, *B* 18, 635) — BaA'_2

Lactone (206°) Liquid, sol 20-25 volumes of water An isomeric anhydride [187°] is also formed by reducing isosaccharin

γ Oxy hexoic acid

$CHMe(OH)CHMeCH_2CO_2H$ Formed by reducing β -acetyl *n* butyric acid (Gottstein, *A* 216, 36) Yields a lactone (210°)

δ Oxy-hexoic acid

$CHMe(OH)CH_2CH_2CH_2CO_2H$ Obtained by reducing γ -acetyl *n* butyric acid with sodium amalgam at 30° (Fittig & Wolff, *A* 216, 138) When boiled with water it is partly converted into the lactone When the lactone is boiled with water it is partly converted into the acid Equilibrium occurs with 65 p c lactone and 35 p c acid — AgA'

Lactone [19°] (c 231° i V) Colourless liquid, solidifying below 0° Miscible with water but separated by K_2CO_3

Oxy hexoic acid $C_6H_{10}O_3$ [108°] Formed by oxidising oil of millet with $KMnO_4$ (Kassner, *As Ph* [8] 25, 1081) Plates, v sol water. Yields an acetyl derivative [71°]

Di-oxy-hexoic acid [141°] Formed from ethyl crotonic acid by successive treatment with

bromine and with water at 100° (Fitting & Howe, *A* 200, 39) Trimetric prisms, $a \cdot b \cdot c = 96 \cdot 1 \cdot 33$ V sol water and alcohol.— CaA' , 8 $\frac{1}{2}$ aq. bright-blue needles

Di-oxy-hexoic acid

$\text{CHMe}(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$ [96°] Formed by oxidising ethyl crotonic acid with KMnO_4 (Fitting, *B* 21, 920)

Di-oxy-hexoic acid

$\text{CHEt}(\text{OH})\text{CMe}(\text{OH})\text{CO}_2\text{H}$ [152° cor] Formed by oxidation of methyl ethyl acrolein (Lieben & Zeissel, *M* 4, 65) Needles or prisms.— CaA' , 3 aq crystalline m ss

Hexa-oxy-hexoic acid $\text{C}_6\text{H}_{10}\text{O}_7$, *Arabinose-carboxylic acid* Formed from arabinose by the action of aqueous HCl , followed by saponification (Kiliani, *B* 29, 3033, 20, 339) When liberated from its salts it immediately forms the lactone.— CaA' , amorphous

Amide Minute needles

Lactone $\text{C}_6\text{H}_{10}\text{O}_6$ [145°–150°] $[\alpha]_D^{20} = -54.8$ Needles or prisms Yields metasaccharic acid dilactone $\text{C}_6\text{H}_8\text{O}_6$ on oxidation by HNO_3 and n hexoic acid on reduction by HI and P

DI OXY HEXYLENE $\text{C}_6\text{H}_{10}\text{O}_2$, *Hexylene glycol* (218°–225°) Formed from epichlorohydrin and Na (Hubner & Miller, *A* 159, 186) Is perhaps di oxy hexylene (Claus, *B* 10, 556)

OXY HIPPURIC ACID $\text{C}_8\text{H}_7\text{NO}_4$, *se* $\text{C}_8\text{H}_7(\text{OH})\text{CO NH CH}_2\text{CO}_2\text{H}$ Formed from m amido hippuric acid by the diazo reaction (Griess, *B* 1, 190, Conrad, *J pr* [2] 15, 259) Needles, v sol hot water

OXY HYDRASTININE *v* **HYDRASTINE**

OXYHYDROANTHRANOL *v* **OXYANTHRANOL**

HYDRIDI

TRI OXY HYDROBENZAMIDE *v* **OXY BEN**

ZOIC ALDEHYDE

OXYHYDROBENZOIC ACID $\text{C}_8\text{H}_6\text{O}_3$ [275° cor] Formed from oxy urvic acid and aqueous KMnO_4 (Oppenheim & Emmerling, *B* 9, 327) Needles Yields benzoic acid by potash fusion.— CaA' , 3 aq.— AgA' , v sl sol water

OXY HYDRO COUMARILIC ACID *v* **COUMA**

RILIC ACID

OXY HYDRONAPHTHOQUINONE *v* **HYDRO**

JUGLONE

OXY HYDROQUINOLINE *v* **OXY QUINOLINE**

QUINOXALINE DIHYDRIDE

OXYHYPOGAEIC ACID $\text{C}_8\text{H}_8\text{O}_4$ [34°] Formed from di bromo palmic acid and Ag_2O (Schroder, *A* 143, 36) White mass

OXY-DIIMIDODIAMIDODIASTIN *v* **ISATIN**

OXY IMIDO METHYL PYRIMIDINE **DI**

HYDRIDE $\text{C}(\text{NH})\langle\text{NH CMe}\rangle\text{CH}$ *Imido-*

methyl uracil [270°] Formed from guanidine, alcohol, and acetoacetic ether (Jaeger, *A* 262, 365) Prisms, v sol hot water Yields a dibromide [160°] MeI forms $\text{C}_4\text{H}_5\text{MeN}_3\text{O}$ [312°], whence $\text{B}'\text{HI}$ [212°], $\text{B}'\text{HClaq}$, and $\text{B}'\text{H}_2\text{SO}_4$ [270°]

Salts— $\text{B}'\text{HCl}$ [295°]— $\text{B}'\text{H}_2\text{SO}_4$ [180°].— $\text{B}'\text{HNO}_3$, needles

Oxy imido-di-methyl-pyrimidine dihydride

$\text{C}(\text{NH})\langle\text{NH CMe}\rangle\text{CMe}$ [320°] Formed

from guanidine and methyl-acetoacetic ether— $\text{B}'\text{H}_2\text{SO}_4$ [265°]— $\text{B}'\text{HNO}_3$ [200°]. Plates

OXY-IMIDO-PHENYL-PYRIMIDINE **DI**

HYDRIDE $\text{C}(\text{NH})\langle\text{NH OPh}\rangle\text{CH}$ *Imido*

phenyl-uracil [294°] Formed from guanidine

and benzoyl acetic ether (Jaeger, *A* 262, 372)

Amorphous powder, insol water and alcohol

OXY IMIDO-DIPHENYL SULPHIDE

$\text{NH}\langle\text{C}_6\text{H}_5\rangle\text{S}$. Formed from oxydi

phenylamine by heating with S (Bernthsen, *A*

230, 182) Colourless mass, v sol alcohol and

ether FeCl_3 forms a chocolate pp of

DI-OXY-IMIDO-DIPHENYL SULPHIDE

$\text{NH}\langle\text{C}_6\text{H}_4(\text{OH})\rangle\text{S}$ Formed by reducing

thionol $\text{N}\langle\text{C}_6\text{H}_4(\text{OH})\rangle\text{S}$ which is itself got

by the action of conc H_2SO_4 on imido diphenyl

sulphide (Bernthsen, *A* 230, 188) Colourless

needles, v sl sol water Yields a tri acetyl

derivative [156°]

DI-OXY-IMIDO-PYRIDINE DIHYDRIDE *v*

DI OXY AMIDO PYRIDINE

DI OXY DI IMIDO QUINONE

$\text{C}_8(\text{NH})_2(\text{OH})_2\text{O}_2$ Formed by oxidising tetra

oxy di amido benzene by FeCl_3 (Nietzki, *B* 16,

2094, 18, 503) Plates, v sl sol alcohol

OXY INDAZOLE $\text{C}_8\text{H}_7(\text{OH})\text{N}_2$ [215°–266°](?)

Formed by boiling diazo indazole with water

(Witt, Noeltling, & Grandmougin, *B* 23, 3642)

Needles, sl sol cold water

OXY-INDOLE *v* **OXINDOLE**

(a) **OXY INDONAPHTHENE** $\text{C}_{12}\text{H}_8\text{O}$ *se*

$\text{C}_6\text{H}_4\langle\text{CO}\rangle\text{CH}_2$ (a) *Hydrindone* [40°] [244°]

Formed by heating o cyano benzyl acetic ether

with conc HClAq (Gabriel & Hausmann, *B* 22,

2018) Colourless tables Conc HClAq at 100°

forms $(\text{O}_2\text{H}_2)_n$, not melted at 280°

Oxim $\text{C}_6\text{H}_5(\text{NOH})$ [146°] White needles

(from alcohol), sol alkalis

Phenyl hydrazide $\text{C}_6\text{H}_5(\text{N}_2\text{HPh})$ [c

120°] White prisms, converted by conc HClAq

into $\text{C}_6\text{H}_5\text{N}$ [235°]

References—**DI BROMO** and **CHLORO DI-OXY**

INDONAPHTHENE

OXY-ITACONIC ACID $\text{C}_8\text{H}_6\text{O}_4$ Formed by

boiling acetic acid with baryta water (Meilly,

A 171, 153) Oil— BaA'' (at 160°)— $\text{Ag}_2\text{A}''$

flocculent pp

OXY-JUGLONE *v* **JUGLONE**

OXY-LEPIDINE *v* **OXY METHYL QUINOLINE**

OXY-MARGARIC ACID $\text{C}_{17}\text{H}_{32}\text{O}_4$ [80°].

Occurs in adipocere (Ebert, *B* 8, 775)— $\text{Ag}_2\text{A}'$

amorphous

OXY-TRIMELLITIC ACID $\text{C}_6\text{H}_4\text{O}_4$ *se*

$\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})_2$ [5421] [c 245°] Formed

by fusing sulpho trimellitic acid with potash

(Jacobsen & Meyer, *B* 16, 192) Prisms (con

taining 2 aq) With HClAq at 240° it yields m -

oxy-benzoic acid— $\text{Ba}_2\text{A}'''$, 5 aq small prisma.

crystalline $C_6H_4(OH)(NMe_2)CO_2Me - B'HCl - B'HI - B'H_2PtCl_4$ 4sq small yellow prisms

Oxy-methylamido-benzoic acid *Methyl derivative* $C_6H_4(OMe)(NHMe)CO_2H$ [above 200°] Formed from potassium amido anisate and MeI (Griess, *B* 5, 1042, 6, 588) Slender needles, v sl sol hot water Yields $B'HClAq$ Further treatment with MeI and KOH forms $C_6H_4 \begin{smallmatrix} NMe_2 \\ \diagup \quad \diagdown \\ CO \end{smallmatrix} > O$ 6sq which gives the salts $B'H_2PtCl_4$ and $B'HI$ aq, and on distillation yields $C_6H_4(NMe_2)(OMe)CO_2H$ (288°)

β OXY METHYL A AMIDO BUTYRIC ACID $CHMe(OH)CH(NHMe)CO_2H$ *S* 56 at 12° Formed from β methyl glycidic acid and methylamine at 100° (Selnasky, *Bl* [2] 43, 247) Crystals

α OXY-TETRA-METHYL-DI- p -AMIDO-TRI-PHENYL CARBINOL $C_{24}H_{28}N_2O_7$ *4e* $C_6H_4(OH)C(OH)(C_6H_4NMe_2)_2$ Formed by oxidising the leuco-base obtained by condensation of salicylic aldehyde with dimethylaniline (O Fischer, *B* 14, 2522) Dyes yellowish green

α OXY-TETRA-METHYL DI p AMIDO TRI-PHENYL METHANE $C_{24}H_{28}N_2O_7$ *4e* $C_6H_4(OH)CH(C_6H_4NMe_2)_2$ Leuco base of salicylic aldehyde green [128°] Prepared by heating a mixture of dimethylaniline (24 pts), salicylic aldehyde (10 pts), and $ZnCl_2$ (20 pts) to 100° for 7 or 8 hours, the yield being nearly theoretical (Fischer, *B* 14, 2522) Colourless rosettes Sol hot alcohol and benzene, nearly insol water Combines with both acids and bases On gentle oxidation it gives a green of yellow shade

Acetyl derivative $C_{24}H_{26}N_2(OAc)$ Iridescent plates [144°]

The isomeride [163°] from p oxybenzoic aldehyde yields a green dye and forms an acetyl derivative [146°] crystallising in prisms

Di-oxy tetra methyl di amido tri phenyl methane *Methyl derivative* $C_6H_4(OH)(OMe)CH(C_6H_4NMe_2)_2$ [136°] Formed from vanillin, $PhNMe_2$, and $ZnCl_2$ (O Fischer a Schmidt, *B* 17, 1895) Crystals, v sol alcohol **OXY TETRA METHYL-AMMONIUM HYDROXIDE** $CH_2(OH)NMe_2OH$ Formed from CH_3NMe_2 and moist Ag_2O (Hofmann, *J* 1859, 377) Yields $(CH_2OH)NMe_2Cl$, $PtCl_4$ crystallising in octahedra

DI OXY METHYL AMYL KETONE *Di-methyl derivative* $CH(OMe)_2COCH_2Et$ (134°) *SG* 15 886 Formed as one of the products of the action of $NaOMe$ upon $CHCl_3COCH_2Et$, CO_2Et (James, *A* 231, 243, *C J* 49, 57) Oil Miscible with alcohol and with ether, burns with pale flame Does not combine with $NaHSO_4$ or react with AcO

OXY-METHYL AMYL PYRROLE CARB OXYLIC ETHER $C_6H_4N(CMe_2)COCH_2Et$ [52°] $COCH_2Et > COCH_2Et$

(188° at 16 mm) Formed from acetosuccinic ether, amylamine, and alcohol in the cold (Emery, *A* 260, 150) White plates (from CS_2)

DI OXY DI METHYL ANILINE v TETRA METHYL DI AMIDO DI PHENYL DI-OXIDE

OXY METHYL ANTHRANOL *Acetyl derivative* $C_6H_4 \begin{smallmatrix} COAc \\ \diagup \quad \diagdown \\ CO \end{smallmatrix} > C_6H_4Me$ [217°] Formed from methyl anthraquinone [177°], Ac_2O , $NaOAc$, and zinc-dust (Liebmann, *B* 21, 1172) Plates

OXY METHYL-ANTHRAQUINONE $C_{14}H_8O_3$ *4e* $C_6H_4 \begin{smallmatrix} CO \\ \diagup \quad \diagdown \\ CO \end{smallmatrix} > C_6H_4Me(OH)$ $\begin{bmatrix} 1 & 4 & 3 \\ 6 & & \end{bmatrix}$

[262°] Formed by heating *o* cresol phthalein or a mixture of phthalic anhydride, *o* cresol, and H_2SO_4 at 160° (Baeyer a Fraude, *B* 12, 241, *A* 202, 163) Yellow leaflets

Bromo- derivative [205°]

Oxy methyl-anthraquinone

$C_6H_4C_6O_2C_6H_4Me(OH)$ [1625] [170°] Formed in like manner from *p* cresol (Drewson, *A* 212, 346, Bruckoff, *B* 20, 2069) Orange needles (by sublimation)

Acetyl derivative [180°] Needles

Oxy methyl anthraquinone $C_{14}H_8Me_2O_3(OH)$ [178°] Formed from amido methyl anthraquinone [202°] by the diazo reaction (Römer a Lank, *B* 16, 699) Yellow needles (by sublimation)

Acetyl derivative [177°] Plates

Di oxy methyl anthraquinone

$C_6H_4(OH)C_6O_2C_6H_4Me(OH)$ [162°] Mol w 254 *S* (boiling 86 pc alcohol) 45 The yellow colouring matter of rhubarb, the wall lichen (*Parmelia parietina*), and of the root of *Rumex obtusifolius* (Rochleder a Heldt, *A* 48, 12, Döpping a Schlossberger, *A* 50, 215, De la Rue a Muller, *C J* 10, 298, Thann, *A* 107, 324) It occurs also in the root of *Rheum pyramidalis*, *Rumex palustris*, and of other varieties of *Rumex* (Grothe, *P* 113, 190) and in senna leaves (Batk, *C C* 1864, 622) Formed by passing air through an alkaline solution of chrysarobin (Liebmann a Seidler, *A* 212, 36) Golden plates (from alcohol), forming a cherry red solution in $NaOH$ aq Insol Na_2CO_3 aq Conc H_2SO_4 forms a red solution Conc HNO_3 forms a tetra nitro derivative Yields methyl anthracene on distilling with zinc dust Does not dye mordants Zinc, $HOAc$, and HCl aq form $C_{14}H_8O_3$ [200°-206°] whence $C_{14}H_8O_3Ac_2O$ [231°] (Liebmann, *B* 21, 437)

Di acetyl derivative [200°] Plates

Di benzoyl derivative [c 201°]

Di oxy methyl anthraquinone

$C_6H_4C_6O_2C_6HMe(OH)_2$ [16325] *Methyl-quinizarin* [160°] Formed from hydrotoluquinone, phthalic anhydride, and H_2SO_4 at 140° (Nietzki, *B* 10, 2011) Red needles (from alcohol) Yields methyl-anthracene when distilled with zinc dust

Acetyl derivative [185°] Needles

Di oxy methyl anthraquinone

$C_6H_4C_6O_2C_6HMe(OH)_2$ [16432] *Methyl-alizarin* [252°] Formed by potash fusion from bromo or oxy methyl anthraquinone (O Fischer, *B* 8, 675, Fraude, *B* 12, 241) Orange needles, which may be sublimed Dyes mordants like alizarin

Alkannin (vol 1 p 125) is probably a di oxy-methyl-anthraquinone as it yields methyl-anthracene on distillation with zinc dust (Liebmann a Römer, *B* 20, 2428)

Di-oxy-di-methyl-anthraquinone

$C_6H_4Me(OH)C_6O_2C_6H_4Me(OH)$ *Di-methyl-anthraruflin* [300°] Got, together with the two following isomerides, by the action of H_2SO_4 on *s*-oxy-toluic acid (Kostanecki a Nismentowski, *B* 18, 256, 2140, *A* 240, 376) Yellow needles

(from benzene) Its alkaline solutions are yellow Does not dye mordants

Di-acetyl derivative [237°] Tables

Di-oxy-di-methyl-anthraquinone

$C_{12}H_8Me_2(OH)_2O_2$, *Di-methyl-anthraflavic acid* (by needles or small yellow plates (by sublimation), not solid at 360° Does not dye mordants

Di-acetyl derivative [223°] Needles

Di-oxy-di-methyl anthraquinone (benz) [213°]. Yellow needles, yielding $C_{12}H_{10}Ac_2O$, [188°]

Tri-oxy-methyl-anthraquinone $C_{12}H_{10}O_3$

Emodin [254°] Occurs in rhubarb root (Warren de la Rue a Hugo Müller, *C J* 10, 304), in the bark and berries of *Rhamnus frangula* (Liebermann a Waldstein, *B* 8, 970, 9, 1775, Schwabe, *Ar Ph* [3] 26, 569), and in the lichen *Nephroma Lusitanica* (Bachmann, *C* 8 1888, 47) Orange red monoclinc prisms (containing aq) Yields methyl anthracene on distilling with zinc dust Its alkaline solution is dark cherry red

Mono-acetyl derivative [180°]

Tri-acetyl derivative [190°]

Tri oxy methyl anthraquinone

$C_{12}H_8Me_2C_2O_2C_6H_5(OH)_3$ [1 6 2 3 4] *Methyl-anthragallol* [c 375°] Made by heating gallic acid with *p* toluic acid at 130° for 15 hours (Cahn, *B* 19, 2335, *A* 240, 284) Orange red needles (by sublimation) Its solution in conc KOHAq is green, becoming violet on dilution Hot NH_3 aq forms a blue solution Conc H_2SO_4 forms a red liquid turned green by a trace of HNO_3 , decolourised by more HNO_3

Tri-acetyl derivative [204°]

Tri oxy methyl anthraquinone

[2' 1' 6'] $C_{12}H_8Me_2C_2O_2C_6H_5(OH)_3$ [1 6 2 3 4] *Methyl anthragallol* [298°] Formed by heating gallic acid with *o* toluic acid (C) Minute yellow needles Forms a green solution in conc KOHAq turned violet on dilution Dyes like anthragallol Conc H_2SO_4 gives a red solution turned green by HNO_3

Tri-acetyl derivative [210°] Tables

(2, 3, 4) **Tri oxy 3' and 5' methyl anthraquinones (methyl anthragallols)** These two isomerides are formed simultaneously by heating gallic acid with *m* toluic acid at 130°-135° The one melts at [312°] and gives an acetyl derivative which forms needles melting at [190°] The other isomeride melts at [235°-240°], and its acetyl derivative, which crystallises in small prisms, melts at 218° Their other properties are almost the same as those of the other methyl-anthragallols (Cahn, *B* 19, 2336)

Tri-oxy-methyl anthraquinone

[3 2 1 6] $C_6H_2(OH)_3C_2O_2C_6H_5Me(OH)$ [1' 6' 2' 5'] *Methyl-oxy alizarin* Formed by saponifying its di-methyl ether which is produced by heating hemipic acid with *p* cresol and H_2SO_4 (Liebermann a Kostanecki, *A* 240, 303) Brownish-yellow flakes, v sol alcohol Dyes like alizarin

Di-methyl ether $C_{12}H_{10}O_2$ Flakes

Tri-oxy-di-methyl-anthraquinone

[4' 2' 1' 6'] $C_{12}H_8Me_2C_2O_2CH(OH)_3$ [1 6 2 3 4] Formed by heating (4,2,1)-di-methyl benzoic acid with gallic acid and H_2SO_4 (Birukoff, *B* 20, 871, *A* 240, 287) Yellowish-red needles Forms a red solution in conc H_2SO_4 Yields di-methyl anthracene [224°], when distilled with zinc-dust

Tri-oxy-tri-methyl-anthraquinone

[4' 3' 2' 1' 6'] $C_{12}H_8Me_3C_2O_2C_6H_5(OH)_3$ [1 6 2 3 4] *Tri-methyl anthragallol* [244°] Formed from tri methyl benzoic (durylo) acid, gallic acid, and H_2SO_4 (Wende, *B* 20, 867) Brown needles Yields tri methyl anthracene [236°]

Acetyl derivative [174°] Plates

Tetra-oxy-di-methyl-anthraquinone

[2' 4' 5' 1' 6'] $C_{12}H_8Me_2(OH)_2C_2O_2C_6H_5Me(OH)_3$ [1 6 2 3 4] *Di methyl anthrachrysone* [above 360°] Formed by heating di oxy-*o* toluic acid with H_2SO_4 (10 pts) at 100° (Cahn, *B* 19, 755) Reddish yellow plates (by sublimation) Does not dye mordants

Tetra acetyl derivative [234°]

OXY-METHYL-BENZOIC ACID v OXY TOLUIC ACID

Oxy di methyl benzoic acid

$C_6H_8Me_2(OH)CO_2H$ [6 3 2 1] *Oxy isoxyllylic acid* [142°] Formed by fusing ethyl *p* xylene sulphonic acid with potash (Stahl, *B* 23, 991) Needles Gives a bluish violet colour with $FeCl_3$

Oxy-di methyl benzoic acid

$C_6H_8Me_2(OH)CO_2H$ [5 4 2 1] *Oxy p xylylic acid* [199°] Formed from ψ cumenol by potash fusion (Reuter, *B* 11, 30, Jacobsen, *B* 12, 436) Needles, volatile with steam Gives a bluish violet colour with $FeCl_3$, HCl aq at 220° gives xylene [61°] —BaA', *S* 11 at 0°

Oxy di methyl-benzoic acid

$C_6H_8Me_2(OH)CO_2H$ [4 2 5 1] [170 5°] Formed by fusing $C_6H_5Me_2BrCO_2H$ (Gunter, *B* 17, 1608) Scarcely volatile with steam Gives no colour with $FeCl_3$

Oxy di methyl benzoic acid [137°] Formed

from *p* xylene, Na, and CO_2 at 180° (Oliver, *G* 12, 166) Needles, coloured violet by $FeCl_3$, —BaA', 4aq

Oxy-di methyl benzoic acid

$C_6H_8Me_2(OH)CO_2H$ [6 3 4 1] [153°] Got from $C_6H_5Me_2BrCO_2H$ and KOH Not coloured blue by $FeCl_3$

Oxy di methyl benzoic acid *Xyletic acid*

[155°] Formed from crude xylene, Na, and CO (Wroblewski, *Z* 1868, 233) —CaA', 2aq —BaA', aq needles

Di oxy di methyl-benzoic acid

$C_6H_8Me_2(OH)_2CO_2H$ [5 3 6 2 1] [196°] Formed from betorcin, $NaHCO_3$, and water at 130° (Kostanecki, *B* 19, 2323) Prisms Coloured blue by $FeCl_3$

Oxy tri-methyl-benzoic acid

$C_6H_8Me_3(OH)CO_2H$ [6 4 3 2 1] *Oxydurylic acid* [148°] Formed by fusing durenol with potash (Jacobsen a Schnappauff, *B* 18, 2844) Needles —CaA', aq prisms, m sol water

Di oxy-tetra methyl benzoic acid *Tetra*

hydride of the methylene derivative $CH_2O_2C_6H_4Me_2CO_2H$ *Piperhydraemic acid* [96°] Formed from (β)-hydropiperic acid and sodium amalgam (Buri, *A* 216, 178) —CaA', aq crystals (from water)

OXY TRI-METHYL-BENZOIC ALDEHYDE

$C_6H_8Me_3(OH)CHO$ [1 3 4 6 5] [106°] Formed by the action of chloroform on an alkaline solution of ψ cumenol (Auwers, *B* 17, 2976) Needles $FeCl_3$ gives a blue colour

OXY-METHYL-BUTYL-PYRROLE CARB-

OXYLIO ETHER $C_6H_5N < \begin{smallmatrix} OMe \\ CO \end{smallmatrix} (CO_2Et)$ [68°].

(175° at 15 mm) Formed from aceto succinic ether (10g) and isobutylamine (8.4g) in the cold (Emery, *A* 360, 149) Needles (from CS₂)

OXY METHYL CINNAMIC ACID *Anhydride* $\left[64\frac{1}{2}\right] \text{C}_6\text{H}_5\text{Me}(\text{OH}) \begin{smallmatrix} \text{CH CH} \\ \text{O CO} \end{smallmatrix} \quad [248^\circ]$

Hemoubelliferon Formed by heating orcin with malic acid and H₂SO₄ (Fechmann & Welsh, *B* 17, 1649) Tables, sol alcohol and aqueous alkalis Conc H₂SO₄ forms a solution with blue fluorescence Potash fusion gives orcyal aldehyde and KOAc

Acetyl derivative [127°] Formed by heating orcyal aldehyde with Ac₂O and NaOAc (Tiemann & Helkenberg, *B* 12, 1002) Needles

OXY METHYL COUMARILIC ACID C₁₀H₈O₄, $\left[4\frac{1}{2}\right] \text{C}_6\text{H}_3(\text{OH}) \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \text{C CO}_2\text{H} \quad [226^\circ]$

Formed by saponification of its ethyl ether, which is obtained by boiling chloroacetic ether (1 mol) with a conc alcoholic solution of mono sodium resorcin C₆H₃(OH)(ONa) Needles (containing $\frac{3}{4}$ aq) V sol hot water On distillation it loses carbonic acid, giving oxy methyl coumarone C₈H₆(OH) $\begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \text{CH} \quad [97^\circ]$

Ethylether A'Et [178°], white needles, v sol ether, its dilute solutions have a blue fluorescence (Hantzsch, *B* 19, 2928)

Di-oxy-methyl-coumarilic acid C₁₀H₈O₄, $\left[64\frac{1}{2}\right] \text{C}_6\text{H}_3(\text{OH})_2 \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \text{C CO}_2\text{H} \quad [281^\circ]$

Formed by saponification of its ethyl ether, which is obtained by boiling chloroacetic ether (1 mol) with a conc alcoholic solution of mono sodium phloroglucin C₆H₃(OH)(ONa) (1 mol) Crystals (containing $\frac{1}{2}$ aq) The acid and its ether give an indigo blue colour with warm conc H₂SO₄

Ethyl ether A'Et [242°], small white needles, the alkaline solution is fluorescent (Lang, *B* 19, 2934)

OXY METHYL COUMARONE v COUMARONE

OXYMETHYLENE v FORMIC ALDEHYDE

OXY-TRIMETHYLENE-DIAMINE

CH(OH)(CH₂NH₂)₂ Formed by heating with HClAq the compound got by the action of epichlorhydrin or (a) dichlorhydrin on potassium phthalimide (Goedeckemeyer, *B* 21, 2689, Gabriel, *B* 22, 225) —B''H₂Cl₂ [184°] Hygroscopic mass —B''H₂PlCl₂ [240°] —B''H₂Br₂ [200°] Needles —B''C₆H₅(NO₂)₂OH yellow needles [230°]

OXY TRIMETHYLENE DIPHTHALAMIC ACID CH(OH)(CH₂NH COC₆H₄CO₂H)₂ [c 120°] Formed by boiling oxytrimethylene diphthalamide with potash (Goedeckemeyer, *B* 21, 2690) Hygroscopic needles Yields oxytrimethylene diamine on evaporating with HClAq

OXYMETHYLENE-PHTHALIDE? C₈H₆O₄, [146°] A crystalline body formed in the action of Br and HOAc on acetophenone carboxylic acid (Gabriel & Michael, *B* 11, 1010)

Phenyl derivative C₈H₅ $\begin{smallmatrix} \text{CH OPh} \\ \text{CO O} \end{smallmatrix}$

[144°] Made by heating phthalic anhydride with phenoxy acetic acid and NaOAc (Gabriel, *B* 14, 922) Needles The homologous *p*-tolyl derivative [174°] is also crystalline

OXYTRIMETHYLENE - DIPHTHALIMIDE

CH(OH)(CH₂NC₆H₄O)₂ [205°] Formed from potassium phthalimide and (a) dichlorhydrin at 150° (Goedeckemeyer, *B* 21, 2689, Gabriel, *B* 22, 224) Needles (from HOAc) Fuming HBr at 200° converts it into CHBr(CH₂NH₂)₂

OXY - METHYL - ETHYL - BENZOIC ACID

C₆H₅MeEt(OH)CO₂H [149°] Made by fusing *s* di methyl ethyl benzene sulphonic acid with potash (Jacobsen, *A* 195, 284) Long needles from dilute alcohol Turned blue by FeCl₃

OXY METHYL-ETHYL KETONE *Ethyl derivative* CH₃(OEt)COEt (100°-105°)

(Formed from CH₃(OEt)COCHMeCO₂Et and alcoholic KOH at 120° (Isbert, *A* 234, 196)

OXY - METHYL - ETHYL - PYRIMIDINE

C₈H₈N₂O $\begin{smallmatrix} \text{N CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{CH} \quad [160^\circ]$

Formed by the action of a 10 p.c. solution of NaOH (1 mol) upon a mixture of propionamide hydrochloride (1 mol) and acetic ether (1 mol) (Pinner, *B* 18, 2847, *B* 22, 1619) Fine white needles V sol water and alcohol Reduced by zinc dust to methyl ethyl pyrimidine

Salts —B''HCl [240°-246°], very soluble thick prisms —B''H₂Cl₂PlCl₂ [236°], thick yellow prisms

Oxy methyl di ethyl pyrimidine

$\begin{smallmatrix} \text{N CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{CET} \quad [135^\circ]$ Formed from propionamide hydrochloride, ethyl acetoacetic ether, and dilute (10 p.c.) NaOH aq (Pinner, *B* 22, 1621) Needles, v sol water

Oxy methyl di ethyl pyrimidine C₈H₈N₂O

$\begin{smallmatrix} \text{N CET} \\ \text{N C(OH)} \end{smallmatrix} \text{CMe} \quad [155^\circ]$ Formed from propionamide hydrochloride, propionyl propionic ether, and KOH (Meyer, *J pr* [2] 39, 264) When warmed with a solution of nitrous acid in HOAc it yields C₈H₈N₄O₂ and a little C₈H₈N₂O₂ [205°]

Oxy di methyl ethyl pyrimidine

$\begin{smallmatrix} \text{N CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{CET} \quad [146^\circ]$ Formed from acetamide and ethyl acetoacetic ether (Pinner, *B* 22, 1618) Needles, v sol water

Oxy di methyl-ethyl pyrimidine

$\begin{smallmatrix} \text{N CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{CMe} \quad [165^\circ]$ Formed from propionamide and methyl acetoacetic ether (P) Needles, v sol water and alcohol

Oxy di methyl-ethyl pyrimidine

$\begin{smallmatrix} \text{N CET} \\ \text{N C(OH)} \end{smallmatrix} \text{CMe} \quad [168^\circ]$ Formed from acetamide and propionyl propionic ether (E von Meyer, *J pr* [2] 40, 304)

Di-oxy-methyl-ethyl-pyrimidine

C₈H₈MeEt(OH)N₂ $\begin{smallmatrix} \text{CO} \text{NH CMe} \\ \text{Net CO} \end{smallmatrix} \text{CH}$

Methyl ethyl uracil [195°] Formed, together with di-oxy methyl di ethyl pyrimidine [58°], by heating potassium methyl uracil with EtBr at 155° (Hoffmann, *A* 253, 68) Prisms (from EtBr) or needles (from alcohol)

OXY-METHYL-ETHYL-PYRROLE CARB

OXYLIC ETHER $\begin{smallmatrix} \text{Net CMe} \\ \text{CO CH} \end{smallmatrix} \text{C CO}_2\text{Et} \quad [76^\circ]$

(165° at 14 mm) Formed from acetyl-succinic ether and cold aqueous ethylamine (Emery, *A* 260, 148) Needles

Oxy-methyl-ethyl-pyrrole dihydride carb-oxylie acid $\text{CO NEt} \begin{array}{c} \text{CH}_2 \\ \text{CH}_2 \end{array} \text{CMe CO}_2\text{H}$ [123°] Obtained, as nitrile, by heating acetyl propionic (levulic) ether with HCl and alcoholic ethyl amine (Kühling, *B* 23, 709) Needles, v sol water and alcohol

Nitrile $\text{C}_6\text{H}_5\text{N}_2\text{O}$ Syrup

Amide $\text{C}_6\text{H}_5\text{N}_2\text{O}_2$ [183°] Needles

Thioamide [176°] Formed from the nitrile and alcoholic H_2S

Amidoxim [c 160°] Formed from the thioamide by boiling with hydroxylamine hydrochloride

OXY-(B 2 Py 2)-DI-METHYL-(Py 3)-ETHYL QUINOLINE $\text{C}_6\text{H}_4(\text{OH})\text{N}$ [45°] (312°-316° at 720 mm) Colourless crystals Formed by fusing di-methyl ethyl quinoline sulphonic acid with KOH—A'K* easily soluble colourless plates (Harz, *B* 18, 3390)

Di-oxy-methyl ethyl quinoline

$\text{C}_6\text{H}_4\text{Me} \begin{array}{c} \text{C(OH) CEt} \\ \text{N}=\text{C OH} \end{array}$ [c 220°] Formed from chloro ethyl oxy o toluquinoline and dilute HCl at 165° (Rugheimer a Schramm, *B* 20, 1235, 21, 302) Needles (from HOAc), insol water

Reference — CHLORO OXY METHYL ETHYL-QUINOLINE

α-OXY-α-METHYL GLUTARIC ACID

$\text{C}_6\text{H}_4\text{O}_2$ *ie* $\text{CO}_2\text{H CMe(OH) CH}_2\text{CH}_2\text{CO}_2\text{H}$ Formed from the lactone of oxy isohexoxic acid by oxidation with dilute nitric acid (Fittig a Bredt, *A* 208, 63, 236, 225) Made also by saponification of the nitrile formed by combination of β acetyl-propionic (levulic) acid with HCl (Kreckeler a Tollens, *B* 18, 2018, *A* 238, 287) The free acid at once changes to the lactonic acid BaA'' 4aq — SrA'' 4aq — CaA'' 7aq — ZnA'' — AgA'' white flocculent pp

Lactonic acid $\text{CMe(CO}_2\text{H)} \begin{array}{c} \text{CH}_2\text{CH}_2 \\ \text{O}=\text{CO} \end{array}$ [70°] Deliquescent prisms, v sol ether Converted by hot H_2SO_4 into CO_2 and levulic acid CaA'' 44aq — MeA'' (252°) — EtA'' (262°)

Amide of the lactonic acid [c 124°]

Nitrile of the lactonic acid [c 33°]

β-Oxy β methyl-glutaric acid

$\text{CMe(OH)(CH}_2\text{CO}_2\text{H)}_2$ Formed by oxidising methyl-di ethyl carbinol with KMnO_4 (Sorokin, *J pr* [2] 23, 278) — CaA'' amorphous — ZnA'' (dried at 110°) — CuA'' (OH)₂ 5aq small tablets AgA''

Oxy-tri methyl glutaric acid Lactonic acid $\text{CMe}_2 \begin{array}{c} \text{CH}_2\text{CMe CO}_2\text{H} \\ \text{CO O} \end{array}$ [104°] Formed

from a bromo tri methyl glutaric anhydride and KOHAq at 0° (Auwers a V Meyer, *B* 23, 307) Crystals, v sol water — AgA'' crystalline powder

Di-oxy-di-methyl glutaric acid?

$\text{CH}_2(\text{CMe(OH)CO}_2\text{H})_2$ [96°] Formed by dissolving di a bromo-di a methyl glutaric anhydride in cold 10 p.c caustic soda solution (Auwers a Jackson, *B* 23, 1614) Six sided plates, v sol cold water

OXY-METHYL-INDONAPHTHENE

$\text{C}_6\text{H}_4\text{Me} \begin{array}{c} \text{CH}_2 \\ \text{C(OH)} \end{array} \text{CH}$ [59°] Formed by condensing *m* tolyl propionic acid by means of hot H_2SO_4 (Von Miller, *B* 23, 1899) White needles with characteristic odour Volatile with steam

The isomeride from *p* tolyl propionic acid melts at 63°

Oxy methyl-indonaphthene

$\text{C}_6\text{H}_4 \begin{array}{c} \text{CH}_2 \\ \text{C(OH)} \end{array} \text{CMe}$ (246° at 719 mm).

Formed from β phenyl isobutyric acid and H_2SO_4 at 150° (Von Miller, *B* 23, 1888) Heavy oil smelling of peppermint, volatile with steam Yields phthalic acid on oxidation Gives a phenyl hydrazide [116°]

OXY METHYL INDOLE Ethyl derivative

$\text{C}_6\text{H}_4 \begin{array}{c} \text{NH} \\ \text{C(OEt)} \end{array} \text{CMe}$ or $\text{C}_6\text{H}_4 \begin{array}{c} \text{NH} \\ \text{CH} \end{array} \text{C CH}_2\text{OEt}$

[142°] Formed by heating at 90° the phenyl-hydrazide of $\text{CH}_2\text{CO CH}_2\text{OEt}$ (Fittig, *B* 21, 2649) Crystals (from alcohol)

OXY-METHYL-JULOLE DIHYDRIDE

$\text{CH}_2 \begin{array}{c} \text{CH}_2\text{CH}_2 \\ \text{CH} \end{array} \begin{array}{c} \text{N CO} \\ \text{C}=\text{C} \\ \text{CH CH} \end{array} \text{CMe} \text{CH}$ [130° cor]

Formed by boiling quinoline tetrahydride with acetoacetic ether (Reissert, *B* 24, 845) White needles, v sol alcohol, insol alkalis, sol conc HClAq — B'HCl 14aq — B'_2H₂PtCl₄ orange needles

OXY METHYL MALONAMIC ACID

$\text{C}_6\text{H}_4\text{NO}_2$ *ie* $\text{CMe(OH)(CONH}_2\text{)(CO}_2\text{H)}$ Formed from pyruvic acid and KCl by heating with conc HClAq (Böttger, *B* 14, 88) Syrup — ZnA'' 2aq crystalline, v sol water

DI OXY DI METHYL MALONIC ACID Di methyl derivative $(\text{CH}_3\text{O CH}_2)_2\text{C(CO H)}$ [138°] Formed from sodium malonic ether, chloro di methyl oxide and NaOEt (Kleber, *A* 246, 111) Prisms, v sol water Its salts are very hygroscopic

Di ethylether $\text{C}_6\text{H}_4\text{O}_2(\text{CO}_2\text{Et})_2$ (c 240°)

OXY-DI-METHYL PENTAMETHENYL

HYDRIDE $\text{CO} \begin{array}{c} \text{CH CMe} \\ \text{CH}_2\text{CHMe} \end{array}$ or

$\text{CO} \begin{array}{c} \text{CH}=\text{CMe} \\ \text{CHMe CH}_2 \end{array}$ 'Di methyl ketopentene' (119°) Made from methylulvic acid by prolonged boiling (Dietzel, *A* 250, 195) Oil, lighter than water

Oxy methyl heptamethenyl trihydride?

$\text{C}_6\text{H}_4\text{O}_2$ *ie* $\text{CH} \begin{array}{c} \text{CMe CH}_2\text{CH}_2 \\ \text{CO CH}_2\text{CH}_2 \end{array}$ (189°) An oil, smelling like camphor, formed by heating its dicarboxylic ether which is formed by distilling $\text{CO}_2\text{Et CHAc CH}_2\text{CH}_2\text{CHAc CO}_2\text{Et}$ (Perkin a Obrembsky, *B* 19, 2051) Reacts with phenyl hydrazine

DI-OXY-DI-METHYL-HEPTAMETHYLENE

$\text{C}_6\text{H}_4\text{O}_2$ *ie* $\text{CH}_2 \begin{array}{c} \text{CH}_2\text{CH}_2\text{CMe(OH)} \\ \text{CH}_2\text{CH}_2\text{CMe(OH)} \end{array}$ (201° at 180 mm) Formed by reducing

$\text{CH}_2(\text{CH}_2\text{CH}_2\text{Ac})_2$ with sodium (Kipping a W H Perkin, jun, *C J* 59, 220) Thick oil with burning taste, smelling of thyme Does not form an oxim or a phenyl hydrazide Yields deliquescent $\text{C}_6\text{H}_4\text{NaO}$ aq Forms an oily product of condensation $\text{C}_{16}\text{H}_{24}\text{O}_2$ (305°-310° at 200 mm)

Di-acetyl derivative $\text{C}_6\text{H}_4\text{AcO}_2$ (201° at 65 mm) Liquid, insol cold water

OXY METHYL-(α)-NAPHTHOQUINOLINE

$\text{C}_{10}\text{H}_7\text{NO}$ *ie* $\text{C}_{10}\text{H}_6 \begin{array}{c} \text{C(OH) CH} \\ \text{N}=\text{CMe} \end{array}$ [292°] (K), [over 800°] (C & L) Formed by boiling with

HCl a naphthyl β imido-butyric ether, which is formed by condensation of acetoacetic ether with (a)-naphthylamine (Knorr, *B* 17, 543, Conrad a. Lumpach, *B* 21, 631) Needles (from alcohol) —B'H₂PtCl₆ v sl sol hot water

The isomeride derived from (8) naphthylamine crystallises in flat needles [286°] (K.) or [above 300°] (C & L) decomposed by distillation

OXY-DI-METHYL (8)-NAPHTHOQUINOLINE DISULPHONIC ACID

C₁₂H₁₁(OH)(SO₃H)N 1 $\frac{1}{2}$ aq Formed by potash fusion from the disulphonic acid of di methyl-(8) naphthoquinoline (Reed, *J pr* [2] 35, 309) small needles, insol water and alcohol

DI-OXY-METHYL-NAPHTHOQUINONE (?)
C₁₁H₈O₂ [170°] Extracted from tubers of *Drosera Whitakeri* (Rennie, *C J* 51, 376) Forms a deep red solution in KOHAq

Tri oxy methyl-naphthoquinone (?) C₁₁H₆O₃ [c 193°] A substance of this empirical composition may be extracted from tubers of *Drosera Whitakeri* (Rennie, *C J* 51, 371) Red plates (from alcohol or glacial HOAc) v sl sol water Gives a violet solution in KOHAq or NH₄Aq Reduced by SnCl₂ to C₁₁H₈O₂ [217°]

OXY-METHYL-ISO OXAZOLE

CMe < CH₂ CO
N—O [170°] Formed from acetoacetic ether, hydroxylamine hydrochloride, and NaOH at 50° (Hantzsch, *B* 24, 497) Satiny needles, sl sol cold water, sol HClAq —Ac O forms on heating a compound [136°] possibly N—O > C < CMe N —NH₄A' [207°] —CMe CH > C < C(OAc) O —BaA' 2aq —CuA'. —AgA' gelatinous

Di oxy di methyl di iso oxazyl
Q CO < CH CH < CO Q
N CMe > CH CH < CMe N Formed by warming isocarbopvrotitanic ether with hydroxylamine and HOAc on the water bath (Knorr, *B* 22, 161) Hair like needles which explode at 190°

OXY-TETRA-METHYL-PHENYL ACETIC ACID [6 5 3 2 1] C₆HMe, CH(OH) CO H [146°] Formed from tetra methyl phenyl glyoxylic acid by reduction with sodium amalgam (Claus a. Foecking, *B* 20, 3102) Nodules —BaA', 2aq —CaA', 8aq needles

Oxy tetra-methyl-phenyl acetic acid
[6 5 4 3 1] C₆HMe, CH(OH) CO₂H [160°] Formed in like manner (Claus, *J pr* [2] 38, 283) Hexahedra, m sol hot water

Oxy tetra methyl phenyl acetic acid
[6 4 3 2 1] C₆HMe, CH(OH) CO₂H [156°] Prisms, v sol alcohol and ether —NaA' 1 $\frac{1}{2}$ aq —CaA' 8aq —BaA', 3aq small crystals

OXY-TRI-METHYL-PHENYL METHYL-PYRAZOLE C₆H₃N₂O

C₆H₃Me, N < CO CH₂
N=CMe [155°] Formed by heating the ψ cumyl hydrazide of acetoacetic ether at 140° for two hours (Haller, *B* 18, 706) Glistening crystals, v sol alcohol Yields a nitrosamine C₆H₃N₂O₂ [156°] and a methyl derivative C₆H₃N₂O [166°]

OXY-TETRA-METHYL-PHENYL-DI-METHYL-PYRIDINE CARBOXYLIC ACID

C₆HMe, N < CMe C(CO₂H)
CMe CH CO > [145°] Made by

heating tetramethyl phenyl amido crotonic ether at 280° (Conrad a. Lumpach, *B* 21, 1655)

OXY-METHYL-ISOPHTHALIC ACID
C₆H₄Me(OH)(CO₂H)₂ [4 5 3 1] [c 270°] Formed by heating C₆H₄Me(SO₃H)(CO₂H)₂ with conc HClAq at 220° (Jacobsen, *B* 14, 2115) Needles (from hot water) Not coloured by FeCl₃

OXY-DI-METHYL-PROPIONAMIDINE
CH, CH(OH) C(NHMe) NMe The crystalline hydrochloride B'HCl [215°], formed by the action of methylamine on the hydrochloride of CH, CH(OH) C(OC₂H₅) NH, is v sol water and m sol alcohol (Pinner, *B* 23, 2948)

OXY-METHYL-PROPYL-BENZOIC ACID
Methyl derivative C₆H₄MePr(OMe)CO₂H [3 6 1 4] [139°] Formed from its amide [149°], which is made by the action of ClCONH₂ on C₆H₄MePr(OMe) in CS₂ in presence of AlCl₃ (Gattermann, *A* 244, 68) The ethyl derivative [159°] and its amide C₆H₄MePr(OEt) CONH₂ [127°] are got in like manner

Oxy-methyl isopropyl-benzoic acid
C₆H₄MePr(OH)CO₂H [3 5 2 1] *Cymenotic acid* [147°] Formed from (4,2,1) cymenol, sodium, and CO₂ (Jesurun, *B* 19, 1414) Slender needles (from water) —BaA', 4aq —AgA' —MeA' [148°]

Isomeric acids v CARVACROTIC ACID and THYMOTIC ACID

OXY-METHYL-PROPYL-CINNAMIC ACID
[1 4 3 6] C₆H₄(CH₂)₃(C₆H₄)₂(OH) C₆H₄ CO₂H *Thymo acrylic acid* [280°] Prepared by heating *p* thymotic aldehyde with acetic anhydride and sodium acetate (Kobek, *B* 16, 2104) White microscopic crystals

Methyl derivative
C₆H₄(CH₂)₃(C₆H₄)₂(OMe) C₆H₄ CO₂H [141°] Needles, v sol alcohol, sl sol water

OXY-METHYL-PROPYL-CINNAMIC ANHYDRIDE v METHYL-PROPYL-COUMARIN

OXY-METHYL-PROPYL-KETONE *Ethyl ether* EtO CH₂ CO Pr (112°-115°) Formed from EtO CH₂ CO CHET CO Et and alcoholic KOH at 120° (Isbert, *A* 234, 195) Lighter than water, smells like a ketone

DI-OXY-METHYL-ISOPROPYL-PYRIMIDINE CMe₂(OH) C < N CMe > CH [98°]

Formed from oxy-isobutyramidine hydrochloride, acetoacetic ether, and NaOH in equivalent proportions (Pinner, *B* 22, 2625) Needles (from acetone), v sol most solvents

OXY-METHYL-PROPYL-PYRROLE CARBOXYLIC ETHER C₆H₄N—CMe > CO CO₂Et [50°]

(172° at 15 mm) Formed from aceto succinic ether and propylamine in the cold (Emery, *A* 260, 148) Needles

OXY-METHYL-PURIN C₆H₂Me(OH)N₄ a.s. CO < NH—C CH N > CH [233°] Made by heating di chloro oxy methyl purin with HI (Fischer, *B* 17, 332) Prisms, v sol water Alkaline in reaction —B'HI —B'H₂PtCl₆

Oxy-di-methyl-purin C₆H₄Me(OMe)N₄ [112°] Formed from di chloro oxy di methyl-purin and HIAq (Fischer, *B* 17, 334) Slender needles, v sol water, insol alkalis

Di-oxy-di methyl purin C₆H₂N₄O₂ Formed by reducing the ethyl derivative of chloro-di-oxy di methyl purin with HI Sparingly soluble crystals

Di-ethyl derivative $C_{14}H_{18}N_4O_4$ ϵ
 $G(OEt) \begin{smallmatrix} N \\ \diagup \end{smallmatrix} C(OEt) \begin{smallmatrix} C \\ \diagdown \end{smallmatrix} NMe \begin{smallmatrix} CO \\ \diagup \end{smallmatrix} ? [127^\circ]$ Formed from di-chloro oxy-di methyl purin and alcoholic NaOH. Fine plates, sol HCl aq, insol alkalis.

Tri-oxy-methyl-purin v METHYL URIC ACID

OXY-METHYL-PYRAZOLE $C_4H_6N_2O$ ϵ

$CMc \begin{smallmatrix} CH_2 \\ \diagup \end{smallmatrix} CO \\ \diagdown \end{smallmatrix} NH$ [215°] Formed by warming acetoacetic ether with hydrazine and water (Curtius, *J pr* [2] 39, 52). Prisms (from water), sl sol hot alcohol. Has a sweet taste.

OXY-DI-METHYL-PYRIDINE *Ethyl derivative* $C_8H_{10}NO$ ϵ $N \begin{smallmatrix} CMc \\ \diagup \end{smallmatrix} CH \\ \diagdown \end{smallmatrix} COEt$ CH $\begin{smallmatrix} CO \\ \diagup \end{smallmatrix} Me$ (246°) Formed from acetoacetic ether and ammonia zinc chloride (Canzoneri & Spica, *G* 16, 449). Oil.

Oxy-di methyl-pyridine *Methyl derivative* $N \begin{smallmatrix} CMc CH \\ \diagup \end{smallmatrix} CO Me$. (208°) SG $\frac{2}{13}$

1011 Formed from chloro-di methyl pyridine, NaOMe, and MeOH at 160° (Conrad & Eckhardt, *B* 22, 81). Oil— $B'H_2PtCl_6$ — $B'MeI$ [204°] Prisms (from water).

Ethyl derivative C_8H_8EtNO (215°)— $B'MeI$ [196°] Crystals (from water).

Oxy di methyl-pyridine C_8H_8NO ϵ
 $NH \begin{smallmatrix} CMc CH \\ \diagup \end{smallmatrix} CO \begin{smallmatrix} CH \\ \diagdown \end{smallmatrix} CO Me$, ψ *Lutidostyryl* [176°] (304°) Formed by heating oxy tri methyl pyridine (methyl ψ lutidostyryl) in a current of HCl (Hantzsch, *B* 17, 2904). Formed also by distilling its carboxylic acids (Collie, *B* 20, 446, Nieme & Pechmann, *A* 261, 205), and by passing dry NH_3 over mesitene lactone at 160° (Anschutz, *A* 259, 169). Needles (from alcohol)— $B'HCl2aq$ prisms— $B'H_2PtCl_6$ — C_6H_5KNO silvery spangles, sl sol KOH aq.

Oxy di methyl-pyridine C_8H_8NO ϵ
 $CO \begin{smallmatrix} CH CMc \\ \diagup \end{smallmatrix} CH CMc \begin{smallmatrix} NH \\ \diagdown \end{smallmatrix}$ *Lutidone* [231°] (Collie, *C J* 59, 177) (350°) Formed by heating its carboxylic or dicarboxylic acid at 280°, and also by heating dehydracetic acid with NH_3 at 100° (Hantzing, *B* 18, 452, Conrad & Guthzeit, *B* 20, 156). Formed also from di acetyl acetone and NH_3 aq (Feist, *B* 22, 1571). Monoclinic pyramids (containing 8aq) PCl_5 gives chloro-di-methyl-pyridine (178°). $FeCl_3$ gives a brownish-red colour— $B'H_2PtCl_6$ [at 100°] [231° cor]— $B'H_2Cr_2O_7$, [125°]— $B'C_6H_5(OH)(NO_2)$, [220°]

Oxy tri methyl-pyridine C_8H_8NO ϵ
 $CO \begin{smallmatrix} CH CMc \\ \diagup \end{smallmatrix} CH CMc \begin{smallmatrix} NMe \\ \diagdown \end{smallmatrix}$ *Methyl-lutidone* [245°] Formed by heating its dicarboxylic acid (Conrad & Guthzeit, *B* 20, 159). Needles (containing 8aq) [111°], v sol water— $B'HI$ [242°] Formed by heating lutidone with MeI and MeOH at 140° (Conrad & Eckhardt, *B* 22, 80). Crystals.

Oxy-tri-methyl pyridine C_8H_8NO ϵ
 $NMe \begin{smallmatrix} CMc CH \\ \diagup \end{smallmatrix} CO \begin{smallmatrix} CH \\ \diagdown \end{smallmatrix} Me$ *Methyl ψ -lutidostyryl* [92°], (292°) Formed by heating 'dicarbo-collidylum dehydride' with H_2SO_4 or HCl at 150°–180° (Hantzsch, *B* 17, 1025, 2908). Formed also by methylation of ψ -lutidostyryl. Very hygroscopic crystals, not volatile with steam. V. sol. water, v. sl. sol. ether.— $B'HCl \frac{1}{2} aq$ —

$B'HI$ — $B'H_2PtCl_6 2aq$ — $B'H_2PtCl_6 2EtOH$ — $B'H_2PtCl_6$, long yellowish red needles.

Di-oxy-tri-methyl-pyridine *Di-ethyl derivative* $N \begin{smallmatrix} CMc C(OEt) \\ \diagup \end{smallmatrix} CMc C(OEt) \begin{smallmatrix} CO \\ \diagdown \end{smallmatrix} Me$ (218°) at 726 mm. Formed from di bromo-collidine and NaOEt (Pfeiffer, *B* 20, 1850). Oil— $B'H_2PtCl_6$.

OXY-DI-METHYL-PYRIDINE CARB-

OXYLIC ACID $CMc NH CMc$ *Lutidone carboxylic acid* $CH-CO C CO_2H$ [258° cor] Got by saponifying its ether. Crystals (containing aq)— BaA' — CuA' — AgA' amorphous. *Ethyl ether* [164° cor] (240°–250°) Formed in small quantity in distilling β amido crotonic ether under reduced pressure (Collie, *A* 226, 310, *C J* 59, 174). Needles, sol water, sl sol alcohol. Does not react with Ac_2O or phenyl hydrazine. Yields a bromo derivative C_8H_8BrNO , [250°] PCl_5 forms C_8H_8ClNO , (264° cor) which yields a chloro-di methyl-pyridine (177°–180°) on heating.

Oxy-di-methyl pyridine carboxylic acid

$CO \begin{smallmatrix} CH CMc \\ \diagup \end{smallmatrix} NH CMc \begin{smallmatrix} CO_2H \\ \diagdown \end{smallmatrix}$ [258°] Formed from isodehydracetic acid and ammonia (Nieme & Pechmann, *A* 261, 206).

Oxy methyl-pyridine dicarboxylic acid v METHYL CHELIDAMIC ACID, vol 1 p 729

Oxy-di-methyl pyridine dicarboxylic acid
 $CO \begin{smallmatrix} CH C(CH_2 CO_2H) \\ \diagup \end{smallmatrix} NH CMc C(CO_2H) \begin{smallmatrix} CO_2H \\ \diagdown \end{smallmatrix}$ ψ *Lutidostyryl di carboxylic acid* [201°] Formed from citra cumalic acid and NH_3 aq (N & P). Needles, v sl sol cold water and alcohol.

Oxy di-methyl pyridine carboxylic acid

$CO \begin{smallmatrix} CH CMc \\ \diagup \end{smallmatrix} NH CMc \begin{smallmatrix} CO_2H \\ \diagdown \end{smallmatrix}$ *Ethyl ether EtA'*. ψ *Lutidostyryl carboxylic ether* [187°] Formed by passing dry NH_3 through mesitene carboxylic acid lactone at 160° (Anschutz, *A* 259, 173). It is also a product of the condensation of amido acetoacetic ether and of β amido crotonic ether (Collie, *B* 20, 445). Needles (from hot water). The corresponding acid is an insoluble crystalline powder [300°].

Oxy-di methyl-pyridine dicarboxylic acid

$CO \begin{smallmatrix} C(CO_2H) CMc \\ \diagup \end{smallmatrix} C(CO_2H) CMc \begin{smallmatrix} NH \\ \diagdown \end{smallmatrix}$ [267°] Made by saponifying its ether. Prisms (from water)— KA' — CaA' 2aq— CuA' 1 $\frac{1}{2}$ aq (dried at 100°). *Ethyl ether EtA'* [221°] *S* (alcohol) 1 at 20° Formed by adding NH_3 aq to an alcoholic solution of $CO \begin{smallmatrix} C(CO_2Et) CMc \\ \diagup \end{smallmatrix} C(CO_2Et) CMc \begin{smallmatrix} O \\ \diagdown \end{smallmatrix}$ obtained from cupric acetoacetic ether and $COCl_2$ (Conrad & Guthzeit, *B* 19, 24, 20, 154). Forms an acetyl derivative C_8H_8NO , [65°]— $B'H PtCl_6$, [190°] Orange pp.

Oxy-tri methyl-pyridine dicarboxylic acid

$CO \begin{smallmatrix} C(CO_2H) CMc \\ \diagup \end{smallmatrix} C(CO_2H) CMc \begin{smallmatrix} NMe \\ \diagdown \end{smallmatrix}$ [245°] Formed by saponifying its ether (C & G)— NaA' crystalline, v sol water— EtA' [193°] Formed by the action of methylamine on dimethyl pyrone dicarboxylic ether, which is obtained from cupric acetoacetic ether and $COCl_2$. Needles (Gerichten, *B* 19, 25, Conrad & Eckhardt, *B* 22, 80).

OXY-METHYL-PYRIDYL-PROPIONIC ACID v. ECGONINE.

OXY-DI-METHYL PYRIMIDINE

$\text{CMe} \begin{smallmatrix} \text{NH CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{CH}$ [192°] Formed from acetamide hydrochloride, acetoacetic ether, and dilute (10 p c) NaOHAq (Pinner, B 18, 2845, 2°, 1616). Needles, v e sol ordinary solvents

Ethyl derivative [55°] (259°) Prisms

Oxy-tri-methyl pyrimidine

$\text{CMe} \begin{smallmatrix} \text{NH CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{CMe}$ Formed from acetamide hydrochloride, methylacetoacetic ether, and dilute NaOHAq (Pinner, B 22, 1617) Needles, v sol water

Di-oxy-methyl-pyrimidine

$\text{CO} \begin{smallmatrix} \text{NH CMe} \\ \text{NH CO} \end{smallmatrix} \text{CH}$ *Methyl uracil* Formed by boiling β uramido crotonic acid with acids (Behrend, A 229, 8, 231, 256) Needles (from alcohol) Decomposes at 270°-280° By heating with potash it is converted into $\text{C}_6\text{H}_2\text{I}_2\text{N}_2\text{O}_2$ Potash and Mel at 140° forms a dihydride $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$ [219°] and di-oxy-tri-methyl pyrimidine A mixture of PCl_5 and POCl_3 at 125° forms oily $\text{C}_6\text{H}_4\text{Cl}_2\text{N}_2$ (246°), SG $\frac{218}{226}$ 1.6273 Yields deep violet coffin-like crystals of di iodide $\text{C}_6\text{H}_2\text{N}_2\text{O}_2\text{I}_2$ (Hoffmann, A 253, 74)

Di-oxy tri-methyl-pyrimidine

$\text{CO} \begin{smallmatrix} \text{NMe CMe} \\ \text{NMe CO} \end{smallmatrix} \text{CH}$ [109°] Formed by methylation of the preceding body (Behrend, Hagen, A 244, 2) Plates, v sol water and alcohol, sl sol ether Yields methylamine on heating with baryta water at 200° Dry Br forms $\text{C}_6\text{H}_4\text{NO}_2\text{Br}_2$, aqueous bromine yields $\text{CO} \begin{smallmatrix} \text{NMe CMe(OH)} \\ \text{NMe CO} \end{smallmatrix} \text{CBr}_2$ [163°], whence boil

ing alcohol gives bromo oxy tri-methyl pyrimidine [126°], converted by conc aqueous ammonia into oxy-amido tri-methyl pyrimidine $\text{CO} \begin{smallmatrix} \text{NMe CMe} \\ \text{NMe CO} \end{smallmatrix} \text{CNH}_2$ [167°], a body that is changed by potassium cyanate and HCl into crystalline $\text{CO} \begin{smallmatrix} \text{NMe CMe} \\ \text{NMe CO} \end{smallmatrix} \text{C NH CO NH}_2$

OXY-METHYL-PYRROLE Dihydride

$\text{CH}_2 \text{CO} \begin{smallmatrix} \text{CH}_2 \text{CHMe} \end{smallmatrix} \text{NH}$ γ Amido valeric lactam [37°] Formed by heating γ amido valeric acid and by the action of sodium amalgam and HOAc at 280° on the phenyl-hydrazide of levulic acid (Tafel, B 20, 250, 22, 1862) Yields an oily nitrosamine, which produces valerolactone on distillation -B'HCl [110°] Needles, v sol water -B', H_2PtCl_6

ν Oxy-di-methyl pyrrole $\text{C}_6\text{H}_4\text{NO}$ 4.6

$\text{CH CMe} \begin{smallmatrix} \text{C(OH) N} \\ \text{C(OH) N} \end{smallmatrix} \text{NOH}$ Made by heating its carb-oxylic acid (Knorr, A 236, 302) Reduces silver solution in the cold and Fehling's solution on boiling Gives a red substance with acids, and exhibits the pine-wood reaction

Oxy-tri-methyl-pyrrole ? $\text{C}_6\text{H}_4\text{NO}$ *Tri-methyl-pyrrolone* (175°) SG $\frac{2}{2}$ 945 Formed from sodio ethyl cyanide and Mel (Hanriot A. Bouveault, Bl. [8] 1, 175)

Di-oxy-tri-methyl pyrrole v. ACETONAMINES, vol. i. p. 27.

OXY-METHYL-PYRROLE CARBOXYLIC

ACID $\text{CO} \begin{smallmatrix} \text{NH CMe} \\ \text{CH}_2 \text{C CO}_2\text{H} \end{smallmatrix}$ *Ethyl ether EtA'*.

[134°] Formed by heating α -amido-ethylidene-succinic ether at 150° (Emery, A 260, 144) Needles, v sol alcohol Yields an acetyl derivative [142°]

Oxy-di-methyl-pyrrole carboxylic acid

Ethyl ether $\text{CO} \begin{smallmatrix} \text{NH CMe} \\ \text{CHMe C CO}_2\text{Et} \end{smallmatrix}$ [127°]

Formed from methyl acetosuccinic ether and alcoholic NH_3 at 0° (Emery, A 260, 151) Small white prisms (from HOAc)

Oxy-di-methyl-pyrrole carboxylic acid

Ethyl ether $\text{CO} \begin{smallmatrix} \text{NMe CMe} \\ \text{CH}_2 \text{C CO}_2\text{Et} \end{smallmatrix}$ [42°]

(160° at 11 mm) Formed from acetosuccinic ether and alcoholic methylamine (E) Bunches of needles, v sol ether

Oxy-di-methyl-pyrrole carboxylic acid

$\text{C}_6\text{H}_4\text{NO}_2$ 1.6 $\begin{smallmatrix} \text{N(OH) CMe} \\ \text{CMe CH} \end{smallmatrix} \text{C CO}_2\text{H}$ Formed by boiling oxy di-methyl pyrrole dicarboxylic ether with NaOHAq (Knorr, A. 236, 301) Slender needles, v sol alcohol Gives off CO_2 at 138°

Oxy-di-methyl-pyrrole dicarboxylic acid

$\text{N(OH)} \begin{smallmatrix} \text{CMe C CO}_2\text{H} \\ \text{CMe C CO}_2\text{H} \end{smallmatrix}$

Mono-ethyl ether EtHA' Formed by boiling the di-ethyl ether with alcoholic potash (Knorr, A 236, 299) Crystals (from alcohol) Decomposes at 185° into CO_2 and oxy-dimethyl pyrrole carboxylic ether

Di-ethyl ether EtA'' [99°] Formed by heating di-acetyl succinic ether with hydroxyl amine hydrochloride, NaOAc, and HOAc (Knorr) Yields the salt $\text{C}_{12}\text{H}_{16}\text{KNO}_3$

OXY METHYL-PYRROLE DIHYDRIDE CARBOXYLIC ACID Nitrile

$\text{CH}_2 \text{CH}_2 \begin{smallmatrix} \text{CH}_2 \text{CH}_2 \end{smallmatrix} \text{CMe CN}$ [141°] Formed by heating $\text{CH}_2 \text{CO CH}_2 \text{CH}_2 \text{CO}_2\text{Et}$ with HCy and ammonia in a closed tube (Kuhling, B 22, 2369, 23, 708) Octahedra (from hot alcohol) Successive treatment with cold H_2SO_4 and water converts it into the corresponding amide [161°], Hydroxylamine yields the amidoxim [156°]

OXY-METHYL-PYRROLE DIHYDRIDE THIOCARBOXYLIC AMIDE

$\text{CH}_2 \text{CH}_2 \begin{smallmatrix} \text{CH}_2 \text{CH}_2 \end{smallmatrix} \text{CMe CS NH}_2$ [220°] Formed by passing H_2S through an ammoniacal solution of the nitrile of oxy-methyl pyrrole dihydride carb-oxylic acid (Kuhling, B 22, 2370) Prisms (from hot water), almost insol alcohol

OXY-METHYL-QUINAZOLINE

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{C(OH) N} \\ \text{N=CMe} \end{smallmatrix}$ *Anhydro-acetyl o-amido benzamide* [238°] Formed from acetyl o-amido benzamide by the action of heat, alkalis, or boiling water (Weddige, J pr [2] 36, 143)

Silky needles (containing aq), v sol hot alcohol Mel and KOH yield the methyl derivative $\text{C}_6\text{H}_4\text{N}_2(\text{OMe})$ [109°] -B'HCl -B', H_2PtCl_6

Oxy-methyl-quinazoline

$\text{CH CH C(OH) N} \begin{smallmatrix} \text{C} \\ \text{C} \end{smallmatrix} \text{CH}$ [238°] Formed from o-amido-p-toluic amide and formic acid (Niemen towski, J pr [2] 40, 12). Crystals, insol water.

Oxy-di-methyl-quinazoline $C_{10}H_{10}N_2O$ *see* $C_6H_4Me < \begin{smallmatrix} CO NH \\ N CMe \end{smallmatrix}$ [255°] Formed by boiling *o* amido-*p* toluic amide with Ac_2O (Niementowski, *B* 21, 1534, *J pr* [2] 40, 13) Needles (from boiling water), sol acids and alkalis

Oxy-di-methyl-quinazoline $C_6H_4 < \begin{smallmatrix} CO-N \\ NMe CMe \end{smallmatrix}$ [199°] Formed by heating acetyl *o* amido benzamide above its melting point (Weddige, *J pr* [2] 36, 154) Crystals (containing 3aq), v e sol alcohol— $B'HCl$

Di-oxy-methyl quinazoline $\begin{smallmatrix} CH CH C CO NH \\ CH CMe C NH CO \end{smallmatrix}$ (?) Formed by heating amido *m*-toluic acid with urea at 180° (Niementowski, *J pr* [2] 40, 21) White needles (from amyl alcohol), insol benzene Not melted at 300° HI and P yield *o* toluidine

Di oxy methyl-quinazoline $C_6H_4 < \begin{smallmatrix} CO NMe \\ NH CO \end{smallmatrix}$ [284°] Formed by heating $C_6H_4(NH_2)CO NHMe$ with urea at 200° (Abt, *J pr* [2] 39, 147) Long white needles, sl sol hot water

Di-oxy-methyl quinazoline $C_6H_4 < \begin{smallmatrix} CO NH \\ NMe CO \end{smallmatrix}$ [148°] Formed by heating $C_6H_4(NHMe)CO NHCO_2H$ with urea (Abt)

Di-oxy-di-methyl quinazoline $C_6H_4 < \begin{smallmatrix} CO NMe \\ NMe CO \end{smallmatrix}$ [151°] Formed by the action of MeI and NaOH on either of the two preceding bodies or on di oxy quinazoline (Abt, *J pr* [2] 39, 145) White needles (from water), v sol alcohol

Oxy methyl-quinazoline dihydride $C_6H_4 < \begin{smallmatrix} CH_2 NMe \\ NH CO \end{smallmatrix}$ [120°] Formed by boiling *o*-oxy tolyl methyl thio urea with yellow HgO Soderbaum a Widman, *B* 22, 2936) Needles, v e sol methyl alcohol— $B'_2H_2PtCl_6$ [203°] $B'HAuCl_4$ [185°] Yellow prisms

OXY-METHYL QUINIZINE v OXY PHENYL-METHYL-PYRAZOLE

(*B* 1, 4)-**OXY METHYL-QUINOLINE** $\begin{smallmatrix} CH C(OH) \\ CH CMe \end{smallmatrix} > C_5H_4N$ [263°] Formed from the amido compound and HNO_2 (Noelting a Trautmann, *Bl* [3] 4, 244), and by fusing (*B* 4) methyl quinoline (*B* 1)-sulphonic acid with NaOH (Herzfeld, *B* 17, 905, 1551) Needles (from dilute alcohol) Yields a nitroso derivative $C_9H_8Me(NOH)(OH)N$ [200°] By KOH, MeI, and MeOH it is converted into the methyl derivative $C_{10}H_9(OMe)N$ (*c* 230°), whence $B'_2H_2PtCl_6$

(*B* 4, 1) **Oxy-methyl-quinoline** $\begin{smallmatrix} CH CMe \\ CH C(OH) \end{smallmatrix} > C_5H_4N$ [124°] Formed by heating amido *p*-cresol (10 g) with glycerin (24 g), H_2SO_4 (20 g), and picric acid (2 g) (*N* a T) Needles, v sl sol cold water Dyes fabrics mordanted with alumina, yellow

(*B* 4, 2)-**Oxy methyl-quinoline** $\begin{smallmatrix} CMe CH \\ CH C(OH) \end{smallmatrix} > C_5H_4N$ [96°] Formed from the amido- compound by the diazo- reaction (*N* a T) Formed also by fusing the sulphonic acid with NaOH (O Fischer a Willmack, *B* 17, 441, Herzfeld, *B*, 17, 1552) Needles (from chloro-

form) Smells like vanilla Its alcoholic solution is coloured green by $FeCl_3$ Yields a nitroso-derivative [200°]— $B'_2H_2PtCl_6$ 2aq orange needles

Methyl derivative $C_{11}H_{11}NO$ Oil— $B'_2H_2PtCl_6$ 2aq brown crystalline pp

Tetrahydride $C_9H_8Me(OH) < \begin{smallmatrix} CH_2 CH_2 \\ NH CH_2 \end{smallmatrix}$ Formed by reduction with tin and HCl Needles or plates, sl sol water Yields a nitrosamine $C_{10}H_9(NO)NO$ crystallising in small yellow needles

(*B* 4, 3) **Oxy-methyl-quinoline** $\begin{smallmatrix} CH CH \\ CMe C(OH) \end{smallmatrix} > C_5H_4N$ [74°] Formed from amido *o* cresol hydrochloride (10 g), glycerin (24 g), H_2SO_4 (20 g), and picric acid (2 g) (Noelting a Trautmann, *B* 23, 3663) Needles (from dilute alcohol), volatile with steam $FeCl_3$ gives a dark green colour Mixed with CuO it colours a flame green Yields a crystalline *p* nitroso derivative decomposing at 200° without melting

(*B* 2, 4)-**Oxy-methyl quinoline** $\begin{smallmatrix} C(OH) CH \\ CH CMe \end{smallmatrix} > C_5H_4N$ [200°] Formed by soda fusion from *o* toluquinoline sulphonic acid (Herzfeld, *B* 17, 903) Needles Not volatile with steam $FeCl_3$ colours its alcoholic solution brownish red

(*B* 1, 2) **Oxy-methyl quinoline** $\begin{smallmatrix} CMe C(OH) \\ CH CH \end{smallmatrix} > C_5H_4N$ *Ana oxy paratoluquinoline* [230°] Formed from the amido compound, and also from *p*-toluquinoline by sulphonation (with 25 p c SO_3 extra) at 90° and potash fusion (Noelting a Trautmann, *B* 23, 3658) Needles, v sl sol hot water Not volatile with steam

(*Py* 3, 1) **Oxy methyl quinoline** $C_6H_4 < \begin{smallmatrix} CMe CH \\ N = C(OH) \end{smallmatrix}$ [224° cor] (above 360°) Formed by heating the amide of acetoacetic acid with H_2SO_4 (Knorr, *A* 236, 83, *C J* 46, 334, Roos, *B* 21, 624, Reissert, *B* 24, 855) Small needles (from water) Reduced by sodium amalgam to $C_{10}H_9N_2O_2$ [280°] Sodium added to its alcoholic solution reduces it to a dihydride $C_{10}H_{11}NO$ [101°] and methyl quinoline tetrahydride $C_{11}H_{13}N$ (253°) $NaOEt$ and MeI form oxy-di-methyl quinoline [132°] and the methyl derivative $C_{10}H_9(OMe)N$ [276° cor], whence $B'_2H_2PtCl_6$ The ethyl derivative $C_{11}H_{11}(OEt)N$ [51°] (250°) is formed from chloro lepidine and KOEt

Salts— $B'HCl$ [187°]— $B'_2H_2PtCl_6$ 2aq— $B'_2H_2SO_4$ needles— $B'HNO_3$ prisms— $B'HI$ —Picrate [166°] Needles— $Ba(C_{10}H_9NO)_2$ 2aq

(*Py* 3, 4) **Oxy methyl quinoline** $C_6H_4 < \begin{smallmatrix} CH CH \\ NMe CO \end{smallmatrix}$ *Methyl- ψ carbostyryl* [72°]

Formed by digesting carbostyryl with MeOH and MeI, adding NaOH as required to neutralise the HI formed (Friedlander a Muller, *B* 20, 2010) Slender needles Weak base Sodium amalgam forms $C_{10}H_9NO$ [276°]— $B'_2H_2PtCl_6$ 2aq— $B'HgCl_2$ [189°] Small pyramids

Methyl- α -iodide $B'MeI$ Bronzed needles

(*Py* 1, 3) **Oxy methyl-quinoline** $C_6H_4 < \begin{smallmatrix} C(OH) CH \\ N = CMe \end{smallmatrix}$ [231°] (above 360°) S 1 in the cold, 10 at 100° Formed by heating

phenylamido crotonic ether rapidly to 240° (Conrad a Limpach, *B* 20, 947) Prisms (containing 2aq), v sol alcohol Tastes bitter FeCl₃ colours its solution yellowish-red KMnO₄ oxidises it to acetyl nitrilic acid Yields quinaldine on distillation with zinc dust —B'HCl —B'₂H₂PtCl₄ [215°] —B'₂H₂CrO₄ [108°] —B'₂O₂H₂(NO₃)₂OH [200°] Yellow needles

Methyl derivative C₁₀H₈(OMe)NO [82°] (296°) Formed from chloro methyl quinoline, MeOH, and NaOMe at 135° Needles, sl sol water

Methylo chloride C₁₀H₇NOMeCl aq [217°] Formed from the methylo iodide and AgCl (Conrad a Eckhardt, *B* 22, 74) —B'₂H₂PtCl₄ [240°] Yellow crystalline pp

Methylo iodide C₁₀H₇NOMeI aq [201°] Formed from the base and MeI at 100° Satiny needles (from hot water)

Sulphonic acid C₁₀H₈NO(SO₃H) [283°]. Long prisms (containing 2aq) —BaA₂ 4aq

(*B* 2)-Oxy-(*Py* 1) methyl quinoline
C(OH) CH C CMe CH [218°] Formed by fusing lepidine sulphonic acid with NaOH (Busch a Koenigs, *B* 23, 2684) Obtained also by boiling with HBrAq the methyl derivative which is produced by heating quinine sulphate (40 g) with KOH (95 g) and water (45 cc) at 220° in a current of superheated steam (Koenigs, *B* 23, 2674) Groups of slender needles, v sol warm alcohol and acetone Gives no colour with FeCl₃

Methyl derivative C₁₁H₁₁NO [52°] Formed as above, and also by heating quinine zinc chloride with water at 200° Slender needles (containing aq) Its solution fluoresces like quinine Gives a bluish green colour with ammonia and chlorine water —B'₂H₂PtCl₄ [237°] Orange powder

Oxy (Py 1) methyl-quinoline [141°] Formed from a sulphonic acid of lepidine prepared by mixing lepidine with H₂SO₄ and heating to 300° (Busch a Koenigs, *B* 23, 2686) Greenish needles, v sol benzene —B'₂H₂PtCl₄ 2aq orange-yellow needles

(*B* 2) Oxy (*Py* 3) methyl quinoline
C(OH) CH C CH CH *p* Oxy quinaldine
CH —CH C N CMe [213°] Formed by the action of paraldehyde and HCl upon *p* amido-phenol, and also by fusing (*Py* 3) methyl quinoline sulphonic acid with potash (Doebner a Miller, *B* 17, 1708) Crystals, not volatile with steam, v sl sol cold water —B'₂H₂PtCl₄ 2aq yellow needles

(*B* 2') Oxy (*Py* 3) methyl-quinoline
C₁₀H₇Me(OH)N [234°] Formed by fusing quinaldine (*B*) sulphonic acid with potash (*D* a *M*) Silvery plates, sol ether and hot alcohol, nearly insol hot water —B'HCl 2aq —B'₂H₂PtCl₄ 2aq small yellow needles

(*B* 4)-Oxy (*Py* 3) methyl-quinoline
CH CH — C CH CH
CH C(OH) C N CMe *o* Oxy quinaldine [74°] (266°) Formed by fusing (*Py* 3) methyl-quinoline (*B* 4)-sulphonic acid with potash, and also by the action of paraldehyde and HCl on *o* amido phenol (Doebner a Miller, *B* 17, 1705). Trimetric prisms, easily volatile with steam. —B'₂H₂PtCl₄ 2aq yellow needles

VOL III

Methyl derivative C₁₀H₇Me(OMe)N [125°] (282°) Formed from *o* anisidine, paraldehyde, and HCl —B'₂H₂PtCl₄ yellow needles

Tetrahydride C₁₀H₇Me(OH)N (280°) Formed by reducing *o* oxy quinaldine with tin and HCl (Doebner a Miller, *B* 17, 1706) Yields C₁₀H₇Me(OMe)N (270°) whence B'HCl and C₁₀H₇Me(OMe)NMe (261°), whence B'₂H₂PtCl₄ yellow needles

(*B* 2) Oxy (*Py* 4)-methyl quinoline tetrahydride **Methyl derivative** C₁₀H₇NMe(OMe) **Methyl thallium** (278°) Formed by methylation of thallium (Skraup, *M* 6, 776) Oil —B'₂H₂SO₄ —B'MeI aq [224°] —B'₂Me₂PtCl₄ Orange plates

(*B* 4) Oxy (*Py* 4) methyl quinoline
Tetrahydride C₁₀H₇NO 2e

CH CH — C CH₂ CH₂ [114°] Formed from CH C(OH) C NMe CH₂ (Fischer, *B* 16, 714) Trimetric tables (from ether) *abc* = 631.1.538 Its alcoholic solution is coloured brown by FeCl₃ —B'HCl aq *Kaurne*, a febrifuge —B'MeI [216°] Prisms (from MeOH) —B'C₂H₂Cl₄ (312°) Oil (Fischer a Kohn, *B* 19, 1040, *C* 7, 49, 503)

Methyl derivative C₁₀H₇(OMe)NMe (257°) Formed by means of MeI and MeOH Pale yellow oil Gives a crimson colour with NaNO₂ and a little acid —B'₂H₂PtCl₄ [199°] —B'₂H₂SO₄ prisms, v sol water

Methyl derivative of the methyloiodide C₁₀H₇(OMe)NMe I [175°] Prisms (from MeOH) Moist Ag₂O converts it into strongly alkaline crystalline C₁₀H₇(OMe)NMe₂OH, whence [C₁₀H₇(OMe)NMe Cl]₂ PtCl₄ [200°]

Ethyl derivative C₁₂H₁₃(OEt)NMe (270°) at 716 mm Oil

(*Py* 3) Oxy (*B* 2) methyl quinoline
CMe CH C CH CH
CH CH C N H CO **Methyl carbostyryl** [228°] Formed by boiling chloro methyl carbostyryl with NaOHAq (Einhorn a Lauch, *A* 243, 359) Crystalline, v sol alcohol

(*B* 1,2,4) Oxy di methyl quinoline
CMe C(OH) C CH CH [198°] Formed by the action of nitrous acid on (*B* 1,2,4) amido di methyl quinoline (Noeltling a Trautmann, *B* 23, 3683) Plates (from chloroform), v sol alcohol

(*Py* 3,1,4) Oxy-di methyl quinoline C₁₁H₁₁NO
CMe CH
C₁₀H₇ NMe CO **Methyl lepidone Di-**

methyl-*q* carbostyryl [132°] (290° at 250 mm) Formed by heating (*Py* 3,1) oxy methyl quinoline with KOH and MeI, or by heating the isomeric methoxy lepidine above its boiling point (290°) Formed also by heating methylaniline with acetoacetic ether, and treating the product with H₂SO₄ (Knorr, *B* 17, 2876, 19, 3301, *A* 236, 104) Needles, sl sol water and ether, v sol alcohol, insol alkalis Sodium amalgam reduces it to (C₁₁H₁₁NO)₂ [268°] —B'₂H₂PtCl₄ 3aq [214°] Slender needles

(*Py* 1,3,4) Oxy di-methyl-quinoline
C₁₀H₇ < CO CH
NMe CMe [176°] Formed from methoxy methyl quinoline by heating at 315° in a sealed tube, or by heating oxy quinaldine methylo iodide with NaHCO₃ (Conrad, *B* 20, 956, 22, 75) Needles, v sol water —B'HHgCl₄

3 A

[187°] Needles — $B'_2H_2PtCl_4$ [240°]. — $B'MeI$ [210°] Sl sol cold water

(*Py* 3, 2, 1) Oxy di methyl quinoline

$C_8H_7 \begin{smallmatrix} \text{CMe CMe} \\ \text{N}=\text{COH} \end{smallmatrix}$ [262°] Formed from methyl-acetoacetic anilide and H_2SO_4 in the cold (Knorr, *A* 245, 357) Yields a sulphonic acid, which forms a crystalline Ba salt $Ba(C_{11}H_{10}NSO_3)_2$. — $B'HCl$ Long silky needles

(*B* 2)-Oxy (*Py* 1, 3) di methyl quinoline

$C(OH)CH \begin{smallmatrix} CMe CH \\ CN=O \end{smallmatrix}$ [214°] (above 360°)

Formed by heating *p* amido phenol hydrochloride (1 vol) with acetone (3 vols) for some days at 175° (Engler a Bauer, *B* 22, 213) Prisms or tables, v sl sol water $FeCl_3$ colours its alcoholic solution brown — $B'HCl$. — $B'_2H_2PtCl_4$ 2aq — $B'_2H_2SO_4$ — $B'_2H_2Cr_2O_7$. — $B'_2C_2H_2(NO_2)_2OH$ [225°] Yellow plates or prisms

(*B* 4)-Oxy (*Py* 1, 3) di methyl-quinoline

$CH \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [65°] (281° uncor)

Formed in like manner from *o* amido phenol Prepared by saturating a mixture of acetone (3 mols) and paraldehyde (8 mols) with dry HCl , adding, after 3 days, *o* amido phenol (2 mols) dissolved in conc HCl aq, and heating on the water bath Crystals, v sol alcohol, ether, and benzene $FeCl_3$ colours its alcoholic solution green — $B'_2H_2SO_4$. — $B'HCl$. — $B'_2H_2PtCl_4$ 2aq — $B'_2H_2Cr_2O_7$. — $B'_2C_2H_2N_2O_3$ [207°] Plates or prisms, sl sol hot alcohol

(*Py* 3)-Oxy-(*B* 2 *Py* 1)-di-methyl-quinoline

$CMe \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [250°] Formed from $CMe \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ by successive treatment with *p* toluidine and H_2SO_4 (Knorr, *A* 245, 365) Flat prisms, sl sol hot water, dilute acids, and alkalis Yields (*B* 2, *Py* 1)-di methyl-quinoline on distillation with zinc dust

(*Py* 3) Oxy (*B* 3, *Py* 1) di-methyl-quinoline

$CH \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [220°] Formed in like manner from *m* toluidine (K) V sl sol hot water Yields (*B* 3, *Py* 1)-di methyl quinoline on distillation with zinc dust — Platinochloride [234°] The hydrochloride is crystalline, and is decomposed by water

(*Py* 3)-Oxy-(*B* 4; *Py* 1) dimethyl quinoline

$CH \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ Formed in like manner from *o* toluidine (Knorr, *A* 245, 368) Slender needles (from water) Yields (*B* 4, *Py* 1) di-methyl-quinoline on distillation — $B'_2H_2PtCl_4$ 2aq [220°] — $NaC_{11}H_{10}NO$ Plates

(*Py* 1) Oxy (*B* 2, *Py* 3) di-methyl quinoline

$CMe \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [275°] Formed by heating *p* tolyl amido crotonic ether $C_8H_7NH \begin{smallmatrix} CMe CH \\ CO_2Et \end{smallmatrix}$ at 250° (Conrad a Limpach, *B* 21, 525, cf Knorr, *B* 17, 542) Needles (containing aq) — $B'HCl$ Needles (from hot water) — $B'_2H_2PtCl_4$ [228°] Prisms (from hot water)

(*Py* 1)-Oxy-(*B* 4, *Py* 3)-di methyl quinoline

$CH \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [261°] Formed by distilling *o*-tolyl amido-crotonic ether (C a L) Plates (containing aq) — $B'_2H_2PtCl_4$ Needles

Oxy-(*Py* 1, 3)-di-methyl-quinoline

$C_{11}H_{11}N(OH)$ [44°]. Made from (*Py* 1, 3) di-

methyl-quinoline by conversion into the sulphonic acid and fusing this with $NaOH$ (Beyer, *J pr* [2] 33, 409) — $(B'HCl)_2PtCl_4$ 2aq

Oxy-tri-methyl quinoline

$CMe \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [264°] Formed by heating *m* xylyl β amido crotonic ether (Conrad a Limpach, *B* 21, 526) Needles (containing aq) — Platinochloride [282°] Needles

Oxy tetra methyl-quinoline $C_{11}H_{11}NO$ etc

$C_8H_7 \begin{smallmatrix} C(OH)CH \\ CN=O \end{smallmatrix}$ Formed by quickly heating ψ -cumyl amido crotonic ether at 250° (Conrad a Limpach, *B* 21, 529) Prisms (from alcohol) Sublimes at 285°, without previous fusion — $B'_2H_2PtCl_4$ Prisms (from alcohol)

(*Py* 1, 3, 4) Di oxy-methyl-quinoline

$C_8H_7 \begin{smallmatrix} C(OH)CH \\ NMe CO \end{smallmatrix}$ [260°] Formed by heating its methyl derivative with HCl aq at 120° Small needles, sol alkalis Yields a nitrosamine $C_{10}H_9NO_2(NO)$ crystallising in red needles [c 188°]

Methyl derivative $C_8H_7 \begin{smallmatrix} C(O)CH \\ NMe CO \end{smallmatrix}$

[68°] Formed by heating (*Py* 1, 3, 4) chloro oxy methyl quinoline with $NaOMe$ (Friedlander a Muller, *B* 20, 2014) Slender white needles, v sol alcohol — $B'_2H_2PtCl_4$ pyramids

Ethyl derivative $C_{10}H_9(OEt)NO$ [87.5°] Slender white needles

(*B* 4, *Py* 1) Di oxy-(*Py* 3) methyl quinoline

Methyl derivative $CH \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [229°] Formed by heating *o* methoxy phenyl amido crotonic ether at 260° (Conrad a Limpach, *B* 21, 1654) Long silky needles (containing aq) — $B'_2H_2PtCl_4$ [239°] Tables

(*B* 2, *Py* 1)-Di oxy (*Py* 3) methyl-quinoline

Methyl derivative $C(O)CH \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ [290°] Formed by the action of heat on *p* methoxy phenyl amido crotonic ether which is made from *p* anisidine and acetoacetic ether (C a L) — $B'HCl$ — $B'_2H_2PtCl_4$ — $B'_2H_2SO_4$ S 6 in the cold — $B'MeCl$ [251°] Needles — $B'_2Me.PtCl_4$ 4aq — $B'MeI$ Converted by moist Ag_2O into $C_{11}H_{10}NO$ [149°]

Di-methyl derivative $C_8H_7Me(O)Me_2N$ [94°] Formed from the methyl derivative, $NaOMe$, and MeI Needles or prisms

(*B* 2, 3)-Di oxy-(*Py* 3) methyl quinoline

Methylene derivative $CH_2 \begin{smallmatrix} CCH \\ CCH \end{smallmatrix}$ [152°] Formed on reduction of

CH_2O_2 , $C_8H_7(NO_2)CH \begin{smallmatrix} CH \\ CN=O \end{smallmatrix}$ (Haber, *B* 24, 623) Silvery needles, m sol ether — $B'_2H_2PtCl_4$ — $B'_2H_2CrO_3$ Detonates at 210° — Picrate [175°] Yellow crystals

(*Py* 1, 2, 3, 4) - Tri - oxy - methyl - quinoline

$C_8H_7 \begin{smallmatrix} C(OH)CH \\ NMe CO \end{smallmatrix}$ Di-oxy-methyl-pseudo carbostyryl Formed by warming the nitroso-derivative of (*Py* 1, 3, 4)-di-oxy methyl-quinoline with $SnCl_4$ White needles, sl sol water, benzene, and $CHCl_3$ By $FeCl_3$ it is oxidised to methyl-pseudo-quinisatin

$C_6H_4 \begin{matrix} \diagup CO \\ \diagdown CO \\ | \\ NMe CO \end{matrix}$ [122°] (Friedlander & Muller, *B* 20, 2015)

References — Bromo, Chloro, and Di-chloro di nitro- oxy methyl quinolines

(*B* 4) OXY (*Py* 4) METHYL QUINOLINE CARBOXYLIC ACID *Tetrahydride*

$C_6H_4Me(OH)(CO_2H)N$ [211°] (S & E), [216°] (K & N) Formed by heating oxy quinoline carboxylic acid tetrahydride with MeI and MeOH at 120° (Schmitt & Engelmann, *B* 20, 1219, Krokowsky & Nencki, *M* 9, 208) Prisms (containing 2aq), v sol hot water and alcohol Has no toxic action After administration to dogs the urine contains the acid $C_6H_4Me(OH)_2(CO_2H)N$ [255], insol water

(*B* 4) Oxy- (*Py* 3) methyl quinoline carboxylic acid $NO_2C_6H_4Me(OH)(CO_2H)$ [207°] Formed by heating potassium oxy quinaldine with liquid CO_2 at 190° (König, *B* 21, 883) Yellow needles (containing aq), sl sol cold water Gives a cherry red colour with $FeCl_3$

(*Py* 1) Oxy- (*Py* 3) methyl quinoline (*Py* 2)-carboxylic acid $C_6H_4 \begin{matrix} \diagup C(OH) \\ \diagdown C(CO_2H) \\ | \\ N=CMe \end{matrix}$ [245°]

Formed by oxidising the corresponding aldehyde with alkaline $KMnO_4$ (Conrad & Lumpach, *B* 21, 1975) Crystals (from alcohol) — MgA_2 (dried at 100°) Crystalline pp

(*Py* 3, 1)-Oxy-methyl quinoline (*B* 4) carboxylic acid [312°] Formed by oxidising (a) oxy (γ) methyl julole dihydride with $KMnO_4$ in acid solution (Reissert, *B* 24, 853) Needles, m sol alcohol, sl sol hot water

(*Py* 1) OXY (*Py* 3) METHYL QUINOLINE (*Py* 2) CARBOXYLIC ALDEHYDE

$C_6H_4 \begin{matrix} \diagup C(OH) \\ \diagdown CCHO \\ | \\ N=CMe \end{matrix}$ [273°] Formed, together with $C_6H_4N_2O_3$ [192°], by boiling (*Py* 1, 3) oxy methyl quinoline with chloroform and KOHAq (Conrad & Lumpach, *B* 21, 1972) Yellow plates (from alcohol), sl acids and alkalis — $B'HCl$ — $B'H \cdot H \cdot PtCl$, [215°-220°]

Phenyl hydrazide $C_6H_4H_2N_2O$ — $B'HCl$ yellow needles, sl sol hot water

(*Py* 1) Oxy (*B* 1, 2, 4, *Py* 3) tetra methyl quinoline (*Py* 2) carboxylic aldehyde $CMe CMe C(OH) CCHO$ Formed by the action of caustic soda and chloroform on the corresponding oxy tri methyl quinoline (C & L) Yields, with phenyl hydrazine hydrochloride, crystalline $C_6H_4H_2N_2O \cdot OHCl$

OXY METHYL QUINOXALINE

$CH CH CN CH$ *Oxytoluquinoxaline*
 $CMc CH ON COH$

Formed by oxidation of its dihydride by the air or by ammoniacal $AgNO_3$ (Hinsberg, *B* 19, 483, *A* 248, 75) Feebly basic plates PCl , yields chloro methyl quinoxaline [77°]. — NaA' aq plates, sol water.

Methyl derivatives [71°].

Ethyl derivatives [67°] From the chloro methyl quinoxaline and $NaOEt$ Satiny needles *Dihydride* $C_6H_4N_2O$ [95°-124°] Formed by reducing o nitro tolyl amido acetic acid with tin and HCl (Plöchl, *B* 19, 10, Leuckart & Hermann, *B* 20, 27) Formed also from chloro acetic ether and tolylene o-diamine (Hinsberg, *B* 18, 2870) Very oxidisable.

Oxy di methyl quinoxaline

$C_6H_4Me \begin{matrix} \diagup N CMe \\ \diagdown N COH \end{matrix}$ [238°] Formed by passing air through an alkaline solution of the dihydride, which is obtained by condensing tolylene o diamine with a bromo propionic or pyruvic acid (Hinsberg, *A* 237, 351, 248, 78) Thin crystals (from alcohol), v sl sol water Is perhaps a mixture of isomerides

Dihydride $C_6H_4Me \begin{matrix} \diagup NH CMe \\ \diagdown NH CO \end{matrix}$ [o 135°]

Crystallises from alcohol.

Oxy-tri methyl quinoxaline *Dihydride*

$C_6H_4Me \begin{matrix} \diagup NH CMe_2 \\ \diagdown NH CO \end{matrix}$ [227°] Formed by heating tolylene o diamine with bromo isobutyric ether (Hinsberg, *A* 248, 79) Plates, v sl sol water Yields an acetyl derivative [206°], a nitrosamine [154°], and a di-nitro compound [above 280°]

Di oxy-di methyl-quinoxaline *Di-ethyl derivative* $CH C(OEt) C N CMe$ [127°]
 $CH C(OEt) C N CMe$

Formed by the action of di methyl-diketone (diacetyl) on the hydrochloride of the di ethyl derivative of (a) di amido-hydroquinone (Nietzki & Reehberg, *B* 23, 1212) Long yellow needles

Di-oxy-di-methyl-di-quinoxaline, so called, $CMc N C CH C N CMe$ Formed by the action of $NaOAc$ and pyruvic acid in excess on a solution of the hydrochloride of tetra amido benzene (Nietzki & Muller, *B* 22, 445) Dissolves in alkalis with greenish yellow fluorescence

OXY METHYL QUINOXALINE CARBOXYLIC

LIC ACID $C_6H_4H_2N_2O_2$ *te* $C_6H_4(CO_2H) \begin{matrix} \diagup N CMe \\ \diagdown N COH \end{matrix}$ Formed by adding pyruvic acid in slight excess to an aqueous solution of di amido benzoic acid (Zehra, *B* 23, 3629) Pale yellow needles, m sol hot alcohol Blackens above 300° without melting — BaA' 3aq yellowish white needles

Oxy-methyl-quinoxaline carboxylic acid $C_6H_4Me \begin{matrix} \diagup N C CO_2H \\ \diagdown N COH \end{matrix}$ Formed by the action of boiling potash on $C_6H_4H_2N_2O$, [258°], which is made by mixing aqueous solutions of alloxan and tolylene o diamine (Hinsberg, *A* 237, 356) Yellow needles (from dilute alcohol) Gives off CO_2 at 214°

OXY-METHYL SUCCINIC ACID v OXYTARTARIC ACID

Oxy di methyl succinic acid v Oxy adipic acid

Di oxy di methyl succinic acid $CO_2H CMe(OH) CMe(OH) CO_2H$ *Di methyl-racemic acid* [179°] Formed by saponifying its nitrile with HCl aq Crystals (containing aq) — KHA'' Plates, m sol hot water — CaA'' 1½aq — BaA'' 2aq small needles

Nitrile $CN CMe(OH) CMe(OH) CN$ [o 110°] Formed from di methyl di ketone (diacetyl) and HCy (Fittig, *A* 249, 208) Very hygroscopic needles, sl sol chloroform

Isomeride — Di-methyl tartaric acid

OXY METHYL-TEREPHTHALIC ACID $C_6H_4Me(OH)(CO_2H)_2$ [254° 1] [285°-290°] Formed by fusing $C_6H_4Me(SO_2NH_2)(CO_2H)_2$ with potash (Jacobsen & H Meyer, *B* 16, 191). Minute prisms (from very dilute alcohol), decomposed on fusion.

OXY - METHYL-THIAZOLE $\begin{smallmatrix} S C(OH) \\ CH CMe \end{smallmatrix} > N$.

Thiocyanacetone [102°] Formed by heating the carboxylic acid (Wohmann, *A* 259, 298), or by heating with dilute HCl aq the compound $CH_3CO CH_2SCy$, formed from chloro acetone and a sulphocyanide (Tscherniak a Norton, *C J* 44, 568, Hantzsch, *B* 20, 3127, 3337, 21, 941, *A* 249, 20) Needles Yields methyl thiazole on distilling with zinc-dust With phenylene *m* diamine it forms $C_6H_4(NH C_6H_4SN)_2$ [152°] Reacts with hydroxylamine

Di - oxy - methyl - thiazole $\begin{smallmatrix} S - CO \\ CH_2 CO \end{smallmatrix} > NMe$

Formed from di oxy thiazole, NaOMe, and MeI (Arapides, *A* 249, 28) Liquid, v e sol water Decomposed by boiling NaOH aq into methyl amine and thioglycollic acid PCl_5 yields $C_4H_4Cl_2NOS$ [161°]

OXY-METHYL THIAZOLE CARBOXYLIC

ACID $\begin{smallmatrix} S C(OH) N \\ C(CO_2H) CMe \end{smallmatrix}$ [222°] Formed from its ether, and also by heating chloro methyl thiazole carboxylic acid with conc KOH aq (Zurcher, *A* 250, 286, Wohmann, *A* 259, 296) Plates or needles (containing aq), v sol water — NH_4A' baq Prisms, decomposing at 138°

Ethyl ether EtA' [129°] Formed together with $(SC_2Me(CO_2Et)N)_2O$ [142°] from chloro-acetoacetic ether and ammonium or barium sulphocyanide (Hantzsch a Weber, *B* 20, 3132) Silky plates Hydroxylamine forms $C_{10}H_{10}O_4N_2S_2$ [α 217°]

OXY METHYL-THIOPHENE $\begin{smallmatrix} CMe CH \\ C(OH) CH \end{smallmatrix} <$

Formed from levulic acid and P_2S_5 (Kues, *B* 19, 555) Oil, sl sol water — $B'HOAc$ (210°) Yellow oil

OXY METHYL UREA *Di-ethyl derivative of the glycollyl derivative* $CH_2(OEt)NH CO NH CO CH_2OEt$ [80°]

Formed from $CH_2(OEt)CONH_2$, bromine, and potash (Hofmann, *B* 18, 2736) Needles (from water)

OXY-METHYL XANTHINE $C_6H_5N_4O_3$ *S* 16 at 16° Formed by the action of potassium cyanate on the hydrochloride of di oxy amido-methyl pyrimidine $CO < \begin{smallmatrix} NMe CH \\ NH CO \end{smallmatrix} > C NH_2$ (Behrend, *A* 231, 252, Lehmann, *A* 253, 80) Needles or prisms (containing 2aq), sl sol water Does not reduce alkaline $AgNO_3$

OXY-MYRISTIC ACID $C_{14}H_{28}O_3$ [51°] Occurs in the essential oil from the fruit of *Angelica archangelica* (Müller, *B* 14, 2480) Pearly plates (from alcohol) — KA' aq — CuA' — AgA' bulky pp *Benzoyl derivative* [68°] — AgA'

(1,2) DI OXY NAPHTHALENE

$C_{10}H_6(OH)_2$ [1 2] [60°] v (β) HYDRONAPHTHOQUINONE, vol n p 728

(1,4) Di-oxy-naphthalene [176°] v (α) HYDRONAPHTHOQUINONE

(1,4') Di-oxy-naphthalene [260°] Formed by potash fusion from (α) naphthol sulphonic acid and from naphthalene (1,4')-disulphonic acid (Erdmann, *A* 247, 356, Bernthsen, *B* 20, 938, Armstrong a Wynne, *C J Proc* 3, 43) Scales, v sol hot alcohol, sl sol water Yields crystalline $C_{10}H_6(OAc)_2$ [160°]

Pers di oxy-naphthalene $C_{10}H_6(OH)_2$ [1 17] [140°] Formed by potash fusion from the anhydride got by boiling naphthylamine *persulphonic* acid with water (Erdmann, *A* 247, 357) Needles or plates, sl sol water Yields $C_{10}H_6(OAc)_2$ [148°] crystallising in white plates

Di-oxy-naphthalene Made by reducing *pers* naphthoquinone with HOAc and zinc-dust (Mel dola a Hughes, *C J* 57, 631) Minute needles which blacken at 205° Yields $C_{10}H_6(OAc)_2$ [227°] According to theory, this body should be identical with the preceding

(1,2')-Dioxynaphthalene [178°] Formed by fusing (β) naphthol (α) sulphonic acid (Bayer, *B* 15, 1851) with potash (Emmert, *A* 241, 371) Needles, v e sol alcohol, m sol water Its alkaline solution blackens quickly $FeCl_3$ gives a blue pp Yields $C_{10}H_6(OAc)_2$ [108°] and $C_{10}H_6(OEt)_2$ [67°]

(1,3') Di-oxy naphthalene [135°] Made by potash fusion from naphthalene (1,3') di sulphonic acid (Ewer a Pick, *G P* 45,229 [1887]) or (β) naphthal (α) sulphonic acid (Claus, *J pr* [2] 39, 315) White prisms (from benzene) Turns red in air $FeCl_3$ gives a blue colour Yields $C_{10}H_6(OAc)_2$ [78°]

(2,3') Di-oxy naphthalene [216°] Formed by potash fusion from naphthalene (2,3') di sulphonic acid (Dusart, *Bl* [2] 8, 200, Darmstadter a Wichelhaus, *A* 152, 306) and from (β) naphthol (β) sulphonic acid (Schaffer, *A* 152, 298, Armstrong a Graham, *C J* 39, 140, Emmert, *A* 241, 369) Thin plates, v sol alcohol, sl sol cold water Gives a yellowish white pp with $FeCl_3$ Yields $C_{10}H_6(OAc)_2$ [175°] and $C_{10}H_6(OEt)_2$ [162°] Forms a disulphonic acid which gives $BaC_{10}H_6S_2O_6$ 2aq (Griess, *B* 13, 1959)

(2,2') Di oxy naphthalene [190°] Formed by potash fusion from naphthalene (2,2') di sulphonic acid (Ebert a Merz, *B* 9, 609, Weber, *B* 10, 1233, 14, 2206, Clausius, *B* 23, 519) Needles (from hot water) Its alkaline solution blackens in air Yields $C_{10}H_6(OAc)_2$ [136°], $C_{10}H_6(OBz)_2$ [139°], $C_{10}H_6(OMe)_2$ [134], and $C_{10}H_6(OEt)_2$ [104°] (Liebermann, *B* 15, 1428)

Dioxynaphthalene [161°] Got by fusing (β) naphthol (β) disulphonic acid (1 pt) with NaOH (4 pts) at 310°, or by heating with dilute (25 p c) H_2SO_4 at 200° (*E P* 15,803) Crystals (from water) $FeCl_3$ gives an intense blue colour Combines with diazo compounds

Tri oxy naphthalene $C_{10}H_3O_3$ Got by reducing oxy (α) naphthoquinone (Graebe, *A* 154, 324) Yellow needles (from ether) Very readily oxidised

DI-OXY-NAPHTHALENE DICARBOXYLIC ACID $C_{10}H_6(OH)_2(CO_2H)_2$ [162°] Formed by heating narcotic acid (Claus a Meixner, *J pr* [3] 37, 1) White needles, v sol ether Yields $C_{10}H_6(CO_2H)_2$ [253°] on reduction — NaA' 6aq — $NaHA'$ 5½aq, small needles — BaA' 2aq — AgA'

DIOXYNAPHTHALIC ACID $C_{10}H_6O_4$ [126°] Made by boiling chloro oxy naphthalic acid (v NAPHTHALENE) with baryta (Hermann, *A* 151, 67) Prisms — KHA' aq — BaA' 3aq — $Ba(HA')_2$ — $Ba(NH_4A')_2$ 2aq — $Ca(NH_4A')_2$ — $Cu(NH_4A')_2$ blue prisms

DI-OXY-NAPHTHAZINE $C_{10}H_6N_4O_2$ [α , 300°] Formed from di oxy naphthoquinone and naphthylene-(1, 2) diamine in alcohol (Nietzke

a. Hasterlik, B 24, 1839). Reddish brown needles, sl sol alcohol

(a) OXY (β)-NAPHTHOIC ACID

$C_{10}H_7(OH)CO_2H$ [182°] *Naphthol carboxylic acid* [187°], S 558 at 17° Formed by passing CO_2 over sodium α -naphthol at 100° (Eller, A 152, 277, Schaffer, A 152, 291, Nietzki & Gietermann, B 20, 1274), or by heating sodium- α -naphthol with liquid CO_2 at 130° (Schmitt & Burkard, B 20, 2699) Stellate groups of needles (from alcohol) $FeCl_3$ colours its solution blue PCl_5 forms $C_{10}H_7(OPOCl_2)Cl_2$ [115°], whence moist air forms $C_{10}H_7(OPO(OH)_2)CO_2H$, while alcohol yields $C_{10}H_7(OPO(OEt)_2)CO_2H$ [63°] (Wolfenstein, B 21, 1186) — NaA' 3aq — NaA' — NH_4A' — PhA' [96°]

Acetyl derivative $C_{10}H_7(OAc)CO_2H$ [158°]

Methyl ether MeA' [78°] Converted by hydroxylamine into $C_{10}H_7(OH)CONH(OH)$ [174°]

Ethylether EtA' [49°]

Phenyl ether PhA' [96°]

Methyl derivative of the anilide $C_{10}H_7(OMe)CONHPh$ [218°] Made from methyl α -naphthol, phenyl cyanate, and $AlCl_3$ (Leuchart & Schmitt, B 20, 2340) Prisms

(β) Oxy (α) naphthoic acid

$C_{10}H_7(OH)(CO_2H)$ [21] [157°] Formed, in like manner, from β -naphthol (S a B, cf Kauffmann, B 15, 804) Slender needles, decomposing at 125° when slowly heated Completely decomposed by boiling water into CO_2 and β -naphthol $FeCl_3$ gives a blue colour PCl_5 yields $C_{10}H_7(OPOCl_2)COCl$ [38°], whence moist air forms $C_{10}H_7(OPO(OH)_2)CO_2H$ [156°], while dilute alcohol produces $C_{10}H_7(OPO(OEt)_2)CO_2H$ [113°] (Rabe, B 22, 392) — NH_4A' yellow needles, m sol cold water

Methyl ether MeA' [76°] Converted by hydroxylamine into amorphous $C_{10}H_7(OH)CONH(OH)$ [178°] (Jeaurenaud, B 22, 1277)

Ethylether EtA' [55°]

Methyl derivative of the amide $C_{10}H_7(OMe)CONH_2$ [186°] Form from methyl β -naphthol, $AlCl_3$, and $ClCONH_2$ (Gietermann, A 244, 75) Crystals (from alcohol)

Ethyl derivative of the amide $C_{10}H_7(OEt)CONH_2$ [161°] Plates (from alcohol)

Methyl derivative of the anilide $C_{10}H_7(OMe)CONHPh$ [169°] Made from methyl β -naphthol and phenyl cyanate in presence of $AlCl_3$ (L a S) Needles

(β) Oxy-naphthoic acid

$C_{10}H_7(OH)CO_2H$ [23°] [216°] Formed in small quantity from sodium β -naphthol and CO_2 at 290° (Schmitt & Burkard, B 20, 2702) Plates, v sol alcohol Very stable $FeCl_3$ colours its solution blue Its methyl ether does not react with hydroxylamine

Pers-Oxy-naphthoic acid

$C_{10}H_7(OH)CO_2H$ [11°] [169°] Made by heating its internal anhydride for a long time with dilute KOHAq (Ekstrand, B 19, 1138, J pr [2] 38, 278) Small needles (from ether), v sol water Solutions of its salts are coloured violet by $FeCl_3$. — CaA' , 8½aq decomposed on boiling

Anhydride $C_{10}H_6\begin{smallmatrix} CO \\ \diagup \diagdown \\ O \end{smallmatrix}$ *Naphtholactone.*

[108°] Made from amido α -naphthoic acid by the diazo reaction Needles (from alcohol) or tables (from ether), insol cold aqueous alkalis

(a)-Oxy-naphthoic acid

$C_{10}H_7(OH)CO_2H$ [14°]

Ethyl derivative $C_{10}H_7(OEt)CO_2H$ [214°] Formed by the action of alcoholic potash on the amide $C_{10}H_7(OEt)CONH_2$ [244°], which is made from $C_{10}H_7OEt$ and $ClCONH_2$ in presence of $AlCl_3$ (Gietermann, B 23, 1198, A 244, 73) Needles, m sol alcohol — NaA' 3aq. plates — CaA' , 3aq needles, sl sol water

Methyl derivative $C_{10}H_7(OMe)CO_2H$ [232°] Formed, in like manner, from $C_{10}H_7(OMe)CONH_2$ [234°] which is prepared from $C_{10}H_7OMe$

(a)-Oxy (α) naphthoic acid [234°–237°]

Formed by fusing α -sulpho α -naphthoic acid [235°] with potash (Battershall, A 168, 114) Needles (from water), v sol alcohol Aqueous solutions of its salts blacken on boiling $FeCl_3$ gives a dirty violet pp

(a)-Oxy-(β) naphthoic acid [213°] Made by potash fusion from sulpho β -naphthoic acid (Needles from boiling water) Its salts are unstable $FeCl_3$ gives a dirty red pp

(β) Oxy (α) naphthoic acid [247°] Made by potash fusion from the sulpho naphthoic acid [218°–222°] (Stumpf, A 188, 6) Mass of needles (from water) $FeCl_3$ has no effect in the cold, but gives a brown pp on warming

(β) Oxy (α) naphthoic acid [187°] Made by potash fusion from sulpho-naphthoic acid [182°–185°] (Stumpf) Branching needles (from water) Gives a chocolate colour with $FeCl_3$. Yields β -naphthol on distilling with lime

(β) OXY NAPHTHOIC ALDEHYDE

$C_{10}H_7(OH)CHO$ *Aldehyde naphthol* [76°] Formed from β -naphthol, chloroform, and aqueous $NaOH$ (Kauffmann, B 15, 805, 16, 683). Prisms (from alcohol), almost insol water $FeCl_3$ colours its solution brown Reduces warm ammoniacal $AgNO_3$, forming a mirror With Ac_2O and $NaOAc$ it forms $C_{10}H_7(OAc)CH(OAc)$, [124°] Yields, on oxidation, oxy-naphthoic acid [150°] — $C_{10}H_7(ONa)CHO$ yellow plates

(a) OXY (α)-NAPHTHOPHENAZINE

$C_{18}H_{10}NO$ *α-Naphthophenazine* [43°] Formed by heating α -amido or diethylamido- α -naphthophenazine with conc $HClAq$ for 5 hours at 180° (Fischer & Hepp, B 23, 845, Eicker, B 23, 3805) Reddish yellow needles (from alcohol) The hydrochloride forms red prisms with green lustre

OXY-(β) NAPHTHOQUINOLINE $C_{18}H_{10}NO$

Formed by fusing β -naphthoquinoline sulphonic acid with potash (Gentil, B 18, 202) Does not melt below 250°

(a) OXY-(α)-NAPHTHOQUINONE $C_{18}H_{10}O_2$

Naphthalic acid [190°] Formed by heating amido- or oxy-naphthoquinonamide or oximido-naphthol with $HClAq$ or alkalis (Martius & Gries, A 134, 377, Graebe & Ludwig, A 154, 321, B 4, 970, Merz & Diehl, B 11, 1314, Kehrman, B 23, 2453) Formed also in like manner from phenyl-amido α -naphthoquinone and from phenyl amido- β -naphthoquinone (Baltzer, B 14, 1900, Zincke, B 14, 1496, Lie-

bermann & Jacobson, *A* 211, 80) Yellow needles, v sl sol cold water. May be sublimed

Reactions—1 Reduced by tin and HCl to tri oxy-naphthalene—2 The Na salt heated with *o*-phenylene-diamine forms (a) naphthoeurhodol (Kehrmann, *B* 23, 2453)—3 *Benzoin aldehyde* forms $\text{CHPh}(\text{C}_6\text{H}_4(\text{OH})\text{O})_2$ [211°–214°] (Zincke, *B* 21, 2203)—4 *Phenyl-hydrazine* yields $\text{C}_{10}\text{H}_7(\text{OH})\text{O}(\text{N}_2\text{HPh})$ [230°] which forms the salts CAa' , 4aq and BAa' , 10aq, the ethers MeA' [175°] and EtA' [173°], and the acetyl-derivative $\text{C}_{10}\text{H}_7\text{AcN}_2\text{O}_2$ [179°]. It reacts with aldehyde, benzoic aldehyde, and acetone, forming $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}_4$ [c 258°], $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}_4$, and $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}_4$ [245°–250°] respectively (Zincke & Thelen, *B* 17, 1812, 21, 2205)— $\text{AgC}_{10}\text{H}_7\text{O}_2$ scarlet needles (from hot water)

Ethyl ether $\text{EtC}_{10}\text{H}_7\text{O}_2$ [127°] Needles

Imide v AMIDO NAPHTHOQUINONE

Amide v PHENYL AMIDO NAPHTHOQUINONE

Oxim $\text{C}_{10}\text{H}_7(\text{NOH})(\text{OH})\text{O}$ [1 2 4] *Nitroso naphtharesorcin* Formed from oxy-naphthoquinone and hydroxylamine (Kostanecki, *B* 22, 1843) Needles, decomposing at 180° Gives with ferrous salts a green, and with ferric salts a dark-brown lake The hydrochloride forms yellow needles Nitrous acid forms $\text{C}_{10}\text{H}_7(\text{NOH})_2\text{O}_2$ crystallising in plates (containing aq), decomposing at 165°

Oxy-(β)-naphthoquinone $\text{C}_{10}\text{H}_6(\text{OH})\text{O}_2$ [2' 1 2] Formed by oxidising its oxim with FeCl_3 . Reddish brown, amorphous pp, v sol alcohol

Oxim $\text{C}_{10}\text{H}_7(\text{OH})(\text{NOH})\text{O}$ [2' 1 2] [235°] Formed from (2,2') di oxy naphthalene and nitrous acid (Clausius, *B* 23, 521) Brownish-yellow needles

Di-oxy-naphthoquinone $\text{C}_{10}\text{H}_6(\text{OH})_2\text{O}_2$ *Naphthazarin* Formed by heating di nitro naphthalene [214°] with zinc and H_2SO_4 at 200° (Roussin, De Aguiar & Baeyer, *B* 4, 251, 438, Liebermann, *B* 3, 905, *A* 162, 330) Reddish brown needles with green lustre, v sl sol boiling water, v sol alcohol Its alkaline solution is blue Its solution in H_2SO_4 is crimson Baryta- and lime- waters give violet blue pps

Isomeride v Oxy juglone, p 101

Di oxy-naphthoquinone $\text{C}_{10}\text{H}_6(\text{OH})_2\text{O}_2$ Formed by heating oxy amido naphthoquinone with HClAq at 175° (Merz & Diehl, *B* 11, 1322) Reddish-brown needles (from alcohol) Its alkaline solution is brownish-violet Dyes violet with alumina mordants and dark blue with iron mordants Dyes silk brownish violet with metallic lustre It forms a crystalline di acetyl derivative— BAa'' — PbA'' — $\text{Ag}_2\text{A}''$. greenish-blue pp

Tri-oxy-naphthoquinone A black by product in preparing naphthazarin (Aguar, *B* 4, 439)

References—Bromo- and Chloro- OXY NAPHTHOQUINONE

OXY-NAPHTHOQUINONE SULPHONIC

ACID $\text{C}_{10}\text{H}_6(\text{OH})\text{O}_2\text{SO}_3\text{H}$ Formed by the action of alkalis on the acid $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})(\text{OSO}_3\text{H})_2$ got by dissolving dichloro naphthoquinone in aqueous KHSO_4 (Graebe, *A* 149, 9)— $\text{K}_2\text{A}'$ (dried at 140°) orange crystals

References—Bromo- and Chloro- OXY NAPHTHOQUINONE SULPHONIC ACID

(β)-OXY- α NAPHTHOYL-BENZOIC ACID $\text{C}_{10}\text{H}_6(\text{OH})\text{CO C}_6\text{H}_4\text{CO}_2\text{H}$ *Phenyl oxy-naphthoyl-ketone-o-carboxylic acid* [256°] Fre-

pared by oxidising an alkaline solution of ($\beta\beta$ -dioxo-dinaphthyl with KMnO_4 (Walder, *B* 16, 299) Silky prisms Sol alcohol, ether, and acetic acid, nearly insol water

Reactions—1 On fusion with KOH gives (β) naphthol and phthalic acid—2 Heated with HI it is reduced to (β -oxy ω naphthyl *o*-toluic acid ($\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$)—3 Heated with ZnCl_2 to 220° it yields a substance $\text{C}_{10}\text{H}_6\text{O}$, which forms colourless crystals [146°], easily soluble in alcohol—4 Heated with resorcin it gives a red colouring matter, and with dimethylaniline and ZnCl_2 a green

Salts— $\text{A}'\text{Na}$ white crystalline powder, sl sol cold water and alcohol— $\text{A}'\text{Ag}$ insoluble pp— $\text{A}'\text{Ba}$ 2aq slightly soluble white pp

Methyl ether $\text{A}'\text{Me}$ [199°], prisms

Ethyl ether $\text{A}'\text{Et}$ [206°], needles

Acetyl derivative $\text{C}_{10}\text{H}_6(\text{OAc})$ [170°]

DI (α) OXY DINAPHTHYL

$\text{C}_{10}\text{H}_6(\text{OH})\text{C}_6\text{H}_4(\text{OH})$ *Dinaphthol* [300°] Formed by adding FeCl_3 to a conc solution of (α) naphthol (Dianin, *B* 6, 1252, 7, 125, 187, Julius, *Chem Ind* 10, 97) Silvery plates (from alcohol), insol water Its alcoholic solution is coloured red by FeCl_3

Benzoyl derivative $\text{C}_{20}\text{H}_{12}(\text{OBz})_2$ [253°]

Di-methylether $\text{C}_{20}\text{H}_{12}(\text{OMe})_2$ [251°]

Di-ethyl ether $\text{C}_{20}\text{H}_{12}(\text{OEt})_2$ [211°] Pearly plates (Osteimayer & Rosenhek, *B* 17, 2453)

Di-(β)-oxy (aa) dinaphthyl [218° cor] *V D* 9 52 (obs) Prepared by oxidation of an ethereal solution of (β) naphthol with FeCl_3 , the yield being 60 p c of the theoretical amount (Dianin, Walder, *B* 15, 2166) Needles or plates Gives with FeCl_3 a greenish colour, becoming red on heating On heating with ZnCl_2 it gives (β) dinaphthylene oxide H_2SO_4 forms $\text{C}_{20}\text{H}_{12}(\text{OH})_2(\text{SO}_3\text{H})_2$, whence BAa'' 6aq, $\text{C}_{20}\text{H}_{12}(\text{OH})_2(\text{SO}_3\text{H})_2$ is also formed ZnCl_2 and NH_3 at 330° form $\text{C}_{20}\text{H}_{12}\text{N}$ [157°], which forms a picrate [217°] and an acetyl derivative [144°]—*Picrate* $\text{C}_{20}\text{H}_{12}\text{O}_2\text{C}_6\text{H}_4(\text{NO}_2)_3\text{OH}$ [174°] White crystals, sol alcohol

Benzoyl derivative $\text{C}_{30}\text{H}_{18}(\text{OH})(\text{OBz})$ [204°]

Di benzoyl derivative $\text{C}_{20}\text{H}_{12}(\text{OBz})_2$ [160°]

Di methylether $\text{C}_{20}\text{H}_{12}(\text{OMe})_2$ [190°]

Di-ethylether $\text{C}_{20}\text{H}_{12}(\text{OEt})_2$ [90°]

Di-oxy dinaphthyl [195°] A product of the action of melted potash on (β) naphthoaldehyde (Kauffmann, *B* 15, 807) Silky needles (from alcohol)

Tetra oxy-dinaphthyl $\text{C}_{20}\text{H}_{10}(\text{OH})_4$ '*Di-naphthyl dihydroquinone*' [178°] Formed by reduction of the quinone $\text{C}_{20}\text{H}_{10}\text{O}_4$ (Stenhouse & Groves, *C J* 33, 415), and by the action of tin and HCl on (β) naphthoquinone (Korn, *B* 17, 3024) Colourless needles, darkening by oxidation in air, insol water, v sol HOAc The quinone $\text{C}_{20}\text{H}_{10}\text{O}_4$ is oxidised in alkaline solution by the air to [4 3 2 1] $\text{C}_{10}\text{H}_6\text{O}_2(\text{OH})\text{C}_{10}\text{H}_6\text{O}_2(\text{OH})$ [1 4 3 2] [245°–250°]

Acetyl derivative $\text{C}_{20}\text{H}_{10}(\text{OAc})_4$ [166°]

α OXY-(α)-NAPHTHYL-ACETIC ACID

$\text{C}_{11}\text{H}_{10}\text{O}_2$, *c c* $\text{C}_{11}\text{H}_9\text{CH}(\text{OH})\text{CO}_2\text{H}$ (α)-*Naphthylglycolic acid* [98°] Formed by reducing (α)-naphthyl glyoxylic acid with sodium amalgam (Boessneck, *B* 16, 640) Formed also by saponifying its nitrile (Brandis, *B* 22, 2158), and

from (a) naphthyl methyl ketone by successive treatment with bromine and potash (Schweizer, *B* 24, 549) Rosettes of needles (from water) Yields (a) naphthoic aldehyde on oxidation with dilute HNO_3 . — BaA' . — AgA' pulverulent pp

Methyl ether MeA' [79°] Needles

Nitrile $\text{C}_{10}\text{H}_7\text{CH}(\text{OH})\text{CN}$ Formed from (a)-naphthoic aldehyde, KC_2H_5 , and cold HClAc Oil, v sol alcohol

a-Oxy-(β) naphthyl-acetic acid [158°] (S), [c 176°] (C & T) Prepared in the same way as its isomeride (Claus & Tersteegen, *J pr* [2] 42, 518, Schweizer, *B* 24, 547) Small needles (from water) Reduced by HIAc to $\text{C}_{10}\text{H}_7\text{CH}_2\text{CO}_2\text{H}$ [c 142°]

Methyl ether MeA' [75°] Needles

Ethyl ether EtA' [87°] Needles

Acetyl derivative $\text{C}_{10}\text{H}_7\text{CH}(\text{OAc})\text{CO}_2\text{H}$ [150°]

Amide $\text{C}_{10}\text{H}_7\text{CH}(\text{OH})\text{CONH}_2$ [228°]

Oxy di-naphthyl acetic acid $\text{C}_{10}\text{H}_7\text{O}_2$ & $\text{C}_{10}\text{H}_7\text{O}_2$ $\text{C}(\text{OH})\text{CO}_2\text{H}$ Yellowish green tables, decomposing about 100°

Anhydride $\text{C}_{20}\text{H}_{12}\text{O}_2$ Formed by heating (a) naphthol with oxalic acid and H_2SO_4 (Hoenig, *M* 1, 251) Pale red plates, sl sol chloroform

(β) OXY-NAPHTHYL-ACRYLIC ACID
 $\text{C}_{10}\text{H}_7(\text{OH})\text{CH}=\text{CHCO}_2\text{H}$ [170°] Formed by heating its anhydride with aqueous potash at 170° Crystalline powder, sol alcohol

Anhydride $\text{C}_{10}\text{H}_7\text{C}(\text{CH}=\text{CH})\text{CO}$ (β)-Naphtho-coumarin [118°] Prepared by heating (β)-oxy-naphthoic aldehyde (2 pts) with Ac_2O (10 pts) and NaOAc (2 pts) at 180° (Kauffmann, *B* 16, 685) Needles, v sol alcohol, sl sol hot water

An isomeride of this anhydride [141°] is got by heating (β) naphthol with malic acid and H_2SO_4 (Pechmann & Welsh, *B* 17, 1651)

OXY-DINAPHTHYLAMINE v. Imido di-NAPHTHYL OXIDE

Tri oxy (β) naphthylamine

$\text{C}_{10}\text{H}_7(\text{OH})_3(\text{NH}_2)_3$ [1342] Formed from nitro oxy quinone, SnCl_4 , and HCl (Kehrmann & Weichardt, *J pr* [2] 40, 181) Brownish violet needles — B'HCl monoclinic prisms

Tetra-acetyl derivative [145°]

(β) OXY-NAPHTHYL-CROTONIC ACID

Anhydride $\text{C}_{10}\text{H}_7\text{C}(\text{CMe}=\text{CH})\text{CO}$ [162°] Formed by the action of H_2SO_4 on a mixture of acetoacetic ether and (β) naphthol (Pechmann & Cohen, *B* 17, 2190) Needles, sol alcohol Its solution in H_2SO_4 exhibits green fluorescence

DI-OXY-NAPHTHYLENE-DIAMINE

$\text{C}_{10}\text{H}_4(\text{OH})_2(\text{NH}_2)_2$ [1824] Formed by the action of SnCl_4 and HCl on the oxim of oxy-amido naphthoquinone (Kehrmann & Weichardt, *J pr* [2] 40, 186) Its alkaline solutions become crimson on oxidation, and then blue on boiling — B'HCl white needles

TRI-OXY-TRI-NAPHTHYL ETHANE

$\text{C}_{10}\text{H}_7(\text{OH})\text{CH}_2\text{CH}(\text{C}_{10}\text{H}_7\text{OH})_2$ Formed from di-chloro di-ethyl oxide and (a) naphthol (Wislicenus, *A* 243, 165) White amorphous powder, insol water, sol alcohol

(a) OXY-NAPHTHYL ETHYL KETONE

$\text{C}_{10}\text{H}_7(\text{OH})\text{CO}\text{C}_2\text{H}_5$ [81°] Formed by heating (a)-naphthol with propionic acid and ZnCl_2 at 178° Pale yellow plates (from ether or alcohol).

Phenyl hydrazide [128°].

Methyl ether [58°] Formed from propionyl chloride, $\text{C}_{10}\text{H}_7\text{OMe}$, and AlCl_3 (Gattermann, *B* 23, 1209) Prisms (from ether). Yields an oxim $\text{C}_{10}\text{H}_7(\text{OMe})\text{C}(\text{NOH})\text{C}_2\text{H}_5$ [172°].

OXY-NAPHTHYL METHYL KETONE

[18] $\text{C}_{10}\text{H}_7(\text{OH})\text{CO}\text{CH}_3$, 'Ketonaephthol' [168°] Formed by the rapid distillation of phenyl aceto isocrotonic acid (Erdmann, *A* 254, 197) Crystals (from dilute alcohol)

Acetyl derivative $\text{C}_{10}\text{H}_7\text{O}_2$ [109°]

Oxim $\text{C}_{10}\text{H}_7\text{NO}_2$ [174°]

Oxy naphthyl methyl ketone [103°] Formed by heating (a)-naphthol with HOAc and ZnCl_2 (Witt, *B* 21, 321) Pale-green six sided prisms (from benzene) Its alkaline salts are yellow Alcoholic NH_3 at 200° forms

$\text{C}_{10}\text{H}_7(\text{OH})\text{C}(\text{NH}_2)\text{CH}_3$ [203°]

Oxim $\text{C}_{10}\text{H}_7(\text{OH})\text{C}(\text{NOH})\text{CH}_3$ [170°]

(a) **Oxy-naphthyl methyl ketone** Probably identical with the preceding isomeride *Methyl ether* $\text{C}_{10}\text{H}_7(\text{OMe})\text{CO}\text{CH}_3$ [72°] (above 350°) Formed from $\text{C}_{10}\text{H}_7(\text{OMe})$, AcCl , and AlCl_3 (Gattermann, *B* 23, 1208) Six sided tables

Ethyl ether $\text{C}_{10}\text{H}_7(\text{OMe})\text{Ac}$ [79°]

(β) **Oxy naphthyl methyl ketone** *Methyl ether* $\text{C}_{10}\text{H}_7(\text{OMe})\text{CO}\text{CH}_3$ [58°] Formed from $\text{C}_{10}\text{H}_7\text{OMe}$, AcCl , and AlCl_3 (G) Slender needles

Ethyl ether [63°] Compact tables

OXY (a) NAPHTHYL METHYL PYRAZOLE

$\text{C}_{10}\text{H}_{12}\text{N}_2\text{O} \rightleftharpoons \text{C}_{10}\text{H}_7\text{N}(\text{C}(\text{OH})\text{CH}=\text{CMe})_2$ [c 190°] Formed by heating (a) naphthyl hydrazine with acetoacetic ether at 130° (Knorr, *B* 17, 551)

Yields a methyl derivative [129°] (a) Naphthyl hydrazine and thio acetoacetic ether form $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}$ [220°] (Sprague, *C J* 59, 343)

Oxy-(β) naphthyl methyl-pyrazole [190°]

Formed in the same way Yields a methyl derivative [129°]

(a) **OXY-NAPHTHYL PROPYL KETONE**

$\text{C}_{10}\text{H}_7(\text{OH})\text{CO}\text{C}_3\text{H}_7$ [78°] Formed by heating butyric acid with (a) naphthol and ZnCl_2 (Goldzweig, *J pr* [2] 43, 97) Silky needles (from ether), m sol hot water

DI-OXY-DI-(a)-NAPHTHYL-PYRAZINE HEXAHYDRIDE

$\text{C}_{10}\text{H}_7\text{N}(\text{C}(\text{OH})\text{CH}=\text{C}(\text{OH})\text{CH}_2)_2\text{NC}_{10}\text{H}_7$ [275°]

Formed by boiling the acetyl derivative of chloro (a) naphthylamine with alcoholic potash (Abenius, *J pr* [2] 40, 437) Formed also by heating (a)-naphthylamido acetic acid with Ac_2O at 200° (Bischoff, *B* 22, 1807, 23, 2003) Plates (from HOAc), insol alkalis

Di-oxy-di (β) naphthyl-pyrazine hexahydride [above 360°] Formed by heating (β)-naphthyl amido acetic acid at 220° in hydrogen, and by the action of chloro acetic ether on the naphthalide of (β) naphthylamido acetic acid (Bischoff) Plates, sol aniline Converted by boiling alcoholic potash into

$\text{C}_{10}\text{H}_7\text{NHCH}_2\text{CO}\text{N}(\text{C}_{10}\text{H}_7)\text{CH}_2\text{CO}_2\text{H}$ [105°]

DI-OXY-DI (β) NAPHTHYL SULPHIDE

$\text{S}(\text{C}_{10}\text{H}_7\text{OH})_2$, *Naphthol sulphide* [215°] Formed, together with the di- and tri-sulphides, by the action of sulphur at 180° in presence of PbO , or of S_2Cl_2 in benzene, upon (β)-naphthol (Tassinari, *G* 17, 94, Onufrovitch, *B* 21, 3559, 23, 3355). Prisms, insol water, ether, and

benzene, m sol hot alcohol Yields di oxy di-naphthyl on heating with powdered copper NH_4Aq forms, on heating, (8) naphthylamine Alcohol and ammoniacal AgNO_3 forms $\text{C}_{20}\text{H}_{12}\text{SO}_2$ [164°] —NaA' 6aq needles

Acetyl derivative $\text{SC}_{20}\text{H}_{12}(\text{OAc})_2$ [154°]

Benzoyl derivative [208°] Plates

Ethyl ether $\text{SC}_{20}\text{H}_{12}(\text{OEt})_2$ [189°] Yields a di-nitro derivative [235°]

Di-oxy di (8) naphthyl disulphide

$\text{S}_2(\text{C}_{10}\text{H}_7\text{OH})_2$ [169°] Formed as above Thin yellow needles, m sol benzene Yields di oxy dinaphthyl on heating with Cu at 240°

Di-acetyl derivative $\text{S}_2\text{C}_{20}\text{H}_{12}(\text{OAc})_2$

[c 140°] Yellowish crystalline mass

Di benzoyl derivative [187°] Prisms

Di-ethyl ether [158 5°] Needles

Di oxy di-naphthyl disulphide $\text{S}_2(\text{C}_{10}\text{H}_7\text{OH})_2$ [210°] Formed by heating (8) naphthol with NaOHAq and S (Lange, B 21, 260) Needles, insol water, v sol HOAc It is accompanied by the preceding isomeride [170°]

Di-oxy di-(8)-naphthyl trisulphide

$\text{S}_3(\text{C}_{10}\text{H}_7\text{OH})_2$ Formed as above (Onufrovitch) Powder Yields a dibenzoyl derivative [194°]

ν OXY-(α)-NAPHTHYL-THIO UREA

$\text{C}_{10}\text{H}_7\text{NH CS NH}(\text{OH})$ [116°] Formed from (α) naphthyl thiocarbimide and hydroxylamine (Tiemann, B 22, 1939, Voltmer, B 24, 382) Pearly plates (from alcohol), insol water Hot alcohol converts it into (α) naphthyl cyanamide

Benzyl ether $\text{C}_{10}\text{H}_7\text{NH CS NH}(\text{OCH}_2\text{Ph})$ [133°] Formed by using benzyl hydroxylamine

(8)-OXY ω NAPHTHYL o TOLUIC ACID

$\text{C}_{10}\text{H}_7(\text{OH})-\text{CH}_2-\text{C}_6\text{H}_4\text{CO}_2\text{H}$ [261°] Formed by reduction of oxy naphthoyl benzoic acid by heating with HI and P to 200° (Waldner, B 16, 304) Small colourless prisms Nearly insol water, sl sol alcohol and ether —A'Ag flocculent pp

OXY-NITRO v NITRO OXY

DI-OXY-OCTANE $\text{C}_8\text{H}_{16}\text{O}_2$ 2e

$\text{CPrH}(\text{OH})\text{CPrH}(\text{OH})$ Mol w 146 [51 5°] (228°) Formed by the action of alcoholic potash on isobutyric aldehyde (Fossek, M 4, 664, 11, 397) Monoclinic tables, v sol alcohol Combines with CaCl_2 Yields isobutyric and oxalic acids on oxidation by HNO_3 Boiling dilute H_2SO_4 forms a (8) pinacolin $\text{C}_{10}\text{H}_{18}\text{O}_2$ (162°) Conc H_2SO_4 in the cold forms an (α)-pinacolin $\text{C}_8\text{H}_{16}\text{O}$ (122°) smelling like camphor

Acetyl derivative $\text{C}_8\text{H}_{16}(\text{OAc})_2$ (235°)

Di oxy-octane $\text{C}_8\text{H}_{16}(\text{OH})_2$ *Octylene glycol* (235°–240°) SG ^a 932 Obtained from octylene bromide by successive treatment with AgOAc and solid KOH (De Clermont, C R 59, 80) Oil, sol alcohol

Acetyl derivative $\text{C}_8\text{H}_{16}(\text{OAc})_2$ (245°–250°)

Di-oxy-octane $\text{CMeEt}(\text{OH})\text{CMeEt}(\text{OH})$

Methyl ethyl-pinacone [c 28°] (200°–205°) A product of the action of sodium amalgam on methyl ethyl ketone (Lavrinovitch, A 185, 124) Crystalline mass, m sol water

Tri-oxy-octane

$\text{CMePr}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{OH}$ (210° at 60 mm) Formed by the action of HOCl followed by KOH upon methyl allyl propyl carbinol (Reformatsky, J pr [2] 40, 412) Thick

liquid, v. sol water and alcohol, sl sol alcohol. Yields a liquid tri acetyl derivative

Tetra oxy-octane $\text{C}_8\text{H}_{16}(\text{OH})_4$ 2e

$\text{CH}_2(\text{OH})\text{CMe}(\text{OH})\text{CH}_2\text{CH}_2\text{CMe}(\text{OH})\text{CH}_2\text{OH}$ [154°] Formed by the action of water on the liquid $\text{C}_8\text{H}_{16}\text{O}_2$ (170°–180° at 125 mm) which is produced by the action of potash on $\text{C}_8\text{H}_{16}\text{ClO}(\text{OH})$, a body formed by the addition of oxygen and HOCl to $\text{CH}_2\text{CMeCH}_2\text{CH}_2\text{CMeCH}_2$ (Przybytek, B 20, 3242)

DI OXY OCTENOIC LACTONE

$\text{CH}_2\text{CHCH}_2\text{C}(\text{OH})\begin{smallmatrix} \text{CH}_2 \\ \text{CO} \end{smallmatrix}\begin{smallmatrix} \text{CHMe} \\ \text{O} \end{smallmatrix}$ Formed by the action of conc H_2SO_4 on $(\text{C}_6\text{H}_5)_3\text{C}(\text{OH})\text{CO}_2\text{H}$ [48°] (Bultsch, J pr [2] 39, 94) Yellow syrup Yields amorphous $\text{Ba}(\text{C}_8\text{H}_{13}\text{O}_4)_2$

OXY OCTINOIC ACID $\text{C}_8\text{H}_{13}\text{O}_4$ 2e

$\text{C}(\text{C}_6\text{H}_5)_3(\text{OH})\text{CO}_2\text{H}$ '*Diallyloxalic acid*' [48°] Formed by saponifying its ether, which is made by the action of zinc and allyl iodide on oxalic ether (Saytzeff, A 185, 183, Schatzky, J pr [2] 34, 485, Bl [2] 45, 183) Needles, m sol water, v sol alcohol and ether —NaA' 2aq —LiA' aq —BaA' 2aq —ZnA' 1¹/₂ aq S (of ZnA') 28 at 22° —CdA' aq —PbA' 2aq —CuA' minute green needles

Ethyl ether EtA' (213 6° cor) SG ^g 9873, ^h 9718

Methyl derivative $\text{C}(\text{C}_6\text{H}_5)_3(\text{OMe})\text{CO}_2\text{H}$ Yields the salts BaA' 2aq —PbA' 1¹/₂ aq —CuA' aq and the ether EtA' (216°) SG ^g 9607 $\mu_s = 1.4556$ $R_\infty = 89.52$ (Barataeff, J pr [2] 35, 1)

Heptic acid [151°], obtained by the action of bromine and potash on isobutyl acetoacetic ether (Demarçay, A Ch [5] 20, 472), is perhaps an oxyoctinoic acid It yields CaA' 5aq, crystals in needles

α OXY-OCTOIC ACID $\text{C}_8\text{H}_{15}\text{O}_4$ 2e

$\text{CPr}_2(\text{OH})\text{CO}_2\text{H}$ [73°] (K' a S), [81°] (R) Formed by the action of zinc and propyl iodide on oxalic ether (Rafalsky, B 14, 2068, Bn 1, 527) Formed also by heating butyrom with conc KOHAq (Klinger a Schmitz, B 24, 1273) Needles —KA' —BaA' scales

Ethyl ether EtA' (209° cor) Oil

α-Oxy-octenoic acid $\text{CPr}_2(\text{OH})\text{CO}_2\text{H}$ [111°]

Formed from its ether, which is made from oxalic acid, isopropyl iodide, and zinc (Markownikoff, Z [2] 6, 516) Needles (from water), volatile with steam —BaA' 3aq, small efflorescent needles

Ethyl ether EtA' (203° cor) Oil

α-Oxy octoic acid

$\text{CH}_2\text{PrCH}_2\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$ [69 5°] Formed from canthanol and HCl, followed by boiling HClAq (Erlenmeyer a Sigel, B 7, 697, 1108, A 177, 102) Plates, v sl sol water Split up by HClAq at 120° into canthanol and formic acid. —AgA'

Ethyl ether EtA' (230°) at 715 mm

Amide [150°] Satiny plates

Nitrile $\text{C}_8\text{H}_{11}\text{CH}(\text{OH})\text{CN}$ SG ^h 905

Formed from canthanol and anhydrous HCl in the cold Liquid, sl sol water

α-Oxy-octoic acid $\text{CMe}_2\text{CH}_2\text{CMe}(\text{OH})\text{CO}_2\text{H}$

[107°] A product of the oxidation of 'isodibutylene' with KMnO_4 (Butleroff, J R 1892, 190, O J 42, 936, Bl [2] 88, 554) Needles or prisms, v sol hot water —AgA' needles

β -Oxy octoic acid $\text{CH}_2\text{CH}(\text{OH})\text{CET}_2\text{CO}_2\text{H}$
 Formed by reducing di ethyl acetoacetic ether with sodium amalgam and water (Schnapp, *A* 201, 62) Hygroscopic syrup, v sol alcohol, m sol water Decomposed on distillation into aldehyde and di ethyl acetic acid $-\text{NaA}', 6\text{aq} - \text{CaC}_2\text{H}_3\text{O}_2 - \text{AgA}'$ flocculent pp

β Oxy octoic acid $\text{CH}_2\text{CH}(\text{OH})\text{CMePr CO H}$
 Formed by reducing methyl propyl acetoacetic ether (Jones, *A* 226, 288) Split up on distillation into aldehyde and methyl propyl acetic acid $-\text{ZnA}_2$ crusts

β Oxy octoic acid $\text{CPrH}(\text{OH})\text{CMe CO H}$ [108°] Formed by reducing isobutyryl isobutyric ether (Wohlbruck, *B* 20, 2334, Hantzsch, *A* 249, 54) Prisms, v sol ether $-\text{BaA}', 3\text{aq}$

γ Oxy octoic acid $\text{CET}_2(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$
 Formed from succinyl chloride and ZnEt_2 (Wischnin, *A* 143, 262) $-\text{CaA}', 2\text{aq} - \text{BaA}'$

Lactone $\text{C}_8\text{H}_{14}\text{O}_2$ (228°-233°) (Emmert, *B* 15, 1852) Oil, v sol alcohol and ether

γ Oxy-octoic acid
 $\text{CH}_2\text{CH}(\text{OH})\text{CMeH CETH CO}_2\text{H}$ Formed by reducing acetyl hexoic acid (Young, *C J* 43, 177, *A* 216, 43) $-\text{BaA}'_2$ amorphous

Lactone $\text{C}_8\text{H}_{14}\text{O}_2$ (227°)

γ Oxy-octoic acid **Lactone** $\text{C}_8\text{H}_{14}\text{O}_2$ (134° at 36 mm) A product of the action of iodoforn or iodine on NaOCH_2Pr (Gorboff, *J pr* [2] 41, 236, 261) Liquid

Oxy octoic acid [92°] A product of the action of alcoholic potash on isobutyric aldehyde (Fossek, *M* 4, 676) Crystals $-\text{CaA}'_2$ sol water

Di oxy-octoic acid
 $\text{CHMe}(\text{OH})\text{C}(\text{CH Pr})(\text{OH})\text{CO H}$ A product of the action of alcoholic potash on bromo isobutyl acetoacetic ether (Demarçay, *C R* 86, 1135) Liquid, m sol water $-\text{BaA}'$ needles $-\text{CaA}'$

Di oxy octoic acid
 $(\text{CHMe}(\text{OH})\text{CH})_2\text{CH CO H}$ Formed by boiling barium di oxy di propyl malonate with water (Hjelt, *A* 216, 70) **Anhydride** $\text{C}_8\text{H}_{14}\text{O}_2$ Liquid, v e sol water

Tri oxy octoic acid **Lactone**
 $\text{CH}_2\text{CH}(\text{OH})\text{CH C}(\text{OH})\text{CH}_2\text{CHMe}$ Formed by the action of H_2SO_4 on a oxy octoic acid [47°] (Bulitsch, *J pr* [2] 39, 89) Syrup, sol alcohol $-\text{Ba}(\text{C}_2\text{H}_3\text{O}_2)_2$

Tetra oxy octoic acid $\text{C}_8\text{H}_{14}\text{O}_6$ etc
 $(\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2)_2\text{CH CO}_2\text{H}$ Formed by boiling tetra oxy di propyl malonic acid with baryta water (H) Readily changes to the only anhydride $\text{C}_8\text{H}_{14}\text{O}_6$

Penta-oxy-octoic acid
 $(\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2)_3\text{C}(\text{OH})\text{CO}_2\text{H}$
Lactone $\text{C}_8\text{H}_{14}\text{O}_6$ Formed by heating α -oxy-octoic ('diallyl oxalic') acid with nitric acid on a water bath (Bulitsch, *J pr* [2] 39, 65) Yellow liquid, v sol water and alcohol, insol ether

References $-\text{Bromo-}$ and **Di chloro oxy-octoic acid**

DI-OXY OCTYLENE $\text{C}_8\text{H}_{14}(\text{OH})_2$ **Conylene-glycol** **Acetyl derivative** $\text{C}_8\text{H}_{14}(\text{OAc})_2$ (225°) $\text{SG } 12.5$ 9887 Formed by conylene bromide and AgOAc (Wertheim, *A* 180, 298) Oil

OXY-OLEIC ACID $\text{C}_{18}\text{H}_{34}\text{O}_2$ An oily product of the action of Ag_2O on dibromostearic acid (Burg a Overbeck, *A* 140, 69) An isomeric acid [58°]

is formed by the action of H_2SO_4 on oleic acid (Liechti a Suida, *B* 16, 2455)

OXY-OXALACETIC ETHER **Ethyl derivative** $\text{CO}_2\text{Et CH}(\text{OEt})\text{CO CO}_2\text{Et}$ (155° at 17 mm) Formed by the action of sodium ethylate on a mixture of oxalic ether and $\text{CH}_3(\text{OEt})\text{CO}_2\text{Et}$ in ether (Wislicenus a Scheidt, *B* 24, 432) Thick liquid, miscible with alcohol and ether

α OXY-PALMITIC ACID $\text{C}_{16}\text{H}_{32}\text{O}_2$ [83°] Formed by boiling α bromo palmitic acid with alcoholic potash (Hell a Jordanoff, *B* 24, 939) Small crystals (from alcohol)

Acetyl derivative [62.5°] **Scale**

OXYPARACONIC ACID $\text{C}_8\text{H}_{14}\text{O}_2$ An acid formed by boiling calcium chlorotamalatate with water (Morawski, *J pr* [2] 11, 450) Thick liquid $-\text{CaA}'_2$ 2aq rhombohedral

TETRA OXY PENTAMETHENYL HYDRIDE
 $\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})$ Formed by the action of HOAc on the Ba salt of its carboxylic acid (Hantzsch, *B* 20, 2792) Oil $-\text{BaA}' 3\frac{1}{2}\text{aq}$ amorphous powder, almost insol water

Carboxylic acid $\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$
 Formed from ammonium tri chloro di oxy hexenoic acid and baryta water at 60° $-\text{BaA}'_2$ 4aq bulky pp, insol water

OXY PENTANE v **AMYL ALCOHOL**
Di-oxy pentane $\text{CH}_2(\text{CH CH}_2\text{OH})_2$ Mol w 104 (260°) Formed from pentamethylenediamine by HNO_2 (Gustavson, *J pr* [2] 39, 542)

Di oxy-pentane
 $\text{CHMe}(\text{OH})\text{CH}_2\text{CH}_2\text{CH}_2(\text{OH})$ (220°) at 713 mm $\text{SG } 1.0003$ Formed by reducing aceto-propyl alcohol by sodium amalgam (Fieer a. Perkin, *C J* 51, 836, *B* 19, 2568, Lupp, *B* 22, 2567) Liquid, miscible with water, decomposing at 236° HBrAq at 100° forms an anhydride (78° at 716 mm), and finally $\text{C}_8\text{H}_{14}\text{Br}_2$ (201°)

Di-oxy pentane $\text{CHEt}(\text{OH})\text{CHMe}(\text{OH})$ (187.5°) $\text{SG } 0.9945$, $\frac{1}{2}$ 9800 Formed from the corresponding di bromo pentane by successive treatment with AgOAc and baryta water (Wagner a Saytzeff, *A* 179, 308) Formed also by heating the oxide $\text{O} < \text{CHEt} < \text{CHMe}$ with water at 100° (Eltehoff, *J R* 1882, 355) Yields α oxy butyric acid on oxidation

Di oxy pentane $\text{CHPr}(\text{OH})\text{CH}_2(\text{OH})$ (206°). $\text{SG } 0.999$ Formed from the corresponding di-bromo pentane (Flavitzky, *B* 10, 230, 2240, *A* 179, 351) Yields oxy valeric acid on oxidation P_2O_5 forms valeric aldehyde and methyl isopropyl ketone

Di-oxy pentane $\text{CMe}_2(\text{OH})\text{CHMe}(\text{OH})$ (177°) $\text{SG } 0.987$ Made from the corresponding di bromo pentane (Wurtz, *A Ch* [3] 51, 458) Formed also by heating methyl isopropenyl carbinol with dilute H_2SO_4 (Kondakoff, *J R* 20, 32) Syrup, with bitter taste Miscible with water, alcohol, and ether Yields oxy-isobutyric acid on oxidation Yields methyl-isopropyl ketone when heated at 220°

Acetyl derivative $\text{C}_8\text{H}_{14}(\text{OAc})_2$ (above 200°) Oil, readily saponified

Benzoyl derivative $\text{C}_8\text{H}_{14}(\text{OBz})_2$ [123°]. Laminæ, sol alcohol and ether (Meyer, *C R* 59, 444)

Di oxy-pentane

$\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CH}_3$ (177°). Formed by reducing methylene-di-methyl-diketone (acetyl acetone) with sodium amalgam (Combes, *A Ch.* [6] 12, 229). Liquid, sol water

Tri-oxy-pentane

$\text{CHMe}(\text{OH})\text{CH}_2\text{CH}(\text{OH})\text{CH}_2(\text{OH})$ (180° at 27 mm) $\text{SG } \frac{3}{4}$ 1185, $\frac{2}{3}$ 1120 Got by oxidising $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CHMe}(\text{OH})$ with KMnO_4 . The yield is 82 p c (Wagner, *B* 21, 3351) Syrup not volatile with steam

Tri-acetyl derivative $\text{C}_6\text{H}_5(\text{OAc})_3$ (270°) at 740 mm $\text{SG } \frac{3}{4}$ 1120, $\frac{2}{3}$ 1101

Tri oxy-pentane

$\text{CHEt}(\text{OH})\text{CH}(\text{OH})\text{CH}_2(\text{OH})$ (192° at 68 mm) $\text{SG } \frac{3}{4}$ 10851 Made by oxidising $\text{CHEt}(\text{OH})\text{CHCH}_3$ (114°) with KMnO_4 (Wagner, *B* 21, 3349) The yield is 63 p c Thick, sweet syrup, miscible with water, alcohol, and ether

Tri-acetyl derivative (265°) $\text{SG } \frac{3}{4}$ 1122, $\frac{2}{3}$ 1103 Smells like onions

Tri oxy-pentane

$\text{CHMe}(\text{OH})\text{CMe}(\text{OH})\text{CH}_2(\text{OH})$ 'Pentenyl glycerol' (158° at 24 mm) Formed from tiglic alcohol by addition of bromine and subsequent distillation (Lieben & Zeisel, *M* 7, 68) Thick liquid

Tri acetyl derivative (149° at 18 mm)

Tetra-oxy pentane $\text{C}_6\text{H}_{12}\text{O}_4$ [253°] $\text{S } 6$ at 16° Formed by the action of lime on a solution of formic and acetic aldehydes (Tollens & Wigand, *A* 265, 316) Prisms Inactive to light HI and P form $\text{C}_6\text{H}_5\text{I}_2(\text{OH})_2$ [180°] and $\text{C}_6\text{H}_5\text{I}_2(\text{OH})$ [62°]

Tetra-acetyl derivative [84°]

Penta-oxy pentane

$\{\text{CH}_2(\text{OH})\text{CH}(\text{OH})\}_2\text{CH}(\text{OH})$ [102°] Formed by reducing arabinose with sodium amalgam, the liquid being kept neutral with H_2SO_4 (Kiliani, *B* 20, 1233) Prisms or needles, v e sol water, v sl sol cold alcohol

OXY-PENTANE TRICARBOXYLIC ACID

$\text{C}_6\text{H}_4(\text{OH})\text{C}(\text{CO}_2\text{H})_2\text{CH}_2\text{CO}_2\text{H}$ Formed from $\text{C}_6\text{H}_5\text{C}(\text{CO}_2\text{H})_2\text{CH}_2\text{CO}_2\text{H}$ by successive treatment with HBr and KOH (Hjelt, *B* 16, 1258)

Anhydride $\text{C}_6\text{H}_4\text{O}_5$ Dicarboxyprolactonic acid [163°] Triclinic crystals (from water).— $\text{BaC}_6\text{H}_4\text{O}_5$.— $\text{Ag}_2\text{C}_6\text{H}_4\text{O}_5$ pulverulent pp

OXY-PENTANE PHOSPHONIC ACID

$\text{C}_6\text{H}_4(\text{OH})_2\text{PO}(\text{OH})_2$ [184°] Formed from isovaleric aldehyde and PCl_5 followed by water (Fossek, *M* 5, 627, 7, 20) Monoclinic scales Yields isovaleric aldehyde on distillation and on treatment with KMnO_4 , PCl_5 forms $\text{C}_6\text{H}_4\text{Cl}_2\text{POCl}_2$ (184°–140° at 22 mm) Reduced by HI and P to isopentane phosphonic acid $\text{C}_6\text{H}_{11}\text{PO}_3$ [161°]— $\text{BaA}''2\text{aq}$ — $\text{Ba}(\text{HA}'')$ — $\text{Ag}_2\text{A}''$ amorphous pp

OXY-PENTANE SULPHONIC ACID

$\text{C}_6\text{H}_4(\text{OH})_2\text{SO}_3\text{H}$ Amylene isethionic acid Formed from chloro amyl alcohol (amylenic chlorhydrin) and Na_2SO_3 (Falk, *J pr* [2] 2, 272) Decomposed on evaporation of its solution— NaA' — CaA'_2 — $\text{CuA}'_22\text{aq}$ pale blue laminae

An isomeric acid is formed by the action of SO_3 on isomyl alcohol (Schwarz, *B* 3, 691)— BaA'_2 crystalline

OXYPENTIC ACID $\text{C}_6\text{H}_4\text{O}_5$ 3aq or $\text{C}_6\text{H}_4\text{O}_5$ [198°] Formed from ethyl acetoacetic ether, bromine, and alcoholic potash (Demarcay, *C R* 88, 289) Crystals, m sol cold water Ammonia converts its ether into a substance [77°],

and its chloride into another body [204°] Zn and H_2SO_4 yield $\text{C}_6\text{H}_4\text{O}_5$ [95°] Oxyptic acid is perhaps $\Delta\gamma$ hydromuconic acid (Gorboff, *J R* 1887, 605, this vol p 443) *

OXYPENTINOIC ACID $\text{C}_6\text{H}_4\text{O}_5$ v e

$\text{CH}_3\text{COCH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ Aceto-acrylic acid. [125°] Prepared by boiling an aqueous solution sodium β bromo-lavulate for a few minutes, neutralising with Na_2CO_3 , again boiling, neutralising again, and so on till the solution finally remains alkaline after boiling (Wolff, *B* 20, 426) Glistening plates V sol alcohol and ether, less sol cold water and chloroform

Salts— CaA'_2 — ZnA'_2 amorphous— AgA' needles

OXY-PHENANTHRAQUINONE v PHENANTHRAQUINONE

DI OXY-PHENAZINE $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_2$ Formed by heating di-amido phenazine with conc HClAq at 200° (Fischer & Hepp, *B* 23, 843, Nietzki & Hasterlik, 24, 1337) Reddish yellow needles (containing 3aq)— $\text{B}'\text{H}_2\text{SO}_42\text{aq}$

Di-acetyl derivative [230°] (F & H), [226°] (N & H) Pale yellow tables

Dioxytriphenazine

$\text{C}_6\text{H}_4\left\langle\begin{array}{c} \text{NH} \text{ C } \text{C } \text{C } \text{N} \\ | \quad | \quad | \\ \text{N} \quad \text{C } \text{C } \text{C } \text{N} \end{array}\right\rangle\text{C}_6\text{H}_4$ Quinone homo-

fluorindin Formed by heating di o nitro diphenyl quinone with alcoholic ammonium sulphide at 100°, the product being oxidised by exposure to air (Leicester, *B* 23, 2794) Dark green crystals, yielding a violet powder Its solution in HOAc exhibits brownish red fluorescence

OXYDIPHENYLS All these compounds yield diphenyl when distilled with zinc dust

p Oxy diphenyl $\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{OH}$ [165°] (c 307°) Formed by fusing diphenyl sulphonic acid with potash (Latschinoff, *B* 6, 194, Osten, *B* 7, 170), by warming diazobenzene chloride with phenol, and in small quantity in the decomposition of diazobenzene chloride by water (Hirsch, *B* 23, 3705) Plates, volatile with steam Yields a mono nitro derivative [67°] and a di nitro derivative [154°]

Acetyl derivative [89°] Plates, v sol alcohol and ether (Kaiser, *A* 257, 101)

Benzoyl derivative [152°] Tables

An isomeric or identical oxydiphenyl [152°] is obtained from p amido diphenyl by the diazo reaction (Hubner, *A* 209, 348)

oo Di-oxy-diphenyl $\text{C}_6\text{H}_4(\text{OH})\text{C}_6\text{H}_4(\text{OH})$ [99°] Formed by potash fusion from diphenyl disulphonic acid (Lumprecht, *Z* 1871, 261, and by dropping fluorene into fused KOH at 400° (Hodgkinson & Matthews, *C J* 43, 168) Crystals (from benzene ligroin)

pp Di-oxy-diphenyl [272°] (above 360°) Formed from benzidine by the diazo reaction (Griess, *J* 1866, 461, Hirsch, *B* 22, 336), and by potash fusion from diphenyl di-p sulphonic acid (Engelhardt & Latschinoff, *Z* 1871, 261, Doebner, *B* 9, 180) Got also by distilling di-oxy-phenyl benzoic acid with lime (Schmidt & Schultz, *A* 207, 334, *B* 12, 490) Obtained also by passing a rapidly alternating electric current through a solution of phenol (Drechsel, *J. pr* [2] 29, 237) Laminae (from alcohol)

Di-acetyl derivative [160°]

Ethyl ether [176°] (Hirsch)

op-Di oxy-diphenyl [161°] (342°) Formed in small quantity by potash fusion from phenol *o*- and *p*-sulphonic acids (Lincke, *J pr* [2] 8, 43, Herzog, *B* 1st, 2234), and by the action of nitrous acid on *op* di amido diphenyl (Schmidt, *A* 207, 357, *B* 12, 497) Yields a di acetyl derivative [94°]

By fusing phenol with potash two more di oxy diphenyls [123°] and [190°] have been obtained (Barth a Schroeder, *A* 156, 93, *B* 11, 1336) The one melting at 123° yields $C_{12}H_8(O_2Me)_2$ (310°-320°) and $C_{12}H_8O_2(SO_3H)_2$, whence $Na.A''$ 2aq and KA'' aq

Tri oxy-diphenyl $C_6H_4(OH)_2C_6H_4(OH)_2$ Two isomerides of this formula [180°] and [205°] are formed by fusing fluorene sulphonic acid with potash at a little above 400° (Hodgkinson a Matthews, *C J* 43, 167) Neither gives any colour with $FeCl_3$ The compound [180°] forms an acetyl derivative [100°]

Tetra oxy diphenyl $C_6H_4(OH)_2C_6H_4(OH)_2$ *Dipyrocatechin* [84°] Formed from diphenyl (a) disulphonic acid by potash fusion (Barth, *B* 11, 1336) Needles $FeCl_3$ colours its solution green

Tetra oxy diphenyl $C_{12}H_8O_4$ *Diresorcin* [310°] Formed in small quantity by fusing resorcin or phenol with NaOH (Barth, *B* 12, 503, Benedikt, *M* 1, 355, 5, 177, Herzog, *M* 11, 419) Needles (containing 2aq) Gives a blue colour with $FeCl_3$ Phthalic anhydride and H_2SO_4 at 120° form $C_{12}H_{10}O_5$ 4aq, which gives blue solutions with alkalis

Acetyl derivative $C_{12}H_8(OAc)_2$ [159°]

Benzoyl derivative $C_{12}H_8(OBz)_2$ [199°] Formed from phloroglucin, $BzCl$, and NaOH (Skraup, *M* 10, 721, Pukall, *B* 20, 1143)

Ethyl ether $C_6H_4(OEt)_2$ [114°] Plates

Tetra oxy-diphenyl $C_6H_4(OH)_2C_6H_4(OH)_2$ *Dihydroquinone* [237°] Formed by fusing hydroquinone with NaOH (Barth, *M* 5, 600) Plates Tastes sweet $FeCl_3$ colours it red, and then forms diquinhydrone $C_{12}H_8O_4$ and diquinone $C_{12}H_8O_2$ [187°]

Hexa-oxy diphenyl $C_6H_4(OH)_2C_6H_4(OH)_2$ Formed by heating hydrocærulignone with $HClAq$ at 200° (Liebemann, *A* 169, 239, *B* 9, 1887) Plates, m sol water $FeCl_3$ gives a bluish grey pp Iodine yields $C_{12}H_8O_6$, crystallising in blue needles

Tri methyl ether $C_{12}H_8(OMe)_3(OH)_2$ Formed from cærulignone and H_2SO_4 (Fischer, *B* 8, 158)

Tetra methyl ether $C_{12}H_8(OMe)_4(OH)_2$ *Hydrocærulignone* [190°] Formed by reduction of cærulignone (Liebemann, *A* 169, 226) Monoclinic prisms (from alcohol) $FeCl_3$ oxidises it to cærulignone Yields $C_{12}H_8(OMe)_4(OAc)_2$ [217°-225°] — $Na_2C_4H_8O_6$ — K_2A'' 4aq (Ewald, *B* 11, 1623)

Hexa-methyl ether $C_{12}H_8(OMe)_6$ [126°]

Tetra-ethyl ether $C_{12}H_8(OH)_2(OEt)_2$ [176°] Crystals (from alcohol) (Hofmann, *B* 11, 802)

Hexa-acetyl derivative $C_{12}H_8(OAc)_6$ [145°]

Hexa-propionyl derivative Needles

Di-bromo hexa-oxy-diphenyl Tetra-methyl derivative $C_{12}H_8Br_2(OH)_2(OMe)_2$ [262°] Formed from $C_{12}H_8Br_2(OAc)_2(OMe)_2$ [178°], which is got from di acetyl cærulignone,

$HOAc$, and bromine (Hayduck, *B* 9, 929) It yields $C_{12}H_8Br_2(OMe)_6$ [140°]

References — Di bromo and Di chloro-~~hexa~~ OXY DIPHENYL

(8) **Hexa oxy diphenyl** Formed by fusing ellagic acid with potash (Barth a Goldschmidt, *B* 12, 1244) Needles, blackening at 250°, and melting at a higher temperature Its alkaline solution is blue, changing in air to red

(7) **Hexa-oxy-diphenyl** Formed from ellagic acid by fusion with NaOH (*B* a *G*), or by treatment with sodium amalgam (Gobenzl, *M* 1, 672) Needles, blackening at 230° Its alkaline solution is red, changing in air to green

(8) **Hexa oxy diphenyl** Formed by fusing hydroquinone with NaOH (Barth a Schroeder, *M* 5, 597) Plates, blackening and melting near 290° Its alkaline solution is red

Acetyl derivative [172°] Needles

OXY PHENYL ACETAMIDINE $C_6H_5N_2O$ 1e $CHPh(OH)C(NH)(NH_2)$ [110°] Formed from mandelic imido ether and alcoholic NH_3 (Beyer, *J pr* [2] 28, 191) Needles (from ether) — $B'HCl$ [214°] Prisms (from water)

Di acetyl derivative

$CHPh(OAc)C(NH)NHAc$ [210°] (Pinner, *B* 23, 2948)

OXY-PHENYL ACETAMIDOXIM

$C_6H_5CH(OH)C(NH_2)(NOH)$ [159°] Formed from the nitrile of mandelic acid and alcoholic hydroxylamine (Tiemann, *B* 17, 126, Gross, *B* 18, 1074) Crystals (from alcohol) Yields the derivatives $C_6H_5NaNO_2$, $B'HCl$, $C_6H_5EtN_2O_2$ [89°], and $C_6H_5(CH_2Ph)N_2O_2$ [103°]

Reactions — 1 $COCl_2$ forms the compound $CHPh(OH)C(NH_2)NO_2CO$ [121°] — 2 Its hydrochloride reacts with *potassium cyanate*, forming $CHPh(OH)C(NOH)NHCONH_2$ [127°] — 3 *Phenyl cyanate* forms the compound $CHPh(OH)C(NOH)NHCONHPh$ [155°] — 4 $ClCO_2Et$ yields $CHPh(OH)C(NH_2)NOCO_2Et$ [107°]

Acetyl derivative

$CHPh(OH)C(NH_2)NOAc$ [140°] Crystals (from alcohol)

Di acetyl derivative [113°] Plates

Benzoyl derivative $C_6H_5N_2O_2$ [149°].

Acetyl benzoyl derivative [165°]

OXY PHENYL-ACETIC ACID

[2 1] $C_6H_4(OH)CHCO_2H$ [137°] Formed from *o* oxy phenyl-glyoxylic acid by reduction with sodium amalgam to $C_6H_4(OH)CH(OH)CO_2H$, and further reduction of this acid with HI (Baeyer a Fritsch, *B* 17, 975) Needles, v sol water Gives a violet colour with $FeCl_3$ On heating it yields the lactone

$C_6H_4 < \begin{smallmatrix} CH_2 \\ O \end{smallmatrix} > CO$, crystallising in tables [49°] (237°)

m **Oxy phenyl-acetic acid** [129°] Formed by saponification of its nitrile and from *m*-amido-phenyl acetic acid by the diazo reaction (H Salkowski, *B* 17, 507) Needles, v sol water Coloured violet by $FeCl_3$

Nitrile [3 1] $C_6H_4(OH)CH_2CN$ [53°] Formed from $C_6H_4(NH)CH_2CN$ and nitrous acid Trimetric tables, v sol alcohol and hot water

p-**Oxy phenyl acetic acid** [148°] Formed by the action of nitrous acid on *p* amido phenyl-acetic acid (Salkowski, *B* 12, 1438), and by

saponifying its nitrile, which is a product of the action of AgNO_3 on sinalbin (Will a Laubenheimer, *A* 199, 156, Salkowski, *B* 22, 2137) Occurs in human urine (Baumann, *B* 13, 280) Prismatic needles, sol water and alcohol FeCl_3 gives a dark colouration $-\text{NH}_4\text{A}' - \text{CaA}'_2, 4\text{aq} - \text{PbA}'_2, -\text{AgA}'$ minute needles

Methyl ether $\text{C}_6\text{H}_5(\text{OH})\text{CH}_2\text{CO Me}$ (310° i v) $\text{SG } \frac{1}{2}$ 11948, $\frac{3}{4}$ 11786 Oil
Ethyl ether EtA' (314° i v) $\text{SG } \frac{1}{2}$ 11886, $\frac{3}{4}$ 11226

Nitrile [70°] (330.5° i v) Made like stem isomeride (Salkowski, *B* 22, 2137) Trichinic crystals Yields $\text{C}_6\text{H}_5(\text{OMe})\text{CH}_2\text{CN}$ (287° i v) $\text{SG } \frac{1}{2}$ 11001

Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CO}_2\text{H}$ [86°] Formed from $\text{C}_6\text{H}_5(\text{OMe})\text{CH}_2\text{Cl}$ and KCy , the product being saponified (Cannizzaro, *A* 117, 243) Pearly plates $-\text{AgA}'$

Ethyl derivative [88°] Plates
Amide $\text{C}_6\text{H}_5(\text{OH})\text{CH}_2\text{CONH}_2$ [175°]

Methyl derivative of the amide
 $\text{C}_6\text{H}_5(\text{OMe})\text{CH}_2\text{CONH}_2$ [189°] Scales

o-Oxy phenyl acetic acid *v* MANDELIC ACID

oo-Di oxy-phenyl acetic acid

$\text{C}_6\text{H}_4(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$ Formed from salicylic aldehyde, HCy , and HCl (Plöschl, *B* 14, 1317), and also by reducing oxy phenyl glyoxylic acid (Bayer a Fritsch, *B* 17, 974) Syrup Yields a crystalline anhydride

Methyl derivative of the nitrile

$\text{C}_6\text{H}_5(\text{OMe})\text{CH}(\text{OH})\text{CN}$ [71°] Formed from methyl salicylic aldehyde and HCy (Voswinckel, *B* 15, 2025) Colourless crystals

Di-oxy phenyl-acetic acid

[1 3 5] $\text{C}_6\text{H}_3(\text{OH})_3\text{CH}_2\text{CO}_2\text{H}$ [54°] Formed from $\text{C}_6\text{H}_3(\text{OH})_3(\text{CO}_2\text{Et})_2\text{CH}_2\text{CO}_2\text{Et}$ and alcoholic potash (Pechmann, *B* 19, 1449) Crystals (containing aq) $-\text{PbA}'_2, 2\text{aq}$ needles (from water)

op-Di oxy phenyl-acetic acid *Methyl derivative*

$\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$ [93°] Formed from anisic aldehyde, HCy , and HCl (Tiemann a Kohler, *B* 14, 1976) Needles $-\text{CaA}'_2, -\text{AgA}'$ amorphous pp

Amide $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CH}(\text{OH})\text{CONH}_2$ [159°]

Nitrile $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CH}(\text{OH})\text{CN}$ [63°]

Di oxy-phenyl acetic acid

$\text{C}_6\text{H}_3(\text{OH})_3\text{CH}_2\text{CO}_2\text{H}$ [4 3 1] *Homoprotocatechuic acid* [127°] Formed by heating its methyl derivative with HClAq at 175° (Tiemann a Nagai, *B* 10, 207) Slender needles (from benzene) FeCl_3 gives a green colour

Di acetyl derivative

$\text{C}_6\text{H}_3(\text{OAc})_3\text{CH}_2\text{CO}_2\text{H}$ [90°] (Nagai, *B* 11, 658)

Methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})_3\text{CH}_2\text{CO}_2\text{H}$ [3 4 1] *Homovanillic acid* [143°] Made from its acetyl derivative [140°], which is got by oxidising acetyl eugenol

Di-methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})_3\text{CH}_2\text{CO}_2\text{H}$ *Homoveratric acid* [99°] (Tiemann a Matsumoto, *B* 11, 143) Needles (containing aq)

Methylene derivative

$\text{C}_6\text{H}_4(\text{OCH}_3)_2\text{CH}_2\text{CO}_2\text{H}$ [128°] Got from saffrol, KMnO_4 , and dilute HOAc (Tiemann, *B* 24, 2882) Yields MeA' (279°), EtA' (291°), and an amide [173°]

A di-oxy phenyl-acetic acid [168°] occurs in urine after poisoning by phosphorus (Baumann, *H* 6, 192) It crystallises in small needles

Tri-oxy phenyl-acetic acid. Methylene derivative [4 3 1] $\text{C}_6\text{H}_3(\text{O}_2\text{CH}_3)_3\text{CH}(\text{OH})\text{CO}_2\text{H}$ [153°] Made from piperonal by treatment with HCy and saponification (Lorenz, *B* 14, 793)

Hexa-oxy-di-phenyl acetic acid Hexa methyl derivative

$(\text{C}_6\text{H}_5(\text{OMe}))_2\text{CH}(\text{OH})\text{CO}_2\text{H}$ [175°] Formed by boiling the hexa methyl derivative of hexa oxybenzil with potash (Marx, *A* 263, 255) Prisms, *v* sol alcohol, *sl* sol water

o-Oxy-di-phenyl-acetic acid *v* BENZILIC ACID

Tri-oxy-di-phenyl-acetic acid *Di methyl derivative v* ANISILIC ACID

(*B* 2) *OXY (A) PHENYL-ACRIDINE*

$\text{C}_6\text{H}_5\text{C}(\text{N})\text{CPh} > \text{C}_6\text{H}_5(\text{OH})$ [c $275^\circ - 280^\circ$] Formed

by heating *p* oxy di-phenylamine with benzoic acid and ZnCl_2 Formed also by heating (*B* 2) amido (*A*) phenyl acridine with HCl at $200^\circ - 220^\circ$ (Hess a Bernthsen, *B* 18, 695) Thin yellow crystals *v* sol alcohol and acetic acid, less sol ether Dissolves in caustic alkalis and in acids The ethereal and alcoholic solutions have a slight bluish-violet fluorescence The salts are all rather sparingly soluble, and have a tendency to separate in a gelatinous form

Acetyl derivative $\text{C}_{10}\text{H}_{13}\text{N}(\text{OAc})$ [174°], glistening four sided prisms

OXY - PHENYL - ACRYLIC ACID v OXY CINNAMIC ACID and COUMARIC ACID

Oxy-di-phenyl-acrylic acid Methyl derivative $\text{C}_6\text{H}_4(\text{OMe})\text{CH CPh CO}_2\text{H}$ [189°] Made from anisic aldehyde, sodium phenyl acetate, and Ac_2O at 160° (Oghaloro, *G* 9, 533) Prisms, yielding $\text{C}_6\text{H}_4(\text{OMe})\text{CH CPh}$ when heated

Methyl derivative of the nitrile $\text{C}_6\text{H}_4(\text{OMe})\text{CH CPh CN}$ [93°] Formed from anisic aldehyde, benzyl cyanide, and alcoholic NaOEt (Frost, *A* 250, 159) White needles

Reference —PHENYL COUMARIN

TRI OXY-PHENYL ALLYL KETONE According to Schiff (*A* 253, 336), flicic acid (vol u p 548) is the isobutryl derivative of this ketone [5 3 1 2] $\text{C}_6\text{H}_2(\text{OH})_3(\text{O COEt})\text{CO CO}_2\text{H}$

OXY TRI PHENYL-ALLYL-PYRROLE

$\text{N}(\text{C}_6\text{H}_5)_3\text{C}(\text{CPh})\text{CH} > \text{CO CPh}_2$ [112°] Formed by heating anhydriacetophenone - benzil PhCBz CHBz with alcoholic allylamine at 100° (Japp a Klingemann, *C* 57, 707) Monoclinic prisms (from alcohol), a b c = 1 665 1 844, β = $88^\circ 53'$

o *OXY PHENYL-ALLYL THIO UREA*

$\text{C}_6\text{H}_4(\text{OH})\text{NH CS NHC}_6\text{H}_5$ [99°] Formed from *o* amido phenol and allyl thiocarbimide in alcoholic solution (Von Chelmicki, *J pr* [2] 42, 442) *v* *sl* sol cold, *v* sol hot, water

o *OXY PHENYL AMIDO ACETIC ACID*

$\text{C}_6\text{H}_4(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ *Oxy - phenyl - glycolic acid* Formed by boiling chloro acetic acid (1 mol) with *o* amido phenol (2 mols) and water (Vater, *J pr* [2] 29, 289) Plates (containing aq), *sl* sol water, *v* sol alcohol FeCl_3 colours its solutions red At 105° it yields an anhydride which crystallises from alcohol in cubes

Methyl derivative

$\text{C}_6\text{H}_4(\text{OMe})\text{NH CH}_2\text{CO}_2\text{H}$ [142°] Formed from *o* anisidine and chloro acetic acid Rectangular plates $-\text{PbH}_4\text{A}'$, $-\text{B'HCl}$ crystals

Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{NH CH}_2\text{CO}_2\text{H}$ [120°] Formed from chloro acetic acid and

$C_6H_5(OEt)NH_2$ — EtA' long waxy needles— $EtA'HCl$

***p*-Oxy-phenyl amido-acetic acid**

$C_6H_5(OH)NHCH_2CO_2H$ Formed from chloro-acetic acid and *p* amido phenol (V) Plates, sl sol water and alcohol $FeCl_3$ colours its solutions red— NaA'

Methyl derivative

$C_6H_5(OMe)NHCH_2CO_2H$ Formed in like manner from *p* anisidine (V), and also by saponifying its nitrile, which is got by heating anisaldehyde cyanhydrin with alcoholic NH_3 (Tiemann & Kohler, B 14, 1976)—Needles, sol hot water— CuA' — $HA'HCl$

Ethyl derivative

$C_6H_5(OEt)NHCH_2CO_2H$ [163°] Crystals (containing $\frac{1}{2}$ aq) Yields, on heating, $C_6H_5(OEt)NHCH_2CO_2NHC_6H_5(OEt)$ [140°] and other bodies (Bischoff & a Navstogel, B 22, 1788)

***p*-OXY-PHENYL-AMIDO-BENZENE SULPHONIC ACID** $C_6H_5(OH)(NPh)SO_3H$ Formed from $C_6H_5(OH)NPh$ [1 4] and conc H_2SO_4 at 100° (Limpicht, B 22, 2910) Small grey prisms Does not melt below 260°

OXY-PHENYL AMIDO CROTONIC ETHER

Methyl derivative $C_{12}H_{13}NO_2$ [46°] Formed from *p* anisidine and acetoacetic ether (Conrad & Limpach, B 21, 1649)

DI OXY-PHENYLAMIDOETHYL BENZOIC ACID

Methylene derivative of the anhydride $C_{16}H_{13}NO_4$ *re*

$CH_2 < \begin{smallmatrix} O \\ \diagup \quad \diagdown \end{smallmatrix} C_6H_5 < \begin{smallmatrix} CO \\ \diagup \quad \diagdown \end{smallmatrix} NPh$ [157°] Formed from CH_2O , $C_6H_5(C_6H_5Cl)CO_2Me$ and alcoholic aniline (Perkin, jun, C J 57, 1036) Prisms, v sl sol hot alcohol

OXY PHENYL AMIDO NAPHTHOQUINONE

$C_{16}H_9O_5(OH)(NPh)$ ***Oxy naphthoquinone anilide*** [210°] Formed from $C_{10}H_7ClO_2(NPh)NO$ and boiling $KOHAq$ (Plagemann, B 16, 896) Deep blue needles with metallic lustre, sol alkalis

***o*-OXY-PHENYLAMIDO PHENYL-ACETO**

NITRILE ***Methyl derivative*** $C_6H_5(OMe)CH(NPh)CN$ [61°] Formed by the action of aniline on $C_6H_5(OMe)CH(OH)CN$ (Voswinkel, B 15, 2027) Six sided tables, sol alcohol

OXY PHENYL AMIDO QUINONE ANILIDE

$C_6H_5(OH)(NPh)O(NPh)$ Formed by heating its ethers with alcoholic potash (Zincke & Hagen, B 18, 788) Small scales, sl sol alcohol Cold, very dilute potash, converts it into the quinone $C_6H_5(OH)(NPh)O_2$, a blue crystalline pp decomposing above 200°

Methyl ether $C_6H_5(OMe)(NPh) < \begin{smallmatrix} O \\ \diagup \quad \diagdown \end{smallmatrix} NPh$

[191°] Formed by warming the compound $C_6H_5(NPh)O(NPh)$ with $MeOH$ and H_2SO_4 (Z & H), and also from azophenine, $MeOH$, and H_2SO_4 (Fischer & Hepp, B 21, 677, A 262, 253) Brownish red plates, forming blue salts with acids, $C_6H_5(OMe)(NPh)O_2$ [189°]

Ethyl ether $C_6H_5(OEt)(NPh)O(NPh)$

[137°] Formed in like manner, using $EtOH$

Isobutyl ether [138°] Needles

OXY-PHENYL-AMIDO-THYMOQUINONE

$C_6Me(C_6H_5)(OH)(NPh)O_2$ [135°] Formed by boiling oxy thymoquinone with aniline and alcohol (Schulz, B 16, 902). Lustrous, dark-

violet needles (from alcohol), forming a violet solution in NH_3Aq

OXY-PHENYL AMIDO-TOLUQUINONE

$C_6HMeO_2(OH)(NPh)$ Formed from di phenyl di amido toluquinone by boiling with alcoholic H_2SO_4 (Hagen & Zincke, B 16, 1560) Deep blue needles (from alcohol), decomposing at 250°

Anilide $C_6HMe(OH)(NPh) < \begin{smallmatrix} O \\ \diagup \quad \diagdown \end{smallmatrix} NPh$

Formed by treating its ethers with acids or alkalis Brown needles (from $HOAc$) The ethers $C_{11}H_{11}MeN_2O_2$ [131°], $C_{11}H_{11}EtN_2O_2$ [116°] and $C_{11}H_{11}(C_6H_5)N_2O_2$ [117°] are crystalline

***o*-OXY-PHENYL-*o*-AMIDO-TOLYL GLYCOLIC ACID** $NPhCH(OH)C_6H_5OCH_2CO_2H$

Formed from *o* aldehyde phenoxy acetic acid and aniline (Rossing B 17, 2992) Very unstable in alkaline solution— $HA'HCl$ [191°]— $HA'H_2SO_4$ [186°] Yellow needles, v sol hot water

***m* OXY DIPHENYLAMINE**

$C_6H_5NH C_6H_5(OH)$ ***Phenyl amido phenol*** [82°] (c 340°) Formed by heating resorcin (1 mol) with aniline (4 mols) and $CaCl_2$ (2 mols) for eight hours at 280°, the yield being 85 p c of the theoretical (Calm, B 10, 2786, Kohler, B 21, 908) White pearly plates, v sol alcohol Yields a crystalline nitrosamine $NPh(NO)C_6H_5OH$ [115°]— $HA'HCl$ needles— $H_2A_2H_2SO_4$ needles— BaA' 5aq colourless plates, sol water

***p* Oxy diphenylamine** $C_6H_5NH C_6H_5OH$

[70°] (330°) Prepared by heating hydroquinone (1 mol) with aniline (4 mols) and $CaCl_2$ (2 mols) for ten hours at 260°, the yield being 90 p c (Calm, B 16, 2799, 17, 2431) Formed also by heating hydroquinone with aniline for sixteen hours at 300° (the yield being 85 p c), and by the action of aniline on quinone phenylimide (Bandrowski, M 9, 133, 416) Plates, v sol aqueous alkalis and acids, sl sol water Yields a nitrosamine [95°] On oxidation with HgO in benzene it yields $C_{12}H_9NO$ [97°] (B)— $HA'HCl$ slender needles, decomposed by water— $HA'HB$ needles

Isobutyl ether C_6H_5A' [68°]

Formyl derivative $C_{12}H_9NO(CHO)$ [178°] White needles, sol alcohol

Di acetyl derivative $NPhAc C_6H_5OAc$

[120°] Monoclinic prisms

Di-benzoyl derivative [175°] Prisms

Di oxy-diphenylamine $NH(C_6H_5O)_2$

Formed by heating resorcin with ammoniacal $CaCl_2$ at 200° (Seyevitch, C R 109, 946). Minute crystals (from dilute alcohol)

***o* OXY PHENYL-ANGELIC ACID**

$C_{11}H_{11}O_2$ *re* $C_6H_5(OH)CHCMeCH_2CO_2H$ [73°] Formed from salicylic aldehyde, sodium pyrotartrate, and Ac_2O (Fittig & Brown, A 265, 290) Large plates, v sol chloroform— BaA' 4aq— AgA' flocculent pp

***o*-Oxy-phenyl-angelic acid**

$C_6H_5(OH)CHCETCO_2H$ [174°] Formed by boiling its anhydride with potash (Perkin, A 150, 84, C J 21, 472) Flat prisms (from dilute alcohol), sl sol water and chloroform.— AgA' yellowish pp

Anhydride $C_6H_5 < \begin{smallmatrix} CHCET \\ \diagup \quad \diagdown \end{smallmatrix} O < \begin{smallmatrix} CHCET \\ \diagup \quad \diagdown \end{smallmatrix} CO_2H$ [71°] (299°).

Formed by boiling sodium salicylic aldehyde

with butyric anhydride (Perkin, *A* 147, 233, *C J* 21, 53, 472, Fletcher, *C J* 39, 447) Formed also by distilling coumaryl propionic acid (Fittig, *A* 255, 288) Monoclinic crystals, $a b c = 1.192 \ 1.694, \beta = 67^\circ 18'$

(a) *Methyl derivative*

$C_6H_5(OMe)CHCHEtCO_2H$ [88°] Formed from the anhydride $NaOH$, and MeI , the resulting $C_6H_5(OMe)CHCHEtCO_2Me$ (282°) being saponified (Perkin, *C J* 39, 435). Monoclinic crystals

(b) *Methyl derivative*

$C_6H_5(OMe)CHCEtCO_2H$ [105°] Formed from methyl-salicylic aldehyde, butyric anhydride, and sodium butyrate. Needles (from alcohol) Yields $C_6H_5Br_2(OMe)C_6H_5Br_2CO_2H$ [159°] and $C_6H_5(OMe)CHCEtCO_2Me$ (292°) HI forms a compound whence Na_2CO_3 produces *o* butenyl-phenol

p-Oxy-phenyl-angelic acid

$C_6H_4(OH)CHCEtCO_2H$

Methyl derivative [124°] Formed from anisic aldehyde, butyric anhydride, and sodium butyrate (Perkin) Needles (from alcohol)

γ Oxy-phenyl-angelic acid *Anhydride*

$C_6H_5CH<\begin{smallmatrix} CH \\ CO-O \end{smallmatrix} CMe$ [53°] Made by distilling a phenyl levulic acid (Erdmann, *A* 254, 219) Plates (from CS_2 and ligroin)

Di oxy-phenyl-angelic acid *Methylene derivative*

$CH_2<\begin{smallmatrix} O \\ \diagup \diagdown \end{smallmatrix} C_6H_5CH_2CHCHCH_2CO_2H$ *Hydropiperic acid* [78°] Formed by reducing piperic acid with sodium amalgam (Foster, *A* 124, 117, *Burn*, *A* 216, 172, *Weinstein*, *A* 227, 32) Needles (from hot water) Changes on heating with $NaOH$ aq into a less soluble isomeric acid [181°] Both acids combine with bromine — $NH_4A' - KHA' - BaA' - AgA'$ crystalline pp

Di-oxy-phenyl angelic acid *Methylene*

derivative $CH_2<\begin{smallmatrix} O \\ \diagup \diagdown \end{smallmatrix} C_6H_5C_6H_5CO_2H$ [c 160°] Prepared by heating piperonal with butyric anhydride and $NaOAc$ (Lorenz, *B* 14, 786) Long felted needles (from dilute alcohol), sl sol water — AgA' curdy pp

Di-*p*-oxy di-phenyl angelic acid *Di-methyl derivative*

$C_6H_4(OMe)CHCHCH(CO_2H)CH_2C_6H_4(OMe)$ [111°] Made by reducing $C_6H_4(OMe)OH$, $C_6H_5CO_2H$ with sodium amalgam (Fittig a Politis, *A* 255, 302) Hard needles (from CS_2), sl sol water, v sol alcohol Yields a dibromide $C_{18}H_{15}Br_2O_4 - CaA'2aq - AgA'$ flocculent pp

DI-OXY-DI-PHENYL-ANTETRAZINE DI-HYDRIDE $N=C(OH)CCH_2C<\begin{smallmatrix} N \\ CPh \end{smallmatrix} CPh$

Formed from dioxyphterphthalic ether, benzamide hydrochloride, and dilute (10 p c) $NaOH$ aq (Pinner, *B* 22, 2624) Crystalline powder, insol water and alcohol — $C_{22}H_{15}N_4Na_2O_4aq$ white needles

OXY-PHENYL-ANTHRANOL $C_{10}H_7O_2$ *is*

$C_6H_4<\begin{smallmatrix} C(OH) \\ C(C_6H_5OH) \end{smallmatrix} C_6H_5$ Formed by the action of H_2SO_4 on oxy-triphenyl-methane carboxylic acid (Fechmann, *B* 13, 1616) Exhibits green fluorescence in ethereal solution.

Di-oxy-phenyl-anthranol $C_{12}H_9O_3$ *is*

$C_6H_5<\begin{smallmatrix} C(C_6H_5OH) \\ C(OH) \end{smallmatrix} C_6H_5$ *Phenolphthalidin* A sticky mass got by dissolving phenol phthalin in H_2SO_4 , and pouring into water (Baeyer, *A* 202, 91) Its ethereal solution fluoresces green Water at 170° converts it into phenol phthalin Potash-fusion gives di oxy benzophenone

OXY-PHENYL-ARSINE v *ARSINE*

DI-OXY-PHENYL-TRIAZOLE $C_8H_5N_3O_2$ *is*

$C_6H_5N-C(OH)<\begin{smallmatrix} N \\ N=C(OH) \end{smallmatrix} N$ or $C_6H_5NCO<\begin{smallmatrix} N \\ HNCO \end{smallmatrix} N$ *Phenylurazol* [263°]

Formation — 1 By heating phenyl hydrazine hydrochloride (1 pt) with urea (2 pts) for 4 or 5 hours at 160°, the yield is 70–80 p c of the hydrazine hydrochloride used — 2 By heating phenyl semicarbazide (1 pt) with urea (2 pts) for 4 hours at about 160°

Properties — Colourless glistening plates M sol hot water, sl sol cold water, v sol hot alcohol, sl sol ether Dissolves in cold aqueous alkalis and ammonia, and is reppd by acids unaltered It does not reduce alkaline solutions of Ag or Cu It is not affected by boiling with alkalis or acids (Pinner, *B* 20, 2358)

TETRA-OXY-PHENYL-BENZOPYRAZOLE

$NPh<\begin{smallmatrix} CO \\ N=C(OH) \end{smallmatrix} C(OH)C=N >NPh$ [c 150°]

Formed by the action of HCl aq on the phenylhydrazide which is made by warming di oxy quinone dicarboxylic ether with alcohol and phenyl hydrazine (Böniger, *B* 22, 1291) Begins to decompose at 125° — $(NH_4)A'$ ochre yellow powder, sol water

OXY-DI-PHENYL-BENZYLIDENE PYRAZOLE

$NPhCO<\begin{smallmatrix} N \\ N=CPh \end{smallmatrix} C>CHPh$ [147°] Formed from oxy di phenyl pyrazole and benzoic aldehyde (Knorr a Klotz, *B* 20, 2548) Needles

Di oxy-tetra phenyl benzylidene dipyrazole $(NPhCO<\begin{smallmatrix} N \\ N=CPh \end{smallmatrix} C>CH)_2OHPh$ [c 220°] Formed from benzoic aldehyde and excess of oxy-di phenyl pyrazole

EXO OXY PHENYL-BENZYL KETONE v *BENZOLIN*

Tri oxy-phenyl-benzyl ketone *Di-methyl-derivative* v *ANISOIN*

Hexa oxy-phenyl-benzyl-ketone *Hexa-methyl derivative*

$C_6H_4(OMe)COCH_2C_6H_4(OMe)_6$, [162°] Formed from hexamethoxy benzil, $HOAc$, and zinc dust (Marx, *A* 263, 255) Needles, insol cold water

OXY-PHENYL-BENZYL-METHYL PYRIMIDINE

$IDINE$ $CPh<\begin{smallmatrix} N \\ N=C(OH) \end{smallmatrix} C<\begin{smallmatrix} N \\ N=C(OH) \end{smallmatrix} CCH_2Ph$ [243°]

Formed from benzamidine hydrochloride, benzyl-acetoacetic ether, and dilute (10 p c) $NaOH$ aq (Pinner, *B* 22, 1626) Needles, insol water, v sl sol alcohol

Di oxy-phenyl-benzyl-methyl-pyrimidine

Ethyl derivative

$C_6H_4(OEt)C<\begin{smallmatrix} N \\ N=C(OH) \end{smallmatrix} C<\begin{smallmatrix} N \\ N=C(OH) \end{smallmatrix} C(OH)$ [242°] Formed from *p*-ethoxy-benzamidine hydrochloride, benzyl-acetoacetic ether, and $NaOH$ aq (Pinner, *B* 23, 2955) Needles, v sl. sol. hot alcohol

OXY-PHENYL BENZYL-PYRIMIDINE

$\text{CH}_2\text{Ph} \text{C} \begin{smallmatrix} \text{N} \text{CPh} \\ \text{N} \text{C(OH)} \end{smallmatrix} \text{CH}$ [233°] Made from phenylacetamidine hydrochloride, benzyl acetoacetic ether and dilute (10 pc) NaOHAq (Pinner, B 22, 1623) Needles, v sl sol water

Oxy-phenyl di-benzyl pyrimidine

$\text{CH}_2\text{Ph} \text{C} \begin{smallmatrix} \text{N} \text{C(CH}_2\text{Ph)} \\ \text{N} \text{C(OH)} \end{smallmatrix} \text{CPh}$ [180°] Formed by heating 'cyanbenzyl' (derived from benzyl cyanide) with HClAq (Wache, J pr [2] 39, 258)

Di oxy phenyl benzyl pyrimidine

$\text{CHPh(OH)} \text{C} \begin{smallmatrix} \text{N} \text{CPh} \\ \text{N} \text{C(OH)} \end{smallmatrix} \text{CH}$ [218°] Formed from a oxy phenyl acetamidine and benzoyl-acetic ether (Pinner, B 23, 2951) Felted needles, v sl sol water, sol alkalis and acids

OXY PHENYL BIURET

$(\text{NHPh CO})_2\text{N(OH)}$, [178°] Formed by the action of an aqueous solution of hydroxylamine on phenyl cyanate (von der Kall, A 263, 263) Needles, sl sol hot water Does not reduce Fehling's solution

p-OXY PHENYL-BROMO *p*-TOLYL THIO-UREA $\text{C}_6\text{H}_4(\text{OH}) \text{NH CS NH C}_6\text{H}_4\text{Br}$

Acetyl derivative [156°] Formed by the action of acetyl oxy phenyl thiocarbamide on bromo-*p* toluidine (Kalkhoff, B 16, 1832) V sol acetic acid, sl sol alcohol and ether, insol water

OXY PHENYL BUTANE *v* BUTYL PHENOL

Di oxy phenyl butane

$\text{CHPh(OH)} \text{C}_2\text{H}_5 \text{CH}_2\text{OH}$ (c 200°) A thick syrup formed by reduction of $\text{C}_6\text{H}_5 \text{CO C}_2\text{H}_5 \text{CHO}$ (Buicker, A Ch [5] 26, 469)

Di oxy di phenyl butane

$\text{CPhMe(OH)} \text{CPhMe(OH)}$ [120°] Formed by adding sodium amalgam to a solution of acetophenone in dilute alcohol (Emmerling, Engler, B 4, 147, 6, 1005, Buchka, B 10, 1714) Long prisms, insol water, v sol alcohol Split up by long boiling in acetophenone and phenyl methyl carbinol (Zincke, A Thorne, B 13, 641)

Di oxy tetra phenyl butane

$\text{CH}_2\text{Ph CPh(OH) CPh(OH) CH}_2\text{Ph}$ [213°] Formed, together with an isomeride [172°], by reducing benzoin with zinc (Limpriecht, A Schwanert, A 155, 60, Zagoumenny, B 7, 1651, Wischenus, A 248, 5) The compound [213°] is formed, together with an isomeride (?) [61°], by reducing benzoin with Na and alcohol (Limpriecht, A 155, 98) The compounds [172°] and [213°] are both converted by heat into phenyl benzyl ketone and phenyl benzyl carbinol

OXY-DI-PHENYL-BUTANE CARBOXYLIC ACID $\text{C}_6\text{H}_5 \text{CH}(\text{CO}_2\text{H}) \text{CH}_2 \text{CH}(\text{OH}) \text{CH}_2 \text{C}_6\text{H}_5$, *Tetrahydrocornicularic acid* Formed by reducing hydro cornicularic acid with sodium amalgam (Spiegel, A 219, 95) Thick oil, decomposed by boiling with water, yielding the lactone *Lactone* $\text{C}_{11}\text{H}_{14}\text{O}_3$ [71°]

Oxy phenyl butane dicarboxylic acid *v*. Oxy-benzyl-pyrotartaric acid

Di-oxy-di-phenyl-butane dicarboxylic acid $\text{C}_6\text{H}_4(\text{OH}) \text{CH}_2 \text{CH}(\text{CO}_2\text{H}) \text{CH}(\text{CO}_2\text{H}) \text{CH}_2 \text{C}_6\text{H}_4\text{OH}$ Formed by heating salicylic aldehyde with sodium succinate and Ac_2O , saponifying the resulting 'dicoumarin', and reducing the product with sodium amalgam (Fittig & Dyson, A

255, 281) Colourless crystals, v sol alcohol.— $\text{CaC}_{11}\text{H}_{14}\text{O}_6$ 6aq — $\text{Ag}_2\text{A}''$ bulky white pp

Lactone

$\text{C}_6\text{H}_5 \text{C} \begin{smallmatrix} \text{O CO} \\ \text{CH}_2 \end{smallmatrix} \text{CH CH} \begin{smallmatrix} \text{CO O} \\ \text{CH}_2 \end{smallmatrix} \text{C}_6\text{H}_5$, *Dicoumarin tetrahydride* [224°] Formed by heating the acid above 100° Needles (from chloroform alcohol)

Di oxy-di phenyl butane dicarboxylic acid.

Lactone $\text{C}_6\text{H}_5 \text{C} \begin{smallmatrix} \text{CH CH}_2 \text{CH}_2 \text{CH} \\ \text{CO O CO O} \end{smallmatrix} \text{C}_6\text{H}_5$

[210°] Formed by treating $\text{C}_6\text{H}_5(\text{CO C}_6\text{H}_5 \text{CO}_2\text{H})_2$ with sodium amalgam (Gabriel & Michael B 10, 2209) Needles (from alcohol), insol water The corresponding acid is unstable

DI *p*-OXY-DI-PHENYL BUTINENE *D*.

methyl ether $\text{C}_6\text{H}_4(\text{OMe}) \text{CH CH CH CH C}_6\text{H}_4(\text{OMe})$ [225°] A body formed on heating anisic aldehyde with sodium succinate and Ac_2O at 120° (Fittig & Politz, A 255, 307) Crystals, insol water, m. sol HOAc

DI-OXY-DI-PHENYL-BUTINENE DI-CARBOXYLIC LACTONE

$\text{C}_6\text{H}_5 \text{C} \begin{smallmatrix} \text{O CO CO O} \\ \text{CH C-C CH} \end{smallmatrix} \text{C}_6\text{H}_5$, *Dicoumarin* [above 330°] Made by heating salicylic aldehyde with sodium succinate and Ac_2O at 140° (Fittig & Dyson, A 255, 276) Needles (from HOAc) Not attacked by cold alkalis

O OXY PHENYL BUTYLENE DICARBOXY-

LIC ACID *Lactone* $\text{C}_6\text{H}_5 \text{C} \begin{smallmatrix} \text{O CO} \\ \text{CH C CHMe CO}_2\text{H} \end{smallmatrix}$ [171°] Made by heating salicylic aldehyde with sodium pyrotartrate and Ac_2O for 30 hours at 120° (Fittig & Brown, A 255, 285) Plates (from water) Yields $\text{Ba}(\text{C}_{11}\text{H}_{14}\text{O}_6)_2$ 3aq, CaA' 5aq, and AgA'

Di oxy di phenyl butylene dicarboxylic acid

Lactonic acid $\text{C}_6\text{H}_5 \text{C} \begin{smallmatrix} \text{O CO} \\ \text{CH C CH} \end{smallmatrix} \text{C}_6\text{H}_5$ Formed by boiling dicoumarin with NaOHAq and adding sodium amalgam (Fittig & Dyson, A 255, 277) Needles, sl sol hot water — BaA' 2aq — $\text{AgC}_{11}\text{H}_{14}\text{O}_6$ curdy pp

Lactone $\text{C}_6\text{H}_5 \text{C} \begin{smallmatrix} \text{O COCO O} \\ \text{CH C CH CH} \end{smallmatrix} \text{C}_6\text{H}_5$

[256°] Obtained by heating the lactonic acid at 130° Crystals, insol water, Na_2CO_3 aq, and NaOHAq Yields an unstable dibromide

O OXY- β -PHENYL-*iso*-BUTYRIC ACID

$\text{CH}_2\text{Ph CMe(OH) CO}_2\text{H}$ [99°] Made by the action of KCy on the bisulphite compound of benzyl methyl ketone, the product being saponified (Gabriel & Michael, B 12, 814) Long prisms, sol water and alcohol

 β -Oxy- β -phenyl-isobutyric acid

$\text{CHPh(OH) CHMe CO}_2\text{H}$ [125°] Formed by reducing a benzoyl-propionic acid with sodium-amalgam (Perkin, jun., a Calman, C J 49, 161) Needles, v e sol hot water — AgA' crystals

 β -Oxy- γ -phenyl-butyric acid

$\text{CH}_2\text{Ph CH(OH) CH}_2 \text{CO}_2\text{H}$ [98°] Formed by boiling phenyl-isocrotonic acid with NaOHAq (Fittig, B 24, 84) Flat needles.

γ -Oxy- γ -phenyl-butyric acid $\text{CHPh(OH) CH}_2 \text{CH}_2 \text{CO}_2\text{H}$ *Benzhydrylic propionic acid* [75°] Formed by reducing benzoyl-propionic acid with sodium-amalgam (Buroker,

Bl [2] 87, 5, *A Ch* [5] 26, 455), and also by boiling its lactone with baryta. Flat crystals (from CS_2), splitting up at 70° into water and lactone. Chromic acid mixture oxidises it to benzoyl propionic acid— BaA'_2 — CuA'_2 — AgA' crystalline pp

Lactone $\text{CHPh} \begin{smallmatrix} \text{O} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{CH}_2\text{CH}_2$ [37°] (306°)

Formed from γ bromo γ -phenyl butyric acid by treatment with Na_2CO_3 or boiling with water (Jayne, *A* 216, 103). Formed also by boiling phenyl paraconic acid with diluted (1:1) H_2SO_4 (Erdmann, *A* 228, 178). Six sided trimetric tables (from CS_2), $a b c = 611.1 \ 426$. It has a pleasant odour, and is volatile with steam.

Amide $\text{CHPh}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}\text{NH}_2$ [86°] Formed by heating the lactone with alcoholic NH_3 at 100° (Fittig, *A* 256, 155). Monoclinic prisms, v sol hot water. Forms unstable $\text{C}_6\text{H}_5\text{NO}_2\text{HCl}$, crystallising in needles.

***o*-Oxy phenyl butyric acid** *Methyl derivative* $\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [56°] Obtained by reducing either (α)- or (β) methoxy-phenyl crotonic acid with sodium amalgam (Perkin, *C J* 39, 433). Transparent prisms (from light petroleum). May be distilled— BaA'_2 (dried at 100°).

***a*-Oxy-di phenyl-isobutyric acid** *Di benzyl-glycollic acid*

γ -Oxy-di- γ phenyl butyric acid $\text{CPh}_2(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [145°] Made from its lactone (Auger, *A Ch* [6] 22, 316). Thin leaflets (from alcohol). Changes to lactone on melting, but is stable at 100° — BaA'_2 , micaceous plates, sol water.

Lactone $\text{CPh}_2 \begin{smallmatrix} \text{O} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{CH}_2\text{CH}_2$ [90°] Formed by

the action of succinyl chloride on benzene in presence of AlCl_3 . Leaflets, insol water, sl sol cold alcohol.

Oxy-tri-phenyl-butyric acid

$\text{CHPh}(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ Formed by reducing di-phenyl-benzoyl propionic acid in alkaline solution with sodium amalgam (Japp a Klingemann, *C J* 87, 680, *B* 22, 2882). White solid, sol $\text{Na}_2\text{CO}_3\text{Aq}$.

Lactone $\text{C}_6\text{H}_5\text{O}_2$ [153°] Small needles, sol hot alcohol.

β -Di-oxy- γ -phenyl butyric acid

$\text{CHPh}(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ [118°] Made from its lactone, which is got by oxidising phenyl isocrotonic acid with KMnO_4 (Fittig, *B* 21, 920). Crystals, forming the lactone on melting.

Lactone $\text{CHPh} \begin{smallmatrix} \text{O} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{CH}(\text{OH})\text{CH}_2$ [87°]

Melts when hydrated (with $\frac{1}{2}$ aq) at 77° .

Di oxy phenyl butyric acid

Methyl derivative

[4:1] $\text{C}_6\text{H}_4(\text{OMe})\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ Got from its lactone [53.5°], which is made by the action of sodium amalgam on bromo *p* methoxy-phenyl-butyrolactone (Fittig a Politz, *A* 256, 299). The free acid is solid, and yields the lactone when heated to 80° — BaA'_2 , amorphous mass.

Di-oxy-phenyl-isobutyric acid

Methyl derivative

[4:3:1] $\text{C}_6\text{H}_4(\text{OH})(\text{OMe})\text{CH}_2\text{CHMeCO}_2\text{H}$ *Hydrohomoferric acid* [115°] Obtained by reducing $\text{C}_6\text{H}_4(\text{OH})(\text{OMe})\text{CHMeCO}_2\text{H}$ (Tiemann a.

Kraaz, *B* 15, 2070). Sol water, alcohol, and ether.

Di-methyl derivative

$\text{C}_6\text{H}_4(\text{OMe})\text{CH}_2\text{CHMeCO}_2\text{H}$ *Methyl hydrohomoferric acid* [59°] Got in like manner. Crystals.

Methylene derivative

$\text{C}_6\text{H}_4(\text{O}_2\text{CH}_2)\text{CH}_2\text{CHMeCO}_2\text{H}$ *Hydrohomocaffic acid* [77°] Formed by reduction of the methylene derivative of di oxy phenyl methacrylic acid (Lorenz, *B* 13, 760). Thick prisms, sl sol water, v sol alcohol and ether.

Di-oxy di phenyl butyric acid?

$\text{CH}_2\text{CPh}(\text{OH})\text{CPh}(\text{OH})\text{CO}_2\text{H}$ Formed from its nitrile, which is made from acetophenone, KOH , and aqueous K_2FeCy_4 (Buchka, *B* 20, 389)— BaA'_2 , 3:1 aq.

***o*-OXY-PHENYL-CARBAMIC ACID** *Ethyl*

ether $\text{C}_6\text{H}_4(\text{NH})\text{CO}_2\text{Et}$ *ie* $\text{C}_6\text{H}_4(\text{OH})\text{NHCO}_2\text{Et}$ [85°] Formed from *o* amido phenol and ClCO_2Et (Groenink, *Bl* [2] 25, 177). Triclinic prisms (from ether alcohol), almost insol cold water. Yields, on distillation, alcohol and the anhydride.

Anhydride $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$ or

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{N} \\ \diagup \text{---} \text{C} \text{OH} \end{smallmatrix} \text{O}$ *Oxycarbonyl Oxymethenyl amido phenol* *Anhydro o amido phenyl carbonic acid* *Carbonyl amido phenol* [138°] (above 360°).

Formation—1 As above—2 By heating oxy phenyl urea (Kalkhoff, *B* 16, 1828)—3 By distilling *o* amido phenyl ethyl carbonate (Bender, *B* 19, 2269, 2950)—4 By heating a mixture of urea and *o* amido phenol (Sandmeyer, *B* 19, 2655)—5 By the action of phosgene on *o*-amido phenol in benzene (Chetnicki, *B* 20, 177, Jacoby, *J pr* [2] 37, 29)—6 By heating *o* amido phenyl di phenyl carbamate (Lellmann a Bonhoeffer, *B* 20, 2126).

Properties—Needles (from water), sol alcohol, ether, and alkalis. Decomposed by heating with HClAq above 150° into CO_2 and *o* amido phenol. Bleaching powder and HCl yield crystalline $\text{C}_6\text{H}_4\text{Cl} \begin{smallmatrix} \text{NCl} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$, whence

further action of HClAq forms $\text{C}_6\text{H}_4\text{Cl} \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$ [196°]. Br forms $\text{C}_6\text{H}_4\text{BrO} \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$ [196°]. HNO_3 produces $\text{C}_6\text{H}_4(\text{NO}_2)_2\text{NH}$ [206°]. Injected into rabbits, it becomes $\text{C}_6\text{H}_4(\text{OSO}_3\text{H}) \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$

(Nencki, *M* 11, 253)— AgO_2HNO_2 , curdy pp.

Acetyl derivative $\text{C}_6\text{H}_4\text{O}_2\text{Nac}$ [98°]

Crystallises from water.

Phenyl-hydrazide

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{C} \text{N}_2\text{HPh} \end{smallmatrix} \text{O}$ [208°] Yellow needles.

Ethyl derivative $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NEt} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$.

[29°] (300°) Formed from the silver salt and EtI . Crystalline. Converted into ethyl amido-phenol by heating with fuming HClAq at 180° .

Ethyl ether $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{N} \\ \diagup \text{---} \text{COEt} \end{smallmatrix} \text{O}$ (225°).

230° Formed from amido phenol hydrochloride and $\text{NH}_4\text{C}(\text{OEt})_2$ (Sandmeyer). Liquid, converted by HClAq into EtCl and $\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \\ \diagup \text{---} \text{CO} \\ \diagdown \end{smallmatrix} \text{O}$.

p-Oxy phenyl-carbamic acid Ethyl ether
 $C_8H_{11}NO_3$, *ie* $C_6H_4(OH)NHCO_2Et$ [120°]
 Formed from p-amido phenol and $ClCO_2Et$
 (Groenink, *Bl* [2] 25, 179) Monochmic tables,
 v sol alkalis. The ethyl derivative
 $C_8H_9(CEt)NHCO_2Et$, formed from $ClCO_2Et$ and
 $C_6H_5(NH_2)(OEt)$ (Köhler, *J pr* [2] 29, 257),
 crystallises in needles [94°], insol water

Reference — CHLORO OXY-PHENYL CARBAMIC
 ACID

p OXY-DI-PHENYL-CARBINOL $C_{15}H_{13}O_3$, *ie*
 $C_6H_5CH(OH)C_6H_4(OH)$ [161°] Formed by
 reducing oxy benzophenone with sodium amal
 gam (Doebner, *A* 210, 253) Silky needles (from
 water) Coloured red by $FeCl_3$

Di-oxy di-phenyl carbinol
 $CH(OH)(C_6H_5)_2$, [160°-165°] Made by
 reducing di oxy benzophenone (salicyl phenol)
 with sodium amalgam (Michael, *B* 14, 657)
 Amorphous powder, sol hot alcohol

Di oxy tri phenyl carbinol
 $C_6H_5C(OH)(C_6H_5)_2$, [c 100°]. Made by
 warming $PhCCl_3$ with dry phenol and treating
 the product with water (Doebner, *A* 217, 227)
 Formed also by warming phenyl glyoxylic acid
 with phenol and H_2SO_4 at 120° (Homolka, *B*
 18, 988) Brick red powder, insol cold water,
 melts under hot water Its alcoholic solution
 dyes silk feebly yellow In alkalis it dissolves
 with deep violet red colour, and is reppd by
 acids

Di acetyl derivative
 $C_6H_5C(OH)(C_6H_5OAc)_2$, [119°] Colourless
 prisms (from dilute alcohol)

Tri oxy tri phenyl carbinol Anhydride
 $C_{15}H_9O_3$, *ie* $(C_6H_5(OH))_2C < \begin{smallmatrix} C_6H_5 \\ O \end{smallmatrix} >$ Aurin
 Rosolic acid

Formation — 1 By heating phenol with
 oxalic acid and H_2SO_4 (Kolbe a Schmitt, *A* 119,
 169, Dale a Schorlemmer, *A* 196, 79) — 2 By
 heating phenol with formic acid and $ZnCl_2$ at
 120° (Nencki a Schmid, *J pr* [2] 23, 549, 25,
 273) — 3 By the action of $AlCl_3$ on a mixture of
 phenol and tri chloro nitro methane (Elbs, *B*
 16, 1275) — 4 From para rosaniline by the
 diazo reaction (Fischer, *A* 194, 268) — 5 From
 di p oxy benzophenone by treatment with PCl_5 ,
 and heating the product with phenol and H_2SO_4
 (Caro a Graebe, *B* 11, 1350)

Preparation — Phenol (10 pts) is heated with
 dried oxalic acid (7 pts) and H_2SO_4 (5 pts) at
 120°-130° about 24 hours, until gas no longer
 comes off rapidly The product is poured into
 water, the pp dissolved in $NaOH$ aq, saturated
 with SO_2 , and mixed with much water The
 filtrate from ψ rosolic acid (which amounts to
 70 p c of crude product) is saturated at 70° with
 HCl , and on cooling it deposits aurin sulphite
 This is recrystallised from dilute alcohol, which
 deposits methyl aurin on cooling, while the
 mother liquor, saturated with SO_2 , deposits aurin
 sulphite, which is freed from SO_2 by heat (Zul-
 kowsky, *A* 194, 119, 202, 184)

Properties — Dark red trimetric crystals
 (from alcohol $HOAc$) or red needles with green
 lustre (from alcohol) Not melted below 220°
 Its alkaline solution is crimson

Reactions — 1 Reduced by *smc-dust* and
 $HOAc$ to tri-oxy-tri phenyl methane — 2 Aque-
 ous NH_3 at 120° yields para-rosaniline. — 3.

Vol. III

Water at 250° yields phenol and di p-oxy
 benzophenone — 4 On warming with KOH aq
 and KCy and adding HCl , a product is got
 which, when heated with Ac_2O , yields tri-acetyl
 hydrocyanaurin [194°]

Salts — $(NH_4)_2C_{15}H_{13}O_3$, dark red needles
 with steely lustre — $C_{15}H_{13}O_3 \cdot HCl$, $HOEt$ red
 crystals — $(C_6H_5O_2HCl)HOAc$ red needles —
 $(C_{15}H_{13}O_3)_2 \cdot H_2SO_4$, 4aq brick red cubes, sl sol
 cold alcohol — $C_{15}H_{13}O_3 \cdot (NH_4)HSO_4$ —
 $C_{15}H_{13}O_3 \cdot NaHSO_4$ — $C_{15}H_{13}O_3 \cdot KHSO_4$, minute
 colourless tables — $C_{15}H_{13}O_3 \cdot H_2SO_4$ —
 $(C_{15}H_{13}O_3)_2 \cdot H_2SO_4$, bluish violet needles.

Di acetyl-derivative
 $(C_6H_5(OH))_2C(OAc)_2$, C_6H_5OAc [168°] Formed
 from aurin and Ac_2O at 100° Colourless tables
 (from alcohol)

Tetra-oxy-tri-phenyl-carbinol
 $C_{15}H_9O_4$, *ie* $C_6H_5C(OH)(C_6H_5(OH))_2$

Anhydride $C_{15}H_5O_4$, *Resorcin benzetrin*.
 Formed by heating benzo trichloride with re-
 sorcin at 180° (Doebner, *B* 13, 610, *A* 217,
 234) Large crystals (from alcohol and $HOAc$)
 Yellow by transmitted, violet red by reflected
 light, at 130° it loses $2H_2O$, and at 200° it is
 decomposed Dilute alkaline solutions show
 yellowish green fluorescence, but less intense
 than fluorescein, they dye wool yellow Insol
 water, v sol alcohol Zinc dust and HCl re-
 duce it to tetra oxy tri phenyl methane Bromine
 in alcohol and $HOAc$ forms a fiery red pp
 $C_{15}H_9Br_2O_4$, which closely resembles eosin Its
 salts dissolve readily in alcohol and dye wool
 and silk like eosin

Penta-oxy-tri-phenyl-carbinol
 $(C_6H_5(OH))_3C(OH)C_6H_5OH$
Anhydride $C_{15}H_5O_5$, Formed by heating
 resorcin with formic acid and $ZnCl_2$ at 140°
 (Nencki a Schmid, *J pr* [2] 23, 547) Hygro-
 scopic brick red powder, v sol alcohol

p OXY-DI-PHENYL-CARBINOL o-CARB-
OXYLIC ACID

Methyl derivative of the anhydride
 $C_6H_5 < \begin{smallmatrix} CH \\ CO \\ O \end{smallmatrix} C_6H_5OMe$ [117°] Formed by re-
 ducing methoxy benzophenone carboxylic acid
 with zinc and alcoholic HCl (Nourrisson, *B* 19,
 2103) Flat white needles, v sol warm alcohol,
 insol water

Oxy-tri-phenyl-carbinol carboxylic acid

Anhydride $C_{15}H_9(OH)CPh < \begin{smallmatrix} C_6H_5 \\ O \end{smallmatrix} > CO$

Oxy di phenyl phthalide [155°] Prepared by
 heating o benzoyl benzoic acid with phenol and
 $SnCl_4$ at 120°, yield 100 p c of the benzoyl-
 benzoic acid (Fechmann, *B* 13, 1613) Colour-
 less crystals Sol all ordinary solvents except
 water and ligroin By fusion with KOH it gives
 benzoic acid and oxy-benzophenone With
 alkalis it forms a deep-red solution By strong
 H_2SO_4 it is converted into oxy-phenyl anthranol
 $C_6H_5 < \begin{smallmatrix} C(OH) \\ C(C_6H_5OH) \end{smallmatrix} > C_6H_5$ On reduction it
 gives oxy triphenyl methane carboxylic acid

Acetyl derivative $C_{22}H_{15}O_5(OAc)$, [186°].
 Colourless crystals

Di-bromo-derivative $C_{20}H_{11}Br_2O_4(OH)$.
 [196°] Spikes

Acetyl di bromo-derivative
 $C_{20}H_{11}Br_2O_4(OAc)$ [172°] Colourless prisms.

***o*-di-oxy-di-phenyl-carbinol carboxylic anhydride** *Methyl derivative*

$C_6H_5 \begin{array}{c} \text{CH} \begin{array}{c} \text{CO} \end{array} \begin{array}{c} \text{CH} \end{array} \begin{array}{c} \text{O} \end{array} \end{array}$ [117°] Made by reducing '*p* anisolphthaloylic' acid (Nourrisson, *B* [2] 46, 206) Needles, insol water, v e sol alcohol

Di-oxy-tri-phenyl-carbinol carboxylic acid
Anhydride $C_6H_5(OH)_2CPh \begin{array}{c} \text{CO} \end{array}$

Benzene resorcin phthalate [176°] Made by heating benzoyl benzoic acid with resorcin (Pechmann, *B* 14, 1859) Prisms (containing $CHCl_3$) melting at 114° (from chloroform) Its alcoholic solution turns greenish blue on addition of HCl On heating with H_2SO_4 it yields anthraquinone, H_2SO_4 acting on its solution in $HOAc$ forms $C_{20}H_{12}O_2$ [285°], which yields $C_{20}H_{12}O_2$, Ac_2O , [245°]

Di acetyl derivative $C_{20}H_{12}O_2(OAc)_2$, [137°]

Di-bromo-derivative $C_{20}H_{12}Br_2O_4$, [219°]

Tri-oxy-tri-phenyl-carbinol-carboxylic acid
Anhydride $(C_6H_5(OH)_3)CPh \begin{array}{c} \text{CO} \end{array}$

Benzene pyrogallol-phthalate Prepared by heating benzoyl benzoic acid with pyrogallol and crystallising the product from acetic acid (Pechmann, *B* 14, 1864) Four-sided tables (containing $AcOH$), [190°] Sol most solvents except ligroin, sl sol hot water It dissolves in alkalis with a green colour

Tri acetyl derivative $C_{20}H_{12}O_2(OAc)_3$, [231°] Fine needles Sol Ac_2O

DI-OXY DI-PHENYL-CARBOLACTONE *v.* *ISO-EUXANTHIC ACID*

OXY-DI-PHENYL-DI-CARBOXYLIC ACID
Hexahydrate $C_{12}H_{10}O_6$ An unstable acid formed by boiling hydro oxybenzyluric acid with potash (Otto, *A* 184, 330) Yields Et_2A (206°), a heavy oil

Di-*p*-oxy-diphenyl carboxylic acid $C_{12}H_{10}O_6$, *s.e.* [4 1] $C_6H_5(OH)(CO_2H)(CO_2H)$ [1 4 2] [270°] Made by fusing diphenylene ketone disulphonic acid with potash (Schmidt & Schultz, *B* 12, 496) Sl sol water, v sol hot alcohol

Di-*p*-oxy-diphenyl dicarboxylic acid
 $C_6H_5(OH)(CO_2H)C_6H_5(OH)CO_2H$ [151°] S 0052 at 15°. Formed by heating sodium di-oxy di phenyl with CO_2 at 200° under high pressure (Schmitt & Kretschmer, *B* 20, 2703) Minute needles, sl sol water, $FeCl_3$ colours its solution bluish violet

Tetra oxy-diphenyl dicarboxylic acid
 $C_6H_5(OH)_2(CO_2H)C_6H_5(OH)_2CO_2H$ *Di-resorcin dicarboxylic acid* Formed by heating tetra-oxy diphenyl (diresorcin) with $KHCO_3$ and a little water at 130° (Will & Albrecht, *B* 17, 2105) Yellowish powder, decomposing, without melting, above 300°. — K_2A —. — BaA ° 6aq — Ag_2A °. white pp

Tetra-oxy-diphenyl dicarboxylic acid
 $C_6H_5(OH)_2(CO_2H)C_6H_5(OH)_2(CO_2H)$ *Dehydro-diprotocatechus acid* [above 300°] Formed by fusing 'dehydrodivanillin' with potash (Tiemann, *B* 18, 3495). Amorphous, v. sl. sol water, sl sol alcohol

Penta-oxy-diphenyl carboxylic acid
 $C_{11}H_{10}O_6$ Formed by the action of $POCl_3$ on *o*-tri-oxy-benzoic acid (Schiff, *G* 17, 552, *A*.

245, 87) Yellowish astringent powder — BaA °. greyish white powder

Penta-acetyl derivative $C_{11}H_4Ac_5O_6$. White powder, rapidly darkening in air

Ethyl ether EtA° [102°]

Penta-oxy di phenyl carboxylic acid

$C_{11}H_{10}O_6$ Formed by heating phloroglucin carboxylic acid with $POCl_3$ (Schiff) Reddish brown hygroscopic mass, resembling tannin and the preceding isomeride

TETRA-OXY-DIPHENYL DICARBOXYLIC

ALDEHYDE *Di-methyl derivative*

$C_6H_5(OMe)(OH)(CHO)C_6H_5(OMe)(OH)CHO$

Divanillin [304°] Formed by boiling vanillin $C_6H_5(OMe)(OH)(CHO)$ [3 4 1] with $FeCl_3$ (Tiemann, *B* 18, 3498) Slender white needles, sl sol alcohol, sol alkalis

Tetra methyl derivative [138°]

***p* OXY-PHENYL-CINNAMIC ACID** *Me-*

thyl derivative $C_6H_5(OMe)CHCPhCO_2H$ [189°] Formed from sodium phenyl acetate, anisic aldehyde, and Ac_2O (Oghaloro, *G* 9, 533, 10, 481) Prisms (from alcohol), sl sol water

***a* OXY- γ PHENYL- α CROTONIC ACID**

$C_6H_5CHCHCH(OH)CO_2H$ [115°] Formed by boiling cinnamic aldehyde with aqueous H_2Cy and HCl (Matsumoto, *B* 8, 1144, Peine, *B* 17, 2114) Formed also by heating the ethyl ether of styryl ψ hydantoin with concentrated baryta water (Pinner & Spulker, *B* 22, 690) Styryl ψ

hydantoin $CHPhCHCH \begin{array}{c} \text{CO NH} \\ \text{O} \end{array} \begin{array}{c} \text{O} \end{array} \begin{array}{c} \text{CNH} \end{array}$ [198°] is obtained by the action of warm alcoholic potash on styryl hydantoin [172°], an isomeric body previously described by Pinner (*B* 20, 2353) as oxystyryl pyrazole Styryl hydantoin is got by the action of boiling dilute $HClAq$ on (*a*) ur

amido phenyl crotonic nitrile $CHPhCHCH(NHCO_2NH_2)CN$ [160°], which is made by heating oxy phenyl isocrotonic nitrile with urea

Properties — Needles, sl sol cold water, v sol alcohol and ether

Salts — PbA °, 2aq needles — AgA ° minute needles

Methyl ether MeA°. (290°) Liquid

Ethyl ether EtA° (295°) (Peine)

Nitrile $CHPhCHCH(OH)CN$ [81°]

Formed from cinnamic aldehyde, KCy , and HCl Crystalline grains (from benzene ligroin) Converted by hydroxylamine into the crystalline amidoxim $CHPhCHCH(OH)C(NH_2)NOH$ (Bornemann, *B* 19, 1513)

***o*-Oxy-phenyl-crotonic acid** (*a*) *Methyl*

derivative $C_6H_5(OMe)CHCO_2H$ [118°]

Made from its methyl ether by boiling with alcoholic potash (Perkin, *C* J 33, 213, 39, 431) Monoclinic crystals (from alcohol), $abc = 863 \ 1 \ 1 \ 252$, $\beta = 64^\circ 54'$ (Fletcher) Not converted into its (*B*) isomeride by light With PCl_5 it gives $MeCl$, HCl , and the anhydride Conc H_2SO_4 also forms propionic coumarin Sodium amalgam reduces it to methoxy phenyl butyric acid With Br and with HI it behaves like the (*B*) acid

Methyl ether of the (a)-methyl derivative $C_6H_5(OMe)CHCO_2H$ (275°) S $\frac{1}{2}$ 1 1112, $\frac{1}{2}$ 1 1061 Formed from sodium propionic coumarin and MeI Liquid

(*B*) *Methyl derivative*

$C_6H_5(OMe)CHCO_2H$ [107°] Formed

from methyl salicylic aldehyde, sodic propionate and propionic acid

Properties — Monoclinic crystals, $a b c = 1.281 \ 1.762 \ \beta = 84^\circ 18'$ (Fletcher) With PCl, it gives the chloride of the acid Conc H_2SO_4 appears to polymerise it Behaves like the (a) isomeride with sodium amalgam With dry bromine vapour it forms the compound $C_6H_4Br_2(OMe)CHBrCMeBrCO_2H$ [c 200°] With HI (S G 1 94) it unites, forming a product whence Na_2CO_3 liberates the methyl derivative of o-allyl phenol — AgA' white pp

Methyl ether of the (B)-methyl derivative MeA' (c 286°) SG $\frac{15}{16}$ 1.1279, $\frac{30}{32}$ 1.1136

(B) **Ethyl derivative** $C_6H_4(OEt)CHCMeCO_2H$ [133°] Formed from ethyl-salicylic aldehyde, sodic propionate, and propionic anhydride Large tables (from alcohol) Its Ba salt forms satiny needles

Anhydride $C_6H_4 \begin{smallmatrix} CHCMe \\ \diagup \quad \diagdown \\ O \quad CO \end{smallmatrix}$ **Propionic**

coumarin Methyl-coumarin [90°] (292 5°) Formed by heating sodium salicylic aldehyde with propionic anhydride (Perkin, C J 28, 10) Trimetric crystals, $a b c = 2.1950 \ 1.4001$ Smells like coumarin, m sol alcohol, nearly insol cold KOHAq Fuming H_2SO_4 forms $C_{10}H_8O_4(SO_3H)$ whence BaA' , 10aq

Oxy-phenyl-crotonic acid **Anhydride** $C_6H_4 \begin{smallmatrix} CHCMe \\ \diagup \quad \diagdown \\ O \quad CO \end{smallmatrix}$ β **Methyl coumarin** [126°]

Formed by the action of H_2SO_4 on a mixture of acetoacetic ether and phenol (Pechmann a. Duisberg, B 16, 2127)

p-Oxy-phenyl-crotonic acid **Methyl derivative** $C_6H_4(OMe)CHCMeCO_2H$ [154°] Formed from anisic aldehyde, sodium propionate, and propionic anhydride Rectangular tables (from alcohol) — AgA'

p-Oxy-phenyl-isocrotonic acid **Methyl derivative** $C_6H_4(OMe)CHCHCH_2CO_2H$ [106 5°] Formed by heating anisic aldehyde with sodium succinate and Ac_2O at 120° (Fittig a. Politis, A 255, 294) Plates, m sol hot water — BaA' , 3aq — CaA' , 2aq — AgA' sol hot water

γ-Oxy-tri phenyl crotonic acid **Lactone** $C_6H_4O_3 \begin{smallmatrix} CHCPh \\ \diagup \quad \diagdown \\ CPh_2CO \end{smallmatrix} > O$ (?) [118°] Mol w

329 (by Raoult's method), 312 (calc) Formed by heating aB di benzoyl styrene at 310° (Japp a. Klingemann, C J 57, 679, 702, 59, 148) Lustrous needles or monoclinic prisms Not attacked by phenyl hydrazine or Ac_2O at 150° Bromine forms $C_{22}H_{15}BrO_2$ [109°] Chromic acid mixture oxidises it to benzophenone May be reduced to oxy tri phenyl butyric acid Alcoholic potash at 100° yields $CH_2BzCPh_2CO_2H$, which at 310° changes to the original lactone Alcoholic methylamine forms $CH_2BzCPh_2CONHMe$ [156°] Ethylamine acts in like manner

γ-Oxy-tetra phenyl-crotonic acid. Lactone $C_6H_4CPhCPh \begin{smallmatrix} CHCPh \\ \diagup \quad \diagdown \\ CPh_2CO \end{smallmatrix} > O$ **Tabular oxylepiden** [136°] S (alcohol) 7 at 78° Formed by heating 'acoular oxylepiden' $CPhBzCPhBz$ at 340° (Zinn, J R 5, 16, Bn. 3, 113, Japp a. Klingemann, C J 57, 665, Klingemann a. Laycock, C J 59, 140) Tables (from alcohol), insol. water. Converted by alcoholic potash into $C_{22}H_{15}KO_3$. Methyl-

amine in alcohol at 100° forms $CHPhBzCPh_2CONHMe$ [267°] crystallising in triclinic plates

Di oxy-phenyl-crotonic acid $C_6H_4(OH)_2CMeCHCO_2H$ (B) **methyl-umbelliferone acid**

Methyl derivative [4 2 1] $C_6H_4(OH)(OMe)CMeCHCO_2H$ [140°] Formed by boiling the methyl derivative of (B)-methyl umbelliferone with conc KOHAq for 5 hours (Pechmann a. Duisberg, B 16, 2125). Four sided tables, insol water, v sol. alcohol. Reconverted into its lactone by boiling with acids or heating with NH_3Aq

Di-methyl derivative $C_6H_4(OMe)_2CMeCHCO_2H$ [145°] Formed by saponification of its methyl ether (310°-320°) which is obtained by further methylation of the methyl derivative (Pechmann a. Cohen, B 17, 2132) Small needles, v sol alcohol — AgA' . white powder

Anhydride $C_6H_4(OH) \begin{smallmatrix} CHCMe \\ \diagup \quad \diagdown \\ O \quad CO \end{smallmatrix}$ (B)-

Methyl umbelliferone [186°] Formed by the action of H_2SO_4 on a mixture of acetoacetic ether and resorcin (Pechmann a. Duisberg, B 16, 2119, A 261, 169, cf Schmid, J pr [2] 25, 82) Formed also by warming acetoacetic ether with resorcin and alcoholic potash, and heating the resulting methyl-umbelliferone carboxylic acid [191°] above its melting point (Michael, J pr [2] 37, 469) (B) methyl umbelliferone is

also obtained by heating citric acid with resorcin and H_2SO_4 (Wittenberg, J pr [2] 24, 123) Plates (by sublimation), sol alcohol and hot water, sl sol ether Its dilute alkaline solution has blue fluorescence Potash-fusion forms di oxy acetophenone Yields a nitro compound, converted by reduction into amido-(B) methyl umbelliferone [247°], whence $B'H_2SO_4$, 2aq and $C_6H_5(NO)NO$, Sodium-amalgam reduces (B)-methyl umbelliferone to $C_{10}H_{10}O_2$ [259°], whence $C_{10}H_8AcO_2$ [222°] (Michael, Am. 5, 436)

Acetyl derivative of the anhydride $C_{12}H_{10}O_4$ [150°] Long white needles, v sol. alcohol

Benzoyl derivative of the anhydride $C_{10}H_8BzO_2$ [160°] Needles (from alcohol)

Methyl derivative

$C_6H_4(OMe) \begin{smallmatrix} CHCMe \\ \diagup \quad \diagdown \\ O \quad CO \end{smallmatrix}$ [159°] Needles (from alcohol), insol water On reduction with sodium amalgam it yields $C_6H_4(OMe) \begin{smallmatrix} CHMe \\ \diagup \quad \diagdown \\ O \quad CO \end{smallmatrix}$ [244°] Bromine in chloroform reacts forming $C_6H_4(OMe) \begin{smallmatrix} CHMeBr \\ \diagup \quad \diagdown \\ O \quad CO \end{smallmatrix}$ [235°]

(4 3 1) **Di-oxy-phenyl-crotonic acid** $C_6H_4(OH)_2CHC(CH_3)CO_2H$ [4 3 1] **Homocafferic acid**

p-Propionyl-m methyl derivative $C_6H_4(OCOCH_3)(OMe)CHC(CH_3)CO_2H$ **Propiohomoferrulic acid** [129°] Formed by heating vanillin with sodium propionate and propionic anhydride (Tieman a. Kraaz, B 15, 2060). White needles, sol alcohol, ether, and benzene, insol water and ligroin.

m-Methyl derivative $C_6H_4(OH)(OMe)CHC(CH_3)CO_2H$ **Homoferrulic**

acid [168°]. Large trimetric tables Sol alcohol and ether, al. sol chloroform, benzene, and hot water, nearly insol cold water and ligroin. On heating the acid it splits off CO_2 forming isoeugenol— A^1Ba yellow needles.

Di-methyl derivative
 $\text{C}_6\text{H}_4(\text{OMe})_2\text{CH}(\text{CO}_2\text{H})\text{CO}_2\text{H}$ *Methyl-homoferric acid* [141°] Needles Sol alcohol, ether, and hot water— A^1Ag white crystalline pp

Di-methyl-derivative-methyl ether
 $\text{C}_6\text{H}_4(\text{OMe})_2\text{CH}(\text{CO}_2\text{Me})\text{CO}_2\text{Me}$ [66°] Colourless plates

Methylene derivative

$\text{CH}_2\text{C}(\text{O})\text{C}_6\text{H}_4\text{CH}(\text{CO}_2\text{H})\text{CO}_2\text{H}$ [194°] Formed by boiling piperonal with propionic anhydride and sodium propionate (Lorenz, *B* 13, 759) Prisms (from dilute alcohol)— AgA^1 pp

Tri-oxy-phenyl-crotonic acid Anhydride

$\text{C}_6\text{H}_3(\text{OH})_3\text{C}(\text{OMe})\text{CH}(\text{CO})\text{CO}$ [235°] Prepared by the action of H_2SO_4 on a mixture of acetoacetic ether and pyrogallol (Wittenberg, *J pr* [2] 26, 68, Pechmann & Duisberg, *B* 16, 2127) Needles, sol. alcohol and hot water. Coloured green by FeCl_3 . Yields a di-acetyl derivative [176°]. An isomeride [284°] is formed by using phloroglucin instead of pyrogallol, it yields a di acetyl derivative [140°] (Pechmann & Cohen, *B* 17, 2189)

Tetra-oxy-phenyl-crotonic acid. Methylene-di-methyl derivative

$\text{CH}_2\text{C}(\text{O})\text{C}_6\text{H}_2(\text{OMe})_2\text{CH}(\text{CO}_2\text{H})\text{CO}_2\text{H}$ [209°].

Formed by heating apionic aldehyde with propionic aldehyde and sodium propionate (Ciamician & Silber, *B* 22, 2488) Yellow needles, almost insol water— CaA^1 , 5aq— AgA^1 white gelatinous pp

OXY-PHENYL-CUMINYLAMINE v CUMINYLAMIDO-PHENOL

OXY-PHENYL-CUMYLAMINE v CUMINYLAMIDENE-AMIDO-PHENOL

o-OXY-PHENYL-CYANAMIDE Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{NHCO}$ [94°] Made by passing gaseous ClCN into an ethereal solution of *o*-amido phenetole (Berlinerblau, *J pr* [2] 30, 100). Crystals Insol water, v sol alcohol and ether. Does not appear to polymerise With fuming HCl at 120° it gives *o*-amido phenol

Salts— $\text{C}_6\text{H}_4\text{N}_2\text{ONa}$ Microscopic needles, got by mixing alcoholic solutions of NaOEt and ethoxy phenyl cyanamide Its aqueous solution does not absorb CO_2 — $\text{C}_6\text{H}_4\text{N}_2\text{OAg}$ Curdy pp

p-Oxy-phenyl-cyanamide Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{NHCO}$. [78°] Made in the same way as the *o*-compound Colourless crystals Insol water, v sol. alcohol and ether— $\text{C}_6\text{H}_4\text{N}_2\text{OAg}$.

OXY-PHENYL-CYANATE. Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{NCO}$ [219°] Made by distilling $\text{C}_6\text{H}_4(\text{OEt})\text{NHCO}_2\text{Et}$ (Köhler, *J pr* [2] 29, 259) White needles (from HOAc), sol alcohol and chloroform

DI-OXY-PHENYL-DI-CUMYL-METHANE $\text{CHPh}(\text{C}_6\text{H}_4\text{MePrOH})_2$. [146°] Formed from benzoic aldehyde, thymol, and H_2SO_4 (Russanoff, *B* 22, 1949). Thin tables (containing EtOH), v. sol. chloroform

Di-acetyl derivative [196°]. Crystals

OXY-DIPHENYLENE-ACETIC ACID

$\text{C}_6\text{H}_4\text{C}(\text{OH})\text{CO}_2\text{H}$. [162°] Formed by boiling phenanthraquinone with NaOHAq (Baeyer, *B* 10, 125, Friedlander, *B* 10, 584) Plates (containing 4aq), v al sol cold water, v sol alcohol Conc H_2SO_4 forms a blue solution on warming Chromic acid mixture yields diphenylene ketone NaOHAq at 160° splits it up into fluorene alcohol and CO_2 . HIAq and P at 140° reduce it to diphenylene acetic acid Bromine forms $\text{C}_{14}\text{H}_8\text{Br}_2\text{O}_2$ [225°], whence $\text{C}_{14}\text{H}_8\text{Br}_2\text{EtO}$ [151°]— CaA^1 , 2aq crystals *Ethyl ether EtA* [92°] Prisms.

DI-OXY-PHENYLENE-DIAMINE

$\text{C}_6\text{H}_4(\text{OH})(\text{NH}_2)_2$ Got by reducing the dioxim of di oxy-quinone with SnCl_4 and HCl (Nietzki & Schmidt, *B* 22, 1656) Yields on oxidation crystalline $\text{C}_6\text{H}_4(\text{OH})(\text{NH}_2)_2\text{B}^1\text{H}_2\text{SO}_4$

Tetra-acetyl derivative [225°] Needles.

Isomeride v DI-AMIDO-HYDROQUINONE

DI-OXY-DIPHENYLENE-DIHYDRAZINE

$\text{C}_6\text{H}_4(\text{OH})(\text{N}_2\text{H}_4)_2$ $\text{C}_6\text{H}_4(\text{OH})(\text{N}_2\text{H}_5)_2$ [140°] Formed by reducing the diazo-compound from di-oxy di amido-diphenyl with SnCl_4 (Kunze, *B* 21, 3333) Thin plates, forming with acetone a compound $\text{C}_{18}\text{H}_{12}\text{N}_4\text{O}_2$ [200°]

OXY-DIPHENYLENE KETONE $\text{C}_{12}\text{H}_8\text{O}_2$

$\text{CO}\text{C}(\text{OH})\text{C}_6\text{H}_4\text{OH}$ [96°] (G), [91°] (R) Formed by warming dry sodium salicylate with excess of POCl_3 and distilling (R Richter, *J pr* [2] 23, 294) It is also one of the products of the action of phenol on the sulphate of *o*-diazobenzoic acid (Griess, *B* 21, 981) Needles, insol water, v sol hot alcohol Its vapour passed over red-hot lime yields diphenylene ketone and di phenylene ketone oxide [82°] Distilled over red hot zinc dust it is reduced to diphenyl Gives a nitro-derivative [224°], a di nitro derivative [c 235°], and a bromo derivative [193°]

OXY-DIPHENYLENE-KETONE OXIDE

$\text{C}_{12}\text{H}_8\text{O}_2$ v $\text{C}_6\text{H}_4\text{C}(\text{O})\text{C}_6\text{H}_4(\text{OH})$ *Oxy-xanthone* [147°] Formed by heating resorcin with salicylic acid and ZnCl_2 (Michael, *Am* 5, 91). Formed also by heating salicylic acid with (β -resorcylic acid and Ac_2O (Graebe, *A* 254, 290) Yellow needles (from alcohol) Split up by fusion with potash into resorcin and salicylic acid. Gives diphenylene methane oxide [99°] when distilled with zinc dust Yields tri oxy-benzophenone [183°] when fused with NaOH — $\text{NaC}_6\text{H}_4\text{O}_2$ — $\text{Na}_2\text{C}_6\text{H}_4\text{O}_4$ (dried at 100°) Lemon-yellow needles

Acetyl derivative $\text{C}_{12}\text{H}_8\text{AcO}$. [168°].

Di-oxy-diphenylene ketone oxide v EUXANTHONE, vol II p 529 (β)-*Iso euxanthone* $\text{C}_6\text{H}_4(\text{OH})\text{C}(\text{O})\text{C}_6\text{H}_4(\text{OH})$, got from di nitro-

diphenylene ketone oxide [260°], yields a crystalline di-acetyl derivative [175°] (Graebe, *A* 254, 301) An isomeride $\text{C}_6\text{H}_4\text{C}(\text{O})\text{C}_6\text{H}_4(\text{OH})_2$ [247°] is obtained from phloroglucin and salicylic acid (von Kostanecki & Nessler, *B* 24, 1896).

A second isomeride with the formula $\text{C}_6\text{H}_4\text{C}(\text{O})\text{C}_6\text{H}_4(\text{OH})_2$ [1 6] [240°], got by heating tetra-oxy-benzophenone with water at 200° , yields a diacetyl derivative [161°] and dyes cotton

mordanted with alumina, yellow, and with iron, greyish black (Graebe, *B* 24, 969) Another isomeride $[1\frac{3}{4}]C_6H_4(OH) < \begin{smallmatrix} O \\ CO \end{smallmatrix} > C_6H_4(OH) [1\frac{5}{6}]$ [246° cor] made by heating resorcylic acid with Ac_2O yields a diacetyl derivative [c 127°] (G).

Tetra oxy-diphenylene ketone oxide *v* Anhydride of Hexa oxy-benzophenone

DI-OXY PHENYLENE-DI METHYL DIKETONE $C_6H_4(OH)_2(COCH_3)_2$ [180°] Obtained from di oxy acetophenone (10 g), $ZnCl_2$ (20 g), $HOAc$ (50 g), and $POCl_3$ (10 g), at 140° (Crepieux, *Bl* [3] 6, 152) Crystals (from hot water), yields with phenyl hydrazine the compound $C_6H_4(OH)_2(CMeN,HPH)_2$ [c 231°]

Tri oxy-phenylene di-methyl diketone $C_6H_3(OH)_3(COCH_3)_2$ [189°] Formed in like manner from tri oxy acetophenone (C) Yields a di phenyl di hydrazide [246°] and also an acetyl derivative [209°] which yields a di phenyl di hydrazide [265°]

DI OXY PHENYLENE DI PHENYL DIKETONE $C_6H_4(OH)_2(CO C_6H_5)_2$ *Di-benzoresorcin* [149°] Formed, together with dioxybenzophenone, by heating resorcin with $ZnCl_2$ and $ZnCl_2$ (Doebner a Stachmann, *B* 11, 2270, *A* 210, 259) Leaflets, insol water

Di acetyl derivative [150°] Needles

Di benzoyl derivative [151°] Needles

Di oxy phenylene di phenyl diketone

$C_6H_3(OH)_3(CO C_6H_5)_2$ *Dibenzohydroquinone* [207°] Formed from hydroquinone, $BzCl$, and $AlCl_3$ (D) Golden needles (from alcohol)

Di-benzoyl derivative [146°] Plates

TETRA OXY DIPHENYLENE DI PHENYL-DI THIO-DI UREA *Tetra methyl derivative*

$NHPh.CS.NH.C_6H_4(OMe)_2.C_6H_4(OMe)_2.NH.CS.NHPh$ [184°] Formed by warming the compound $C_6H_3(OMe)_3(NH)C_6H_4(OMe)_2(NH_2)$ with phenylthiocarbamide (Bossler, *B* 17, 2128) Flakes, sol hot alcohol

TETRA - OXY - DIPHENYLENEQUINONE *Tetra methyl ether v* CEREULIGNON

DI OXY DIPHENYLENE QUINOXALINE *Di ethyl ether*

$[6\frac{3}{4}]C_6H_4(OEt)_2 < \begin{smallmatrix} N & C & C_6H_4 & [1\frac{2}{3}] \\ N & C & C_6H_4 & [1\frac{2}{3}] \end{smallmatrix} > [260°]$

Formed by the action of phenanthraquinone on the hydrochloride of the diethyl ether of (a)-diamido hydroquinone (Nietzki a Reehberg, *B* 23, 1212) Yellowish needles, sl sol water

OXY DI-PHENYL ETHANE

C_6H_5O *ie* $C_6H_5CH_2CH_2C_6H_4(OH)$ or $CH_3CH(C_6H_5)C_6H_4(OH)$ [58°] Formed by allowing a mixture of styrene, phenol, H_2SO_4 , and $HOAc$ to stand (Koenigs, *B* 23, 3144) Crystals, sol dilute $NaOHaq$

Benzoyl derivative [83°]

Methyl derivative $CH_3PhCH_2C_6H_4OMe$ [61°] Formed from α -phenyl methoxy cinnamic acid, alcohol, and Na (Freund a Remse, *B* 23, 2865) Plates, sol alcohol

Sulphonic acid $C_{12}H_{12}(OH)(SO_3H)$ Formed by potash-fusion from *s*-di phenyl-ethane disulphonic acid (Kade, *B* 7, 239) Plates, sol hot water

Di-p oxy-s-di phenyl-ethane

$C_6H_4(OH)CH_2CH_2C_6H_4(OH)$ [189°] Formed from di-phenyl-ethane disulphonic acid by potash-fusion (Kade). Plates or needles, almost

insol cold water Does not give a dye stuff on oxidation (Heumann a Wiernik, *B* 20, 914)

Di-oxy-di-phenyl-ethane $CH_3CH(C_6H_4OH)_2$ *Ethylidene diphenol* [122°] (F), [125°] (Claus, *B* 19, 3004) Formed by the action of $SnCl_4$ or HCl on a mixture of phenol and paraldehyde (Fabiny, *B* 11, 283) Needles (containing $\frac{1}{2} C_6H_5$) Reduces ammoniacal $AgNO_3$ forming a mirror

Di benzoyl derivative [152°] Prisms

Di methyl derivative [140°] Formed from acetyl chloride, anisole, and $AlCl_3$ (Gattermann, *B* 22, 1129) Micaceous scales

Di ethyl derivative [142°] Scales

Isomerides *v* **DI OXY ETHYL-BENZENE**

Tri oxy-tri phenyl-ethane

$C_6H_4(OH)CH_2CH(C_6H_4OH)_2$ *Ethynyl-triphenol* Formed from $CH_3ClCHCl(OEt)$ and phenol (Wischneus, *A* 243, 153) Amorphous resin, v. sl sol ether Yields iso rosolic acid on oxidation with $FeCl_3$ Forms a tri acetyl derivative

Tetra oxy di-phenyl ethane

$C_6H_4(OH)CH(OH)CH(OH)C_6H_4(OH)$ *Anhydride* $C_{12}H_{10}O_2$ Two isomerides [68°] and [117°] are formed by the action of zinc dust and $HOAc$ on *o* oxy benzoic aldehyde (Tiemann, *B* 24, 3172, Harries, *B* 24, 3175)

Tetra oxy-tetra-phenyl ethane $C_{24}H_{18}(OH)_4$ [248°] Formed by fusing tetra phenyl-ethane tetra sulphonic acid with potash (Engler, *B* 11 930) Plates (from dilute alcohol)

Tetra oxy-tetra-phenyl ethane

$(HO C_6H_4)_4CHCH(C_6H_4OH)_2$ Formed from di oxy benzophenone (Baeyer, *A* 202, 133) Resin, yielding a crystalline tetra acetyl derivative

Hexa oxy tri phenyl ethane

$(HO)_2C_6H_3CH_2CH_2C(C_6H_4OH)_2$ Three amorphous isomerides are formed from di-chloro-di-ethyl oxide by the action of pyrocatechin, resorcin, and hydroquinone respectively (Wischneus, *A* 243, 181) They are v sol alcohol

OXY DI-PHENYL ETHANE CARBOXYLIC ACID $C_6H_4(OH)CH_2CHPhCO_2H$ [120°] Formed from phenyl-coumarin, dilute alcohol, and sodium amalgam (Sardo, *G* 13, 273) Small prisms— AgA' sl sol hot water

Oxy-di-phenyl ethane dicarboxylic acid $C_6H_4(CO_2H)CH_2CH(OH)C_6H_4CO_2H$ *Hydroxy-diphthalic acid* [c. 170°] Formed from its anhydride, which is a product of the action of zinc-dust and $HOAc$ on phthalic anhydride (Wischneus, *B* 17, 2181) Prisms— Ag_2A'' ; decomposes at 225° *in vacuo* (Hasselbach, *A* 243, 249)

Ethyl ether Et_2A'' Crystalline

Anhydride $C_{12}H_{10}O_4$ *Hydrodiphthalic acid* [198 5°] Prisms. Converted by KOy at 215° into $C_6H_4(CO_2H)CHCHClC_6H_4CO_2H$ — AgA' pp

Di-oxy-di-phenyl-ethane di-o-carboxylic acid $C_6H_4(CO_2H)CH(OH)CH(OH)C_6H_4CO_2H$ Formed by dissolving hydrodiphthalyl in $KOHaq$ (Hasselbach, *A* 243, 266) Hydrodiphthalyl is a product of the action of zinc-dust and $HOAc$ on diphthalyl The free acid is unstable, at once yielding the anhydride $C_{12}H_{10}O_4$, which on heating to 190° yields its second anhydride hydrodiphthalyl $C_{12}H_{10}O_4$ [250°]— AgA'' Pp

Di-oxy-di-phenyl-ethane di-p-carboxylic acid $C_6H_4(CO_2H)CH(OH)CH(OH)C_6H_4CO_2H$ Formed by reducing benzoic dicarboxylic acid

with sodium-amalgam (Oppenheimer, *B* 19, 1817). M sol water Infusible

o-OXY-PHENYL-ETHYL-AMIDO-ACETIC ACID *Ethyl derivative*

$C_6H_4(OEt)NEtCH_2CO_2H$ Formed from chloroacetic acid (1 mol), $C_6H_4(OEt)NH_2$ (2 mols), and alcohol (Vater, *J pr* [2] 29, 296) Oil — $C_6H_4(NO_2)HCl$ Very hygroscopic — *Ethylchloride* $C_6H_4(NO_2)HCl$ Formed from $C_6H_4(OEt)NEt$, and chloroacetic acid Oil — $(C_6H_4(NO_2)EtCl)_2PtCl_4$ yellow crystals

p-OXY-PHENYL ETHYLAMINE

$C_6H_4(OH)CH_2CH_2NH_2$ Formed by heating tyrosine at 270° (Schmitt & Nasse, *A* 133, 214) Solid. Yields *p* oxy benzoic acid on fusion with potash (Barth, *A* 152, 101) — $B'HCl$ Needles

Oxy di-phenyl ethylamine

$CHPh(OH)CHPh(NH_2)$ [161°] Formed by reducing the oxim of hydrobenzoin or the mono oxim of benzoin with sodium amalgam and alcohol (Goldschmidt & Polonowska, *B* 20, 492, 21, 488) Needles (from alcohol) — $B'HCl$ [210°] — $B_2H_4PtCl_4 \cdot 2aq$ — $B'HOAc$ [156°] Prisms

Di-acetyl derivative [159°]

p-Oxy-di-phenyl-ethyl-amine *Ethylether* $EtN(C_6H_4)(C_6H_4OEt)$ [319°] Formed from *p*-oxy-diphenylamine, EtI , and alcoholic potash Oil, with an odour between that of geraniums and violets (Philip & Calm, *B* 17, 2434)

β -OXY- β -PHENYL-ETHYL ISOAMYL MALONIC ACID $CHPh(OH)CH_2C(CO_2H)_2C_6H_5$ Formed by reducing phenacyl isoaeryl-malonic acid with sodium amalgam (Paal & T Hoffmann, *B* 23, 1503) Thick oil, almost insol water, yielding the lactone of γ oxy γ phenyl-heptonic acid on distillation

OXY PHENYL ETHYL CARBAMIC ANHY.

DRIDE $C_6H_4 \begin{smallmatrix} \diagup \\ \text{NH} \\ \diagdown \end{smallmatrix} \begin{smallmatrix} \text{NEt} \\ \diagup \\ \text{O} \end{smallmatrix} \diagdown \text{CO}$ [29°] Formed from $C_6H_4 \begin{smallmatrix} \diagup \\ \text{NH} \\ \diagdown \end{smallmatrix} \begin{smallmatrix} \text{O} \\ \diagup \\ \text{O} \end{smallmatrix} \diagdown \text{CO}$, alcoholic potash, and EtI (Bender, *B* 19, 2952) Not affected by HCl

o-OXY-PHENYL-ETHYL CARBAZIDE

Methyl derivative $C_6H_4N_2O_2$ *re* $C_6H_4(OMe)N_2HCO_2NH_2$ [110°] Formed from $C_6H_4(OMe)N_2H$, and phenyl cyanate (Reisenegger, *A* 221, 323) Needles (from Aq)

o-OXY-DI-PHENYL ETHYLENE $C_{12}H_{10}$ *re* $C_6H_4CHCHC_6H_4(OH)$ [136°] Formed in small quantity by heating salicylic aldehyde with phenylacetic acid and $NaOAc$ at 200° (Michael, *Am* 1, 315) Needles (from alcohol)

p-Oxy-di-phenyl-ethylene *Methyl derivative* $C_{12}H_{11}(OMe)$ [186°] Formed by heating the methyl derivative of *p*-coumaric acid (Ogliastro, *G* 9, 586) Plates, sl alcohol

Di-o-oxy-di-phenyl ethylene

$C_6H_4(OH)CHCHC_6H_4(OH)$ [95°] Formed from salicylic aldehyde, zinc-dust, and $HOAc$ (Harnies, *B* 24, 8178, Tiemann, *B* 24, 3176) Needles Its alkaline solutions show blue fluorescence Yields a di-benzoyl derivative [108°] which forms a dibromide [59°]

Di-p-oxy-di-phenyl-ethylene

$C_6H_4(OH)CHCHC_6H_4(OH)$ *Di-oxy-stilbene*. [280°]. Formed by boiling an alcoholic solution of $COCl_2CH(C_6H_4OH)_2$ with zinc-dust (Ester Meer, *B* 7, 1200, Elbs & Hoermann, *J pr* [2] 39, 498) Small crystals (from $HOAc$) Yields a di acetyl derivative [218°].

Di-oxy-di-phenyl ethylene *Di benzoyl derivative* $C_6H_4C(OBz)C(OBz)C_6H_5$ *Isobenzil* [159°] Formed by the action of sodium on a mixture of benzoic aldehyde and $BzCl$, or on $BzCl$ alone, in ether (Klinger & Schmitz, *B* 24, 1276) Decomposed by HCl into benzil and benzoic acid Alcoholic potash forms benzoil

Di p oxy di phenyl ethylene *Di methyl derivative* $CH_3C(C_6H_4OMe)_2$ [140°] Formed from anisole, $AcCl$, and $AlCl_3$ (Gattermann, *B* 22, 1132) Plates, v sl sol cold alcohol Yields $CO(C_6H_4OMe)_2$ on oxidation by CrO_3

Di-ethyl derivative $CH_3C(C_6H_4OEt)_2$ [142°] Formed from C_6H_4OEt , $AcCl$, and $AlCl_3$

Tetra oxy tetra-phenyl ethylene $C_{24}H_{20}O_4$ Formed by potash fusion from tetra phenyl-ethylene tetra sulphonic acid (Behr, *B* 5, 278) Plates (from $HOAc$) Not melted at 300° $FeCl_3$ in $HOAc$ forms green metallic crystals of $C_{24}H_{20}O_4 \cdot 3aq$, sl sol alcohol

DI OXY-DI-PHENYL ETHYLENE DIAMINE

Di ethyl derivative $C_6H_4(NH C_6H_4OEt)_2$ [98°] Formed by the action of ethylene bromide and Na_2CO_3 on the hydrochloride of $C_6H_4(OEt)NH_2$ (Bischoff, *B* 23, 1979) Plates (from ether alcohol)

OXY-DI PHENYL-ETHYLENE CARBOXYLIC ACID

$C_6H_4CH_2CH(OH)C_6H_4CO_2H$ [96°] Formed from deoxybenzoic o carboxylic acid by sodium amalgam (Gabriel & Michael, *B* 11, 1020, 18, 3480) Plates (from dilute alcohol) At 100° it forms an anhydride $C_{12}H_{10}O_2$ [60°]

The isomeric acid $C_6H_4CH(OH)CH_2C_6H_4CO_2H$, [127°], formed by reducing the isomeric deoxybenzoic o carboxylic acid, also yields an anhydride $C_{12}H_{10}O_2$ [90°]

p OXY-PHENYLETHYLENE-QUINOLINE $C_6NH_4CHCHC_6H_4OH$ [253°] Formed from (*Py* 1) quinoline (lepidine) by heating with *p* oxy benzoic aldehyde and $KHSO_4$ at 160° (Heyman & Koenigs, *B* 21, 1424) Crystals, sl sol dilute $NaOHaq$

p OXY PHENYL ETHYL KETONE

$C_6H_4(OH)CO C_6H_5$ *Propionyl phenol* [148°] *S* 034 at 15°, 33 at 100° Formed by heating phenol with propionic acid and $ZnCl_2$ (Goldzweig, *J pr* [2] 43, 86), and also by the action of propionyl chloride on phenol (Perkin, *C I* 55, 546) Needles or prisms, v e sol alcohol Potash fusion yields phenol and *p* oxy benzoic acid Yields a di bromo derivative [100°] and a nitro derivative [180°]

Methyl derivative $C_6H_4(OMe)CO C_6H_5$ [27°] (274°) Formed from anisole (10g), propionyl chloride (10g), and $AlCl_3$ (12g) in CS_2 (Gattermann, *B* 23, 1203) Yields an oxim [67°] crystallising from alcohol

Ethyl derivative [30°] Prisms Yields an oxim $C_{12}H_{11}(OEt)C(NOHEt)Et$ [97°]

Di-oxy-phenyl ethyl ketone

[134] $C_6H_4(OH)CO C_6H_5$ [95°] Formed from resorcin (1 pt), propionic acid (1 pt), and $ZnCl_2$ (Goldzweig) Needles Gives a red colour with $FeCl_3$. Yields a phenyl-hydrazide [115°]

Di-ethyl derivative $C_6H_4(OEt)_2CO C_6H_5$ [76°] Formed from propionyl chloride, $C_6H_4(OEt)_2$, and $AlCl_3$ (Gattermann). Yields an oxim [183°] crystallising in needles

Di-oxy-phenyl ethyl ketone

[521] $C_6H_4(OH)CO C_6H_5$ [92°] Formed from hydroquinone (1 pt), propionic acid (1 pt), and

ZnCl_2 (2 pts) at 190° (Goldzweig) Needles, giving a yellowish red colour with FeCl_3 Yields a phenyl hydrazide [100°]

OXY DI-PHENYL-ETHYL NITRITE

$\text{C}_6\text{H}_5\text{NO}_2$ 16 $\text{C}_6\text{H}_5(\text{OH})\text{CH}_2\text{ONO}$ [106°] Formed from di phenyl ethane (1 pt), HOAc (10 pts), and HNO_3 (1 pt of S G 15) in the cold (Anschutz a Romig, A 233, 327) Needles, oxidised by CrO_3 to benzophenone and di-phenyl-nyl nitrite [87°]

DI OXY DI PHENYL-DI-ETHYL PYRAZINE

INE DIHYDRIDE $\text{NPh} \begin{array}{c} \text{CHET CO} \\ \text{CO CHET} \end{array} \text{NPh}$ [260°] Formed, together with an isomeride [163°], by the action of Ac_2O on a phenylamido butyric acid (Nastvogel, B 22, 1795, 23, 2014) Needles (from alcohol)

OXY-PHENYL ETHYL PYRIMIDINE

$\text{Cet} \begin{array}{c} \text{N-CPh} \\ \text{C(OH)} \end{array} \text{CH}$ [238°] Formed from propionamidine hydrochloride, benzoyl aceto acetic ether, and dilute (10 p c) NaOHAq (Pin ner, B 22, 1621) Needles, v sl sol water

OXY TRI-PHENYL ETHYL PYRROLE

$\text{CPh} \begin{array}{c} \text{CH CPh} \\ \text{CO NEt} \end{array}$ [123°] and [129°] Formed from $\text{C}_6\text{H}_5\text{CBzCHBz}$ and alcoholic ethylamine (Japp a Klingemann, C J 57, 705) Formed also by heating the ethylamide of di phenyl-benzoyl propionic acid at 340° Trichino prisms [123°], $a b c = 912 \ 1 \ 952$, $\alpha = 78^\circ 48'$, $\beta = 89^\circ 10'$, $\gamma = 68^\circ 2'$ From dilute solutions it also crystallises in monoclinic prisms [129°], $a b c = 1 \ 690 \ 1 \ 1 \ 958$, $\beta = 86^\circ 54'$ (Tutton, C J 57, 731) Yields a biomo derivative $\text{C}_{14}\text{H}_{18}\text{BrNO}$ [142°] crystallising in monoclinic prisms

OXY PHENYL (Py 1) ETHYL QUINOLINE

$\text{C}_6\text{H}_5 \begin{array}{c} \text{C(CH}_3\text{CH}_2\text{C}_6\text{H}_5\text{OH)} \\ \text{N CH CH} \end{array}$ Formed by condensing *o* oxy benzoic aldehyde with (Py 1) methyl quinoline and reducing the product with HI in HOAc and P (Koenigs, B 21, 1428, 2167) The *o* compound melts at 181° , the *m* compound at 209° , and the *p* compound at 177° They yield the oxybenzoic acids on fusion with potash

β OXY PHENYL ETHYL SUCCINIC ACID

$\text{CO}_2\text{H CHPh CH(CO}_2\text{H)}\text{CH(OH)Me}$ Formed from phenyl acetosuccinic ether, alcohol and sodium amalgam (Weltner, B 18, 791) The free acid splits up at once, yielding the anhydride $\text{C}_{12}\text{H}_{12}\text{O}_4$ [$167 \ 6^\circ$] whence $\text{Ca}(\text{C}_{12}\text{H}_{11}\text{O}_4)_2 \cdot \text{AgC}_2\text{H}_3\text{O}_2$, flocculent pp

DI OXY DI PHENYL-ETHYL + THIO

UREA *Di methyl derivative* $\text{C}_6\text{H}_5(\text{OMe})\text{N}(\text{C}(\text{SEt})\text{NH C}_6\text{H}_5\text{OMe})$ [83°] Got from di amyl thio-urea and EtI (Foerster, B 21, 1863) Prisms $\text{—C}_{12}\text{H}_{18}\text{N}_2\text{SO}_2\text{HI}$ [163°] Rhombohedra $\text{—B'H}_2\text{P}(\text{Cl})_4$

o OXY PHENYL GLYCIDIC ACID

$\text{C}_6\text{H}_5(\text{OH}) \begin{array}{c} \text{O} \\ \text{CH CH} \end{array} \text{CO}_2\text{H}$ *Salicylglycidic acid* Formed by the action of conc aqueous NaOH NBz

upon benzoyl imido-cumarin $\text{C}_6\text{H} \begin{array}{c} \text{CH CH} \\ \text{CO CO} \end{array}$ (Flöchl a Wolfrum, B 18, 1185) Flat needles or prisms V sol alcohol and ether, sl sol cold water. By boiling with dilute H_2SO_4 , it is con-

verted into oxido-cumarin $\text{C}_6\text{H} \begin{array}{c} \text{O} \\ \text{CH CH} \\ \text{O CO} \end{array}$ [153°].

—CaA' , 6sq prisms

o OXY-PHENYL-GLYOXYLIC ACID

$\text{C}_6\text{H}_5(\text{OH})\text{CO CO}_2\text{H}$ [44°] Formed by adding acid to a solution of NaNO_2 and isatin in dilute NaOH , and heating the solution of the diazo compound thus obtained to 60° (Baeyer a Fritsch, B 17, 973) Yields *o* di oxy phenyl acetic acid on reduction with sodium amalgam

Di-oxy-phenyl-glyoxylic acid Methyl derivative [$4 \ 3 \ 1$] $\text{C}_6\text{H}_5(\text{OH})(\text{OMe})\text{CO CO}_2\text{H}$ [134°] A product of the oxidation of acetyl eugenol by KMnO_4 (Tiemann, B 24, 2878)

Prisms, v sol water and alcohol *Dimethyl derivative* [$4 \ 3 \ 1$] $\text{C}_6\text{H}_5(\text{OMe})_2\text{CO CO}_2\text{H}$ [139°] Formed, together with veratric acid by oxidation of the methyl derivative of eugenol or isoeugenol by KMnO_4 (Tiemann a Matsmoto, B 11, 141, Ciamician a Silber, B 23, 1165) Trimetric tables, melting at 100° when hydrated.

Methylene derivative

$\text{CH}_2 \begin{array}{c} \text{O} \\ \text{O} \end{array} \text{C}_6\text{H}_5\text{CO CO}_2\text{H}$ [149°] Formed by oxidising iso safrol with alkaline KMnO_4 (C a S) Light yellow needles, containing benzene of crystallisation (from benzene) $\text{—C}_6\text{H}_5\text{AgO}_2$

o OXY PHENYL HEXENOIC ACID

$\text{C}_6\text{H}_5(\text{OH})\text{C}_6\text{H}_5\text{CO}_2\text{H}$ *Anhydride* $\text{C}_{12}\text{H}_{16}\text{O}_2$ [54°] (301°) Formed by boiling sodium salicylic aldehyde with valeric anhydride (Perkin, A 147, 235) Prisms (from alcohol), insol cold Aq

An isomeric lactone, prepared by heating phenyl acetyl butyric acid, is oily (Erdmann, A 254, 182)

OXY PHENYL HEXOIC ACID

$\text{CHMe}(\text{OH})\text{CH}(\text{CH}_2\text{Ph})\text{CH}_2\text{CO}_2\text{H}$ [76°] Small prisms (containing aq) —CaA' , 6sq minute prisms *Anhydride* $\text{C}_{12}\text{H}_{16}\text{O}_2$ *Benzyl valero lactone* [86°] Formed by reducing benzyl-acetylpropionic acid with sodium amalgam (Erdmann, A 254, 182) Crystals (from CS_2)

o-OXY-PHENYL-HYDRAZINE

Methyl derivative $\text{C}_6\text{H}_5(\text{OMe})\text{NH NH}_2$ [43°] (240°) By reducing $\text{C}_6\text{H}_5(\text{OMe})\text{N}_2\text{SO}_2\text{Na}$ with Zn and glacial acetic acid there is formed the salt $\text{C}_6\text{H}_5(\text{OMe})\text{N}_2\text{H}_2\text{SO}_2\text{Na}$ aq, which is then warmed with HClAq (Reisenegger, A 221, 314) Needles (from ligroin) Yields B'HCl , $\text{B'H}_2\text{C}_2\text{O}_4$, and $\text{B'C}_6\text{H}_5\text{N}_2\text{O}$

Acetyl derivative $\text{C}_6\text{H}_5\text{N}_2\text{O}_2$ [135°]

Di-o-oxy-di-phenyl hydrazine Di ethyl derivative $\{\text{C}_6\text{H}_5(\text{OEt})\}_2\text{N}_2\text{H}_2$ [89°] Formed

by reducing the azo-compound $\text{N}_2(\text{C}_6\text{H}_5\text{OEt})_2$ by alcoholic ammonium sulphide (Schmitt a Möhlau, J pr [2] 18, 202) Colourless needles, in sol water, sol alcohol and ether The *m* iso meride forms colourless needles [85°] (Buchstab J pr [2] 29, 300)

Tetra-oxy-diphenyl-hydrazine Tetra

methyl derivative $\text{C}_6\text{H}_5(\text{OMe})_2\text{NH NH C}_6\text{H}_5(\text{OMe})_2$ *Hydrazodi-methylhydroquinone* Formed by reducing the di methyl derivative of nitro-hydro quinone in alkaline solution (Baessler, B 17, 2126) Converted by acids into the tetra methyl derivative of tetra oxy-diamido-diphenyl

p-OXY-PHENYL IMIDO DIACETIC ACID

Di ethyl derivative of the oxy anilide

$C_6H_5(OEt)N(CH_2CO_2H)CH_2CONHC_6H_5OEt$ [167°] Got from $C_6H_5(OEt)NHCH_2CO_2H$ by heating at 260° (Bischoff a Nastvogel, *B* 22, 1790) Crystalline, insol hot water

DI-*o*-OXY-DI-PHENYL-IMIDO-ACETO-NITRILE *Di-methyl derivative* $C_{11}H_{11}N_3O_2$, α . $NH(CH_2C_6H_5OMe)_2$ [123°] Formed by heating $C_6H_5(OMe)CH(OH)CN$ with alcoholic NH_3 at 70° (Voswinkel, *B* 15, 2025) Tables, insol water, sol alcohol

***o*-OXY-PHENYL- α -IMIDO-PROPIONIC ANHYDRIDE** *Di-benzoyl derivative* $\{C_6H_5(OH)C_6H_5(NBz)CO\}_2O$ Obtained by heating hippuric acid with salicylic aldehyde dissolved in acetic anhydride with addition of sodium acetate (Plöchl a Wolfrum, *B* 18, 1183) [160°] Crystalline solid By boiling its acetic acid solution with a few drops of aqueous HCl it is converted into the benzoyl derivative of imidocoumarin

DI-*o*-OXY-DI-PHENYL IMIDO THIAZOLE *Tetrahydride of the di-methyl derivative* $CH_2\langle\begin{smallmatrix} N(C_6H_5OMe) \\ CH_2S \end{smallmatrix}\rangle CN C_6H_5OMe$ [128°]

Formed by boiling di-anisyl thio urea with $C_6H_5Br_2$ (Foerster, *B* 21, 1864) Prisms On heating with CS_2 at 200° it yields the compound $CH_2\langle\begin{smallmatrix} N(C_6H_5O) \\ CH_2S \end{smallmatrix}\rangle CS$ [136°] — $B'H_2P_4Cl_4$ unstable when moist

***p*-OXY-PHENYL INDIAZOLE**

$C_6H_5\langle\begin{smallmatrix} N \\ OH \end{smallmatrix}\rangle N C_6H_5OH$ [195°] Formed by boiling its ethyl derivative with HIAq and a little P (Paal, *B* 24, 965) Groups of short prisms, ν sol HClAq, sl sol ether — $B'HI$ [200°] Large yellow plates

Ethyl derivative [118°] Formed by heating a conc alcoholic solution of the ethyl derivative of *o* nitro benzyl *p* amido phenol with tin and HCl Pearly plates (from alcohol), prisms (from benzene ligroin), or needles (from dilute HOAc) The tin double salt crystallises in yellowish plates [138°]

OXY-PHENYL-INDOLE $C_{11}H_{11}NO$ α .

$C_6H_5\langle\begin{smallmatrix} O(OH) \\ NH \end{smallmatrix}\rangle C_6Ph(?)$ [α 163°] Formed by heating the phenyl hydrazide of α oxy aceto phenone with $ZnCl_2$ at 160° (Laubmann, *A* 243, 246) Amorphous pp, ν sl sol ligroin

DI-OXY-DI-PHENYL KETONE ν DI-OXY-BENZOPHENONE

Di-oxy-di phenyl-diketone *Di-methyl derivative ν Anisal* Anisal forms a monooxime [180°] and two di oxims [195°] and [217°] The (α)-dioxim [217°] forms a diacetyl derivative [189°], while the (β) dioxim [195°] forms an isomeric di acetyl derivative [180°] (Suerlin, *B* 22, 877)

***o*-OXY-PHENYL MERCAPTAN**

$C_6H_5(SH)(OH)$ *Thiopyrocatechin* [6°] (217° cor) S G § 1287, 1189 Formed by reducing di oxy-di-phenyl disulphide with sodium-amalgam (Haitinger, *M* 4, 170) Formed also by the action of potassium xanthate on diazophenyl chloride, the oxyphenyl ethyl xanthate being subsequently saponified by sodium sulphide (Leuckart, *J pr* [2] 41, 192) Oil, volatile with steam, sl sol water Attacks the skin

p-Oxy-phenyl mercaptan $C_6H_5(SH)(OH)$ [80°]. (168°) Formed in like manner from

p-diazophenol (L) Crystalline mass, forming a bluish green solution in sulphuric acid — $Pb(S C_6H_5OH)_2$ bulky yellow pp Oxidised in alcoholic ammoniacal solution by air to di *p*-oxy-di phenyl disulphide [151°]

***Acetyl derivative* $C_6H_5(SH)(OAc)$ (280°)**

Di acetyl derivative [86°] Plates *Ethyl ethers* $C_6H_5(SH)(OEt)$, [41°], (277°) and $C_6H_5(SeEt)(OH)$, [41°], (287°) Crystalline **OXY-PHENYL METHACRYLIC ACID** is described as OXY-PHENYL CROTONIC ACID (*q* v)

OXY DI-PHENYL-METHANE ν BENZYL-PHENOL

o Oxy tri-phenyl-methane $CHPh_2C_6H_5OH$ [118°] Formed by passing air through a solution of diazoamido tri-phenol methane sulphate, and boiling the product in a current of CO_2 (O Fischer, *A* 241, 862) Sol alcohol and ether

Di p oxy di phenyl-methane $CH_2(C_6H_5OH)_2$ [158°] Formed by fusing di phenyl methane disulphonic acid with potash (Beck, *A* 194, 318) Plates or needles (from hot water), not volatile with steam Its sodium salts $C_{12}H_{11}NaO_2$ and $C_{15}H_{13}NaO_2$ form green solutions — BaA''

Di-acetyl derivative [70°] Prisms *Di-benzoyl derivative* [156°] Needles *Di methyl derivative* $CH_2(C_6H_5OMe)_2$ [52°] (M), [49°] (B) (335°) Formed from anisole, methylal, HOAc, and H_2SO_4 (Ter Meer, *B* 7, 1200) Small plates (from alcohol)

Di-ethyl derivative $CH_2(C_6H_5OEt)_2$ [89°] Scales, ν sol alcohol

Isomeride ν OXY DI PHENYL CARBINOL

Di p-oxy tri-phenyl methane $CHPh(C_6H_5OH)_2$ *Leucobenzaurn* [161°] Formed from di oxy tri phenyl carbinol, zinc dust and HCl (Doebner, *B* 12, 1462, *A* 217, 230) Formed also from di amido tri phenyl methane by the diazo reaction (O Fischer, *A* 206, 153), and from benzoic aldehyde, phenol, and H_2SO_4 (Russanoff, *B* 22, 1943) Yellowish needles (from dilute alcohol), sl sol hot water Absorbs atmospheric oxygen when heated above 160°, changing to di oxy tri phenyl carbinol Potash fusion gives di oxy benzophenone Yields a di nitro compound [134°]

Di-acetyl derivative [111°] Plates

Di-benzoyl derivative [130°]

Tri oxy tri phenyl methane $CH(C_6H_5OH)_3$, *Leucaurn* Formed by reducing tri oxy tri-phenyl carbinol (aurin) with zinc dust and NaOHaq (Dale a Schorlemmer, *A* 166, 286) Colourless prisms (from HOAc), sl sol water

Tri acetyl derivative [139°] (Zulkowsky, *A* 202, 197) Small needles

Tri-benzoyl derivative Crystals

Tetra-oxy di-phenyl methane $C_{12}H_9O_4$ Formed by fusing orcin with NaOH (Barth, *M* 8, 646) Needles, turning brown at 260°

Tetra-oxy tri phenyl methane $C_{15}H_{11}O_4$ α $CHPh(C_6H_5(OH))_2$ [171°] Formed by reducing the anhydride of the corresponding carbinol ('resorcinbenzein') with zinc dust and HCl (Doebner, *A* 217, 236) Colourless needles (from dilute alcohol) Reoxidised by alkaline K_2FeO_4 to the anhydride of the carbinol

Octo-oxy tri-phenyl-methane *Methyl derivative* $C_6H_5(OMe)(OH)CH(C_6H_5(OH))_2$ Formed from vanillin (1 pt), pyrogallol (1 87 pts), alcohol (20 pts), and conc HClAq (50 pts.) (Ettl,

M 3, 638). Colourless crystals, insol water, turned violet by HCl. An isomeride is formed from vanillin and phloroglucin.

p-OXY DI PHENYL-METHANE o-CARB- OXYLIC ACID *Methyl derivative* $C_6H_4(OMe)CH_2C_6H_4CO_2H$ [111°] Formed by reduction of $C_6H_4(OMe)COCH_2C_6H_4CO_2H$ (Nourisson, B 19, 2105) White needles, insol Aq.

Oxy-di phenyl-methane carboxylic acid $C_6H_4CH_2C_6H_4(OH)CO_2H$ [140°] Formed from sodium benzyl phenol and CO_2 (Paterno a Fiolet, J 1873, 440) Small needles (from water) —AgA' small needles (from water)

Oxy di phenyl-methane di carboxylic acid $OH(OH)(C_6H_4CO_2H)_2$ Formed, as K salt, by heating 'diphthalic acid' with KOHAq at 130° (Jullard, C C 1887, 1148) The free acid at once forms the lactone [205°] which yields a methyl ether [155°], an ethyl ether [99.5°], and an amide [160°]

Oxy-di phenyl methane tri carboxylic acid $C(OH)(C_6H_4CO_2H)_3$ Formed, as K salt, by heating 'diphthalic acid' $C_2O_3(C_6H_4CO_2H)_2$ with KOHAq at 110° (Jullard) The free acid changes to lactone

Ethyl ether [108°]

Oxy tri phenyl methane carboxylic acid $C_6H_4O_3$ *see* CHPh $(C_6H_4OH)_3$ $C_6H_4CO_2H$ [210°] Formed by reducing an alkaline solution of oxy tri phenyl carbinol carboxylic anhydride with powdered zinc (Pechmann, B 13, 1616) Needles

Di oxy-tri phenyl methane carboxylic acid $C_6H_4(OH)_2CHPh(C_6H_4CO_2H)$ [184°] Formed by reduction of di oxy tri phenyl carbinol carboxylic anhydride with zinc dust and NH_4Aq (Pechmann, B 14, 1859) Converted into anthranol by H_2SO_4

Di oxy tri phenyl methane carboxylic acid $C_6H_4(CO_2H)CH(C_6H_4OH)_2$ [225°] Formed by boiling phenol phthalein with zinc dust and NaOHAq (Baeyer, A 202, 80, 212, 350)

Di acetyl derivative [146°] Needles

Anhydride $C_6H_4O_3$ [214°-217°] Formed by reducing phenol phthalein anhydride with zinc dust and alcoholic NaOH. Small needles (from alcohol) Warm H_2SO_4 forms a green solution turning red

OXY-PHENYL PENTAMETHENYL HYDRIDE *see* PHENYL METHYL PURPURINE

OXY DI PHENYL DI METHYL DI AMIDO-BUTYRIC ACID *Lactone*

$O < \begin{smallmatrix} C(NMePh)_2 \\ CO \end{smallmatrix} CH_2$ *Phenyl methyl succinimide*

[157°] Got by heating succinic acid with phenyl-methyl-amine (Putti, G 16, 160) Needles or prisms, sl sol ether

p OXY-DI PHENYL-METHYL AMINE

Methyl derivative $MeN(C_6H_4)(C_6H_4OMe)$ [313°] Formed by methylation of p oxy di-phenyl amine (Philip a. Calm, B 17, 2433) Crl, with an odour like geranium or violets

OXY DI-PHENYL TETRAMETHYLENE-QUINONE (so-called) $C_{12}H_8O_2$ The following derivatives of this body are formed by the action of bases on the quinone $C_{12}H_8O_2$ got by oxidising di-phenyl butinene (Zincke a Breuer, B 18, 631, A 226, 88)

Imide $C_{12}H_8(OH) < \begin{smallmatrix} O \\ NH \end{smallmatrix}$ [174°]. Red plates, yielding a diacetyl derivative [201°] Aqueous SO_3 forms $C_{12}H_8O_3$ [187°]

Methylimide $C_{12}H_8(OH) < \begin{smallmatrix} O \\ NMe \end{smallmatrix}$ [170°].

Ethylimide [130°] Brown needles

Phenylimide $C_{12}H_8(OH)O(NPh)$ [158°]

o-Tolylimide [108°] Red needles

p-Tolylimide [155°] Violet needles

(a)-Naphthylimide [148°]

Isomeride $C_{12}H_8(OH)O_2$ [144°] Formed by warming the quinone $C_{12}H_8O_2$ with dilute NaOH (Z a B) Needles or prisms (from alcohol) Yields phthalic acid on oxidation. Aqueous SO_3 yields an oxyquinhydrone [155°]. HI reduces it to an oxyhydroquinone [73°] — $Ca(C_{12}H_8O_3)_2$ — BAA' — AgA' brownish-red pp

Acetyl derivative $C_{12}H_8O_4$ [111°]

Benzoyl derivative Monoclinic crystals

DI OXY-DI-PHENYL TRI-METHYLENE

THIO UREA *Di-methyl derivative* $CH_3CH_2NC_6H_4OMe$ [114°] Formed from $CH_3S-CNC_6H_4OMe$ [114°] Formed from di anisyl thio urea and trimethylene bromide (Foerster, B 21, 1872) Prisms (from alcohol)

DI - OXY - DI - PHENYL - DI - METHYLENE DIPYRAZOLE $C_8H_8N_4O_2$ *see*

$NPh < \begin{smallmatrix} N-CMe \\ CO CH \end{smallmatrix} CH_2CH_2CH_2CO > NPh$ Formed by splitting off alcohol (2 mols) from the phenylhydrazide of di acetyl-adipic ether (Perkin a Obrembsky, B 19, 2049, C J 57, 206) Small crystals, solid at 250° Sol acids and alkalis

OXY-PHENYL-METHYL-ETHYL-PYRAZ-

OLE $C_{12}H_{14}N_2O$ *see* $NPh < \begin{smallmatrix} CO \\ N \end{smallmatrix} CH_2 > C_2H_5$ [108°]

Formed by heating ethyl acetoacetic ether with phenyl hydrazine at 140° (Knorr a Blank, B 17, 2051) Crystals (containing aq) Oxidised by nitrous acid to $C_{12}H_{12}N_2O_3$ [160°]

OXY-PHENYL-METHYL-ETHYL-PYRIM-

IDINE $CPh < \begin{smallmatrix} N-CMe \\ N-C(OH) \end{smallmatrix} > C_2H_5$ [167°] Formed

from benzamidine hydrochloride, ethylacetoacetic ether, and dilute (10 p c) NaOHAq (Pinner, B 22, 1625) Prisms

Di-oxy-phenyl-methyl-ethyl-pyrimidine

Ethyl derivative

$C_6H_4(OEt) < \begin{smallmatrix} N-CMe \\ N-C(OH) \end{smallmatrix} > OEt$ [194°] Formed

from ethyl-acetoacetic ether and p-ethoxybenzamidine (Pinner, B 23, 2955) Needles (from alcohol), m sol hot alcohol

OXY-PHENYL-DIMETHYL-TETRAHYDRO-

PYRIDINE *see* BENZYLIDENE-DIACETONE-ALGAMINE

OXY PHENYLMETHYL KETONE *see* OXY-

ACETOPHENONE and BENZYL CARBINOL

DI OXY DI-PHENYL-DI-METHYL-PYRAZ-

INE DIHYDRIDE $NPh < \begin{smallmatrix} CHMe \\ CO \end{smallmatrix} > NPh$

[183°] Formed from phenyl- α -amido propionic acid and Ac_2O in the cold (Nastvogel, B 22, 1794, 23, 2012) Needles, insol water

An isomeride [146°] accompanies the preceding body. On heating with KOHAq both compounds yield $C_{12}H_{12}N_4O_2$ [80°]

OXY-PHENYL-METHYL-PYRAZOLE

$NPh < \begin{smallmatrix} CO \\ N=O \end{smallmatrix} CH_2$ [127°] (287° at 265 mm.).

Preparation.—1 By heating acetoacetic ether with phenyl hydrazine (Knorr, B 17, 550, 2082; A 293, 187) —2 By the action of NH_4Aq and H_2S on (β)-phenyl-azo-crotonic ether (Bender, B 20, 2748)

Properties—Crystals, sol hot alcohol Yields bromo-, dibromo-, and di-chloro- derivatives Condenses with cinnamic aldehyde, acetone, and acetoacetic ether Zinc dust reduces it to phenyl methyl-pyrazole Excess of phenyl-hydrazine forms, on boiling, $C_{12}H_{11}N_2O_2$, whence $C_{12}H_{11}N_2O_2(SO_3H)_2$ Nitrous acid forms $C_{12}H_{11}N_2O_2$ [187°] Diazobenzene chloride forms a compound

got by heating azobenzene acetoacetic amide with phenyl hydrazine at 130° (Leuckart & Holzapfel, *B* 22, 1406, Buchka, *B* 22, 2541) S_2Cl_2 forms a product which crystallises from alcohol as $C_{12}H_{11}N_2SO_2HClHOEt$ (Sprague, *C J* 59, 334) Alloxan forms a compound $C_{12}H_{11}N_2O_2$, whence dilute potash gives $C_{12}H_{11}N_2O_2$, converted by hot potash into $C_{11}H_9N_2O$, which on heating with alcohol gives rise to oxy phenyl methyl methyl ene-pyrazole [178°] (Pellizzari, *A* 255, 230)

Oxy-phenyl-di-methyl-pyrazole $C_{11}H_9N_2O_2$

heating methyl acetoacetic ether with phenyl-hydrazine at 140° (Knorr, *B* 17, 2050, *A* 238, 162) Formed also by heating oxy phenyl methyl pyrazol acetic acid Crystalline powder

Oxy-phenyl-di-methyl-pyrazole $C_{11}H_9N_2O_2$

by methylation of oxy-phenyl methyl pyrazole (Knorr, *B* 17, 2032) and by heating acetoacetic ether with *s* phenyl methyl-hydrazine (Knorr, *A* 238, 203) Monoclinic crystals (from water), *v* sol water, alcohol, and ether Febrifuge $FeCl_3$ colours its solution deep red Nitrous acid gives a bluish green colour Sodium added to its alcoholic solution liberates methylamine K_2FeCy_4 and HCl give a yellow colour Chromic acid gives an orange pp (Gay & Fortuné, *Ph* 18, 1066) Gives the usual reactions for alkaloids ICl solution forms crystalline $C_{11}H_9IN_2O$ [160°] and $C_{11}H_9IN_2OICl$ [142°] (Dittmar, *B* 18, 1617) Bromine forms $C_{11}H_9Br_2N_2O$ [c 150°], whence water yields $C_{11}H_9BrN_2O$ [117°] HNO_2 forms $C_{11}H_9N_2O_2$, which explodes at 200° Alloxan yields $NMe \text{ CO} \begin{array}{c} \text{CO NH} \\ \text{CO NH} \end{array} \text{ CO}$, decomposing at 261°, whence boiling conc $HClAq$ forms $C_{12}H_{11}N_2O_2$ [238°] (Pellizzari, *G* 18, 340) Benzoin aldehyde in presence of HCl forms benzylidene-di antipyryne $C_{22}H_{21}N_2O_2$ [201°] Combines with chloral

Salts — $B'H_2PtCl_2 \cdot 2aq$ — $B'H_2FeCy_4$ — $B'O_2H_2(NO_2)_2 \cdot OH$ [188°] Long yellow needles

Oxy phenyl tri-methyl-pyrazole $C_{12}H_{11}N_2O$

Formed by heating antipyryne with MeI and $MeOH$ (Knorr) Crystals, *v* sol water and alcohol Yields a picrate [94°]

Oxy-phenyl-tri-methyl-pyrazole $C_{12}H_{11}N_2O$

Formed from oxy phenyl methyl pyrazole $NaOMe$, and MeI (Knorr, *A* 238, 165), and also by heating di-methyl-acetoacetic acid with phenyl hydrazine Insol water, *v* sol alcohol

Oxy-di-phenyl-methyl-pyrazole $C_{11}H_9N_2O_2$

tion of oxy di phenyl pyrazole (Knorr & Klotz, *B* 20, 2549) Needles (from ether), *sl* sol boiling water Bromine in chloroform forms a di bromide, whence water liberates $C_{12}H_{11}Br_2N_2O$ [110°-120°]

Salts — $B'HCl$ needles — $B'H_2FeCy_4$ — $B'O_2H_2(NO_2)_2 \cdot OH$ [170°] Yellow prisms

Oxy di-phenyl methyl pyrazole

ing hydrazobenzene with acetoacetic ether at 120°, the yield being 60 p.c. of the theoretical (Muller, *B* 19, 1771, Perger, *B* 19, 2140, *M* 7, 191) Crystals (containing $\frac{1}{2}aq$), *v* sol alcohol

OXY PHENYL METHYL-PYRAZOLE CARB

Made from its ether, which is got by heating oxal propionic ether with phenyl hydrazine at 120° (Arnold, *A* 246, 331) Plates (from alcohol)

Ethyl ether EtA' [149°]

Oxy phenyl methyl pyrazole carboxylic acid

ether [85°], which is formed by heating acetone dicarboxylic ether with phenyl hydrazine (Pechmann, *A* 261, 171) Prisms, *sol* alcohol

Oxy-phenyl methyl pyrazole dicarboxylic

Formed by saponifying its ether Needles (containing aq), *sl* sol cold water Gives a dark violet colour with $FeCl_3$

Ethyl ether EtA'' [130°] Formed by heating oxalsuccinic ether with phenyl hydrazine at 170° (Wischneus, *B* 22, 888) Needles

Oxy phenyl di methyl pyrazole carboxylic

tained from its ether [138°], which is got by heating acetyl succinic ether with phenyl hydrazine at 150° (Knorr) Needles (from water)

DI OXY-DI PHENYL DI-METHYL DI-

PYRAZOL $C_{22}H_{21}N_2O_2$

the action of phenyl hydrazine (3 mols) on acetoacetic ether (2 mols) Formed also by the action of phenyl hydrazine on di acetyl succinic ether, on isocarbopyrrolitic ether and on thioacetoacetic ether (Knorr, *B* 17, 2044, 2058, 22, 160, Buchka & Sprague, *B* 22, 2554) Formed also from *s* phenyl azo crotonic ether, alcoholic NH_3 and H_2S (Bender, *B* 20, 2749) Yellowish powder Decomposes on heating without melting Insol neutral solvents, *sol* alkalis Gives the pyrazole blue reaction Yields a bromo derivative [217°]

Di-oxy-di-phenyl-tetra methyl dipyrazyl

Formed by oxidation of oxy phenyl di methyl pyrazole with nitrous acid (Knorr & Blank, *B* 17, 2050) Long prisms (from $HOAc$), insol water and alkalis, *sol* conc H_2SO_4

Di-oxy di-phenyl-tetra methyl dipyrazyl

[245°] Formed by methylation of the preceding body (Knorr, *A* 238, 210) Crystals (from $MeOH$),

nearly insol water —B'H₂Cl₂ 2aq —B'H₂PtCl₆ • orange red prisms Picrate [c 161°]

Oxy di phenyl di-methyl-dipyrasyl sulphide $\text{NPh} \begin{smallmatrix} \text{CO} \\ \text{N} \end{smallmatrix} \begin{smallmatrix} \text{CH} \\ \text{CMe} \end{smallmatrix} \text{CH}_2 \text{S}$ Formed by adding phenyl hydrazine (2 mols) dissolved in HOAc to etho aceto acetic ether (1 mol) in the cold (Buchka a Sprague, B 23, 849) Formed also from oxy phenyl methyl pyrazole and SCl₂ in chloroform Small needles, decomposing at 183° without melting, sl sol alcohol, sol alkalis

OXY PHENYL METHYL PYRIDAZINE

$\text{NPh} \begin{smallmatrix} \text{CO CH} \\ \text{N} \text{CMe} \end{smallmatrix} \text{CH}$ [82°] Formed, together with its chloro- derivative [137°], from the anhydride of the phenyl hydrazide of levulinic acid and PCl₅ at 160° (Ach, A 253, 47) Translucent crystals, v sol alcohol Na added to its alcoholic solutions forms a compound C₁₂H₁₂N₄? [200°], coloured violet by H₂SO₄ and CrO₃ —B'HCl

Oxy phenyl-methyl-pyridasine

$\text{NPh} \begin{smallmatrix} \text{CO CO} \\ \text{N} \text{CMe} \end{smallmatrix} \text{CH}_2$ [196°] Formed from the chloro derivative, mentioned above, by treatment with alcoholic potash, the resulting $\text{NPh} \begin{smallmatrix} \text{CO C(OEt)} \\ \text{N} \text{CMe} \end{smallmatrix} \text{CH}$ [146°] being heated with HClAq at 130° White needles, sl sol hot water

OXY PHENYL-DI-METHYL PYRIDINE

$\text{C}_{13}\text{H}_{13}\text{NO} \pm e$ $\text{NPh} \begin{smallmatrix} \text{CMe CH} \\ \text{CMe CH} \end{smallmatrix} \text{CO}$ *Phenyl lutidone* [197°] (above 360°) Formed by the action of aniline on methyl dehydracetate (Perkin, B 18, 682, C J 51, 498), and also by heating its carboxylic acids (Conrad a Guthzeit, B 20, 161, 22, 85) Needles or prisms (containing aq) v sol hot water and alcohol —B'H₂PtCl₆ yellow needles (from water) —B'O₂H₂(NO)₂OH [95°] Transparent plates

Oxy phenyl di methyl pyridine

$\text{NMe} \begin{smallmatrix} \text{CO CH} \\ \text{CMe CH} \end{smallmatrix} \text{CPh}$ *Methyl phenyl p pco lostyrl* [112°] Formed by heating 'methyl-carbo phenyl lutidylum dehydride' with conc HClAq at 180° (Hantzsch, B 17, 2915) Prisms B'HCl 2aq —B'H₂PtCl₆ 3aq crystalline powder *m-Oxy (Py 3) phenyl (Py 1 5) di methyl-pyridine* C₁₁H₁₁NO ± e C₆H₅(OH) C₂NH₂(CH₃)₂ *Oxy phenyl lutidine* [191°] From the corresponding amido compound by the diazo-reaction White crystalline solid (Lepetit, B 20, 2399) —B'HCl 2aq —B'H₂PtCl₆ [c 200°]

OXY PHENYL DI METHYL PYRIDINE CARBOXYLIC ACID C₁₁H₁₁NO₃ ± e

$\text{NPh} \begin{smallmatrix} \text{CMe CH} \\ \text{CMe C(CO}_2\text{H)} \end{smallmatrix} \text{CO}$ [257°] Formed by heating the dicarboxylic acid at 227° (Conrad a Guthzeit, B 20, 161, 947, 22, 84) Formed also from β phenyl amido crotonic ether and NaOEt at 90° (Knorr, B 20, 1399) Satiny needles Melts at 267° when quickly heated —BaA', 4aq needles, v sol water

Methyl ether MeA' [152°] Formed from methyl dehydracetate and aniline (Perkin, jun, B 18, 682, C J 51, 498) Needles

Oxy-phenyl-di methyl-pyridine dicarboxylic acid $\text{NPh} \begin{smallmatrix} \text{CMe C(CO}_2\text{H)} \\ \text{CMe C(CO}_2\text{H)} \end{smallmatrix} \text{CO}$ Got by electrolysis of its ether Prisms, v sol hot alcohol —Ba(HA'')₂ aq

Ethyl ether EtA' [171°] Formed by

boiling an acetic acid solution of aniline and the product of the action of COCl₂ on cupric acetoacetic ether (Conrad a Guthzeit, B 19, 25, 20, 161) Crystalline solid, v sol alcohol —B'H₂PtCl₆ [120°] Orange yellow pp

m Oxy-(Py 3) phenyl-(Py 1 5)-di-methyl-pyridine-(Py 2 4) di carboxylic acid C₆H₅(OH) C₂N(CH₃)₂(CO₂H)₂ *m Oxy phenyl-lutidine di carboxylic acid*

Di-ethyl-ether A'Et, [174°] From the corresponding amido compound by the diazo reaction (Lepetit, B 20, 2398) White needles

OXY PHENYL METHYL PYRIMIDINE

$\text{CPh} \begin{smallmatrix} \text{N CMe} \\ \text{N CO} \end{smallmatrix} \text{CH}_2$ [216°] Formed by mixing a solution of benzamidine hydrochloride (1 mol) with acetoacetic ether (1 mol) and NaOH (1 mol) Formed also by the action of benzimidio ether CPh(NH)OEt on acetoacetic ether at 100° and of benzamidine on acetyl malonic ether (Pinner, B 18, 759, 2851, 22, 1624, 2617, 23, 3820) Needles, v sol alcohol, sl sol water —B'H₂PtCl₆ 2aq —B'C₆H₅(NO)₂OH [189°] —B'H₂Cr₂O₅ 5aq [177°] Orange red prisms

Acetyl derivative C₁₁H₁₁N₂O₃ [41°]

Ethyl derivative C₁₁H₁₁(OEt)₂N₂ [31°]

(300°) Formed from chloro phenyl methyl-pyrimidine and NaOEt Thick prisms —B'HCl 2aq [86°] —B'HCl [149°] —B'H₂PtCl₆ [197°] —B'HI 4aq [144°] Yellow prisms

Oxy phenyl methyl pyrimidine

$\text{CMe} \begin{smallmatrix} \text{N CPh} \\ \text{N CO} \end{smallmatrix} \text{CH}$ [238°] Formed from acetamidine hydrochloride, benzoyl acetic ether, and dilute (10 p c) NaOHAq (Pinner, B 22, 1618) Needles, m sol hot alcohol

Oxy phenyl-di-methyl-pyrimidine

$\text{CPh} \begin{smallmatrix} \text{N CMe} \\ \text{N CO} \end{smallmatrix} \text{CHMe}$ [203°] Formed from benzamidine hydrochloride, methyl acetoacetic ether, and NaOHAq (Pinner, B 22, 1624) Needles

Oxy di-phenyl-methyl-pyrimidine

$\text{CPh} \begin{smallmatrix} \text{N CPh} \\ \text{N CO} \end{smallmatrix} \text{CHMe}$ [250°] S 195 at 20° Formed from benzamidine and a benzoyl propionic ether (E v Meyer, J pr [2] 39, 197, 40, 303, Schwarze, J pr [2] 42, 12) Minute needles Oxidised by KMnO₄ to oxy di phenyl pyrimidine carboxylic acid [236°] Yields a methyl derivative [132°]

Oxy-phenyl-methyl-pyrimidine *Ethyl derivative* C₆H₅(OEt) C $\begin{smallmatrix} \text{N CMe} \\ \text{N CO} \end{smallmatrix} \text{CH}_2$ [146°]

Formed by mixing o ethoxy benzamidine hydrochloride with NaOH and acetoacetic ether (Pinner, B 23, 2953) Short columns, v sol alcohol

An isomeride [204°] is formed from p ethoxy benzamidine and acetoacetic ether or acetyl-malonic ether

Oxy-phenyl-di methyl-pyrimidine *Ethyl derivative* C₆H₅(OEt) C $\begin{smallmatrix} \text{N CMe} \\ \text{N CO} \end{smallmatrix} \text{CHMe}$ [216°]. Formed from p ethoxy benzamidine and methyl acetoacetic ether (P) Small prisms

Reference — Bromo - oxy - phenyl - methyl - PYRIMIDINE

OXY-PHENYL-DI-METHYL PYRIMIDINE CARBOXYLIC ACID

$\text{CPh} \begin{smallmatrix} \text{N CMe} \\ \text{N CO} \end{smallmatrix} \text{CH CH}_2 \text{CO}_2\text{H}$ [259°] Got by saponifying its ether Needles, sl sol water.

Ethyl ether EtA' [178°] Formed from acetyl succinic ether and benzamidine (Pinner B 22, 2618) Crystals, sl sol water

OXY-PHENYL-METHYL-PYRIMIDYLME THYL METHYL KETONE

$\text{CPh} \begin{smallmatrix} \text{N CMe} \\ \text{CO} \end{smallmatrix} > \text{C CH}_2 \text{CO CH}_2$, [225°] Formed from di-acetyl-succinic ether and benzamidine (Pinner, B 22, 2622) Needles, sl sol alcohol

OXY-PHENYL-METHYL PYRIMIDYL PRO- PIONIC ACID

$\text{CPh} \begin{smallmatrix} \text{N CMe} \\ \text{CO} \end{smallmatrix} > \text{CH CH}_2 \text{CH}_2 \text{CO}_2\text{H}$ [215°] Formed by saponification of its ether [145°], which is got by the action of benzamidine on acetyl glutaric ether (Pinner, B 22, 2620) Powder, sl sol water

OXY-TRI PHENYL-METHYL PYRROLE

$\text{C}_6\text{H}_5\text{NO}$ *se* $\text{NMe} < \begin{smallmatrix} \text{CO CPh}_2 \\ \text{CPh CH} \end{smallmatrix}$ *Tri phenyl-methyl pyrrolone* [139°] and [143°] Formed from $\text{C}_6\text{H}_5\text{CBz CHBz}$ and alcoholic methylamine (Japp a Klingemann, B 22, 2884, C J 57, 698) Colourless rhombohedra [139°], $a c = 1.248$ Occurs also in triclinic forms [143°], $a b c = 906.1 \ 870$, $\alpha = 79^\circ 52'$, $\beta = 86^\circ 3'$, $\gamma = 70^\circ 28'$ (Tutton, C J 57, 724) Oxidised by chromic acid to $\text{C}_6\text{H}_5\text{NO}$, [167°] Bromine in chloroform yields $\text{C}_6\text{H}_5\text{BrNO}$ [150°]

Dihydrate $\text{NMe} < \begin{smallmatrix} \text{CO} - \text{CPh}_2 \\ \text{CHPh CH}_2 \end{smallmatrix}$ *Tri-*

phenylmethylpyrrolidone [153.5°] Mol w (by Raoult's method) 335 (calc 327) Formed by reduction of the preceding body by sodium and boiling amyl alcohol Monoclinic needles, $a b c = 1.655 \ 1.1043$, $\beta = 88^\circ 29'$

Oxy-tetra-phenyl-methyl-pyrrole $\text{C}_6\text{H}_5\text{NO}$ *se* $\text{NMe} < \begin{smallmatrix} \text{CO CPh}_2 \\ \text{CPh CPh} \end{smallmatrix}$ [161°] Formed by heating $\text{C}_6\text{H}_5\text{CBz CHBz C}_6\text{H}_5$ with alcoholic methylamine at 200°, and also from benzoyl-tri-phenyl propiomethylamine and KOH (Klingemann a Laycock, C J 59, 146, B 24, 518) Small yellow monoclinic plates (from boiling alcohol), v sol CS₂.

OXY-PHENYL METHYL PYRROLE CARB- OXYLIC ACID *Ethyl ether*

$\text{NH} < \begin{smallmatrix} \text{CO CPh} \\ \text{CMe CCO}_2\text{Et} \end{smallmatrix}$ [128°] Formed by the action of alcoholic ammonia on phenyl acetyl-succinic ether (Emery, A 260, 152) Needles

Oxy-phenyl-methyl pyrrole dihydride carb- oxylic acid $\text{NPh} < \begin{smallmatrix} \text{CO CH}_2 \\ \text{CMe(CO}_2\text{H)} \end{smallmatrix} > \text{CH}_2$, [188°]

Obtained from its nitrile, which is made from levulic ether, HCy, and alcoholic aniline (Kühling, B 22, 2364) Hard prisms, sl sol water *Amide* [127°] Needles

Nitrile Oil Converted by NH_3 and H_2S into $\text{NPh} < \begin{smallmatrix} \text{CO} - \text{CH}_2 \\ \text{CMe(CS NH)} \end{smallmatrix} > \text{CH}_2$, [193°] Hy- droxylamine forms the amidoxim [120°]

OXY - PHENYL - METHYL - QUINAZOLINE

C_6H_5 $\begin{smallmatrix} \text{CO NMe} \\ \text{N} - \text{CPh} \end{smallmatrix}$ [181°] Formed by the action of KOH and MeI at 120° on o-benzoyl amido-benzamide or on oxy phenyl quinazoline (Körner, J pr [2] 86, 162) Shining lamellae, sol alcohol

Isomeride C_6H_5 $\begin{smallmatrix} \text{CO NPh} \\ \text{N CMe} \end{smallmatrix}$ [147°]. Formed

by heating the acetyl derivative of o amido benzoic anilide (K) Four-sided prisms

OXY - PHENYL - METHYL - QUINOLINE $\text{CMe CH C C(OH) CH} \begin{smallmatrix} \text{CH} \\ \text{CH} - \text{CH C N} - \text{CPh} \end{smallmatrix}$ [291°] Formed by heating its carboxylic acid at 250° (Just, B 19, 1544) Plates (from alcohol)

Isomeride v FLAVENOL

OXY - PHENYL - METHYL - QUINOLINE CARBOXYLIC ACID $\text{CMe CH C C(OH) C CO}_2\text{H} \begin{smallmatrix} \text{CH} \\ \text{CH CH C N} - \text{CPh} \end{smallmatrix}$

Formed by saponifying its ether [236°], which is got by heating to 160° the product of the action of $\text{C}_6\text{H}_5\text{MeN CClPh}$ on sodium malonic ether (Just, B 19, 1542) V sl sol water and alcohol

OXY - PHENYL - METHYL - (Py) - QUINO-

$\text{N} - \text{NPh} \begin{smallmatrix} \text{C} \\ \text{C} \\ \text{N} - \text{C(OH)} \end{smallmatrix} \begin{smallmatrix} \text{C} \\ \text{C} \\ \text{CMe} \end{smallmatrix}$ **PYRAZOL** C_6H_5 *Inner - anhy-*

dride of o amido di phenyl methyl pyrazol-carboxylic acid [261°] Formed by reduction of o nitro di phenyl methyl pyrazol carboxylic acid with SnCl_2 (Knorr a Jödicke, B 18, 2262) Fine needles V sol alcohol, chloroform, and acetic acid, insol water, alkalis, and dilute acids It can be distilled undecomposed It is a very stable body By sodium and alcohol it is reduced to a hydro compound which dissolves in strong H_2SO_4 with a deep green colour

OXY-PHENYL-METHYL-QUINOXALINE

$\text{C}_6\text{H}_5\text{Me}$ $\begin{smallmatrix} \text{N C(OH)} \\ \text{N CPh} \end{smallmatrix}$ [198°] Formed from (1,3,4)-tolylene diamine and phenyl glyoxylic acid (Hunsberg, A 237, 352) Pale yellow needles

γ OXY-γ-PHENYL-S DI-METHYL-SUCCINIC ACID $\text{CHPh(OH) CH(CO}_2\text{H) CHMe CO}_2\text{H}$ *Phenyl homo stamnic acid* The free acid is unstable, but the salts CaA'' 3aq, BaA'' 2aq, and $\text{Ag}_2\text{A}''$ are got by boiling its lactone with bases (Fittig a Penfield, B 216, 119, 20, 3179)

Lactone [177°] *Phenyl homoparaconic acid* Formed from benzoic aldehyde, sodium pyro tartrate, and Ac_2O by heating for 10 hours at 130° Plates (from water) Yields AgA' Forms phenyl-butylene (177°) on distillation Conc HBr at 0° forms $\text{CHPhBr CH(CO}_2\text{H) CHMe CO}_2\text{H}$ [149°] which on warming with water becomes $\text{CHPh CH CHMe CO}_2\text{H}$ The lactone [177°] is accompanied by an isomeride [124.5°] The lactone [177°] yields on distillation methyl-naphthol [89°], while the isomeride yields an isomeric methyl naphthol [92°] Both methyl-naphthols yield (8) methyl naphthalene on distillation with zinc dust

o - Oxy - phenyl - di - methyl succinic acid $\text{C}_6\text{H}_5\text{(OH) CH}_2\text{CH(CO}_2\text{H) CHMe(CO}_2\text{H)}$ [145° 150°] Formed by reducing coumaryl propionic acid in alkaline solution with sodium amalgam (Fittig a Brown, A 255, 288) Crystals, v sol water - BaA'' - CaA'' - $\text{Ag}_2\text{A}''$ curdy pp

Oxy-phenyl-methyl succinic acid is described as **OXY BENZYL-SUCCINIC ACID**

OXY-DI PHENYL-METHYL ψ-THIO UREA.

Methyl derivative $\text{C}_6\text{H}_5\text{(OMe) NH C(SMe) NPh}$ [80°] Formed by the action of MeI on phenyl amyl thio urea (Foerster, B 21, 1870) Long white needles

Di oxy-di phenyl-methyl- ψ thio-urea Di-methyl derivative

$C_6H_5(OMe)NH C(SMe)NC_6H_5OMe$ [87°] Made by heating di-anisyl thio urea with MeI at 100° (Foerster, B 21, 1860) Prisms, v e sol hot alcohol Yields on distillation MeSH and a substance [56°] which on boiling with dilute HCl gives di anisyl urea [184°]— $C_{12}H_{15}N_2SO_2HCl$ white plates— $B^*H_2PtCl_6$ prisms

OXY-PHENYL-NAPHTHYL-ACETIC ACID

$CPh(C_6H_5)(OH)CO_2H$ The salt NaA' 2aq [145°] is formed from sodium phenyl (α) naphthyl ketone, water, and CO_2 (Beckmann, B 22, 915)

α DI OXY PHENYL NAPHTHYL KETONE
 $C_6H_5(OH)CO C_{10}H_7(OH)$ [c 106°] Formed by heating (α) phenonaphthoxanthone with alcoholic potash at 200° (Phomina, A 257, 93) Yields a methyl derivative [66°], an acetyl derivative [137°] and an acetoxim [196°]

The $\alpha\beta$ isomeride [169°] yields K_2A'' and a methyl derivative [68°], an ethyl derivative [c 141°], an acetyl derivative [108°], an acetoxim [188°], and a phenyl hydrazide [198°]

DI OXY DI PHENYL OCTANE

$CPhPr(OH)CPhPr(OH)$ [64°] Formed by the action of sodium amalgam on a solution of phenyl propyl ketone in dilute alcohol (Schmidt & Fieberg, B 6, 499) Needles (from acetone)

Di oxy di phenyl-octane $C_6H_5CMe(C_6H_5OH)_2$ [83 5°] Formed from methyl hexyl ketone, phenol, and HCl (Dianin, J R 1888, 534) Needles Yields a di benzoyl derivative [114°]

OXY PHENYL OXANTHRANOL $C_{12}H_9O_3$

$C_6H_5 \begin{smallmatrix} CO \\ \diagup \quad \diagdown \\ C(OH)(C_6H_5OH) \end{smallmatrix} C_6H_5$ [194°]

Formed by oxidising oxy phenol anthranol with $KMnO_4$ (Pechmann B 13, 1617) Yellowish crystals Yields anthraquinone on oxidation

Acetyl derivative $C_{12}H_9O_4$ Needles

Di oxy-phenyl oxanthranol v PHENOL

PHTHALIDIN**OXY PHENYL-ISO OXAZOLE**

$CPh \begin{smallmatrix} CH \\ \diagup \quad \diagdown \\ N \end{smallmatrix} CO$ [147°] Formed from benzoyl acetic ether and hydroxylamine in acid, neutral, or ammoniacal solution (Claisen & Zedel, B 24, 141, Hantzsch, B 24, 502) Needles, sl sol cold alcohol $HClAq$ at 120° yields the oxim of acetophenone Ammonia forms $CPh \begin{smallmatrix} CH \\ \diagup \quad \diagdown \\ N \end{smallmatrix} CO NH_2$ [168°] Yields a

nitroso derivative $CPh \begin{smallmatrix} C(OH) \\ \diagup \quad \diagdown \\ N \end{smallmatrix} CO$ [143°]

DI OXY DI PHENYL OXIDE $C_{12}H_9O_3$ v e $O(C_6H_5OH)_2$? Formed from phenol and CrO_2Cl_2 (Eliard, B [2] 28, 276) Amorphous powder Yields quinone on oxidation, v RESORCIN

DI OXY DI PHENYL OXINDOLE $C_{20}H_{13}NO_2$

$se NH \begin{smallmatrix} C_6H_5 \\ \diagup \quad \diagdown \\ CO \end{smallmatrix} C(C_6H_5OH)_2$ Phenolsatin [220°] Formed by adding H_2SO_4 to a mixture of isatin and phenol (Baeyer & Lazarus, B 18, 2641) White needles, insol water, sol alkalis Acetyl derivative $C_{20}H_{13}O_3NaO$ [185°] Colourless needles (from HOAc)

Di methyl derivative $C_{20}H_{15}Me_2NO_2$ [65°] Made from anisole, isatin, and H_2SO_4

p OXY-PHENYL PENTADECYL KETONE

Methyl derivative $C_{15}H_{31}CO C_6H_5OMe$ [70 5°] (280° at 15 mm.) Formed from anisole,

palmityl chloride, and $AlCl_3$ (Krafft, B 21, 2269)

Ethyl derivative [69°] (289 at 15 mm) Formed in like manner from phenetole Plates

Di oxy-phenyl pentadecyl ketone Di-methyl derivative [63 5°] (290° at 15 mm) Formed in like manner from the dimethyl derivative of resorcin (K) Plates

DI OXY PHENYL PENTANE

$CHPh(OH)CH(OH)Pr$ [82°] (287°) Formed by the action of alcoholic potash on a mixture of benzoic and isobutyric aldehydes (Swoboda, M 11, 390) White crystals, v sol ether

Di-acetyl derivative $C_{11}H_{14}O_4$ [55°] (297°)

Di oxy phenyl pentane

$CHPh(OH)CH_2CH_2CH_2CH_2OH$ [54°] Formed by reducing benzoyl butyl alcohol with sodium amalgam The glycol is extracted with ether (Kipping & Perkin, jun, C J 57, 312). Needles (from benzene), v sol ether

Di-oxy-di-phenyl-pentane $CEt_2(C_6H_5OH)_2$ [200°] Formed from di ethyl ketone, phenol, and HCl (Dianin, J R 1888, 534) On fusion with NaOH it yields $C_6H_5C_6H_5OH$ [76 5°] (253°)

OXY PHENYL PENTENOIC ACID v OXY-PHENYL ANGELIC ACID**DI OXY DI PHENYL-PENTINOIC ACID**

Di methyl derivative $C_6H_5(OMe)CH CH CO(CO_2H)CH C_6H_5OMe$ [160°] Formed from p methoxy benzoic aldehyde, sodium succinate, and Ac_2O (Fittig & Politis, A 255, 299) Long yellow needles (from HOAc)— BaA' , 2aq silky plates— CaA' , 3aq— AgA light yellow pp

OXY-PHENYLPHENYLENE-ANTHRA-QUINONE DIHYDRIDE $C_{20}H_{12}O_2$ se

$CO \begin{smallmatrix} C_6H(OH) \\ \diagup \quad \diagdown \\ C_6H_2 \end{smallmatrix} CO \begin{smallmatrix} C_6H_5 \\ \diagup \quad \diagdown \\ C_6H_2 \end{smallmatrix} Ph$ [266°] Formed by

fusing truxone with potash (Liebermann & Bergmann, B 23, 321) Yellow needles, sl sol alcohol Yields an acetyl derivative $C_{20}H_{12}AcO_2$ [180°], v sol HOAc

OXY-DI PHENYL PHOSPHINE Phenyl derivative $P(C_6H_5)_2OPh$ (265°-270° at 62 mm) SG $\frac{2}{3}$ 114 VD 1002 (obs) Got by heating PPh_2Cl with phenol (Michaelis & La Coste, B 18, 2109) Oil Readily absorbs oxygen from the air, becoming $(C_6H_5)_2PO OPh$ Sulphur yields $(C_6H_5)_2PS OPh$ [124°] Selenium forms $Ph_2PSe(OPh)$ [115°] Yields a crystalline methyl iodide [c 136°] and a benzylo chloride $Ph_2P(OPh)CH Cl$ [232°-236°]

TETRA-OXY-DI PHENYL-PHTHALIDE**Anhydride v FLUORESCIN****OXY PHENYL-PHTHALIMIDE v. AMIDOPHENOL****DI-OXY-DI-PHENYL-PROPANE**

$OMe_2(C_6H_5OH)_2$ [154° cor] Got from acetone, phenol, and $BzCl$ (Dianin, J R 1888, 534) Flat needles Yields, on soda-fusion, p isopropyl-phenol [61°]

OXY PHENYL-PROPIOLIC ACID v Cog-**MARLIC ACID** **α -OXY β -PHENYL-PROPIONIC ACID**

$C_6H_5CH_2CH(OH)CO_2H$ [98°] Formed from phenyl acetic aldehyde, H_2Cy , and HCl (Erlenmeyer, B 18, 308, A 219, 179) Got also by reducing phenyl glyoxylic acid with sodium-amalgam (Plöchl B 16, 2823) Prisms (from

water) Yields formic acid and phenyl-acetic acid on heating —BaA', aq globular aggregates
Nitrile [58°] Needles (from benzene)

***β* Oxy *β* phenyl propionic acid**

$C_6H_5CH(OH)CH_2CO_2H$ [93°] Formed by the action of sodium amalgam on the acid $C_6H_5CH(OH)CHClCO_2H$ (Glaser, *A* 147, 86) and by boiling *β*-bromo *β*-phenyl propionic acid with water (Fittig a Binder, *A* 195, 138) Got also by reducing benzoyl acetic ether with sodium amalgam (Perkin, *C J* 47, 254) Prisms, v sol cold water Yields cinnamic acid on heating with baryta water (Kast, *A* 206, 26) or with dilute H_2SO_4 at 100° (Erlenmeyer) —KA' —BaA', 1:1 aq —ZnA', 1:1 aq —AgA' needles

***Acetyl derivative* [100 5°] Crystals**

Yields cinnamic acid when heated with Ac_2O at 120° (Slocum, *A* 227, 59)

***β* Oxy-*α*-phenyl-propionic acid**

$CH_3(OH)CHPhCO_2H$ *Tropic acid* Mol w 166 [118°] S 2 at 145°

Formation —1 By decomposing atropine or hyoscyamine with fuming $HClAq$ or with baryta water (Lossen, *A* 138, 230, Kraut, *A* 148, 238, Ladenburg, *B* 13, 607) —2 From atropic acid by union with $HOCl$ followed by reduction with zinc dust, iron filings, and conc $KOHaq$ (Ladenburg a Rüdheimer, *B* 13, 379) —3 From atropic acid by heating it with fuming hydrogen chloride at 100° and digesting the resulting acid ($CHClCHPhCO_2H$) with aqueous Na_2CO_3 at 120° (Ladenburg, *A* 217, 114) —4 From acetophenone cyanhydrin by treatment with HCl , the resulting chloro phenyl propionic acid being heated with sodium carbonate (Spiegel, *B* 14, 237, 1852, Merling, *A* 209, 5)

Properties —Needles or tables, v sol water Yields phenyl acetic acid on fusion with potash Chromic mixture oxidises it to benzoic acid

Salts —CaA', 4aq —AgA' crystals

***Reference* —CHLORO TROPIC ACID**

***α* Oxy *α* phenyl propionic acid**

$C_6H_5CMe(OH)CO_2H$ *Atrolactic acid* [94°]

Formation —1 From atropic acid by successive treatment with HBr and aqueous Na_2CO_3 (Fittig a Wurster, *A* 195, 145, 206, 24) —2 By oxidation of *α*-phenyl propionic acid with alkaline $KMnO_4$ (Ladenburg a Rüdheimer, *B* 13, 373, *A* 217, 107) —3 By reduction of the dibromo derivative obtained by the action of H_2SO_4 on a mixture of dibromo pyruvic acid and benzene (Böttinger, *B* 14, 1238) —4 By dissolving the cyanhydrin of acetophenone in saturated $HClAq$ (Spiegel, *B* 14, 1353, Tiemann, *B* 14, 1980)

Properties —Trimetric needles or tables (containing $\frac{1}{2}aq$), $abc = 72.1$ 57 Becomes anhydrous below 85° Gives rise to atropic acid CH_3CPhCO_2H on distillation with HCl

Salts —CaA', 8aq —BaA', 2aq —ZnA', 2aq. small crystals, v sl sol cold water

Ethyl derivative $CMePh(OEt)CO_2H$ '*Ethyl tropic acid*' [c 62°] Formed from acetophenone by treatment with PCl_5 , acting upon the resulting $PhCCl_2Me$ with KCy and dilute alcohol, and saponifying the product with baryta Small prisms, sol hot water

Nitrile Formed from acetophenone, KCy and HCl (S) Oil

***p*-Oxy-*α*-phenyl-propionic acid**

$C_6H_4(OH)CHMeCO_2H$ *Phloretic acid*. [129°].

Formed from phloretin (7g) and KOH (55 cc. of S G 1.2) by boiling for 3 hours (Hlasiwetz, *J* 1855, 700, Schiff, *A* 172, 357) Formed also from amido phenyl propionic acid by diazo reaction (Trimus, *A* 227, 268) Yellowish needles V sol hot water, sol alcohol and ether, insol CS_2 Yields *p* oxy benzoic acid on fusion with potash On heating with phloroglucin at 180° it yields the crystalline phloroglucide $C_{23}H_{16}O_{11}$ Heating with $POCl_3$ forms crystalline triphloretide $C_{12}H_8O_6$ Phloretic acid gives a green colour with $FeCl_3$, possibly due to phloroglucin
 Salts —BaA', 2aq —CuA', (at 120°)

Ethyl ether EtA' (above 265°)

Isoamyl ether $C_5H_{11}A'$ (above 290°)

Methyl derivative

$C_6H_4(OMe)CHMeCO_2H$ [108°] S 11 at 25°. Got by methylation (Körner a Corbetta, *B* 7, 1732) Yields BaA', 2aq and MeA' (38°) (278°)

Ethyl derivative [106 5°] Scales

Amide $C_6H_4NO_2$ [110°-115°] Prisms

Isophloretic acid, made by boiling isophloretin with $KOHaq$ (Roehleider, *Z* 1868, 711) is probably identical with phloretic acid

***o* Oxy *β* phenyl propionic acid**

$C_6H_4(OH)CH_2CH_2CO_2H$ *Mellitic acid Hy drocoumaric acid* [83°] S 5 at 18°, 109 at 40° Occurs, partly combined with coumarin, in yellow mellot (*Mellotus officinalis*) (Zwenger a Bodenbender, *A* 126, 257, *Suppl* 5, 100)

Formed by reducing coumarin with sodium-amalgam (Zwenger, *A* *Suppl* 8, 32, Dyson, *C J* 51, 70, Hochstetter, *A* 226, 355, Tiemann, *B* 10, 286) Trimetric crystals Its ammoniacal solution turns blue in air Yields salicylic acid when fused with potash Conc $HBrAq$ converts it into the anhydride

Salts —KA', 2aq —BaA', 3aq —CaA', —CaA', 2aq —MgA', 4aq —CuA', 2aq —PbA', —ZnA', aq —AgA' bulky pp

Ethyl ether EtA' [34°] Prisms

Methyl derivative

$C_6H_4(OMe)CH_2CH_2CO_2H$ [92°] Crystals (from alcohol) (Perkin, *C J* 39, 416)

Ethyl derivative

$C_6H_4(OEt)CH_2CH_2CO_2H$ [80°] Needles (from dilute alcohol) Yields the salts $Ba(C_6H_4O_2)_2$ and CaA_2 , 2aq (Fittig a Ebert, *A* 216, 153)

Anhydride $C_6H_4O_2$ *Hydrocoumarin* [25°] (272°) Got by distilling the acid Tables, sl

sol hot water Its oxim $C_6H_4<\frac{C=O}{O}>C(NOH)$ is only (Tiemann, *B* 19, 1664)

Amide $C_6H_4NO_2$ [70°] Needles

***m* Oxy-*β* phenyl propionic acid**

$C_6H_4(OH)CH_2CH_2CO_2H$ [111°] Formed by reduction of *m*-coumaric acid (Tiemann a Ludwig, *B* 15, 2050) Long needles, insol ligroin

Ethyl derivative [c 51°] Needles

***p* Oxy-*β* phenyl propionic acid**

$[4\frac{1}{2}]C_6H_4(OH)CH_2CH_2CO_2H$ *Hydropara coumaric acid* [129°] Occurs in very slight quantity in human urine (Baumann, *H* 4, 307) Formed by reducing paracoumaric acid with sodium amalgam (Hlasiwetz a Malin, *A* 142, 358) Formed also from *p* nitro-cinnamic ether by reduction followed by the diazo reaction (Stöhr, *A* 225, 57, cf. Buchanan a Glaser, *Z* [2] 5, 198) Occurs in putrid meat (Salkowski, *B* 13, 190). Formed also by putrefactive fermentation of tyrosine (Baumann, *B* 12, 1450;

Acetyl derivative $C_{11}H_{11}AcON_2Oaq$ [100°] Prisms

Nitrosamine $C_{10}H_{11}(NO)N_2O$ [109°].

DI-*p*-OXY-DI-PHENYL PROPYLENE *Di-methyl derivative* $CH_3CH(O_2CH_3)_2$ [101°] Formed from anisole, $AlCl_3$, and propionyl chloride (Gattermann, *B* 22, 1130) Plates Yields $CO(O_2CH_3)_2$ on oxidation The homologous $CH_3CH(O_2CH_2OEt)_2$ crystallises in needles [77°]

OXY-PHENYL ISOPROPYL KETONE

Ethyl derivative $C_6H_5(OEt)COCHMe$, [41°] Made from isobutyl chloride, C_6H_5OEt , and $AlCl_3$ (Gattermann, *B* 23, 1206) Tables (from ether) Yields an oxim [111°] crystallising in needles

Oxy phenyl propyl ketone $C_6H_5COCH_2CH_2OH$ [91°] (c 280°) Formed from phenol and butyl chloride (Perkin, *C J* 55, 546) Pearly plates

DI-OXY-PHENYL-ISOPROPYL-PYRIM

IDINE $CH<\begin{smallmatrix} OPh-N \\ O(OH)N \end{smallmatrix}>CMe(OH)$ [198°]

Formed from oxy isobutyramidine hydrochloride, benzoyl acetic ether, and $NaOH_{aq}$ (Pinner, *B* 22, 2626) Prisms (from alcohol or benzene)

OXY-TRI-PHENYL-PROPYL-PYRROLE

$C_{25}H_{23}NO$ *is* $NPr<\begin{smallmatrix} CO CPh_2 \\ CPh CH \end{smallmatrix}>$ [105°] Formed from $C_6H_5CBzCHBz$ and alcoholic propylamine at 100° (Japp a Klingemann, *C J* 57, 706) Monoclinic prisms [95°-98°] or triclinic prisms [105°], $a:b:c = 694:1:765$

DI-*o*-OXY-DI-PHENYL PROPYL- ψ -THIO

UREA *Di methyl derivative* $C(SPr)(NH C_6H_5OMe)N C_6H_5OMe$ [58°] Made from di-anisyl thio urea and propyl chloride (Foerster, *B* 21, 1864) Plates, insol water

OXY-DI-PHENYL PYRAZINE *Tetra*

hydride $NPh<\begin{smallmatrix} CH_2CH_2 \\ CO CO \end{smallmatrix}>NPh$ [148°] Formed from di phenyl ethylene diamine, chloro acetic acid, and $NaOAc$ at 170° (Bischoff a Nastvogel, *B* 22, 1788, 23, 2026) Crystalline insol Aq

Di-oxy di phenyl pyrazine *Dihydrate*

$NPh<\begin{smallmatrix} CH_2CH_2 \\ CO CO \end{smallmatrix}>NPh$ *Di phenyl as diacetyl perazine* [258°] Got by oxidising the above with CrO_3 and $HOAc$, and also by heating di phenyl ethylene diamine with oxalic acid at 200° (B a N) Plates, v sl sol alcohol and ether Nitrous acid forms $C_{16}H_{16}N_4O_2$ [290°]

Di-oxy di phenyl-pyrazine *Dihydrate*

$NPh<\begin{smallmatrix} CO CH_2 \\ CH_2 CO \end{smallmatrix}>NPh$ *Diphenyl as diacetyl perazine* *Di oxy-di phenyl piazine dihydrate* [268°] Made from aniline and chloro acetic acid (Hausdörfer, *B* 22, 1797, cf Meyer, *B* 10, 1967, Abenius, *J pr* [2] 40, 431) Needles Alcoholic potash forms phenyl amido acetic acid [127°] on boiling, and in the cold produces $NHPhCH_2CO NPhCH_2CO_2H$ [130°]

Di-oxy-phenyl-pyrazine *Dihydrate*

$NPh<\begin{smallmatrix} CH_2CO \\ CH_2CO \end{smallmatrix}>NH$ [158°] Made from aniline and chloro-acetic amide (B) Prisms

Di-oxy-di-phenyl-pyrazine *Dihydrate*

$NPh<\begin{smallmatrix} CH_2CO \\ CH_2CO \end{smallmatrix}>NPh$ *Diphenyl-as diacetylperazine* [152°] Formed by heating the mono-amide of phenyl-imido diacetic acid with Ac_2O

at 160° (Bischoff, *B* 23, 1990) Needles Nitrous acid yields $C_{16}H_{16}N_4O_2$ [c 95°] crystallising in golden plates

Di-*p*-oxy-di-phenyl-pyrazine *Di-methyl derivative of the hexahydrate*

$C_6H_5(OMe)N<\begin{smallmatrix} CH_2CH_2 \\ CH_2CH_2 \end{smallmatrix}>N C_6H_5OMe$ [238°].

Formed from *p* anisidine, ethylene-bromide, and $NaOAc$ (Bischoff, *B* 22, 1782) Tables

Di ethyl derivative of the hexahydrate [223°] Gives a nitroso derivative [c 80°]

Tri oxy di phenyl-pyrazine *Di ethyl derivative of the tetrahydrate*

$C_6H_5(OEt)N<\begin{smallmatrix} CH_2CH_2 \\ CH_2CO \end{smallmatrix}>N C_6H_5OEt$ [162°].

Formed from $C_6H_5(NH C_6H_5OEt)_2$ by heating with chloro acetic acid and fused $NaOAc$ at 150° (Bischoff, *B* 23, 2030) Crystals, sl sol ether

Tetra oxy di phenyl-pyrazine *Di ethyl derivative of the dihydrate*

$C_6H_5(OEt)N<\begin{smallmatrix} CH_2CO \\ CO CH_2 \end{smallmatrix}>N C_6H_5OEt$ [265°]

Formed by heating *p* ethoxy phenyl amido-acetic acid at 260° (B a N) Needles

OXY PHENYL PYRAZOLE $C_6H_5(OH)N_2$ [153°] Got from bromo oxy phenyl pyrazole by reduction with sodium amalgam (Fischer a Knoevenagel, *A* 239, 201) Needles Sol conc HCl_{aq} and alkalis The Na salt forms needles

Oxy-phenyl pyrazole tetrahydrate $C_6H_5N_2O$ *is* $NPh<\begin{smallmatrix} NH CH_2 \\ CH_2CH(OH) \end{smallmatrix}>?$ [104°] Formed by the

action of phenyl hydrazine on epichlorhydrin in ethereal solution at 15° (Gerhard, *B* 24, 352) Pearly prisms (from ether), v sol warm water Yields aniline and phenyl pyrazole on boiling with phenyl hydrazine hydrochloride in benzene solution Forms an acetyl derivative—Salt $B'H_2PtCl_2$ 2aq [156°] Yellowish red prisms

Oxy-di-phenyl-pyrazole $NPh<\begin{smallmatrix} NH CO \\ CPh CH \end{smallmatrix}>NPh$ *Di phenylpyrazolone* [251°] Formed by heating cinnamoyl phenyl hydrazine (Knorr, *B* 20, 1108) Needles (from alcohol), exhibiting green fluorescence

Oxy di phenyl pyrazole $NPh<\begin{smallmatrix} N CPh \\ CO CH_2 \end{smallmatrix}>$

[137°] Formed from benzoyl acetic ether and phenyl hydrazine (Knorr a Klotz, *B* 20, 2546) Yields, with nitrous acid, the red compound

$NPh<\begin{smallmatrix} N CPh \\ CO CNOH \end{smallmatrix}>$ [200°] Diazobenzene chloride forms $C_6HPhN_2O(N_2Ph)$ [171°] Phenyl hydrazine converts it into di oxy tetra phenyl dipyrazyl melting above 300° — $B'HCl$ — $B'H_2SO_4$ Powder Decomposes at 237°

Oxy di phenyl-pyrazole $NPh<\begin{smallmatrix} N CH \\ CO CHPh \end{smallmatrix}>$

[196°] Formed from a phenyl glyoxylic acid and phenyl hydrazine (Wishnecus, *B* 20, 2932) Plates (from $EtOH$), sl alkalis, sl sol ether

Di-oxy-phenyl metapyrazole $C_6H_5N_2O$, probably $C_6H_5OH-N=\begin{smallmatrix} O(OH)N \\ C(OH) \end{smallmatrix}$ [182°] Ob-

tained by boiling phenyl uramido aceto nitrile $C_6H_5CH(OH)NHCO NH_2$ (from benzaldehyde-cyanhydrin and urea) with dilute HCl Colourless dimetric plates Dissolves readily in alkalis (Pinner a Lifschutz, *B* 20, 2355)

OXY PHENYL PYRAZOLE CARBOXYLIC

ACID $C_{10}H_9N_3O_3$, $\text{v sol NPh} \left\langle \begin{smallmatrix} \text{N} & \text{C}(\text{CO}_2\text{H}) \\ & \text{CO OH} \end{smallmatrix} \right\rangle$ [263°]

Formed by the action of HCl or NaOH on the phenyl hydrazide of oxalacetic ether (Buchner, *B* 23, 2931) Colourless needles, v sl sol cold water FeCl₃ colours its solution dark blue
• *Ethyl ether* [182°] Formed by heating the above phenyl hydrazide by itself (Wishnecus, *A* 246, 306)

OXYPHENYL PYRIDINE $C_{11}H_9NO$ Formed by heating aniline chelidonate (Lerch, *M* 5, 407) Crystallises from water in needles (containing aq)

Oxy-di-phenyl-pyridine $C_{17}H_{11}NO$ $\text{v sol NH} \left\langle \begin{smallmatrix} \text{CPh CH} \\ \text{CPh CH} \end{smallmatrix} \right\rangle \text{CO}$ [267°] Formed by heat

ing dehydro benzoyl acetic acid with alcoholic NH₃ at 160° (Feist, *B* 23, 3736) Plates

DI OXY-PHENYL PYRIDINE CARBOXYLIC ACID $C_{12}H_9(OH)_2NPh \text{ CO}_2\text{H}$ Made by boiling a solution of comenic acid with aniline (Mennel, *J pr* [2] 32, 177) Tetrahedra (containing aq), m sol water Coloured violet by FeCl₃

OXY PHENYL PYRIMIDINE $C_{10}H_7N_2O$ $\text{v sol CPh} \left\langle \begin{smallmatrix} \text{N} & \text{CH} \\ \text{N} & \text{C}(\text{OH}) \end{smallmatrix} \right\rangle \text{CH}$ [199°] Made by heating its carboxylic acid (Pinner, *B* 22, 2616) Small prisms, sl sol hot Aq, v sol alkalis and acids

Oxy di phenyl pyrimidine $C_{16}H_{11}N_2O$ $\text{v sol CPh} \left\langle \begin{smallmatrix} \text{N} & \text{CPh} \\ \text{N} & \text{C}(\text{OH}) \end{smallmatrix} \right\rangle \text{CH}$ [284°] Formed from benzamididehydrochloride, benzoyl acetic ether, alcohol, and dilute (10 p c) NaOH (Pinner, *B* 22, 1626) Formed also by heating amido di phenyl pyrimidine with HClAq at 180° (Schwarze, *J pr* [2] 42, 15) Needles, v sl sol hot alcohol

Oxy tri phenyl pyrimidine $C_{22}H_{15}N_2O$ [340°] Formed by heating the corresponding amido compound with HClAq at 170° (Wache, *J pr* [2] 39, 255) Needles

Di oxy di phenyl pyrimidine *Ethyl derivative* $C_8H_7(OEt)_2 \text{C} \left\langle \begin{smallmatrix} \text{N} & \text{CPh} \\ & \text{N} & \text{C}(\text{OH}) \end{smallmatrix} \right\rangle \text{CH}$ [274°] Formed from *p* ethoxy benzamidine and benzoyl-acetic ether (Pinner, *B* 23, 2956)

OXY PHENYL PYRIMIDINE CARBOXYLIC ACID $C_{10}H_7 \left\langle \begin{smallmatrix} \text{N} & \text{C}(\text{CO}_2\text{H}) \\ & \text{N} & \text{C}(\text{OH}) \end{smallmatrix} \right\rangle \text{CH}$ [247°] Formed from benzamidine hydrochloride, oxalacetic ether, and dilute (10 p c) NaOH (Pinner, *B* 22, 1628, 2616) Granules, sl sol water—BaA"—CaA'. Prisms—Amide prisms, sl sol water—Benzamidide $C_{10}H_7N_2O_3$ [263°]

Oxy di phenyl-pyrimidine carboxylic acid $C_{16}H_{11} \left\langle \begin{smallmatrix} \text{N} & \text{CPh} \\ & \text{N} & \text{C}(\text{OH}) \end{smallmatrix} \right\rangle \text{CO}_2\text{H}$ [236°] Made by oxidising oxy di phenyl methyl pyrimidine with KMnO₄ (E von Meyer, *J pr* [2] 40, 303) Yellowish prisms (from alcohol) Yields oxy-di phenyl pyrimidine [284°] on heating

Di oxy phenyl pyrimidine carboxylic acid *Ethyl derivative* $C_8H_7(OEt)_2 \text{C} \left\langle \begin{smallmatrix} \text{N} & \text{C}(\text{CO}_2\text{H}) \\ & \text{N} & \text{C}(\text{OH}) \end{smallmatrix} \right\rangle \text{CH}$ [246°] Made from *p*-ethoxy benzamidine and oxalacetic ether (Pinner, *B* 23, 2956) Needles, sl sol hot alcohol—Salt $C_8H_7(OEt)_2 \text{CN}_2\text{H}_4\text{A}'$ [280°]

VOL. III.

OXY-TRI PHENYL-PYRROLE $C_{21}H_{15}NO$ s.e.

$\text{NH} \left\langle \begin{smallmatrix} \text{CO CPh}_2 \\ \text{CPh CH} \end{smallmatrix} \right\rangle$ Mol w 311 [221°] Formed by boiling C_6H_5 , CBz CHBz for a long time with alcoholic ammonia (Japp a Klingemann, *B* 22, 2884, *C J* 57, 682) Triclinic crystals, $\alpha b c = 779 \ 1 \ 512$, $\alpha = 78^\circ 56'$, $\beta = 73^\circ 23'$, $\gamma = 87^\circ 32'$ (Tutton, *C J* 57, 720) Sl sol hot alcohol

Dihydrate $\text{NH} \left\langle \begin{smallmatrix} \text{CO} & \text{CPh}_2 \\ & \text{CHPh CH}_2 \end{smallmatrix} \right\rangle$ [201°]

Formed by reduction with sodium and amyl alcohol Ac_2O at 180° yields an acetyl derivative $\text{NaO} \left\langle \begin{smallmatrix} \text{CO} & \text{CPh}_2 \\ & \text{CHPh CH}_2 \end{smallmatrix} \right\rangle$ [105°].

o Oxy-tri-phenyl-pyrrole

$C_6H_5(OH) \text{N} \left\langle \begin{smallmatrix} \text{CPh CH} \\ \text{CPh CH} \end{smallmatrix} \right\rangle$ [176°] Made by heating its carboxylic acid with lime (Paal a Braikoff, *B* 22, 3094) Yellowish needles, v sol alkalis

Oxy-tetra phenyl-pyrrole

$C_{22}H_{15}NO$ $\text{v sol NH} \left\langle \begin{smallmatrix} \text{CO CPh}_2 \\ \text{CPh CH} \end{smallmatrix} \right\rangle$ [207°]. Formed by heating CPhBz CPhBz with alcoholic NH₃ at 200° (Klingemann a Laycock, *C J* 59, 144, *B* 24, 513) Pale yellow plates

Dihydrate $\text{NH} \left\langle \begin{smallmatrix} \text{CO} & \text{CPh}_2 \\ & \text{CHPh CHPh} \end{smallmatrix} \right\rangle$ [237°]

Oxy tetra phenyl pyrrole $C_6H_5N_2O$ [182°] Formed from CPhBz CHBz and alcoholic NH₃ at 200° Yellow prisms Changed into the iso meride [207°] by heating to 310°

o-OXY TRI PHENYL-PYRROLE CARBOXY-

LIC ACID $C_6H_5(OH) \text{N} \left\langle \begin{smallmatrix} \text{CPh C CO}_2\text{H} \\ \text{CPh CH} \end{smallmatrix} \right\rangle$ [245°] Made from its ethyl ether [159°] which is got by the action of o amido phenol on phenacyl benzoyl acetic ether (Paal a Braikoff, *B* 22, 3093) Nodular groups of needles, v sol ether

OXY-PHENYL-QUINAZOLINE

Dihydrate $C_6H_5 \left\langle \begin{smallmatrix} \text{CH}_2 \text{NPh} \\ \text{NH CO} \end{smallmatrix} \right\rangle$ [143°] Formed from phenyl- ω oxy tolyl urea and HCl (Söderbaum a Widman, *B* 22, 1670) Needles

Oxy phenyl quinazoline

$C_6H_5 \left\langle \begin{smallmatrix} \text{C}(\text{OH}) \text{N} \\ \text{N}=\text{CPh} \end{smallmatrix} \right\rangle$ [234°] S (alcohol) 2. Formed by heating benzoyl o amido benzamid (Korner, *J pr* [2] 36, 157) Needles, insol water—B'H₂PtCl₆ brick red needles

Oxy phenyl quinazoline $C_6H_5 \left\langle \begin{smallmatrix} \text{CO NPh} \\ \text{N}=\text{CH} \end{smallmatrix} \right\rangle$

[189°] Formed by oxidation of phenyl quinazoline dihydride with KMnO₄ (Paal a Busch, *B* 22, 2691) Plates, v sol benzene With hydrazine N₂H₄ it forms $C_6H_5 \left\langle \begin{smallmatrix} \text{C}(\text{N}_2\text{H}_2) \text{NPh} \\ \text{N}=\text{CH} \end{smallmatrix} \right\rangle$ [204°]—B'HCl [214°]—Platinochloride [above 300°] Yellow needles

Di-oxy phenyl quinazoline *Dihydrate* $\text{CH}_2\text{CH}_2\text{C} \left\langle \begin{smallmatrix} \text{N} & \text{CPh} \\ & \text{CO CH}_2 \text{C}(\text{OH}) \text{N} \end{smallmatrix} \right\rangle$ [272°] Formed from

di oxy terephthalic ether, dihydride, and benzamidine (Pinner, *B* 22, 2623) Slender needles, sol alkalis, sl sol alcohol

OXY PHENYL-QUINAZOLINE CARBOXY-

LIC ACID $C_6H_5 \left\langle \begin{smallmatrix} \text{N} & \text{CH} \\ \text{CO N} & \text{CO N} \end{smallmatrix} \right\rangle \text{CO}_2\text{H}$ [320°]. Made by oxidising oxy *p* tolyl-quinazoline (Paal a Busch, *B* 22, 2693) White crystals

(a) **OXY (Py 1)-PHENYL-QUINOLINE**
 $C_{11}H_{11}NO \text{ is } C_6H_5 \cdot \begin{smallmatrix} C(C_6H_5OH)CH \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad CH \end{smallmatrix}$ Phenol-quinoline [248°] Formed by diazotising (a)-amido (Py 1)-phenyl-quinoline [150°], and boiling the dilute H_2SO_4 solution (Koenigs a Nef, B 20, 629) Colourless flat needles or plates Volatilises undecomposed V sol alcohol and chloroform, sl sol benzene, nearly insol ether By CrO_3 and H_2SO_4 it is oxidised to cinchoninic acid The hydrochloride forms glistening plates, the sulphate yellow tables, both are v sol hot water, sl sol cold The platino chloride forms hair-fine yellow needles, v sol conc HCl The K and Na salts are colourless glistening plates, which dissolve in water with a yellow colour

(8) **Oxy (Py 1) phenyl quinoline** $C_{11}H_{11}NO$
 $\text{is } C_6H_5 \cdot \begin{smallmatrix} C(C_6H_5OH)CH \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad CH \end{smallmatrix}$ Phenol quinoline [235°] Formed by diazotising the corresponding amido compound [198°] and boiling the dilute H_2SO_4 solution (Koenigs a Nef, B 20, 630) Colourless granular crystal Sl sol alcohol, nearly insol ether Volatilises undecomposed Dissolves with a yellow colour in alkalis and acids By CrO_3 and H_2SO_4 it is oxidised to cinchoninic acid KOH fusion yields di-oxy-phenyl-quinoline [305°] The sulphate crystallises in glistening yellow needles, the hydrochloride in yellow tables, both are m sol cold water

o Oxy (Py 3) phenyl quinoline
 $C_6H_5 \cdot \begin{smallmatrix} CH \quad CH \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad C \quad C_6H_5 \quad OH \end{smallmatrix}$ [115°] Got by heating its (Py 1)-carboxylic acid [238°] (Doebner, A 249, 101) Light yellow needles (from alcohol), sol alkalis and acids $-B'_2H_2PtCl_4$ $-B'_2C_6H_5N_2O$, [184°] Yellow needles

m Oxy-(Py 3) phenyl-quinoline
 $C_6H_5 \cdot \begin{smallmatrix} CH \quad CH \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad C \quad C_6H_5 \quad OH \end{smallmatrix}$ [156°] Formed by the action of nitrous acid upon m amido phenyl-quinoline (Miller a Kinkel, B 18, 1908) Long needles, v sol alcohol and ether

p Oxy (Py 3) phenyl quinoline
 $C_6H_5 \cdot \begin{smallmatrix} CH \quad CH \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad C \quad C_6H_5 \quad OH \end{smallmatrix}$ [238°] Formed from the amido-compounds (Weidel, M 8, 127) Monoclinic needles, insol water, v sol hot benzene Yields quinoline carboxylic acid [157°] on oxidation Yields a crystalline tetrahydride on reduction $-B'HCl$ 2aq $-B'_2H_2PtCl_4$ Acetyl derivative [123°] Plates

(Py 1, 4) **Oxy-phenyl quinoline**
 $C_6H_5 \cdot \begin{smallmatrix} C(OH) \quad CH \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad CPh \end{smallmatrix}$ [254°] Formed, by heating to 250°, from the phenyl β amido cinnamic ether $NPhH$ CPh CH CO_2Et , got by the action of aniline on benzoyl acetic ether (Conrad a Lumpkin, B 21, 521, Knorr, A 245, 377) Got also by heating its carboxylic acid (Just, B 19, 1462) Plates, v sl sol water, insol ether $-B'HCl$ [230°]. Needles (from alcohol) $-B'HCl$ 2aq (J)

(B 2) **Oxy-(Py 3) phenyl-quinoline** *Methyl derivative*
 $C_6H_5 \cdot \begin{smallmatrix} C(OMe) \quad CH \quad C \quad CH \quad CH \\ \backslash \quad \quad \quad / \\ CH \quad CH \quad \quad \quad C \quad N \quad CPh \end{smallmatrix}$ [133°] Got by heating its carboxylic acid [237°] (Doebner, A 249, 106) Plates (from dilute alcohol) $-B'HCl$ needles, sol. hot water $-B'_2H_2PtCl_4$ $-Picrate$ [205°].

(B 4)-**Oxy (Py 3)-phenyl quinoline** *Methyl derivative*
 $CH \quad CH \quad \quad \quad C \quad OH \quad CH$
 $CH \quad C(OMe) \quad C \quad N \quad CPh$
 Formed by heating its carboxylic acid [216°] (D) Oil $-B'_2H_2PtCl_4$ 2aq orange needles

Di oxy phenyl-quinoline $C_{11}H_{11}NO_2$ etc
 $C_6H_5 \cdot \begin{smallmatrix} C(C_6H_5OH) \quad CH \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad C \quad OH \quad (?) \end{smallmatrix}$ [305°] Formed by potash fusion from (8) oxy (Py 1) phenyl quinoline [235°], the yield being 75 p c (Koenigs a Nef, B 20, 632) Needles, v sol alcohol Has no basic properties An isomeride, solid at 315°, appears to be formed from (a)-oxy (Py 1)-phenyl quinoline by potash fusion.

Di oxy-phenyl quinoline [114°] Formed in small quantity when p amido (Py 3) phenyl quinoline is acted upon by nitrous acid (Weidel, M 8, 127) Prisms, insol water Reduced by zinc dust to (Py 3) phenyl quinoline

Di-oxy phenyl-quinoline
 $C(OH) \quad CH \quad C \quad CH \quad CH$
 $CH = CH \quad C - N \quad C(C_6H_5OH)$ [247°] Formed from (B 2) oxy p amido (Py 3) phenyl quinoline by the diazo reaction (Weidel a Georgievitch, M 9, 138) Pale-yellow mass of hair like needles, sl sol hot water Yields (Py 3) phenyl quinoline when distilled with zinc dust

Di-oxy-(Py 1) phenyl-quinoline *Methyl derivative*
 $C(OH) \quad CH \quad C \quad C(C_6H_5OH) \quad CH$
 $CH \quad CH \quad \quad \quad C \quad N \quad \quad \quad CH$
 [188°] Got by boiling the diazo compound of m amido (Py 1)-phenyl (B 2) methoxy quinoline with dilute H_2SO_4 (Miller a Kinkel, B 20, 1922) Plates Its solution in dilute H_2SO_4 gives with chlorine water, a little NaOH, and ammonia, a dark green colour

Tetrahydride [111°] Tablets Gives a deep green with $FeCl_3$ and HCl $-B'HCl$ plates (Py 4)-**OXY (Py 2) PHENYL-ISOQUINOL-**

$C_6H_5 \cdot \begin{smallmatrix} CH \quad CPh \\ \backslash \quad \quad \quad / \\ N \quad \quad \quad CO \quad NH \end{smallmatrix}$ or *Isobenzylidene*

phthalimidine [197°] Formed by the action of ammonia on deoxybenzoin o carboxylic acid CH_2Bz $C_6H_5 \quad CO \quad H$ Prepared by heating crude isobenzylidene phthalide (15 g) with alcoholic NH_3 (30 cc) at 100° for 8-10 hours (Gabriel, B 18, 2449, 3470, 19, 830) Triclinic crystals, $abc = 8608 \text{ 1 ?}$, $\alpha = 88^\circ 28'$, $\beta = 111^\circ 24'$, $\gamma = 74^\circ 47'$ Sl sol cold alcohol By heating with $POCl_3$ or PCl_5 it is converted into (Py 4)-chloro (Py 2) phenyl isoquinoline, PCl_5 yields (Py 1, 4) di chloro (Py 2) phenyl quinoline Nitrous acid converts it into (Py 1) nitro-(Py 4) oxy (Py 2) phenyl isoquinoline

Ethylether $C_{11}H_{11}N(OEt)$ [46°] Formed by heating chloro phenyl isoquinoline with alcoholic sodium ethylate (Gabriel, B 19, 835) Flat colourless needles, v sol ordinary solvents, weak base $-B'_2H_2PtCl_4$, reddish pp.

Di oxy-phenyl-iso-quinoline
 $C_6H_5 \cdot \begin{smallmatrix} C(OH) \quad CPh \\ \backslash \quad \quad \quad / \\ CO \quad \quad \quad NH \end{smallmatrix}$ [257°] Formed from nitro benzylidene phthalide, P, and HI (Gabriel, B 18, 3471, 20, 2866) Crystals, sl sol boiling Aq
Methyl ethers Two isomeric methyl ethers [237°] and [121°] may be prepared Both are crystalline.

Reference — CHLORO OXY PHENYL ISOQUINOLINE

(Py 1, 3, 2)-OXY PHENYL-QUINOLINE CARBOXYLIC ACID $C_6H_4 \begin{smallmatrix} \diagup C(OH) \\ \diagdown N \end{smallmatrix} \begin{smallmatrix} \diagup CO_2H \\ \diagdown CPh \end{smallmatrix}$

[232°] Made from its ethyl ether [262°] which is formed by heating NPh CPh CH(CO₂Et), to 150°, alcohol being split off (Just, B 18, 2632, 19, 1462) Crystals (containing aq), v sl sol hot water —AgA' sl sol water

o Oxy (Py 3, 1)-phenyl quinoline carboxylic acid $C_6H_4 \begin{smallmatrix} \diagup C(CO_2H)CH \\ \diagdown N \end{smallmatrix} C_6H_4OH$ [238°] Made from salicylic aldehyde, aniline, and pyruvic acid (Doebner, A 249, 98) Needles, v sl alcohol —AgA'—H₂A'.H₂PtCl₆, golden yellow needles.

(B 2, Py 3, 1) Oxy phenyl quinoline carboxylic acid *Methyl derivative* C(OMe) CH C C(CO₂H) CH CH CH—C—N CPh *Phenyl quinic acid* [237°] Formed by heating together

equimolecular quantities of *p* amido anisole, benzene aldehyde, and pyruvic acid in an alcoholic solution (Doebner, A 249, 105) Needles, insol water —AgA'—H₂A'.H₂PtCl₆, orange red crystals

(B 4, Py 3, 1) Oxy phenyl quinoline carboxylic acid *Methyl derivative* CH CH—C C(CO₂H) CH CH C(OMe) C—N CPh [216°] Formed in like manner from [2 1]C₆H₄(NH₂)OMe, benzoic aldehyde, and pyruvic acid (D) Yellow needles —PbA'.aq —AgA'—H₂A'.H₂PtCl₆.

DI OXY DI-PHENYL QUINOXALINE *Diethyl derivative* CH C(OEt) C N CPh CH C(OEt) C N CPh

[163°] Formed by the action of benzil and NaOAc on an alcoholic solution of the diethyl ether of (a) di amido hydroquinone (Nietzki & Rechberg, B 23, 1212) Yellow needles

Di oxy di phenyl quinoxaline Dihydrate *Di methyl derivative*

$C_6H_4 \begin{smallmatrix} \diagup NCHC_6H_4OMe \\ \diagdown NCHC_6H_4OMe \end{smallmatrix}$ *Phenylanisaldehyde* [129°] Formed from anisic aldehyde and phenylene *o* diamine (Rugheimer a Ladenburg, B 11, 1660) Needles (from alcohol)

α-OXY PHENYL-SUCCINIC ACID

$C_6H_4C(OH)(CO_2H)CH_2CO_2H$ *Phenyl maleic acid* [188°] S 159 at 15° Formed by heating a bromo phenyl succinic acid with hot water (Alexander, A 258, 76) Needles (from chloroform) Yields, on heating, phenyl maleic anhydride [119°], phenyl fumaric acid [161°], and a sublimate [106°] probably atropic acid

β Oxy-phenyl succinic acid $C_6H_4CH(CO_2H)CH(OH)CO_2H$ [150°–160°] S 37 35 at 15° Got from C₆H₄CH(CHO)CO₂Et, potassium cyanide, and HCl (A) Crystalline powder, v sol water Yields phenyl maleic anhydride when heated to 160°

Di-oxy-di-phenyl succinic acid CO₂H CPh(OH) CPh(OH) CO₂H *The nitrile* of this acid CPh(OH)Cy CPh(OH)Cy [182°] is formed by union of benzil with HCN (Zimin, A 34, 189, Jacoby, B 19, 1519) It is converted in the cold by HOAc saturated with HBr into the amide C₆H₄N₂O [150°–230°] (Burton, B 16, 2282)

DI-OXY-DI-PHENYL SULPHIDE S(C₆H₄OH)₂ [151 5°] Formed from 'thio-

aniline' by the diazo reaction (Krafft, B 7, 1165, 22, 821), and also by the action of SOCl₂ on phenol in presence of CS₂ (Tassinari, G 17, 88) Silvery plates, sl sol cold water.

Di acetyl derivative [93°]

An isomeride [129°] may be obtained from S(C₆H₄Br OH)₂ [176°] by reduction with zinc-dust (T)

Reference — DI BROMO DI-OXY-DI PHENYL SULPHIDE

Di p-oxy-di-phenyl disulphide S₂(C₆H₄OH)₂ [151°] Formed by oxidising *p*-oxy phenyl mercaptan (thio hydroquinone) with dilute FeCl₃ (Leuckart, J pr [2] 41, 196) Yellow needles, v e sol alcohol

Di acetyl derivative [89°]. Plates

Di o oxy di-phenyl disulphide

S₂(C₆H₄OH)₂ Formed by heating sodium phenate (2 mols) with sulphur (1 at) at 190° (Hartinger, M 4, 165) Thick oil Yields *o* oxy-phenyl mercaptan on reduction —NaHA"6aq —KHA"5aq —PbA" yellow pp

Di methyl derivative Me₂A" [119° cor]. Yields anisole *o* sulphonic acid on oxidation

DI-OXY DI-PHENYL SULPHONE

SO₂(C₆H₄OH)₂ [239°] S G 15 1 366 Formed by heating phenol (2 pts) with fuming H₂SO₄ (1 pt) at 190° (Glutz, A 147, 52, Annaheim, J pr [2] 1, 14, 2, 385, B 8, 1059, 11, 1668, A 172, 28) Trimetric crystals, a b c = 1.283 1.0 534. V sol hot water and alcohol —K A" Sol. alcohol (Guarachi, G 8, 246) —NH₄HA" —NaHA"aq —AgHA" —AgA"

Di acetyl derivative Needles (Glutz)

Di methyl ether Me₂A" [130°]

Di ethyl ether [159°] Laminæ

Di isoamyl ether [98°] Plates

Di oxy di-phenyl sulphone SO₂(C₆H₄OH)₂

[187°] Got from its acetyl derivative which is made by oxidation of C₆H₄(OAc)(SH) [1.2 or 3] (Tassinari, C C 1888, 1354) Crystalline, sl sol water

References — DI BROMO, DI BROMO DI-NITRO-, DI CHLORO, TETRA IODO, DI IODO-DI-NITRO, and DI NITRO, DI OXY DI PHENYL SULPHONE

OXY PHENYL SULPHONIC ACID *o* PHENOL SULPHONIC ACID

Oxy diphenyl sulphonic acid C₆H₅(OH)SO₃H Made, together with the disulphonic acid, by heating oxydiphenyl (1 pt) with H₂SO₄ (3 pts) (Latschnoff, J R 5, 54) —KA' aq plates, sl sol water —BaA'₂aq —CaA'₂3aq —K₂CuA'₂ 6aq green laminæ

Oxy diphenyl disulphonic acid

C₆H₅(OH)(SO₃H)₂ Made as above —K₂A" 1½aq.

Di oxy diphenyl disulphonic acid

[4 2 1] C₆H₅(OH)(SO₃H) C₆H₅(SO₃H)(OH) [1 2 4] Made from benzidine disulphonic acid by the diazo reaction (Lamprecht, A 261, 334) Crystalline mass The K salt forms laminæ, v e sol. water —BaA"2aq —PbA"4aq rhombohedra.

Di p-oxy diphenyl disulphonic acid

C₆H₄(OH)₂(SO₃H)₂ Got by warming di-oxy-diphenyl with fuming H₂SO₄ (Doebner, B 9, 130). Probably identical with the preceding acid. —K₂A" prisms, sl sol cold water

Di p-oxy-diphenyl trisulphonic acid

C₆H₄(OH)₂(SO₃H)₃ Formed, together with the tetra-sulphonic acid, from benzidine by diazotising and warming with conc H₂SO₄ (Griess, J 1866, 462) —Ph₂C₆H₄S₃O₉ 2aq —Ph₂C₆H₄S₄O₁₀ 2PbO. 8 c 2

Di *p*-oxy-diphenyl tetrasulphonie acid
 $C_{12}H_8(OH)_2(SO_3H)_4$ Made as above—BaA^{iv} 54q
 prisms— Pb, C, H, S, O_2 amorphous pp

***o*-OXY-PHENYL-SULPHONO-180BUTYRIC ACID**
 $C_{12}H_8, SO_2, CH_2, OMe(OH) CO_2H$ [121°]
 Made by oxidising $CH_2(SPh) CMe(OH) CO_2H$
 with $KMnO_4$ in the cold (Delisle, *A* 260, 259)
 Prisms (from ether)—KAⁱ 2aq needles—BaAⁱ,
 —CaAⁱ, aq groups of needles

OXY-PHENYL SULPHURIC ACID

$C_6H_4(OH) O SO_3H$ The K salts of the *o*-, *m*-,
 and *p*-compounds are formed by the action of
 $K_2S_2O_8$ on potassium pyrocatechin, resorcin, and
 hydroquinone respectively (Baumann, *B* 11,
 1918) They are crystalline, sol water, and
 unstable Potassium pyrogallol yields, in like
 manner, $C_6H_3(OH)_3SO_3K$ crystallising in needles

OXY-PHENYL-THIAZOLE $\begin{matrix} S(OH) \\ CH OPh \end{matrix} \gg N$

[204°] Formed from bromo acetophenone by
 the action of xanthamide (Hubacher, *A* 259,
 249), or by successive treatment with barium
 sulphocyanide and dilute HCl (Arapides, *A* 249,
 14, of Dyckerhoff, *C J* 92, 327) Needles,
 insol water, sol cold $NaOH$ aq Converted by
 PCl_5 into chloro-oxy-phenyl thiazole [206°] and
 another body [98°] (Schatzmann, *A* 261, 18).

Sodium and EtI yield $\begin{matrix} S CO \\ CH OPh \end{matrix} > NEt$ [71°],
 which on heating with HCl at 220° gives $NEtH_2$.

Di-*exo-o*-oxy-phenyl-thiazole dihydride

Methyl derivative $\begin{matrix} S-CO \\ CH_2, CH_2 \end{matrix} > N C_6H_4OMe$

[116°] Formed by the action of boiling alco-
 holic chloro acetic acid on the product of the
 action of CS_2 on the substance formed from
 ethylene bromide and di anisyl thio-urea (Foer-
 ster, *B* 21, 1867) Plates, v sol alcohol

***p*-OXY-PHENYL THIOCARBIMIDE** *Acety-*
l derivative $C_6H_4(OAc) NCS$ [36°] Made
 by heating di *p*-oxy di phenyl urea with Ac_2O
 (Kalkhoff, *B* 16, 1831) Plates, sol alcohol

Methyl derivative $C_6H_4(OMe) NCS$
 [265°] Formed from anisidine and CS_2 (Hof-
 mann, *B* 20, 1796, of Salkowski, *B* 7, 1012)

Isomeride **OXY METHENYL AMIDO PHENYL-**
MERCAPTAN

Di-oxy phenyl-thiocarbimide *Di-methyl*
derivative $C_6H_4(OMe)_2 NCS$ Formed by heat-
 ing $CS(NH C_6H_4(OMe)_2)_2$ with conc HCl aq
 (Bechhold, *B* 22, 2381) Occurs in three crys-
 talline forms [57°], [120°], and [155°] Sol
 aniline and H_2SO_4

DI-OXY-DI-PHENYL-THIOHYDANTOIN
Di-methyl derivative $C_{12}H_{14}N_2SO_2$, i.e.
 $C_6H_4(OMe) N C N(C_6H_4OMe) S CH_2 CO$ [190°] Made

from di-anisyl thio urea and fused chloro acetic
 acid (Foerster, *B* 21, 1867) Needles

***p*-OXY-PHENYL-THIO-UREA** C_6H_4NH, SO i.e.
 $C_6H_4NH CS NH(OH)$ [108°] Formed from

phenyl-thiocarbimide and aqueous hydroxyl
 amine (Schiff, E Fischer, *B* 22, 1935, Tie-
 mann, *B* 22, 1939, Von der Kall, *A* 263, 260,
 Voltmer, *B* 24, 378) White plates, insol water,
 sl sol ether, v sol alcohol Fehling's solution
 ppt Os_2S Dilute acids and alkalis decompose
 it, yielding phenyl cyanamide

Methyl derivative $NHPh CS NH OMe$
 [116°] Formed from phenyl-thiocarbimide and
 methyl-hydroxylamine.

Ethyl derivative [103°] Prisms De-
 composed, by boiling its alcoholic solution, into
 phenyl cyanamide, alcohol, and S

Benzyl derivative [113°] Prisms

o-Oxy-phenyl-thio-urea

$C_6H_4(OH) NH CS NH_2$ [161°] Made from *o*-
 amido phenol hydrochloride and potassium sul-
 phocyanide (Bendix, *B* 11, 2263) Needles, sol
 hot water— B^i, H_2PtCl_6

Methyl derivative

$C_6H_4(OMe) NH CS NH_2$ [152°] Needles (from
 alcohol) (Muhlhauser, *B* 13, 923)

Ethyl derivative

[110°] Tablets, sol
 alkalis (Berlinerblau, *J pr* [2] 80, 106)

p-Oxy-phenyl thio-urea

[41] $C_6H_4(OH) NH CS NH_2$ [214°] Got by
 evaporating to dryness on the water-bath, a so-
 lution of potassium sulphocyanide and *p* amido
 phenol hydrochloride (Kalkhoff, *B* 16, 375).
 Tables, sl sol cold water

Ethyl derivative Crystalline (B)

o Oxy-diphenyl-thio-urea

$NHPh CS NH C_6H_4OH$ [146°] Formed by the
 action of phenyl thiocarbimide on *o*-amido-
 phenol (Kalkhoff, *B* 16, 1829) White pearly
 plates Heated by itself or with HgO it loses
 H_2S , yielding anilido carbamido phenol

Methyl derivative

$NHPh CS NH C_6H_4OMe$ [127°] Formed from
 anisyl thiocarbimide and aniline, and also from
 phenyl-thiocarbimide and anisidine (Foerster,
B 21, 1868) Prisms With ethylene bromide
 it forms crystals [143°] whence platine chloride
 yields $(C_6H_4N_2OS)_2, H_2PtCl_6$

p-Oxy-di-phenyl-thio urea

$NHPh CS NH C_6H_4OH$ *p* Oxy thiocarbimide
 [162°] Formed by the action of phenyl thio-
 carbimide on *p* amido phenol (K) V sol alcohol
 and alkalis, nearly insol water

Acetyl derivative

[137°] Insol alkalis
Di *o*-oxy-di-phenyl thio urea *Di-methyl*
derivative $CS(NH C_6H_4OMe)_2$ [135°] Formed
 from *o* anisidine, CS_2 , and alcoholic potash
 (Muhlhauser) Formed also from anisidine and
 thio urea in alcoholic solution (F) Needles, sl
 sol water With methyl iodide it forms
 $C_6H_4(OMe) N C(SMe) NH C_6H_4OMe$ [87°] EtI
 forms $C_{12}H_{18}N_2SO_2$ [82.5°], while propyl iodide
 gives $C_{18}H_{28}N_2SO_2$ [58°] Ethylene bromide gives
 $CH_2 < \begin{matrix} S \\ CS \end{matrix} CH_2$ crystallising in trimetric
 prisms [186°] and yielding $C_6H_4NH_2NS_2OMeI$
 [c 141°] and, on boiling with alcohol and chloro-
 acetic acid, $S < \begin{matrix} CO \\ CH_2 \end{matrix} > NC_6H_4OMe$ [116°]

Di-*p*-oxy-di-phenyl thio-urea [222°] Got
 from *p* amido phenol and CS_2 (K) Pearly
 plates, v sol alkalis

Di-methyl derivative [185°] Plates
 (Salkowski, *B* 7, 1012) Sl sol alcohol

Di-oxy-di-phenyl-thio urea

Di-methyl derivative $NHPh CS NH C_6H_4(OMe)_2$ [137°]
 Formed by the combination of phenyl thiocarb-
 imide with amido-di methyl-hydroquinone
 (Baessler, *B* 17, 2123) Minute needles, v sol.
 hot benzene and hot alcohol

Tetra-oxy-di phenyl thio urea

Tetra-
methyl derivative $CS(NH C_6H_4(OMe)_2)_2$,
 [160°] Formed from the di methyl derivative of
 amido resorcin and CS_2 (Bechhold, *B* 22, 2380).
 White mass (from alcohol-ether), insol alkalis

An isomeride [109°] is formed from the dimethyl derivative of amido-hydroquinone (Baessler)

Reference - DI CHLORO DI OXY-DI-PHENYL-THIO-UREA

OXY-PHENYL-TOLYLAMINE v TOLYL-AMIDO PHENOL

TRI OXY-DI-PHENYL-TOLYL-CARBINOL

Anhydride $C_{20}H_{16}O_4$, i.e.

Corallin Formed by the action of nitrous acid on rosaniline (Caro & Wanklyn, *J pr* 100, 49, A 179, 192) Got also by heating a mixture of phenol and cresol with H_2SO_4 and arsenic acid (Zulkowsky, *B* 10, 1201) Red plates with green lustre, nearly insol water, sol chloroform, alcohol, and acids Alkalis form a red solution Reduced by sodium amalgam to tri oxy di-phenyl tolyl methane Water at 240° yields phenol and $C_6H_4(OH)CO C_6H_4Me(OH)$ KCl followed by HCl forms crystalline $C_{20}H_{16}NO_4$, whence Ac_2O yields $C_{21}H_{14}Ac_2NO_4$ [142°]

p-OXY-PHENYL p-TOLYL-HYDRAZINE

Ethyl derivative

$C_6H_4(OEt)NH NH C_6H_4Me$ Formed by reducing $C_6H_4(OEt)N_2 C_6H_4Me$ with alcoholic ammonium sulphide (Noelting & Werner, *B* 23, 3258, *Bl* [3] 4, 794) Needles, v sol hot alcohol The isomerides $C_6H_4NH NHCO C_6H_4Me(OEt)$ [1 3 4] [76°] and $C_6H_4NH NHCO C_6H_4Me(OEt)$ [1 5 2] [105°] are formed in like manner

DI OXY-PHENYL-TOLYL KETONE

$C_6H_4(OH)CO C_6H_4Me(OH)$ [200°] Formed by heating rosolic acid with water at 220°-250° (Graebe & Caro, A 179, 196) Crystals, sol hot water

Di acetyl derivative [150°] Needles

Di oxy phenyl tolyl ketone Anhydride

$C_6H_4 \begin{array}{c} \diagup \\ O \\ \diagdown \end{array} C_6H_4Me$ [105°] Made by boiling p tolyl salicylate for a long time (Graebe & Feer, *B* 19, 2612) V sol hot alcohol

Tri oxy phenyl-tolyl ketone

$C_6H_4(OH)CO C_6H_4Me(OH)_2$ Anhydride $C_{18}H_{14}O_4$ [140°] Made by fusing salicylic acid with orcin and $ZnCl_2$ (Michael, *Am* 5, 95) Yellow needles (from alcohol) -NaA' 14aq

Acetyl derivative $C_{19}H_{14}AcO_4$ [152°]

DI OXY-PHENYL-DI-TOLYL METHANE

$CHPh(C_6H_4MeOH)_2$ [171°] Formed from o-cresol benzoin and boiling SO_2Aq (Schroeter, A 257, 70) Yellow needles Yields a di bromo-derivative [130°] and a di nitro-derivative [127°]

Di acetyl derivative $C_{22}H_{16}Ac_2O_4$ [94°]

Di benzoyl derivative [91 5°] Plates

Tri oxy-di-phenyl-tolyl methane

$C_6H_4Me(OH)CH(C_6H_4OH)_2$ Phenolphthalol [190°] Obtained by boiling phenol phthalin $CO_2H C_6H_4CH(O_2H)_2$ with $HOAc$ and sodium-amalgam (Baeyer, A 202, 87) Prisms (from dilute $HOAc$), v sol alcohol

Tri-acetyl derivative $C_{22}H_{14}O_4$ [40°]

Tri-oxy di-phenyl-tolyl-methane $C_{20}H_{16}O_4$, i.e.

$C_6H_4Me(OH)CH(O_2H)_2$ Leucorosolic acid Got by reducing rosolic acid with potash and zinc-dust (Graebe & Caro, A 179, 198) Needles (from alcohol), v al sol water

Tri-acetyl derivative. [149°]. Needles.

DI OXY-PHENYL o TOLYL PYRAZINE.

[166°] Formed by heating aniline with chloro-acetyl o tolyl amido acetic acid at 160° (Abenius, *J pr* [2] 40, 443) Formed also by the action of o toluidine on chloro acetyl phenyl amido-acetic acid in presence of $NaOAc$ (Bischoff, *B* 23, 1996) White needles, v sol hot alcohol The isomeric compound from p-toluidine also crystallises in needles [221°]

OXY-PHENYL-p-TOLYL-PYRIMIDINE

from tolenyl amidine and benzoyl acetic ether (Pinner, *B* 23, 3826) Slender needles, sl sol hot alcohol

o OXY PHENYL o TOLYL-THIO-UREA

$CH_2(OH)C_6H_4NH OS NHPH$ [o 136°] Made from phenyl thiocarbimide and o amido benzyl alcohol (Söderbaum & Widman, *B* 22, 1871). Prisms Alcohol and HgO convert it into

o OXY-PHENYL TOLYL-UREA

$CH_2OH C_6H_4NH CO NHPH$ [191°] Made from o amido benzyl alcohol and $PhNCO$ (Söderbaum & Widman, *B* 22, 1670) Needles

v OXY-PHENYL UREA $C_6H_4NH CO NH OH$

[140°] Made from phenyl cyanate and aqueous hydroxylamine (E Fischer, *B* 22, 1935, von der Kall, A 263, 264) Crystals, v al sol water, sol alkalis Reduces hot Fehling's solution On boiling with alkalis it yields aniline, CO_2 , and hydroxylamine

Benzyl derivative

$NHPH CO NH OCH_2Ph$ [106°] Needles (Tiemann, *B* 22, 1940, Voltmer, *B* 24, 384)

o Oxy phenyl-urea $C_6H_4(OH)NH CO NH_2$

[154°] Made from o amido phenol hydrochloride and potassium cyanate (Kalkhoff, *B* 18, 374) Prisms, v sol water

Methyl derivative

$C_6H_4(OMe)NH CO NH$ [147°] Crystals (Muhlhauser, *B* 13, 922, A 207, 244)

p-Oxy phenyl-urea $C_6H_4N_2O_4$ [168°] (K).

Needles or tables, sol acids and alkalis

Ethyl derivative [160°] Made from

$C_6H_4(NH_2)OEt$ and $KCyO$ (Berlinerblau, *J pr* [2] 30, 103) Nitrous acid passed into its alcoholic solution forms brick-red crystals of $C_6H_4N_2O_4$

Di-o-oxy di-phenyl urea Di-methyl

derivative $CO(NH C_6H_4OMe)_2$ [182°] Made from $COCl_2$ and o anisidine (M., Conrad, *B* 21, 1649) Crystals, v sol alcohol

Di p oxy-di phenyl urea Di-methyl derivative

$C_{12}H_{10}N_2O_4$ [234°] Prisms or needles (Lossen, A 175, 295, Pieschel, A 175, 812) V sl sol hot alcohol

β-OXY PHENYL VALERIC ACID $C_{11}H_{14}O_4$, i.e.

$CHPh(OH)CMe_2CO_2H$ Phenyl-oxypivalic acid [184°] Formed from benzoic aldehyde, sodium isobutyrate, and isobutyric anhydride by Perkins's reaction (Fittig & Jayne, A 216, 119, Ott, A 227, 61) Needles, sl sol. cold water. Split up at 150° into CO_2 and phenyl-butylene. -BaA', 4aq -CaA', 4aq plates, m. sol. water

Acetyl derivative [187°]. Monoclinic crystals (from CS_2). Yields $Ba(C_{11}H_{13}O_4)_2$ 2aq and CaA' 2aq

Anhydride $C_{10}H_{16}O_4$, [155°] Prisms
Iso-butyryl derivative [65°] Needles,
 v. sl. sol water Yields $Ba(C_{11}H_{17}O_4)_2$, 2aq,
 CaA'_2 , 2aq, and AgA'

β -Oxy-phenyl-n-valeric acid
 $C_6H_5CH_2CH_2CH(OH)CH_2CO_2H$ [131°] Got
 by boiling β styryl-propionic acid with $NaOH$ aq
 (Fittig, *B* 24, 84) Prisms

β -Oxy-phenyl-valeric acid
 $CH_3CH(OH)CH(CH_2Ph)CO_2H$ [153°] Got
 by reducing benzyl aceto acetic ether (Ehrlich,
B 8, 1086, *A* 187, 26) Needles (from benzene)
 $-BaA'_2$, 2aq $-Zn(OH)A'$ $-Cu(OH)A'$

γ -Oxy- α -phenyl-valeric acid
 $CH_3CH(OH)CH_2CHPhCO_2H$ Formed from
 α -phenyl- β acetyl propionic acid by reduction
 with sodium amalgam (Weltner, *B* 17, 73)
 The free acid at once forms the only anhydride
 $C_{11}H_{18}O_4 - Ca(C_{11}H_{17}O_4)_2$ aq crystalline

γ -Oxy- γ -phenyl-isovaleric acid The only
 lactone $C_9H_{14}O_3$ $\begin{smallmatrix} CHMe \\ \diagup \quad \diagdown \\ O \quad CO \end{smallmatrix} CH_2$ is made by
 warming γ -bromo γ -phenyl isovaleric acid with
 aqueous Na_2CO_3 (Fittig a Liebmann, *A* 255,
 271) It yields $Ba(C_{11}H_{17}O_4)_2$

Oxy-phenyl-valeric acid **Methyl deriva-**
tive $C_6H_5(OMe)CH_2CH_2CH_2CO_2H$ Got
 by reducing $C_6H_5(OMe)C_2H_4CO_2H$ with sodium-
 amalgam (Perkin, *C* 39, 438) $-Oil - BaA'_2$

Di-oxy-phenyl-valeric acid **Methylene**
derivative $C_6H_5OCH_2CH_2CO_2H$ *Piperhy-*
droic acid [96°] Made by reducing (8) hydro-
 piperic acid with sodium amalgam (Fittig a
 Buri, *A* 216, 178) Thin tables (from alcohol) $-$
 CaA'_2 aq v sl sol cold water

Di-oxy-phenyl-valeric acid
 $C_6H_5CH(OH)CH_2CH(CO_2H)CH(OH)CH_3$ The
 only anhydride of this acid is got by reducing
 phenacyl-acetoacetic ether (Wellner, *B* 17, 69)

Tri-oxy-phenyl-valeric acid **Methylene**
derivative

$CH_3OCH_2C_6H_4CH_2CH(OH)CH_2CH_2CO_2H$ [95°]
 Made by reducing with sodium amalgam the acid
 $CH_3OCH_2C_6H_4CH_2COCH_2CH_2CO_2H$ (Weinstein,
A 227, 38) Crystals, m sol hot water Yields
 an oily lactone $-BaA'_2 - AgA'$ flocculent pp

Tri-ppr-oxy di phenyl-valeric acid **Di-**
methyl derivative

$C_6H_5(OMe)CH(OH)CH_2CH(CO_2H)CH_2C_6H_5OMe$
 The lactone [83°] is got by the action of sodium-
 amalgam on its bromo derivative [136°], which
 is formed by dissolving di bromo di p methoxy-
 di-phenyl-valeric acid in $HOAc$ (Fittig a Politis,
A 255, 305) It yields a gummy Ba salt

Tetra-oxy-phenyl-valeric acid **Methylene**
derivative

$CH_3OCH_2C_6H_4CH_2CH(OH)CH(OH)CH_2CO_2H$
 [128°] Made by oxidising (a) hydropiperic
 acid with $KMnO_4$ at 0° (Regel, *B* 20, 415)
 Slender crystals $-BaA'_2 - AgA'$ needles

Anhydride $C_{11}H_{18}O_5$ [104.5°] Crystals.
 An isomeric acid

$CH_3OCH_2C_6H_4CH_2CH_2CH(OH)CH(OH)CO_2H$
 [165°], formed by oxidising (8) hydropiperic
 acid, yields the salts CaA'_2 aq and AgA'

Reference $-Tetra-bromo-oxy-phenyl-val-$
eric acid

c OXY-PHTHALIC ACID $C_6H_5(OH)(CO_2H)_2$
 [123] [α 200°] *S* 20 at 17° Obtained by
 potash fusion from its methyl derivative (Jacob

sen, *B* 16, 1965), and from c sulpho phthalic
 acid (Stokes, *Am* 6, 282) Got also from c -
 amido-phthalic acid (Bernthsen, *B* 20, 937).
 Prisms (from water), v sol alcohol and ether
 Coloured red by $FeCl_3$ Forms a fluorescein
 when heated with resorcin $-KHA''$ needles $-$
 AgA'' pp, sl sol hot water

Anhydride $C_6H_5(OH) \begin{smallmatrix} CO \\ \diagup \quad \diagdown \\ CO \end{smallmatrix} O$ [α 148°]

Formed by heating the acid

Methyl derivative $C_6H_5(OMe)(CO_2H)_2$
 [160°] Formed by oxidation of c methoxy-
 toluic acid with $KMnO_4$ Minute prisms

Anhydride of the methyl derivative

$C_6H_5(OMe)C_2O_2$ [87°] Needles (by sublimation)
 α -Oxy-phthalic acid $C_6H_5(OH)(CO_2H)_2$ [1344]
 [185°] (Rée), [205°] (Claus) *S* 3 at 10°

Formation -1 From t -amido phthalic acid
 by the diazo reaction (Baeyer, *B* 10, 124, 1079)
 2 By oxidising α methoxy o toluic acid with
 potassium permanganate, and heating the re-
 sulting $C_6H_5(OMe)(CO_2H)_2$ with hydrochloric acid
 (Schall, *B* 12, 816) -3 By potash fusion from
 $C_6H_5(SO_2NH_2)(CO_2H)_2$, which is got by oxidising
 [341] and [521] $C_6H_5Me(SO_2NH_2)(CO_2H)$ (Ja-
 cobsen, *B* 14, 42) -4 By fusing i sulpho phtha-
 lic acid with $NaOH$ (Graebe a Rée, *C* 49, 524,
B 18, 1130, 1630) -5 By fusing di chloro-(a)
 naphthoquinone sulphonic acid with potash
 (Claus, *J* pr [2] 87, 194) -6 By fusing di
 nitro naphthol sulphonic acid with potash (Rée,
A 233, 230)

Properties $-$ Needles, sl sol cold water, sol
 alcohol and ether Gives a yellowish red colour
 with $FeCl_3$ Dilute HCl at 180° forms m oxy
 benzoic acid Gives the fluorescein reaction
 with resorcin at 200° $-AgA''$ tufts of needles

Methyl ether Me_2A'' [102°] Plates

Anhydride $C_6H_5O_4$ [165°] Made by
 heating the acid

Methyl derivative $C_6H_5(OMe)(CO_2H)_2$
 [138°-144°] Needles Forms on heating an
 anhydride [93°] $-Ag_2C_6H_5O_4$ curdy pp

α Oxy-isophthalic acid $C_6H_5(OH)(CO_2H)_2$

[135] [288° cor] *S* 0305 at 5°, 19 at 99°

Made by fusing s sulpho isophthalic acid with
 potash (Heine, *B* 13, 491, Lommies, *B* 13, 705)

Got also from rufigallie acid by potash fusion
 (Schreder, *M* 1, 437), and by the action of
 nitrous acid on s -amido isophthalic acid (Beyer,
J pr [2] 25, 515) Needles (containing 2aq), v

sol hot water, alcohol, and ether $-BaA''$ 3aq $-$
 $Cu_2(C_6H_5O_4)_2$ 4aq $-Ag_2A'' - AgHA''$ needles

Di-methyl ether Me_2A'' [160°] Needles

Di-ethyl ether Et_2A'' [103°] Prisms

c -Oxy-isophthalic acid $C_6H_5(OH)(CO_2H)_2$
 [126] [239°] *S* 8 at 100°, 14 at 24°

Formation -1 Obtained by potash fusion
 from (2,1,6) aldehyde oxy benzoic acid (Tiemann
 a Reimer, *B* 10, 1562), and also from the acid
 [126] $C_6H_5(SO_2NH_2)(CO_2H)_2$ (Jacobsen, *B* 11,
 902) -2 From (1,2,6) methoxy-toluic acid by
 oxidising with $KMnO_4$, and heating the resulting
 $C_6H_5(OMe)(CO_2H)_2$ with HCl at 160° (Schall, *B*
 12, 826) -3 In small quantity, in the prepara-

tion of the following isomeride, by the action of
 CCl_4 and KOH on salicylic acid (Hasse, *B* 10,
 2185) -4 By oxidising a naphthol with CrO_3
 and $HOAc$ (Miller, *A* 208, 247) -5 From c -
 amido isophthalic ether (*M*)

Properties $-$ Needles (containing aq), v sol.

alcohol and ether. Melts at 244° after drying at 100° (T & R). Coloured cherry red by FeCl₃. Forms salicylic acid when strongly heated. Its solutions exhibit bluish violet fluorescence -- Ag, A'' minute plates -- Et, A'' oil.

Mono-methyl ether

$\text{C}_6\text{H}_5(\text{OH})(\text{CO}_2\text{H})(\text{CO}_2\text{Me})$ [135°] Made from
 $[\text{1 2}]\text{C}_6\text{H}_5(\text{ONa})\text{CO}_2\text{CH}_3$ by heating with CO_2 at
 150° under pressure (Hahle, *J pr* [2] 44, 6)
 Grouped needles, which melt under water
 Coloured red by FeCl_3 Gives NaA' as colourless
 needles

Methyl derivative $C_6H_3(OMe)(CO_2H)_2$
[218°] Prisms, sol hot water

2 Oxy isophthalic acid $C_6H_4(OH)(CO_2H)_2$

[1 2 4] [306"] S 02 at 10°, 625 at 100°
Formation—1 By potash fusion from (2,1,4)- and (4,1,2) aldehyde oxy benzoic acid (Tiernann a Reimer, B 10, 1562), from *m* xyenol (Jacob sen, B 11, 377), from *m* xylene sulphonic acid (Remsen, B 11, 580), from $C_6H_5(SO_2NH_2)(CO_2H)$, (Remsen, *Am* 1, 131), and from benzoic acid (Barth, M 3, 803)—2 By the action of KOH, dilute alcohol, and CCl₄ on salicylic acid (Hasse) 3 By heating $C_6H_5(ONa)CO_2Na$ [1 2] or [1 4] in a current of CO (Ost, J pr [2] 14, 93, 15, 301. Kunferberger, J pr [2] 16, 428).

Preparation—A mixture of C_6H_5ONa (3 mols) and C_6H_5OK (1 mol) is heated in a current of CO_2 at 300° . The yield is 30 p.c. of the phenol used (Ost).

Properties—Needles, sl sol water, insol chloroform. Not volatile with steam. Its aqueous solution is coloured cherry red by FeCl_3 . Yields salicylic acid and phenol when distilled. Br $\text{C}_6\text{H}_4\text{Br}$ bromo phenol on heating. $-\text{Na A}^{\cdot\cdot}\text{aq} - \text{Ca}_3(\text{C}_6\text{H}_5\text{O}_3)_2 \cdot 5\text{aq} - \text{CdA}^{\cdot\cdot}\text{aq} - \text{Ag}_2\text{A}^{\cdot\cdot} - \text{AgHA}^{\cdot\cdot}$ needles

Methylether $\text{Me}_2\text{A}''$ [96°]

Mono ethylether

$C_6H_5(OH)(CO_2H)(CO_2Et)$ [4 3 1] [195°] Made from [4 1] $C_6H_5(ONa)CO_2Et$ and CO_2 at 170° under pressure (Hahle, *J pr* [2] 44, 12) Monoclinic leaflets

Diethyl ether Et₂A'' [52°]

Phenylethylether
 $C_6H_5(OH)(CO_2Ph)(CO Et)$ [4 3 1] [65°] Got
 from $HEtA''$, phenol, and $POCl_3$ (H)

Amide $C_6H_3(OH)(CONH_2)_2$ [250°]

Methyl derivative $C_9H_8O_3$ [261°]

Oxy isophthalic acid *Hexahydrate*

$\begin{array}{l} \text{CH}_2\text{CH}_2\text{C}(\text{OH})(\text{COH}) \\ \text{CH}_2\text{CH}(\text{CO}_2\text{H})\text{CH}_2- \end{array} >$ Formed by saponi-
 cation of its semi nitrile $[\text{130}^\circ\text{--}\text{140}^\circ]$ which is
 the product of the union of prussic acid with
 $\begin{array}{l} \text{CH}_2\text{CH}_2\text{CO} \\ \text{CH}_2\text{CH}(\text{CO}_2\text{H}) \end{array} > \text{CH}_2$ (Baeyer & Tutein, *B* 22,
 2186) Nodules (from alcohol) — $\text{Ag}_2\text{A}''$

Di oxy phthalic acid Methyl derivative
 $C_8H_6(O_2Me)(OH)(CO_2H)$ *Normethylhemipic acid*
 [2255] (Wegscheider, *M* 3, 378) Made by
 warming hemipic acid with conc HIAq (Liechti,
A Suppl 7, 151, Beckett & Wright, *C J* 29,
 281) Nodules (containing 2aq) Melts at 150°-
 155° when hydrated V sol water and alcohol
 Coloured blue by FeCl₃ Yields protocatechuic
 acid when fused with potash The anhydride
 $C_8H_4O_2$ 2aq forms crystals [1489]— KHA^+

D-methyl derivatives of Hemipic acid

Methylene derivative
CH₂O.C₆H₄(CO₂H)₂ [175°] *Hydrastic acid.*

Got by the action of boiling potash on the methylimide [233^o] which is obtained by oxidizing hydrastinic acid (Freund & Lachmann, *B* 22, 2325) Needles (from Aq) — $\text{NMeH.A}'$ [224^o]

Di-oxy phthalic acid *Hexahydrate*
 $C_8H_6O_8$ [180°] Got by the action of baryta on 'bromo malophthalic' acid (Baeyer, *A* 166, 355) Prisms (containing 2aq), v sol water — PbA" aq needles

Reference — OXYTEREPHTHALIC ACID

(a) OXY-ISOPHTHALIC ALDEHYDE

$\text{C}_6\text{H}_5(\text{OH})(\text{CHO})_2$ [431] [1087] Formed by boiling *p* oxy benzoic aldehyde with chloroform and NaOHAq , and also, together with the (β)-isomeride, from salicylic aldehyde in like manner (Voswinckel, B 15, 2021) Needles, sol. ether, sl sol water, almost insol ligroin

(β) Oxy-isophthalic aldehyde

$C_6H_3(OH)(CHO)_2$ [2 3 1] [88°] Made as above
Needles (from water), v sol ligroin Yields
c oxy isophthalic acid on fusion with potash

D1 oxy-isophthalic aldehyde

$C_6H_2(OH)_2(CHO)_2$ *Resorcylic dialdehyde*
[127*] Made by the action of chloroform and
NaOHaq on resorcin (Tiemann & Lewy, B 10,
2212, 13, 2368) Needles (from hot water)
With alcoholic aniline it yields yellow crystals
[199*] Phenyl hydrazine acetate forma
 $C_6H_2(OH)_2(CHO)_2$ [o 230*] (Rudolph, A 248, 105)
Yields a dioxim [209*] (Marcus, B 24, 3652)

Methyl derivatives

$C_6H_2(OMe)(OH)(CHO)_2$ Two isomerides, $[179^\circ]$ and $[89^\circ]$, are formed from $[1\ 3]$ $C_6H_4(OMe)(OH)$, chloroform, and $NaOHaq$

OXY-PHTHALIDE $C_8H_4O_4$, 16.

$C_6H_5(OH) \langle \begin{smallmatrix} CH_2 \\ CO \end{smallmatrix} \rangle O$ [222°] Got by reducing oxyphtalimide with tin and HCl, treating with nitrous acid, and heating the resulting nitroso oxyphtalidine with NaOH aq (Graebe & Rée, *C J* 49, 526) Prisms or needles, sl sol ether

OXY-PHTHALIMIDE $C_6H_4(OH) \begin{smallmatrix} \diagup CO \diagdown \\ \diagdown CO \diagup \end{smallmatrix} NH$

or $\text{C}_6\text{H}_3(\text{OH})\langle\frac{\text{C}(\text{NH})}{\text{CO}}\rangle\text{O}$ [290°] Formed by saturating α oxy phthalic acid with NH_3 (Réé, *A* 233, 232, *C J* 49, 525) Yellow crystals, sl. sol ether When reduced by tin and HCl it yields a product from which a nitroso compound [170°] may be prepared

OXY-DIPHTHALYL $C_{18}H_8O_5$, 2 e

$$\text{C}_6\text{H}_5 \begin{array}{c} \diagup \text{C} = \text{C} \diagdown \\ \diagdown \text{CO} \diagup \quad \diagdown \text{CO} \diagup \end{array} \text{C}_6\text{H}_4\text{OH} \quad [\text{above } 374^\circ]$$

Made by heating phthalide with 1-oxy phthalic anhydride and NaOAc at 200° (Graebe & Guye, *A* 233, 244) Needles (from HOAc)

A di-oxy-diphthalyl [250°] appears to be formed by dissolving di-chloro diphthalyl in alcoholic potash (Ador, *A* 164, 245)

DI-OXY-PROPANE v PROPYLENE GLYCOL

DI-OXY PROPANE TRI-CARBOXYLIC ACID

$C_6H_3(OH)_2(CO_2H)_2$. Formed by oxidation of isosaccharin with HNO_3 (Kiliani, *B* 18, 636). Colourless syrup. By HI it is reduced to glutaric acid $C_5H_7(CO_2H)_2$. — A''' . H_2Ca small prisms

An isomeric acid, formed by boiling chloro-
nitroic acid with lime, forms the salts $\text{Ca}_2\text{A}'''$, 9aq,
 $\text{Ba}_2\text{A}'''$, 5aq, and $\text{Cd}_2\text{C}_2\text{H}_3\text{O}_8$, 8aq (Pavloveck, *A.*
178, 157). The same acid, yielding $\text{Ca}_2\text{A}''$, 10aq,

occurs in beet root juice (Lippmann, *B* 16, 1078)

Tri-oxy-propane tri carboxylic acid $C_3H_4O_8$, *s.e.* $CO_2H \cdot CH(OH) \cdot CH(OH) \cdot C(OH)(CO_2H)_2$ Got by oxidising mannite with alkaline $KMnO_4$ (Pabst, *J* 1880, 611) Yields a soluble NH_4 salt

OXY-PROPANE PHOSPHONIC ACID
 $C_3H_5PO_4$, *s.e.* $CH_2(OH) \cdot PO(OH)_2$ [162°] Formed from propionic aldehyde and PCl_3 , followed by water (Fossek, *M* 7, 29) Plates, v sol water— CaA''

OXY-PROPANE SULPHONIC ACID
 $C_3H_5(OH)(SO_3H)$ Formed from *n* propyl alcohol and SO_3 , and also by boiling allyl alcohol with aqueous $KHSO_4$ (Max Müller, *B* 6, 1441) The same, or an isomeric acid, is got from propylene oxide and $NaHSO_4$ (Erlenmeyer, *A* 158, 280) The *K* salt crystallises in small needles

Oxy-propane disulphonic acid
 $CH(OH)(CH_2SO_3H)_2$ Formed by boiling glycerin dichlorhydrin with aqueous K_2SO_5 (Schauffelen, *A* 148, 111) and, in like manner, from epichlorhydrin (Pazschke, *J pr* [2] 1, 86, *Z* [2] 5, 613) Syrup.— K_2A'' 2aq trimetric octahedra $abc = 41 \cdot 48 \cdot 1$ — BaA' 2aq m sol water— PbA'' 2aq— AgA'' crystals, v sol alcohol

Reference—CHLORO-OXY-PROPANE SULPHONIC ACID

TRI-OXY-PROPENYL-BENZENE *Tri-methyl derivative*

[1 2 4 5] $C_9H_8(OMe)_3$, $CH \cdot CHMe$ This is the constitution of asaron (*q v*) (Eykmann, *B* 22, 3172).

OXY-PROPENYL-BENZOIC ACID
 $C_9H_8(OH)(OH)CO_2H$ [4 2 1] *Propenyl-salicylic acid* [146°] Formed from oxyisopropyl-salicylic acid $C_9H_8(CMe_2OH)(OH)CO_2H$, by elimination of H_2O by warming with dilute HCl White slender needles V sol. alcohol, ether, and CS_2 , sl sol water Sublimable Volatile with steam Gives a deep reddish-violet colouration with $FeCl_3$. By sodium amalgam it is reduced to oxy-cummic acid $C_9H_8 \cdot Pr(OH)CO_2H$ [4 2 1]

Salts— $A'Ag$ sparingly soluble white crystalline pp— A'_2Cu 2aq small green crystals, nearly insol water

Polymeride $(C_9H_8O)_x$ [230°] Formed by boiling oxy-propenyl benzoic acid with strong HCl Small white crystals M sol hot acetic acid, alcohol, and ether, insol water and CS_2 Gives a deep bluish-violet colouration with $FeCl_3$ Not volatile with steam— $(CuA') \frac{1}{2} aq$ — $(AgA')_2$ white pp (Heymann & Königs, *B* 19, 3318, 20, 2390)

OXY-PROPIONAMIDE

$CH_3 \cdot CH(OH) \cdot C(NH) \cdot NH_2$
The hydrochloride $B'HCl$ is formed from $(CH_3 \cdot CH(OH) \cdot C(NH) \cdot OC_2H_5) \cdot HCl$, and alcoholic NH_3 (Pinner, *B* 23, 2947) Needles, converted by $AgNO_3$ into $B'HNO_3$ [84°], v sol water

OXY-PROPIONIC ACID v LACTIC ACID AND HYDRAXYLIC ACID V. also BROMO-, CHLORO-, and IODO-, OXY-PROPIONIC ACIDS

Di-oxy-propionic acid v GLYCERIC, GLYXYLIC, PRUVIC, and GLYCIDIC ACIDS

***α*-OXY-PROPIONIC ORTHALDEHYDE** *Tri-methyl derivative* $C_3H_4O_5$, *s.e.*

$CH_3 \cdot CH(OMe) \cdot CH(OMe)_2$ (148°) *SG* 2 948 Formed by heating acrolein (2 vols) with methyl alcohol (6 vols) and $HOAc$ (1 vol) at 100° (Alsborg, *J* 1864, 495). Liquid, with pleasant smell, sl sol water.

Tri-ethyl derivative (186°) *SG* 13 90.

OXY-PROPIONIC IMIDO ISOAMYL ETHER
 $CH_3 \cdot CH(OH) \cdot C(NH) \cdot OC_4H_9$ The hydrochloride $B'HCl$ [69°], formed by the action of HCl gas on a solution of aldehyde cyanhydrin in isoamyl alcohol, crystallises in thin needles The homologous $CH_3 \cdot CH(OH) \cdot C(NH \cdot Cl) \cdot OC_4H_9$ also melts at 69° and gradually decomposes forming lactamide and ammonium chloride (Pinner, *B* 23, 2947)

OXYPROPYL-AMIDO BENZOIC ACID

$C_9H_8(CMe_2OH)(NH_2)CO_2H$ [4 2 1] [158°] Made by reduction of nitro oxypropyl-benzoic acid with $FeSO_4$ and ammonia (Widman, *B* 19, 271) Prisms Exhibits blue fluorescence in ethereal solution

Acetyl derivative

$C_9H_8(C_2H_5OH)(NHAc)CO_2H$ [174°] Trimetric tables, v sol hot alcohol

Oxypropyl amido-benzoic acid

$C_9H_8(CMe_2OH)(NH_2)(CO_2H)$ [4 3 1] Made by reducing the corresponding nitro acid (Widman, *B* 16, 2570, 17, 1305) Prisms, v sol alcohol, v sl sol ether With $ClCO_2Et$ it forms $C_9H_8(CMe_2OH)(NH \cdot CO_2Et) \cdot CO_2H$ [167°] and $C_9H_8 \cdot N_2O_2$ (above 300°) which is converted by H_2SO_4 into $CO(NH \cdot C_6H_5)(CMe_2OH)(CO_2H)_2$

Acetyl derivative Crystalline

***α* OXY PROPYLAMINE**

$CH_3 \cdot CH(OH) \cdot CH \cdot NH_2$ *Amido iso propyl alcohol* [30°] (176°) Formed from allylamine and H_2SO_4 , followed by water (Liebermann a Paal, *B* 16, 531) Needles

Benzoyl derivative

$CH_3 \cdot CH(OBz) \cdot CH_2 \cdot NH_2$ Got by boiling bromopropyl benzamide with $HBrAq$ Oil, v sol water Converted into $CH_3 \cdot CH(OBz) \cdot CH \cdot OH$ by nitrous acid Boiling $NaOHAq$ converts it into the isomeric $CH_3 \cdot CH(OH) \cdot CH_2 \cdot NHBz$ [93°] (Hirsch, *B* 23, 970)— $C_{10}H_{15}NO \cdot HBr$ [133°] Needles— $B'C_6H_5N_2O$, [189°] Needles— $B'_2H_2PtCl_6$, yellow needles (from water)

***β*-Oxy-propylamine** $CH_2(OH) \cdot CH_2 \cdot CH_2 \cdot NH_2$ Formed by heating bromo propyl phthalimide with dilute (1 2) H_2SO_4 for 5 hours at 200° (Gabriel, *B* 21, 2672)— $B'_2H_2PtCl_6$, yellow plates— $B'HAuCl_4$ plates

Sulphuric acid derivative

$CH_2(O \cdot SO_3H) \cdot CH_2 \cdot CH_2 \cdot NH_2$ [221°] Formed from *β* bromo propylamine hydrobromide and aqueous Ag_2SO_4 , at 100° (Gabriel a Lauer, *B* 23, 91) Prisms (from warm water) Indifferent body

Benzoyl derivative $NH_2 \cdot C_6H_5 \cdot OBz$

Liquid, v sol water Formed from phenyl-pentoxazoline and HBr (Gabriel a Elfeldt, *B* 24, 3216) Yields $B'HBz$ [135°], $B'_2H_2PtCl_6$, [205°] and $B'O_2C_6H_5N_2O$, [178°]

Phenyl derivative $PhO \cdot C_6H_5 \cdot NH_2$

(242°) Got from phenoxy propyl phthalimide acid and HCl (Lohmann, *B* 24, 2684) Yields $B'HCl$ [168°] crystallising in shining plates, and $PhO \cdot C_6H_5 \cdot NHBz$ [118°] Cyanic acid forms $PhO \cdot C_6H_5 \cdot NH \cdot CO \cdot NH_2$, [114°]

Oxy-propyl amine $(C_3H_7OH)(C_3H_7) \cdot NH$ (175°) [80°] *SG* 13 9018 Prepared by heating propyl-allyl amine with H_2SO_4 , and pouring the product into water (Liebermann a Paal, *B* 16, 581) Needles $B'_2H_2PtCl_6$ 2aq efflorescent

Oxy-tri-propyl amine $(C_3H_7OH)_3 \cdot N(C_3H_7)_2$ Got by heating di-propyl-allyl-amine with

H_2SO_4 , and pouring the product into water (L. a. P.) — $\text{B}^+\text{H}_2\text{PtCl}_6$

OXY PROPYL AMYL AMINE $\text{C}_9\text{H}_{19}\text{NO}$ (c. 200°) [c 2°] Formed by heating allyl amyl amine with H_2SO_4 , and pouring the product into water (Liebmann a. Baal, B 16, 531) Solidifies to long fine needles

Oxy propyl di isomyl-amine $(\text{C}_5\text{H}_{11})_2\text{N}(\text{C}_5\text{H}_9\text{OH})$ (243°) Formed from propylene chlorhydrin and di isomylamine (Lomse, A Ch [6] 13, 433) Oil, sl sol water Inactive to light — $\text{B}^+\text{H}_2\text{PtCl}_6$, orange crystals The acetyl and benzoyl derivatives form crystalline oxalates, the latter being $\text{C}_{20}\text{H}_{35}\text{NO}_8\text{H}_2\text{C}_2\text{O}_4$

OXY PROPYL-BENZENE v. **PROPYL PHENOL** and **PHENYL PROPYL ALCOHOL**.

Di-oxy propyl benzene $\text{CH}_2\text{CH}(\text{OH})\text{CH}(\text{OH})\text{C}_6\text{H}_5$, [53°] Made from phenyl propylene bromide by successive treatment with KOAc and alcoholic potash (Zincke, B 17, 709) Tables (from ether ligron), v e sol water A more sparingly soluble isomeride [93°], made from phenyl propylene bromide by boiling with aqueous K_2CO_3 , crystallises from ether in monoclinic tables

Tri-oxy propyl-benzene v. **PROPYL PYRO-GALLOL**

Tetra-oxy-propyl-benzene *Methylene derivative* $\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2$, [83°] Formed from safrol and dilute KMnO_4 , at 75° (Tiemann, B 24, 2881) White needles, v. sol boiling water and ether Yields piperonal, piperonyl acid, and CH_2O , $\text{C}_6\text{H}_5\text{CH}$, CO_2H on further oxidation Phenyl cyanate forms CH_2O_2 , $\text{C}_6\text{H}_5\text{CH}$, $\text{C}_6\text{H}_5(\text{O CO NHPh})_2$ [127°]

Acetyl derivative CH_2O , $\text{C}_6\text{H}_5\text{CH}$, $\text{C}_6\text{H}_5(\text{OAc})_2$, (240° at 18 mm) **OXY PROPYL-BENZENE SULPHONIC ACID** Me $\text{C}(\text{OH})\text{C}_6\text{H}_4\text{SO}_3\text{H}$ Got from cumene p-sulphonic acid, KOH and KMnO_4 (R Meyer, A 219, 302)

Salts — KA' — BAa' , Splits off H_2O at 140° — PbA' , Splits off $2\text{H}_2\text{O}$ at 110°, probably forming lead propenyl benzene sulphonate

Reaction — PCl_5 followed by ammonia forms the amide of propenyl benzene sulphonic acid [152°]

OXY o-ISOPROPYL BENZOIC ACID $\text{OMe}_2(\text{OH})\text{C}_6\text{H}_4\text{CO}_2\text{H}$ The salt KA' [197°] is formed by the action of conc KOH aq on dimethyl-phthalide (Wischneus, A 248, 59) The free acid is unstable, at once forming di methyl-phthalide [68°]

Oxy-p isopropyl-benzoic acid $\text{OMe}_2(\text{OH})\text{C}_6\text{H}_4\text{CO}_2\text{H}$ [156°] Formed by oxidising cumic acid, or cymene, with alkaline KMnO_4 (R Meyer, B 11, 1283, 1790, A 219, 248, Remsen & Emerson, A C J 1, 267, Widman, B 19, 583) Thin triclinic prisms (from water), v sol alcohol and ether Gives no colour with FeCl_3 Yields terephthalic and acetyl benzoic acids on oxidation by CrO_3 Boiling HCl aq forms two isomeric propenyl-benzoic acids. — BAa' , aq — CaA' , $2\frac{1}{2}$ aq — CuA' , 3 aq — AgA' , 4 aq crystalline pp

An isomeric or identical acid is got by boiling bromo-propyl benzoic acid with alcoholic potash (Ozumpelk, B. 8, 478)

Isomerides v Oxy-CUMINIC ACID.

Di-oxy-isopropyl-benzoic acid $\text{C}_6\text{H}_4(\text{OMe}_2\text{OH})(\text{OH})\text{CO}_2\text{H}$ [1 2 4] [173°].

Formed by the action of nitrous acid on oxy-amido isopropyl benzoic acid (Widman, B 17, 722) Crystals (from water), v sol alcohol and ether Coloured dark brown by FeCl_3

Di oxy-isopropyl benzoic acid $\text{C}_6\text{H}_4(\text{OMe}_2\text{OH})(\text{OH})\text{CO}_2\text{H}$ [1 3 4] [130°-185°]. Formed by oxidising carvacryl sulphuric acid with alkaline KMnO_4 (Heymann a. Konigs, B. 19, 3310) Flat needles (from water), v e sol alcohol — CuA' , aq — AgA' needles

DI-OXY-DI-ISOPROPYL-DI CARBOXY DI-PHENYL-ALLOPHANIC ETHER $\text{C}_{24}\text{H}_{28}\text{N}_2\text{O}_8$, i.e. $\text{N}(\text{CO}_2\text{Et})\text{C}_6\text{H}_4(\text{OMe}_2\text{OH})\text{CO}_2\text{H}$ [above 300°]. $\text{CO NH C}_6\text{H}_4(\text{OMe}_2\text{OH})\text{CO}_2\text{H}$

Formed, with $\text{CO}(\text{NH C}_6\text{H}_4(\text{OMe}_2\text{OH})\text{CO}_2\text{H})_2$, and the action of ClCO_2Et on oxy amido-isopropyl benzoic acid (Widman, B 17, 1306) Tables (from HOAc), almost insol water

OXY-PROPYLENE-DIAMINE $\text{C}_3\text{H}_6\text{N}_2\text{O}$ + a. $\text{CH}(\text{OH})(\text{CH}_2\text{NH}_2)_2$ Formed from glycerin dichlorhydrin and alcoholic NH_3 (Claus, A 168, 36) — $\text{B}^+\text{H}_2\text{PtCl}_6$

OXY-PROPYLENE-TETRA METHYL-DI-AMINE $\text{C}_3\text{H}_8(\text{OH})(\text{NMe}_2)_2$, (170°-185°) Formed by heating s dichlorhydrin with NMe_2H (Berend, B 17, 510) Liquid, v sol water

Benzoyl derivative Crystalline

OXY PROPYL-ETHYL-AMINE v. **ETHYL-OXY-PROPYL AMINE**

OXY-PROPYL-MALONIC ACID

$\text{CO}_2\text{HCH}(\text{CH}_2\text{CHMeOH})\text{CO}_2\text{H}$ The free acid at once splits off water, leaving the lactonic acid The salts $\text{BaC}_4\text{H}_6\text{O}_5$, CaA' , and $\text{Ag}_2\text{A}'$ may, however, be prepared

Lactonic acid $\text{C}_4\text{H}_6\text{O}_5$ Got by combining allyl malonic acid with HBr , and boiling the product with water (Hjelt, B 15, 621, A 216, 53) Syrup, v sol water, sl sol ether Yields $\text{Ba}(\text{C}_4\text{H}_6\text{O}_5)_2$ crystallising in soluble plates

Di-oxy-propyl-malonic acid

$(\text{CO}_2\text{H})_2\text{CHCH}_2\text{CH}(\text{OH})\text{CH}_2\text{OH}$ The free acid in aqueous solution remains unchanged at 15°, but at 100° it splits off water, forming a lactonic acid whose barium salt is $(\text{C}_6\text{H}_6\text{O}_5)_2\text{Ba}$

Salts — BAa'' Got by boiling di-bromo-propyl malonic acid with baryta (Hjelt, A 216, 58) — $\text{Ag}_2\text{A}''$ flocculent pp

Di oxy di propyl-malonic acid

$(\text{CH}_2\text{CH}(\text{OH})\text{CH}_2)_2\text{C}(\text{CO}_2\text{H})_2$
Dilactone $\text{C}_8\text{H}_{10}\text{O}$, [106°] Obtained from di allyl malonic acid by evaporating with conc HBr aq (Hjelt) Thin plates (from alcohol), long needles (from water), or trimetric crystals (from conc HBr aq) $a:b:c = 61:1:94$ Warm baryta water forms $(\text{C}_8\text{H}_8\text{O}_4)_2\text{Ba}$, which on heating splits up into BaCO_3 , and the neutral lactone $\text{C}_8\text{H}_8\text{O}_4$ $\text{CH} < \text{CH}_2\text{CHMe} >$

Reference — **DI-BROMO-DI-OXY-DI-PROPYL-MALONIC ACID**

DI-OXY-ISOPROPYL-TRIMETHYLENE so-called $\text{CHPr} < \text{CH OH} > \text{CH OH}$? (126°) S 10 Formed

from isobutyric aldehyde and ethylene glycol by heating in a sealed tube (Lochert, B! [2] 46, 716) Liquid, lighter than water, v sol alcohol and ether Decomposed by water at 100° into its constituents. Bromine yields a heavy oil $\text{C}_8\text{H}_8\text{BrCH}(\text{CH OH})_2$ (c 187°).

α OXY-*p*-PROPYL-PHENYL-ACETIC ACID $C_9H_9O_3$, $\approx C_6H_4(C_2H_5)CH(OH)CO_2H$ [158°]. S 19 at 21°. Formed from cuminnic aldehyde, HCl, and HCl (Raab, *B* 8, 1148, Plöchl, *B* 14, 1816) Small needles (from water) — BaA_2 , aq — PbA_2 , — AgA_2 stellate needles

OXY ISOPROPYL-DIPHENYLENE-KETONE

CARBOXYLIC ACID $C_{11}H_{11}O_4$, \approx
 $CO < \begin{smallmatrix} C_6H_5 \\ C_6H_2(CMe_2OH) \end{smallmatrix} CO_2H$ [5 2]. [190°]

Formed by oxidising retene quinone with alkaline $KMnO_4$ (Bamberger & Hooker, *B* 18, 1080, 1750, A 229, 150) Yellow plates, sl sol cold water and ether, m sol alcohol — BaA_2 , aq — CuA_2 , — AgA_2 yellow flocculent pp

Oxam Not melted at 270°

TRI OXY-TRI-PROPYL-PHOSPHINE

Hydrate $PH(OH)(CH(OH)C_2H_5)_3$. Formed by the action of conc KOHAq upon $(C_2H_5O)_3PHI$, which is got, together with the crystalline oxypropyl iodide $(C_2H_5O)_3PI$ by dissolving PHI in propionic aldehyde at 0° (De Girard, *A Ch* [6] 2, 24) Syrup, sl sol water

OXY PROPYL PHTHALIMIDE $C_{11}H_9NO$, $\approx C_6H_4C_2O, NCH_2CH_2CH_2OH$ Formed from bromo propyl phthalimide and hot conc KOHAq (Gabriel & Lauer, *B* 23, 87) Needles (from Aq)

Phenyl derivative $C_{15}H_{11}O_2$, $C_6H_5NCH_2CH_2CH_2OPh$ [88°] Formed from the bromo propyl derivative of phenol and potassium phthalimide at 220° (Lohmann, *B* 24, 2633) Needles, converted by KOH into $PhO C_2H_5NH CO C_2H_5CO_2Et$ [134°] a white crystalline powder

OXY PROPYL-PIPERIDINE

$C_9H_{19}N$, C_2H_5OH So called '*piperpropylalkine*' (194°) SG \approx 947, Δ 936 VD 4 79 (obs) Made from piperidine and propylene chlorhydrin (Ladenburg, *B* 14, 1880, 2407, 15, 1144, Laun, *B* 17, 680) Liquid, sol water — B^+HAuCl_4 — $B^+H_2PtCl_6$ — Mandelate dilute HCl forms $C_9H_{19}NO_3$, which gives B^+HAuCl_4

Acetyl derivative $C_9H_{17}NO$ — B^+HAuCl_4

Benzoyl derivative $C_{11}H_{13}NO_2$, OBz — B^+HAuCl_4 — $B^+C_2H_5N_2O$, yellow powder

Oxy-propyl-piperidine

$C_9H_{19}N$, $CH_2CH(OH)CH_2NH$ So called '*(α)-pipercolyl methylalkine*' [47°] (225°) Got by reducing the corresponding oxypropyl pyridine with sodium and alcohol (Ladenburg, *B* 22, 2588) Crystalline, v sol water, alcohol, and ether Yields an oily nitrosamine — $B^+H_2PtCl_6$, [149°] Small crystals (from alcohol)

Oxy-propyl-piperidine $C_9H_{19}N$, $CH_2CH(OH)EtNH$ [100°] Got by reducing (α) pyridyl ethyl ketone in amyl alcohol with sodium (Engler & Bauer, *B* 24, 2533) Needles Probably identical with the ψ conhydrin in *Conium maculatum*

Dioxypropyl-piperidine $C_8H_{11}NO_2$ Made by heating piperidine with glycerin chlorhydrin (Roth, *B* 15, 1150) Silky plates — B^+HBr — B^+HAuCl_4 , yellow needles

OXY-PROPYL-PYRIDINE C_8H_9NO , \approx

$C_6H_4(CH_2CH_2CH_2OH)N$ So called '*(α) isovalalkine*' (\approx 130° at 17 mm) Formed from (α) ethyl pyridine and formic aldehyde (Ladenburg & Adam, *B* 24, 1878) V sol water. — B^+HAuCl_4 , [71°] — $B^+H_2PtCl_6$, [142°]

Hexahydrate $C_8H_{11}NO$ — B^+HBr

Oxypropyl-pyridine

C_8H_9N , $CH_2CH(OH)CH_2N$ '*(α)-procolylmethylalkine*' (176°–181° at 18 mm.) Made from

(α) methyl-pyridine and acetic aldehyde (*L*) Liquid, sl sol water — $B^+H_2PtCl_6$, [189°] Small tables, sl sol water

Oxy propyl-pyridine C_8H_9N , $CH_2CH(OH)EtN$ (215°) Got, together with corvine and another body [69°], by reducing (α)-pyridyl ethyl ketone with sodium amalgam at 30°–40° (Engler & Bauer, *B* 24, 2532) — $B^+H_2PtCl_6$

Oxy-propyl-pyridine Tetrahydrate
 $CH_2 < \begin{smallmatrix} CH_2(C_6H_5) \\ CH_2 \end{smallmatrix} CO > NH$ [57°] (274°)

Made by heating δ amido- α propyl valeric acid to 200° (Aschan, *B* 23, 3701) Flat snowy needles

OXY - PROPYL - PYRIDINE DIHYDRIDE

CARBOXYLIC ACID ν MORRHUIC ACID

(*Py* 3) **OXY-(B 3)-ISOPROPYL-QUINOLINE**

$CH CH C CH CH$ Cumostyryl [169°] Made

by boiling the hydrochloride of phenyl o amido cumyl acrylic acid with water and a few drops of HCl for 5 hours (Widman, *B* 19, 264) Needles, v sol hot alcohol, sl sol hot water

Oxy - n - propyl - quinoline Dihydrate

$CH CH C CH_2CH_2$ [134°] Formed, by intra

molecular change, by reducing the preceding body, and also from nitro n cumyl propionic acid (Widman, *B* 19, 2778) Prisms (from benzene ligroin), insol water

OXY-PROPYL SUCCINIC ACID Lactonic

$acid CH_2CH < \begin{smallmatrix} CH_2CH_2CO_2H \\ O-CO \end{smallmatrix}$ [69°]

(\approx 260°) Formed from allyl succinic acid and conc HBrAq (Hjelt, *B* 16, 334) Crystals (from alcohol)

OXY ISOPROPYL-SULPHOBENZOIC ACID

$CMe_2(OH)C_6H_4(SO_3H)CO_2H$ [13 4] Made by oxidising cymene sulphonic acid, an intramolecular change taking place Got also from iso cymene sulphonic acid and $KMnO_4$ (R Meyer & Boner, *A* 220, 8, 30, *B* 13, 1495, 14, 2391, Remsen, *Am* 8, 262) — KA'' 5aq Triclinic crystals, $a b c = 675.1 \ 542$, $\alpha = 131^\circ 14'$, $\beta = 104^\circ 26'$, $\gamma = 66^\circ 27'$ — KA'' 2aq — BaA'' aq An isomeric acid, got from m isocymene sulphonic acid, yields BaA'' and PbA''

OXYPROPYL *p*-TOLUIDINE $C_{10}H_{11}NO$, \approx

$C_6H_4MeNHCH_2CH_2OH$ [74°] (293° cor) Formed from propylene oxide and *p* toluidine (Morley, *C J* 41, 387, *B* 15, 179) Needles (from light petroleum), insol water, v sol benzene and ether — $B^+H_2C_2O_4$, [151°] Pearly plates

(α) **OXY-PYRIDINE** C_8H_9NO , \approx

$N < \begin{smallmatrix} (OH)CH \\ CH=CH \end{smallmatrix} CH$ [107°] VD 2 8 (obs)

Formed by distilling its carboxylic acids (Königs, *B* 16, 2160, 17, 590, 2391, 19, 2463, Pechmann, *B* 17, 2384, Weidel & Strache, *M* 7, 297) Dimetric needles, v e sol water and alcohol Coloured red by $FeCl_3$ Yields a di bromo-oxy pyridine [207°]

Tetrahydrate C_8H_9NO , \approx

$NH < \begin{smallmatrix} COCH_2 \\ CH_2CH_2 \end{smallmatrix} CH_2$ [40°] (255°) Made by

distilling δ amido valeric acid (Schotten, *B* 21, 2285, Gabriel, *B* 23, 1770) Crystalline mass. Yields an acetyl derivative (298°)

(β) **Oxy-pyridine** C_8H_9NO , \approx

$N < \begin{smallmatrix} CH(OH) \\ CH=CH \end{smallmatrix} CH$ [124 5°] Formed by

potash fusion from pyridine sulphonie acid (Fischer a Renout, *B* 17, 763, 1896) Needles, v sol water and alcohol Coloured red by FeCl₃. —Oxalate [175°] White needles

Acetyl derivative (210° uncor) Oil

Ethyl derivative Made by ethylation, and also from bromo pyridine and alcoholic potash (Weidel a Blau, *M* 6, 664) Oil — B₂H₂PtCl₆ [192°] Prisms

Methyl iodide B'MeI Needles

Methylo-chloride B'MeCl Needles — B₂Me₂PtCl₆ Orange prisms, sl sol alcohol

(γ) *Oxy pyridine* NH $\begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ CO *Pyrid.*

one [148°] (above 350°) S 100 at 15° Formed by heating chelidamic acid under reduced pressure at 230° or with water at 196° (Lerch, *M* 5, 402, Hartinger a Lieben, *M* 6, 300) Formed also by distilling its carboxylic acid (Ost, *J pr* [2] 29, 65) Small efflorescent grains (from alcohol), prisms (containing aq), or trimetric tables, *abc* = 55 1 15 V sol water and alcohol Melts below 100° when hydrated Converted by treatment with MeI and KOH into NMe $\begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ CO, a deliquescent mass [89°]

which gives (C₅H₅NO).H₂PtCl₆ aq [176°], B'MeI, and B Me₂PtCl₆ Does not yield an acetyl derivative

Salts — B₂H₂PtCl₆ aq — B' H₂PtCl₆ 2aq Efflorescent monoclinic needles [200°], converted by boiling water into B'₂H₂PtCl₆ aq — B'HNO₃AgNO₃ tables — B'HgCl₂ — B'HHg₂Cl₄

Methyl derivative N $\begin{smallmatrix} \text{CH} \\ \text{CH} \end{smallmatrix}$ C OMe

(191° cor) at 738 mm Formed from (γ) chloro-pyridine and NaOMe (H a L) Liquid, sol water Alkaline in reaction Changes at 220° into the crystalline isomeride (*v supra*) Gives a deep blue liquid with aqueous CuSO₄ Conc HIAq converts it into (γ) oxy pyridine — B'₂H₂PtCl₆ crystals, sl sol water

Di-oxy-pyridine C₅H₂(OH)₂N [c 255°] (K a G), [239°] (W a B) Formed by potash fusion from its ethyl derivatives and also from pyridine disulphonic acid (Königs a Geigy, *B* 17, 1835, Weidel a Blau, *M* 6, 651) Needles (containing 4aq), v sol water, sl sol alcohol Coloured red by FeCl₃ — B'HCl needles

Mono ethyl derivative C₅H₄NO [128°] Formed, together with the di ethyl derivative, by heating dibromopyridine [111°] with alcoholic potash Tables, sl sol cold water — B'HNO₃ — B'₂H₂PtCl₆ red triclinic needles

Di ethyl derivative C₅H₄(OEt)₂N (c 244°) Made as above Liquid, nearly insol water — B'₂H₂PtCl₆ yellow needles — B'HHg₂Cl₄ [106°] Crystals (from HClAq)

Di-oxy-pyridine *Di oxim of the dihydroxide* NH $\begin{smallmatrix} \text{C(OH)CH}_2 \\ \text{C(OH)CH}_2 \end{smallmatrix}$ CH₂ [193°] A product of the action of hydroxylamine on trimethylene cyanide (Biedermann, *B* 22, 2967) Yields a di acetyl derivative [127°] and a dibenzoyl derivative [180°]

Picrate [175°] Needles

Tri-oxy-pyridine C₅H₂NO₃ a.s

N $\begin{smallmatrix} \text{C(OH)CH}_2 \\ \text{C(OH)CH}_2 \end{smallmatrix}$ C OH [220°-230°]. Formed by heating di-oxy amido pyridine (glutazine)

with conc HClAq (Stokes a Von Pechmann, *Am* 8, 384, *B* 19, 2701) Yellowish sandy powder, v sol hot water On evaporation of its solution it is partly converted into its anhydride. FeCl₃ gives a red colour Forms with bromine CBr₄ CO CBr₂ CONH₂ NH₄OAc at 140° converts it into glutazine — BaA' — AgA' — B'HCl

Oxim NH $\begin{smallmatrix} \text{CO CH}_2 \\ \text{CO CH}_2 \end{smallmatrix}$ C NOH [196°].

Made by boiling tri oxy pyridine or glutazine with hydroxylamine hydrochloride Minute hexagonal plates (containing aq), m sol hot water — B'HCl plates

Phenyl-hydrazide

NH $\begin{smallmatrix} \text{CO CH}_2 \\ \text{CO CH}_2 \end{smallmatrix}$ C N₂HPh [230°] Tables

Anhydride C₅H₂N₂O₂ Made by boiling glutazine with dilute H₂SO₄ Minute flesh coloured prisms, sl sol water — BaA'₂ 4aq yellow prisms — AgHA' — B'H₂SO₄ — B'HCl

References — Di bromo, Di chloro, and Di iodo, oxy PYRIDINE

OXY-PYRIDINE CARBOXYLIC ACID

C₅H₃N(OH)CO₂H (a) *Oxypicolinic acid* [267°] Made by heating di chloro oxy pyridine carb oxylie acid [282°] with HI in HOAc at 210° (Ost, *J pr* [2] 27, 289) Long needles (containing aq) or short anhydrous needles, v sol hot water and alcohol, insol ether Coloured reddish brown by FeCl₃ AgNO₃ is not reduced, but gives a white pp — BaA'₂ aq — CaA'₂ — C₅H₃N(OK)CO₂K aq groups of needles

Oxy pyridine carboxylic acid

C₅H₃N(OH)CO₂H (b) *Piccolinic acid* [250°] Made by the action of HI in HOAc on chloro oxy pyridine carboxylic acid [257°] at 200° (Ost) Formed also without by products by boiling comanic acid C₅H₄O₂(CO H) with NH₄Aq (Ost, *J pr* [2] 29, 64) Glittering plates Yields oxypyridine [148°] on heating strongly — Salt BaA'₂ 2aq small needles, m sol water

Oxy pyridine carboxylic acid

C₅H₃N(OH)CO₂H (γ) *Oxy picolinic acid* [258°] Formed by the action of tin and HClAq on chloro oxy pyridine carboxylic acid [224°] (Bellmann, *J pr* [2] 29, 7) Small trimetric pyramids (containing aq), sl sol water, sol conc HClAq Coloured brown by FeCl₃ — BaA'₂ prisms — CaA'₂ 4aq needles

Oxy-pyridine carboxylic acid

C₅H₃N(OH)CO₂H ϵ C(OH) $\begin{smallmatrix} \text{N} \\ \text{CH} \end{smallmatrix}$ C CO₂H *Oxy nicotinic acid* [302°] Formed by heating oxy-pyridine di carboxylic (oxyquynolinic) acid with water at 195° (Königs a Geigy, *B* 17, 589) Formed also by the action of NH₄Aq on the methyl ether of coumalic acid (*v vol u p* 264), the product being saponified (Pechmann a Welsh, *B* 17, 2384, *C J* 47, 145) Needles, sl sol hot water May be sublimed PCl₅ yields chloro pyridine carboxylic acid, whence tin and HCl form nicotinic acid FeCl₃ gives a light yellow colour — PbA'₂ 2½aq needles, sl hot water

Methyl derivative C₅H₃N(OMe)CO₂H [238°] Formed by methylating the acid, and also from methyl coumalate and methylamine, the product being saponified Needles (containing aq), nearly insol cold water

Phenyl derivative C₅H₃N(OPh)CO₂H.

[280°] Formed by the action of boiling NaOHAq on methyl coumal anilide (*loc cit*) Needles

Oxy-pyridine carboxylic acid

$\text{CH} \begin{smallmatrix} \text{N} \text{C(OH)} \\ \text{CH} \text{CH} \end{smallmatrix} > \text{C CO}_2\text{H}$ (a) *Oxy-nicotinic acid*

[256°] Formed by heating (a)-oxy isocinchomeronic acid with HOAc and a little Ac₂O at 210° (Weidel a Strache, *M* 7, 295) Slender needles (from water) Yields (a) oxy pyridine when heated —AgA' silky needles

Oxy-pyridine dicarboxylic acid C₈H₅NO₄, *z* e

$\text{N} \begin{smallmatrix} \text{C(CO}_2\text{H)} \text{CH} \\ \text{C(OH)} \text{C(CO}_2\text{H)} \end{smallmatrix} > \text{CH}$ (a) *Oxyisocinchomeronic acid*

Formed by oxidising (a) diquinolyl with KMnO₄ (Weidel a Strache, *M* 7, 293) Vitreous crystals Gives no colour with FeCl₃ —BaA' —AgA'' needles, nearly insol water

Oxy-pyridine dicarboxylic acid

C₈H₅N(OH)(CO₂H)₂, *z* e

$\text{N} \begin{smallmatrix} \text{C(CO}_2\text{H)} \text{C(CO}_2\text{H)} \\ \text{C(OH)} \text{CH} \end{smallmatrix} > \text{CH}$ *Oxyquinolinic acid*

Formed from quinolinic acid by potash-fusion (Königs a Körner, *B* 16, 2158) Small crystals (from dilute H₂SO₄), blackening at 254° FeCl₃ colours its aqueous solution red Its Ag salt yields (a) oxy-pyridine on heating —BaA' 4aq needles (from hot water)

Methyl derivative C₈H₅N(OMe)(CO₂H)₂

[140°] Got by adding KMnO₄ to an aqueous solution of the methyl derivative of (γ) amidocarboxystyryl (Feer a Königs, *B* 18, 2398) Needles, *v* e sol water —AgH₂A''₂ needles (from water)

Isomeride *v* CHELLAMIC ACID, vol 1 p 729

Di-oxy-pyridine carboxylic acid C₈H₅NO₄, *z* e

$\text{N} \begin{smallmatrix} \text{C(OH)} \text{CH} \\ \text{C(OH)} \text{CH} \end{smallmatrix} > \text{C CO}_2\text{H}$ *Citraconic acid* Formed by heating the mono-, di-, or tri- amide of citric acid with HCl or H₂SO₄ (Behrmann a Hofmann, *B* 17, 2687) Crystalline powder, nearly insol water, sl sol hot HClAq Carbonises at 300° PCl₅ converts it into di chloro-pyridine carboxylic acid [210°] Gives a deep blue colour with NaNO₂. Tin and HCl reduce it to tricarballic acid —BaA', 2aq

Di-acetyl derivative Crystalline

Methyl ether MeA' Plates, decomposing above 220°

Ethyl ether EtA' Plates

Amide C₈H₅N(OH)₂CONH₂ Formed by the action of conc NH₃Aq on ethyl acetyl citrate and on acetic ether (Ruhemann, *O* J 51, 405, *B* 20, 8368) Small grey crystals (from water)

Di-oxy-pyridine carboxylic acid

C₈H₅N(OH)₂CO₂H *Comenamic acid* *Di oxy-pyridine carboxylic acid* Formed by heating hydrogen ammonium comenamate at 190°, or by boiling comenic acid with NH₃Aq The yield is about 45 p c of the comenic acid used (How, *T* *E* 20 [2] 255, *A* 80, 65, 83, 350, Ost, *J* pr [2] 27, 269) Tables (containing 2aq), m sol hot water and alcohol Not decomposed by boiling NaOHAq Gives a purple colour with FeCl₃

Reactions —1 Yields pyridine on distillation with zinc-dust (Lieben a Hattinger, *B* 16, 1263) 2 Conc HIAq at 200° does not attack it, but when heated with it for two days at 270° pyrocomenic acid (probably a di oxy-pyridine) C₈H₅NO₄ is formed This body crystallises in needles (containing aq), gives a violet colour with FeCl₃, and forms B' HBr —8 PCl₅ (8 mols) acting on the acid (1 mol) at 100° forms a product

which on treatment with tin and HClAq yields a di-oxy-methyl-pyridine C₈H₅NO₄, crystallising in trimetric prisms (containing aq), and forming the salts B' HCl and B' I₃PO₄ PCl₅ and POCl₃ at 200° convert this tri-oxy methyl pyridine at 200° into hexa chloro methyl pyridine and C₈H₅Cl₆N(CCl₃), which is converted by boiling water into chloro (γ) oxy pyridine (a) carboxylic acid (Bellmann, *J* pr [2] 29, 19) Excess of PCl₅ (5 mols) at 220° acting on comenamic acid in presence of POCl₃ forms penta and hexa chloro-methyl pyridine, and other bodies, whence water produces chloro (γ)-oxy pyridine (a) carboxylic acid and chloro cyamic acid C₈H₅NO₄, which crystallises in needles [186°], and gives a blue colour with FeCl₃ Chlorocymamic acid yields the salts AgA' and BaA', aq —4 Ammonium comenamate forms, among other products, on distillation, a very poisonous base called 'Oxycomazine' C₈H₅N₂O (Krippendorff, *J* pr [2] 32, 163) The base crystallises from alcohol in four sided prisms, *S* 0035 at 20° Its solutions in dilute acids show green fluorescence, and in strong acids a blue fluorescence Tin and HCl reduce it to oxy amido pyridine Oxycomazine forms the following salts B'H₂Cl₂ [c 265°], B'H₂PtCl₆, B'H₂SO₄, 8aq, [c 295°], and C₈H₅AgN₂O —5 KMnO₄ oxidises comenamic acid to tri oxy pyridine carboxylic acid

Salts —NH₄A' very small grains —BaC₈H₅NO₄, aq pp —BaA', 2aq crystalline

Ethyl ether EtA' [205°] Needles (containing aq), sol hot water (Reibstein, *J* pr [2] 24, 284) Yields Ba(C₈H₅NO₄)₂, 2aq and EtA' HClAq, both crystalline When heated with AcCl it yields an anhydride C₈H₅NO₃ [261°] and two derivatives, C₈H₅N(OH)(OAc)CO₂Et [152°] and C₈H₅N(OAc)₂CO₂Et [38°] BrCl forms C₈H₅N(OBz)₂CO₂Et [102°]

Di-oxy-pyridine carboxylic acid C₈H₅NO₄ *Oxymido comenic acid* Made from comenic acid and hydroxylamine (Ost, *J* pr [2] 29, 378) Small needles, decomposing at 200° Reduced by tin and HCl to (8) oxy picolinic acid

Di oxy pyridine dicarboxylic acid *Ethyl derivative* $\text{N} \begin{smallmatrix} \text{C(OEt)} \text{C(CO}_2\text{Et)} \\ \text{C(OH)} \text{C(CO}_2\text{H)} \end{smallmatrix} > \text{CH}$ [182°]

Formed by the action of NaOHAq on the mono-ethyl ether EtHA'' [160°], which is made by treating ethoxy (a) pyrone dicarboxylic ether with NH₃Aq (Guthzeit a Dressel, *B* 22, 1427, *A* 262, 104) Needles (containing aq) Conc HClAq at 140° forms glutamic acid [184°] PCl₅ in POCl₃ at 250° gives di chloro pyridine dicarboxylic acid [230°] whence EtA'' [76°] and, by treatment with HI, pyridine dicarboxylic acid [322°] may be prepared —AgA''

Mono-ethyl ether

$\text{OH} \begin{smallmatrix} \text{C(OEt)} \text{C(CO}_2\text{Et)} \\ \text{C(OH)} \text{C(CO}_2\text{H)} \end{smallmatrix} > \text{N}$ [160°]. Needles Yields AgA' and an acetyl derivative C₈H₅NO₄ [100°].

Di-ethyl ether EtA' [81°]

Tri-oxy-pyridine carboxylic acid C₈H₅NO₄ *Tri-oxy-picolinic acid* *Oxy comenamic acid*. Formed, in small quantity, by oxidising comenic acid with potassium permanganate and H₂SO₄ in the cold Prepared by heating oxycomenic acid C₈H₅O₄(OH)₂CO₂H with conc NH₃Aq at 180° (Reibstein, *J* pr [2] 24, 290; Ost, *J* pr [2] 27, 265) Small needles (contain-

ing aq) (from water). Does not form a hydrochloride. Gives an azure pp with BaCl_2 and NH_4 . Alcoholic potash gives, in alcoholic solutions, a blue flocculent pp, forming a colourless solution in water. FeCl_3 gives an indigo blue colour. AgNO_3 gives a white pp, soon turning black. Br forms bromo tri oxy pyridine carb oxylic acid, crystallising with 2aq. Nitric acid added to the ethereal solution forms oxypyridoquinone carboxylic acid $\text{C}_8\text{HNO}_2(\text{OH})\text{CO}_2\text{H}$, crystallising in orange tables (containing 2aq).

References.—Bromo, Chloro, and Bromonitro-, OXY PYRIDINE CARBOXYLIC ACID

OXY PYRIDYL ETHYL FURFURANE

$\text{CH} \begin{smallmatrix} \text{CH CH} \\ \text{CH N} \end{smallmatrix} > \text{C CH}_2 \text{CH}(\text{OH}) \text{C} \begin{smallmatrix} \text{CH CH} \\ \text{OH} \end{smallmatrix} [\text{43}^\circ]$. (164° at 20 mm). Formed from (a) methylpyridine, furfuraldehyde, and some water at 150° (Klein, B 23, 2693). Greenish mass, v sol alcohol.— $\text{B}^+\text{H}_2\text{PtCl}_6$ [162°].— B^+HHgCl_4 [c 150°].— B^+HCl_4 .— $\text{B}^+\text{C}_6\text{H}_5\text{N}_3\text{O}$, [c 160°]

Acetyl derivative Oil

$(\text{C}_{11}\text{H}_{10}\text{AcNO}_2)_2 \cdot \text{H}_2\text{PtCl}_6$ [165°].— B^+HHgCl_4 [c 155°]. Small needles

Benzoyl derivative $\text{C}_8\text{H}_{10}\text{BzNO}_2$ [49°].— $\text{B}^+\text{H}_2\text{PtCl}_6$ [140°–145°].— B^+HHgCl_4

OXY PYRIDYL-MALONIC ACID

$\text{C}_8\text{H}_8\text{N C}(\text{OH})(\text{CO}_2\text{H})_2$. Formed by oxidising pilocarpine with KMnO_4 (Hardy & Calmels, Bl [2] 48, 228). Syrup. Yields pyridine (β) carb oxylic acid on further oxidation.— BaA'' 3aq.— $\text{Cu}_2\text{A}''(\text{OH})$ aq.— $\text{Ag}_2\text{A}''$ pp

OXY-PYRIDYL-PHENYL-PROPIONIC ACID

Hexahydrate $\text{C}_8\text{H}_{10}\text{N CHPh CH}(\text{OH}) \text{CO}_2\text{H}$ [244°]. Formed from piperidine and sodium phenyl glycidate (Erlenmeyer, B 22, 1482)

α -OXY (β)-PYRIDYL PROPIONIC ACID

$\text{C}_8\text{H}_8\text{N CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$. Formed by boiling pilocarpine with water for 12 hours (Hardy & Calmels, Bl [2] 48, 227). Gummy mass.— B^+HCl — B^+PtCl_6 .— B^+AuCl_3 [154°]. Prismatic needles

a Oxy-(α)-pyridyl propionic acid $\text{C}_8\text{H}_8\text{N CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$ [125°]. Formed by the action of hot dilute caustic soda on $\text{C}_8\text{H}_8\text{N CH}_2\text{CH}(\text{OH})\text{CCl}_2$, the product of the union of chloral with (a) picoline (Einhorn, B 23, 219, A 265, 211). Prisms.— $\text{Cu}_2\text{A}''\text{O}$ needles.— $(\text{HA}')\text{H}_2\text{PtCl}_6$ [204°].— $\text{HA}'\text{HAuCl}_4$ [174°]. Orange prisms.— AgA' white needles.— $\text{HA}'\text{HCl}$ [86°].— $\text{HA}'\text{HBr}$

Benzoyl derivative [145°]. Needles.— $\text{B}^+\text{H}_2\text{PtCl}_6$ [179°]. Yellow prisms

Methylether MeA' — $\text{MeA}'\text{HAuCl}_4$ [119°]

—Benzoyl derivative of the ether $\text{C}_8\text{H}_8\text{N CH}_2\text{CH}(\text{OBz})\text{CO}_2\text{Me}$ [c 41°]. Yields $\text{B}^+\text{H}_2\text{PtCl}_6$ [193°], crystallising in yellow needles

β Oxy-(α) pyridyl propionic acid

$\text{C}_8\text{H}_8\text{N CH}_2\text{CH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$ [86°]. Formed by warming β bromo pyridyl propionic acid with NaOH aq (Einhorn, B 23, 221). White needles, v e sol water.— $\text{Cu}_2\text{A}''\text{O}$ blue crystals.— B^+HCl [147°]. Prisms.— $\text{B}^+\text{H}_2\text{PtCl}_6$ [191°].

Benzoyl derivative [185.5°]. Prisms

Methylethyl MeA' Yields $(\text{MeA}')\text{H}_2\text{PtCl}_6$ [178.5°] and a benzoyl derivative [79°] crystallising in prisms

Ethyl ether EtA' Yields $(\text{EtA}')\text{H}_2\text{PtCl}_6$

Di-oxy-pyridyl-propionic acid

$\text{C}_8\text{H}_8\text{N CH}(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$ [190°]. Formed by oxidising pyridyl-acrylic acid with alkaline KMnO_4 (Einhorn, B 23, 223). White crystals

Ethyl ether EtA' [96°]. Tables. Yields a benzoyl derivative [122°] crystallising in needles

DI-OXY-PYRIMIDINE o HYDROQUINONE TETRACARBOXYLIC ACID

OXY-PYRONE DICARBOXYLIC ACID

Ethyl derivative of the ethyl ether

$\text{CH} \begin{smallmatrix} \text{C}(\text{CO}_2\text{Et}) \\ \text{C}(\text{CO}_2\text{Et}) \end{smallmatrix} > \text{CO}$ Anhydride of tri-

ethyl propylene-tetracarboxylate [94°]. Formed by distilling di carboxy-glutaconic ether at 210° under 15 mm pressure (Guthzeit & Dressel, B 22, 1415). Needles, insol water and alcohol. Converted by HClAq into glutaconic acid

OXY-PYROTARTARIC ACID $\text{C}_8\text{H}_6\text{O}_4$ t.s

$\text{CH}_2\text{C}(\text{OH})(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$ Mol w 148 [108°]. Formed by the action of boiling dilute HCl upon $\text{CH}_2\text{C}(\text{OH})(\text{CN})\text{CH}_2\text{CO}_2\text{Et}$, which is got by heating acetoacetic ether for three days with dry HCy at 100° (Morris, C J 37, 7, c Demarçay, Bl [2] 27, 120). Made also by oxidation of isovaleric acid by long boiling with dilute HNO_3 (Bredt, B 14, 1782, 15, 2318). Deliquescent, star like groups of needles, sol water, alcohol, and ether. On dry distillation it splits up into water and citraconic anhydride— BaA'' 2aq. Not decomposed by boiling with water— CaA'' 1½aq.— AgA'' ½aq needles

Oxy-pyrotartaric acid

$\text{CH}_2\text{CH}(\text{CO}_2\text{H})\text{CH}(\text{OH})\text{CO}_2\text{H}$ Citramalic acid [119°]. Formed by the action of zinc on a dilute solution of chloro citramalic acid (which melts at 130° according to Melikoff, A 253, 88). HCl is added towards the end of the reaction (Carius, A 129, 160, Morawski, Sitz W 76 [2] 670, J pr [2] 10, 69). Large hygroscopic crystals, yielding citraconic anhydride and water on distillation—Salts KA'' 2aq.— BaHA'' 2aq.— MgA'' — CaA'' 2aq.— CaA'' 1½aq.— CaHA'' ½aq.— ZnA'' 2aq.— PbA'' 3½aq.— AgA''

Oxy pyrotartaric acid

$\text{CH}(\text{OH})\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CO}_2\text{H}$ Itamalic acid

Formed from itaconic acid by successive treatment with HBr and hot water. Formed also by boiling ita chloro pyrotartaric acid with aqueous NaCO_3 (Swarts, Bull Acad Belg [2] 24, 25, Bl [2] 9, 317, Fittig, A 188, 76, Morris, C J 37, 14). The free acid, liberated from its Ca salt by oxalic acid, or from its Ag salt by H_2S , changes on evaporation, even at 15°, into its lactone [58°].— NaA'' — $(\text{NH}_4)\text{HA}''$ — CaA'' aq.— CaA'' 3aq.— PbA'' — CuA'' — $\text{Cu}_2\text{A}''\text{O}$ — AgA'' — EtA' oil

Lactone $\text{CH}(\text{CO}_2\text{H}) \begin{smallmatrix} \text{CH}_2 \\ \text{CO} \end{smallmatrix}$ Paraconic

acid [58°]. Formed as above, and also by boiling ita bromo pyrotartaric acid (1 pt) with water (10 pts) (Beer, A 216, 90). Crystalline. Yields citraconic anhydride on distillation. With bases it yields salts of itamalic acid— $\text{NaC}_8\text{H}_6\text{O}_4$ — CaA'' 3aq. Small needles. Yields calcium itamale on boiling with CaCO_3 — AgA''

Chloro-itamalic acid $\text{C}_8\text{H}_6\text{ClO}_4$ [150°]. Made by passing chlorine into a solution of sodium itaconate. Crystals, v e sol water

Oxypyrotartaric acid [c 135°] described by Maxwell Simpson (Pr 13, 44) as got from glycerin diolrhhydrin by successive treatments with KCy and KOH , is probably β oxy glutaric acid. It yields $\text{Ag}_2\text{A}''$ and EtA' (298°). An isomeric or identical acid, made by fusing

sulpho-pyrotartaric acid with potash, yields $\text{Ag}_2\text{A}'$ aq (Wieland, *A* 157, 41) A liquid isomeride, got by potash fusion from bromo-eyano-butyric acid, yields $\text{Ag}_2\text{A}'$

Di-oxy pyrotartaric acid $\text{C}_4\text{H}_4\text{O}_6$ *Citratar-taric acid* Formed by the action of boiling baryta water on chloro citramalic acid prepared from barium citraconate and HOCl (Carius, *A* 129, 159) and by heating oxycitraconates with water at 120° (Morawski, *J pr* [2] 11, 432) Amorphous, deliquescent mass — $\text{Pb}_2\text{A}'$ aq

Isomeride v ITATARTARIC ACID

DI-OXY-DI-PYRRYL-BUTANE $\text{C}_{12}\text{H}_{16}\text{N}_4\text{O}_2$ $\text{C}_6\text{H}_7\text{N CMe(OH) CMe(OH) C}_6\text{H}_7\text{N}$ [120°] Formed from pyrrol methyl ketone, water, and sodium amalgam (Dennstedt a Zimmermann, *B* 19, 2204) Monoclinic prisms (containing 2aq) Melts at 98° when hydrated v e sol alcohol

OXY PYRUVIC ACID $\text{C}_3\text{H}_4\text{O}_5$ $\text{CH}_2\text{(OH) CO CO}_2\text{H}$ Formed by dissolving 'nitro cellulose' (collodion) in dilute NaOHAq and allowing the solution to stand at 20° (Will, *B* 24, 405) Amorphous, v sol water, but ppd by alcohol Reduces Fehling's solution and ammoniacal AgNO_3 Its solutions, and those of its salts, are slightly laevogyrate Phenyl hydrazine forms the compound $\text{C}_{11}\text{H}_{11}\text{N}_3\text{O}_2$ or $(\text{N.HPh})\text{CH C(N.HPh) CO}_2\text{H}$, [205°], whence NaA' [231°], KA' [233°], $\text{NH}_4\text{A}'$ [200°], CaA' , and EtA' [149°]

Salts — CaA' , 8aq — SrA' , 4aq — CdA' , 4aq

OXY QUINALDINE v OXY METHYL QUIN-

OLINE

OXY QUINAZOLINE *Dihydrate*

$\text{C}_8\text{H}_6\text{N}_2\text{O}_2$ CH_2NH NH CO 'Phenylidihydroacimazine' [160°] Formed from oxy tolyl urea and HCl (Soderbaum a Widman, *B* 22, 1669) Scales, insol cold conc KOH aq — B'HCl — $\text{B}'_2\text{H}_2\text{PtCl}_2$, 2aq [205°] — B'H aq , [179°]

Oxy-quinazoline $\text{C}_8\text{H}_6\text{N}_2\text{O}$ C(OH)N N=CH [212°]

Made by heating formyl o amido benzamide [123°] for two hours at 180° (Knappe, *J pr* [2] 43, 214) Thin needles — $\text{B}'_2\text{H}_2\text{PtCl}_2$ aq [above 250°]

Methyl derivative [71°].

Di oxy quinazoline

$\text{C}_8\text{H}_6\text{N}_2\text{O}_2$ C(OH)NH N=COH 'Uramido benzoyl' [above 350°] Formed by passing cyanogen into an alcoholic solution of o amido benzoic acid and boiling the product with HCl aq Formed also by fusing o amido benzoic acid or o amido benzamide with urea, and by heating the product of the action of ClCO_2Et on o amido benzamide (Griess, *B* 2, 415, 11, 1985, *Abt*, *J pr* [2] 89, 140) Needles, sl sol hot water With PCl_5 it yields di chloro quinazoline [115°] — $\text{C}_8\text{H}_6\text{N}_2\text{O}_2\text{EtOH}$ needles

Di-methyl derivative $\text{C}_8\text{H}_8\text{(OMe)}_2\text{N}_2$, [66°] Made from di chloro quinazoline and NaOMe Needles, v e sol alcohol

OXY p-QUINAZOLYL-BENZOIC ACID

$\text{C}_{12}\text{H}_8\text{N}_2\text{O}_4$ N CH $\text{CO N C}_6\text{H}_4\text{ CO}_2\text{H}$ Made by oxidising p-tolyl quinazoline dihydrate with KMnO_4 (Paal a Busch, *B* 22, 2699) Small needles — AgA'

OXY-QUINHYDRONE $\text{C}_8\text{H}_8\text{N}_2\text{O}_2$ Formed from oxyhydroquinone and HNO_3 (Barth a Schreder, *M* 5, 595) Dark greyish-blue crystals.

(*Py* 1)-**OXY-QUINOLINE** $\text{C}_8\text{H}_7\text{N}$ CH CO CH NH CH

[235°] Made by heating phenyl- β amido acrylic acid at 200° or oxanilic acid at 170° (Reissert, *B* 20, 3109, *B* 21, 1876) Lup needles (from alcohol) Yields quinoline when distilled with zinc dust

Acetyl derivative [228°] Needles

Phenyl hydrazide $\text{C}_{15}\text{H}_{11}\text{N}_3$, [168°]

(*Py* 2)-**Oxy-quinoline** This is probably the constitution of cynurine v *infra*

(*Py* 3) **Oxy-quinoline** $\text{C}_8\text{H}_7\text{N}$ CH CH N=COH

Carbostyryl [199°]

Formation — 1 By reducing o nitro cinnamic acid (Chiozza, *A* 83, 118, Tiemann, *B* 13, 2070, Friedlander, *B* 14, 1916) — 2 By heating o amido cinnamic acid with HCl aq (T) or dilute H_2SO_4 (Feer a Königs, *B* 18, 2395) — 3 By reducing tri chloro-oxy quinoline with HI — 4 By heating (*Py* 3) chloro quinoline with water at 120° (Friedlander a Ostermaier, *B* 15, 335) — 5 By the action of aqueous HOCl upon quinoline (Erlenmeyer a Rosenhek, *B* 18, 3295) — 6 By heating quinoline on the water bath with a conc solution of bleaching powder (E a R, *B* 19, 489, Roos, *B* 21, 619)

Properties — Long thin feathery crystals (containing aq) (from water) or thick anhydrous prisms (from alcohol), v sl sol cold water, insol NH_4Aq

Salts — $\text{Ba(C}_2\text{H}_3\text{NO)}_2$ plates — AgA' pp

Methyl ether MeA' (247°) Oil

Ethyl ether EtA' (256°) Formed from (*Py* 3) chloro quinoline and KOEt Formed also by heating o amido cinnamic ether with alcohol and ZnCl_2 at 90° (Friedlander a Weinberg, *B* 15, 1424, 2103) and by ethylation of carbostyryl Pungent oil, solidifying below 0° Yields a dihydrate [199°] when reduced by sodium amalgam

Phenyl ether [69°] Plates

Dihydrate v AMIDO PHENYL PROPIONIC ACID

(*B* 1)-**Oxy-quinoline** CH C(OH) C CH CH $\text{CH CH} - \text{C N CH}$

[224°] Formed by potash fusion from quinoline (*Py* 1) sulphonic acid (Riemerschmied, *B* 16, 721, Lellmann, *B* 20, 2174) Formed also from (*Py* 1)-amido-quinoline by the diazo reaction (Skraup, *M* 5, 533) Silky needles or plates, sol alcohol and aqueous Na_2CO_3 , v sl sol water — Salts BHCl yellow needles — $\text{B}'_2\text{H}_2\text{PtCl}_2$, 4aq orange tables

Tetrahydrate $\text{C}_8\text{H}_8\text{(OH)}_4\text{N}_2$ CH_2 NH CH_2

[117°] Made by reducing with tin and HCl Needles, sol water, alcohol, and ether Yields a nitrosamine crystallising in tables, sol alcohol

(*B* 2) **Oxy-quinoline** C(OH) CH C CH CH $\text{CH CH} - \text{C N CH}$

[193°] (above 360°) Formed by heating a mixture of p amido-phenol, p nitro phenol, glycerin, and H_2SO_4 (Skraup, *B* 15, 893, *M* 3, 545) Formed also by heating its carboxylic acids (Weidel, *M* 2, 575, Skraup, *M* 4, 696) and by potash-fusion from its sulphonic acid (Fischer, *B* 17, 440) Small prisms (from alcohol) Not coloured by ferric chloride solution $\text{B}'_2\text{H}_2\text{PtCl}_2$, 2aq [236°] — $\text{B}'_2\text{Cu(OAc)}_2$ — $\text{B}'_2(\text{H}_2\text{SO}_4)_2$, 11aq — B'HCl aq prisms, v e sol.

water — $B'MeIaq$ Crystalline (Claus & Howitz, *J pr* [2] 42, 232, 43, 520) — $B'MeCl$ [c 272°] — $B'Me_2PtCl_2$ — $B'Me_2SO, 5aq$ — $B'MeOH$ [c 200°] — $B'EtBr$ [c 242°] — $B'C_2H_5Cl 1\frac{1}{2}aq$ [237°] — $(B'C_2H_5Cl)_2PtCl_2$

Methyl ether MeA' p Quinansole (305°) $SG \pm 1.665$ Got by methylation, and also from p-amisidine, nitro anisole, glycerin, and H_2SO_4 (Skraup, *M* 6, 762) Oil Solutions of its salts show blue fluorescence Gives a green colour with chlorine water and ammonia — $B'HCl 2aq$ — $B'_2H_2PtCl_4, 4aq$ — $B'_2H_2SO_4$ — $B'_2H_2Cr_2O_7$ — $B'MeI$ [235°] Prisms — **Picrate** [204°]

Acetyl derivative $C_6H_5(OAc)N$ [38°] (298°) Crystals — $B'_2H_2PtCl_4$ Prisms

Benzoyl derivative [231°] Needles

Tetrahydride of the methyl ether $C_6H_5(OMe)N$ **Thallin** [43°] (283°) at 735 mm Got by reducing the methyl ether with tin and conc $HClAq$ Prisms $FeCl_3$ gives a golden colour, changing to emerald green — Chlorine water gives a green colour turned yellow by ammonia — $B'HCl$ — $B'_2H_2SO_4, 2aq$ — $B'HI$ [155°] — $B'C_2H_5O_2$ four sided prisms S 10 at 15° — **Picrate** [162°]

Acetyl derivative $C_6H_5Ac(OMe)N$ [47°]

(B 3) Oxy quinoline $\begin{matrix} CH & CH & - & C & CH & CH \\ & C(OH) & CH & C & - & N & CH \end{matrix}$ [c 238°] Formed by heating *m*-nitro phenol with *m* amido phenol, glycerin, and H_2SO_4 (Skraup, *B* 15, 893, *M* 3, 559) Formed also by potash fusion from quinoline (B 3) sulphonic acid (Fischer, *B* 15, 1979) Silky needles, sol alcohol, not volatile with steam Its solutions show green fluorescence $FeCl_3$ gives a brownish red colour — $B'_2H_2PtCl_4, 2aq$ — $B'HCl 1\frac{1}{2}aq$ prisms — $B'Cu(OAc)_2$ — **Picrate** [244°]

Benzoyl derivative [86°] Prisms

Methyl ether C_6H_5NO (275° at 720 mm) Oil, volatile with steam

(B 4) Oxy quinoline $\begin{matrix} CH & CH & - & C & CH & CH \\ & CH & C(OH) & C & - & N & CH \end{matrix}$

[75°] (267° cor)

Formation — 1 By distilling its carboxylic acid (Weidel & Cobenzl, *M* 1, 862) — 2 By soda fusion from its sulphonic acid (Bedall & Fischer, *B* 14, 443, 1366) — 3 By heating *o* amido phenol with *o* nitro phenol, glycerin, and H_2SO_4 (Skraup, *B* 15, 893, *M* 3, 536)

Properties — Prisms, sl sol water May be distilled with steam $FeCl_3$ gives a green colour Gives quinolinic acid on oxidation with $KMnO_4$ (Fischer & Renouf, *B* 17, 756) Chlorine in $HOAc$ forms mono, di-, and tri, chloro derivatives (Zincke & Hebebrand, *A* 264, 198) Ethylene chlorhydrin forms crystalline $B'(C_2H_5OH)Cl$, whence $(C_6H_4NO_2Cl)_2PtCl_2$ (Wurtz, *C R* 96, 1269) $ClCO_2Et$ forms C_2H_5NO , [105°] whence $(C_6H_4NO_2)_2H_2PtCl_4$ (Lippmann, *M* 8, 439) According to Lippmann (*M* 10, 667), MeI in $MeOH$ at 100° forms $C_6H_5(OMe)N(C_6H_5(OH)NMeI)HI 2aq$, whence $C_6H_5ClN_2O_2HCl 5aq$ and $C_{20}H_{12}Cl_4N_2O_2PtCl_4 2aq$ These bodies may perhaps be more simply formulated, as below Chloroform and Na yield $CH(C_6H_5(OH)N)$. (Lippmann, *B* 19, 2471)

Salts — $B'HCl aq$ — $B'_2H_2PtCl_4, 2aq$ golden needles — $B'_2H_2SO_4, 2aq$ — $B'_2C_2H_5N_2O_2$ [204°] $Cu(C_6H_5NO)_2$ canary-yellow pp — $B'MeI aq$ [c 170°] — $B'MeCl 2aq$ [c 260°] — $B'_2Me_2PtCl_4, 2aq$

Acetyl derivative $C_6H_5(OAc)N$ (280°).

Oil — $B'_2H_2PtCl_4, 2aq$ yellow plates

Benzoyl derivative [120°] Crystals

Methyl ether $C_6H_5(OMe)N$ (268°) Got by methylation, and also from *o* amido anisole by Skraup's reaction Oil — $B'_2H_2PtCl_4, 2aq$ — $B'HCl$ — $B'_2C_2H_5N_2O_2$, yellow needles or plates — $B'MeI aq$ [160°] Leaflets (Claus & Howitz, *J pr* [2] 42, 229)

Ethyl ether $C_6H_5(OEt)N$ (286°) at 718 mm Needles (Fischer & Renouf, *B* 17, 759) — **Picrate** [181°] Yellow needles

Tetrahydride $C_6H_5(OH)C_6H_5N$ [122°]

Made by reducing (B 4)-oxy-quinoline with $SnCl_4$ (Fischer, *B* 14, 1368, 14, 2571, 16, 713, 17, 759) Needles or prisms, sol hot water Yields a nitrosamine [68°] The methyl ether $C_6H_5(OMe)N$ is oily and yields a crystalline hydrochloride and a nitrosamine [80°] The ethyl ether is also liquid (275°) at 715 mm, and forms a crystalline nitrosamine [113°] and an oily acetyl derivative (307°)

Oxy quinoline C_6H_5NO **Cynurine** [201°] above 300° S 477 at 15° Probably (Py 1)- or (Py 2) oxy quinoline Formed by heating its carboxylic acid (cynurenic acid) (Schmiedeberg & Schultzen, *A* 164, 158, Kretschy, *M* 2, 68) Formed also by oxidising cinchonine or cinchonine acid (Skraup, *M* 9, 821, 10, 729) Monoclinic prisms (containing 3aq), m sol hot water Melts at 52° when hydrated Tastes bitter $KMnO_4$ oxidises it to cynuric acid ICl gives a brownish pp [275°] (Dittmar, *B* 18, 1618) Distillation with zinc dust forms quinoline Ac_2O on heating forms an indigo blue dye Yields a tetrahydride — $B'_2H_2Cl 2aq$ monoclinic prisms — $B'HCl aq$ — $B'_2H_2PtCl_4, 2aq$ orange needles

(Py 2, 3) **Di oxy-quinoline**

$C_6H_5 \begin{matrix} < CH & C(OH) \\ & N=C(OH) \end{matrix}$ **β -Oxy-carbostyryl** [above

300°] Prepared by heating (Py 2, 3) chloro oxy quinoline (8 chloro carbostyryl) with fused KOH at 200° (Friedlander & Weinberg, *B* 15, 2681) Fine colourless needles Maybe sublimed Is a very weak base but a strong acid, it dissolves in concentrated HCl , but is reprecipitated on dilution By PCl_5 it is converted into the di chloro-quinoline [104°] — **A'Ag** crystalline

Di-oxy-quinoline $C_6H_5 \begin{matrix} < C(OH) & CH \\ & N=C & OH \end{matrix}$ [above

320°] **Formation** — 1 By the action of conc H_2SO_4 on *o* amido phenyl propionic acid (Baeyer & Bloem, *B* 15, 2151) — 2 By potash fusion from (Py 1, 3) bromo oxy quinoline (Friedlander & Weinberg, *B* 15, 2683) — 3 By reducing *o* nitro benzoyl malonic ether with tin and HCl (Bischoff, *B* 22, 387, *A* 251, 377) — 4 By boiling its carboxylic acid with conc $HClAq$ (B)

Properties — Needles, sol Na_2CO_3 and in a mixture of alcohol and $HClAq$, insol ordinary menstrua Its ammoniacal solution turns blue in air PCl_5 yields di-chloro-quinoline [67°]

Salt — $C_6H_5AgNO_2$ needles

Ethyl ether $C_6H_5 \begin{matrix} < C(OH) & CH \\ & N=C(OEt) \end{matrix}$ [228°].

Formed by reducing *o* nitro benzoyl malonic ether with tin and HCl (B) Slender needles

Dihydride $C_6H_5 \begin{matrix} < CH(OH) & CH \\ & N=C(OH) \end{matrix}$ [149°]

Formed by reducing *o*-nitro- β -oxy phenyl propi-

(containing aq), sl sol hot water, m sol hot alcohol. Gives a green colour with FeCl_3 . Yields (B 4) oxy quinoline on distillation, and pyridine (a) tri carboxylic acid on oxidation— BaA' — $\text{BaC}_{10}\text{H}_7\text{NO}_3$, aq— HgA' , aq— AgA' — $\text{HA}'\text{HCl}$ monoclinic needles— $\text{B}_2\text{H}_2\text{PtCl}_6$, 2aq needles

(B 2) Oxy quinoline carboxylic acid $\text{C}_{10}\text{H}_7\text{NO}_3$, (B) Oxy cinchonic acid [c 320°]. Made by potash fusion from (B) sulpho cinchonic acid (Weidel, *M* 2, 571). Tables (containing aq), sl sol water. Yields (B 2) oxy quinoline on distillation, and a pyridine tricarboxylic acid on oxidation— BaA' — $\text{HA}'\text{HCl}$ aq needles—(H) H_2PtCl_6 , 2aq monoclinic tables, decomposed by water

(B 3) Oxy quinoline (Py 1?) carboxylic acid $\text{C}_{10}\text{H}_7\text{NO}_3$, Xanthoquinic acid [above 300°]. Possibly identical with the preceding acid. Got by heating quinic acid with conc HCl aq at 225° (Skraup, *M* 2, 601, 4, 695). Yellow grains. Yields (B 2) oxy quinoline on distillation—Salts BaA' , 6aq— CaA' , 10aq— CuA' , aq— AgA' , 2aq— $\text{HA}'\text{HCl}$ 2aq— HA' , H_2PtCl_6 , 6aq— H H H SO_3 , 3aq golden prisms

Methyl derivative $\text{C}_{10}\text{H}_7(\text{OMe})(\text{CO}_2\text{H})\text{N}$ Quinic acid [280°]. Made by oxidising quinine or cinchonine with chromic acid (Skraup, *M* 2, 589). Thin yellowish prisms, sl sol hot water and hot alcohol, nearly insol ether. Its alcoholic solution shows blue fluorescence, destroyed by H_2SO_4 . KMnO_4 oxidises it to pyridine tri carboxylic acid—Salts BaA' , 4aq— CaA' , 2aq— CuA' , 1 $\frac{1}{2}$ aq— AgA' pulverulent pp $\text{HA}'\text{HCl}$ 2aq triclinic tables— $\text{H}_2\text{A}'$, H PtCl_6 , 4aq yellow crystals

(B 4) Oxy quinoline carboxylic acid $\text{C}_{10}\text{H}_7\text{NO}_3$, [280°]. Made by boiling o oxy quinoline with CCl_4 , water, KOH and alcohol (Lippmann a Fleissner, *B* 19, 2467, *M* 8, 318). Minute prisms, v sl sol hot water. Yields (B 4) oxy quinoline on distillation, and pyridine dicarboxylic (quinolime) acid [235°] on oxidation. FeCl_3 gives a green colour. Yields a di bromo derivative [193°]— $\text{BaC}_{10}\text{H}_7\text{NO}_3$, aq needles— AgHA' , (dried at 105°). Minute needles

Tetrahydride $\text{C}_{10}\text{H}_7\text{NO}_3$, [265°]. Got by reduction with tin and HCl . Prisms, sl sol water, almost insol ether. Reduces AgNO_3 in the cold. Gives a red colour with FeCl_3 . PtI yields $\text{C}_{10}\text{H}_7\text{NO}_3\text{EtNO}_3\text{HI}$, whence $\text{C}_{10}\text{H}_7\text{NO}_3$, [220°] may be got. Nitrous acid forms a nitrosamine [195°]— $(\text{C}_{10}\text{H}_7\text{NO}_3)\text{HCl}$ aq needles— B' H_2SO_4 , 3aq— $\text{B}'\text{HOAc}$ pp

(B 4) Oxy quinoline carboxylic acid $\text{C}_{10}\text{H}_7\text{NO}_3$, aq [250°]. Got from o oxy quinoline dithiocarboxylic acid $\text{C}_{10}\text{H}_7(\text{OH})(\text{CSH})\text{N}$ by warming with lead acetate and KOH aq (Lippmann a Fleissner, *M* 9, 300). Silky needles, sol water. Coloured red by FeCl_3 . Yields o oxy quinoline on distillation— KA' — BaA' , (dried at 180°)— AgA' — HgA' , Cl_2 — HA' , H_2PtCl_6 , 4aq— $\text{HA}'\text{HCl}$ 2 $\frac{1}{2}$ aq trimetric crystals

Tetrahydride $\text{C}_{10}\text{H}_7\text{NO}_3$, [222°]. Crystalline powder— $\text{B}'\text{HCl}$ needles, v sol water

(B 4) Oxy quinoline carboxylic acid $\text{C}_{10}\text{H}_7(\text{OH})(\text{CO}_2\text{H})\text{N}$. Formed by heating sodium o-oxy quinoline with liquid CO_2 in a closed vessel at 150° (Schmitt a Engelmann, *B* 20, 1217, 2690). Small yellow prisms (containing aq), m sol hot water and hot alcohol. Coloured red

by FeCl_3 . At 150° it splits up into CO_2 and o-oxy quinoline. Yields $\text{C}_{10}\text{H}_7\text{BrNO}_3$, [235°]

Salts— $\text{B}'\text{HCl}$ needles— $\text{B}'\text{HNO}_3$ — $\text{NH}_4\text{A}'$ aq— BaA' , 2aq needles, sl sol water— $\text{BaC}_{10}\text{H}_7\text{NO}_3$, amorphous, v sl sol water— AgA' amorphous powder

Phenyl ether PhA' [226°]. Made by heating the acid with phenol and POCl_3 at 170°. Prisms

Tetrahydride $\text{C}_{10}\text{H}_7(\text{OH})(\text{CO}_2\text{H})\text{N}$. Colourless prisms— $\text{B}'\text{HCl}$ prisms. MeI and MeOH at 100° form $\text{C}_{10}\text{H}_7\text{Me}(\text{OH})(\text{CO}_2\text{H})\text{N}$ [211°], which crystallises with 2aq

(B 2) Oxy quinoline carboxylic acid $\text{C}_{10}\text{H}_7(\text{OH})(\text{CO}_2\text{H})\text{N}$ [204°]. Formed by boiling p oxy quinoline with NaOH , CCl_4 , water, and alcohol (Lippmann a Fleissner, *M* 8, 324). Made also by heating potassium (not sodium) p oxy quinoline with liquid CO at 170° (Schmitt a Altschul, *B* 20, 2695). Minute prisms, v sl sol hot water and alcohol. Splits up at 200° into CO_2 and p oxy quinoline. Yields quinolime acid on oxidation— $\text{HA}'\text{HCl}$ — $\text{HA}'\text{HNO}_3$ needles— H A' , H_2PtCl_6 , 2aq— $\text{NH}_4\text{A}'$, $\frac{1}{2}$ aq needles, v sol hot water— BaA' , 2aq— CaA' , 6aq— $\text{PbC}_{10}\text{H}_7\text{NO}_3$, aq— CaA' , 6aq small needles— AgA'

Oxy quinoline carboxylic acid $\text{C}_{10}\text{H}_7\text{NO}_3$, Cynurenic acid [258°]. S 9 at 100°. Occurs in the urine of dogs after a fat diet (Liebig, *A* 8b, 125, 108, 354. Voit a Richter, *J* 1865, 676, Schmiedeberg a Schultzen, *A* 164, 155, Hofmeister, *H* 5, 70), or a diet of flesh only (Kietzschy, *M* 2, 57, 5, 16). Prisms (containing aq) insol cold water. Decomposed by heat into CO and oxy quinoline. Yields quinoline on distillation with zinc dust. Evaporation with KClO_4 and HCl leaves a residue which is turned emerald green by ammonia (Jaffé, *H* 7, 399)— $\text{HA}'\text{HCl}$. Decomposed by water (Bruegel, *H* 4, 92)— $\text{NH}_4\text{A}'$ — KA' , 2aq— BaA' , 4 $\frac{1}{2}$ aq— BaA' , 3aq— CaA' , 2aq— CuA' , 2aq— AgA' aq thick white pp

(Py 3) Oxy quinoline (B 3) carboxylic acid. Dihydride $\begin{array}{c} \text{CH CH} \\ | \quad | \\ \text{C}(\text{CO}_2\text{H})\text{CH C NH CO} \end{array}$ [above 280°]. Prepared by the reduction of [3 1 4] $\text{C}_{10}\text{H}_7(\text{NO}_2)(\text{CO}_2\text{H})\text{CH CH}_2\text{CO}_2\text{H}$ with ammonia and FeSO_4 (Widman, *B* 22, 2274). Yellow plates (from water), v sl sol alcohol. Yields a methyl ether MeA' [192°] crystallising in tables

Di-oxy-quinoline carboxylic acid Ethyl derivative of the ethyl ether

$\text{C}_6\text{H}_5\text{N} \begin{array}{c} \text{C}(\text{OH})\text{C CO}_2\text{Et} \\ \text{C OEt} \end{array}$ [107°]. Got by the action of zinc, alcohol, and gaseous HCl on o-nitro benzoyl malonic ether (Bischoff, *B* 22, 386). Small needles. Coloured violet by FeCl_3 .

Tetra oxy quinoline carboxylic acid Lactone of the di methyl derivative of the dihydride $\text{C}_{12}\text{H}_{11}\text{NO}_5$, etc

$\text{C}_6\text{H}(\text{OMe}) \begin{array}{c} \text{CH CH}_2 \\ | \quad | \\ \text{CO O} \end{array}$ NH CO [c 256°]. Prepared by

the reduction of o nitro meconin acetic acid

$\text{C}_6\text{H}(\text{NO}_2)(\text{OMe}) \begin{array}{c} \text{CO O} \\ | \quad | \\ \text{CH CH}_2 \text{CO}_2\text{H} \end{array}$ with tin and

HCl (Liebermann a Kleemann, *B* 19, 2296). Colourless needles (from water), v sol alcohol. Boiling baryta water yields $\text{Ba}(\text{C}_{10}\text{H}_7\text{NO}_3)_2$, 6aq.

oxidation by KMnO_4 . — NaA ' 8aq — AgA '. yellow pp — H_2A , H_2PtCl_6 5aq

B Oxy-(Py 8)-quinolyl-propionic acid

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{CH} & \text{CH} \\ \diagdown & \diagup \\ \text{N}=\text{O} & \text{CF}(\text{OH})\text{CH}_2\text{CO}_2\text{H} \end{smallmatrix}$ [176°]. Got from its amide, or by the action of Na_2CO_3 aq on bromo quinolyl propionic acid in the cold (Einhorn, *A* 246, 176) Colourless prisms, v sol alcohol and HOAc, insol chloroform. — NaA ' — AgA ' — HA ' HCl [188°] White prisms — H_2A , H_2PtCl_6 [218°] Yellowish red prisms
Methyl ether MeA' [62°] Prisms
Amide [152°] Made by dissolving the hydrobromide of bromo quinolyl propionic acid in ammonia in the cold White crystals (from alcohol)

Lactone $(\text{C}_6\text{H}_4\text{N}) \text{CH} \begin{smallmatrix} \diagup \text{O} \\ \diagdown \text{CH}_2 \end{smallmatrix} \text{CO}$ [82°]

Made by adding an equivalent quantity of Na_2CO_3 to the hydrobromide of bromo quinolyl propionic acid suspended in water (Einhorn, *A* 246, 169) Needles — $\text{C}_6\text{H}_4\text{NO}_2\text{HCl}$ [138°] — $\text{B C}_6\text{H}_4\text{N}_2\text{O}$, Golden plates (from alcohol)

OXY-QUINONE *Methyl ether*

$\text{C}_6\text{H}_4\text{O}_2(\text{OMe})$ [140°] Prepared by oxidation of *o*-anisidine with $\text{K}_2\text{Cr}_2\text{O}_7$ and dilute H_2SO_4 (Muhlhaner, *B* 13, 323, *A* 207, 251, Will, *B* 21, 605) Got in like manner from the methyl ether of amido resorcin (Bechhold, *B* 22, 2381) Yellow needles, with pleasant smell, sol alcohol, m sol ether and water Conc H_2SO_4 forms a deep blue solution The vapour colours filter paper red Reduced by SO_2 to $\text{C}_6\text{H}_4(\text{OH})_2(\text{OMe})$ With aniline it forms $\text{C}_6\text{H}_4(\text{NHPh})_2(\text{OMe})_2$, crystallising in coppery needles, and forming a dark blue solution in H_2SO_4 (Schweitzer, *C* 1888, 1434) *o*-Toluidine, *o*-xyldine, and diphenylamine form corresponding bodies melting at 239°, 228°, and 120° respectively

Ethyl ether $\text{C}_6\text{H}_4\text{O}_2(\text{OEt})$ [117°] Made by oxidation of $\text{C}_6\text{H}_4(\text{NH}_2)(\text{OEt})$, with $\text{K}_2\text{Cr}_2\text{O}_7$ and dilute H_2SO_4 at 15° (Will a Pukall, *B* 20, 1128) Yellow needles (by sublimation), m sol warm water, decomposed by hot water

Dioxy-quinone $\text{C}_6\text{H}_4(\text{OH})_2\text{O}$ [5 2 4 1]

Formation —1 By boiling the basic sodium salt of dioxyquinone dicarboxylic acid with HCl or H_2SO_4 (Loewy, *B* 19, 2387) —2 From di-amido-resorcin by oxidation to di-imido resorcin and treatment of this body with dilute (10 p c) KOH at 70° (Nietzki, *B* 21, 2374, Böninger, *B* 22, 1298) —3 By heating $\text{C}_6\text{H}_4(\text{NHPH})(\text{OH})_2$ or tetra-methyl di-amido-quinone with KOHAq (Kehrmann, *B* 23, 904)

Properties —Dark yellow needles, almost insol cold water, v sol alcohol. Its alkaline solutions are red. Not melted at 180° May be sublimed Forms a dioxim Conc HNO_3 forms nitranilic acid — $\text{Na}_2\text{C}_6\text{H}_4\text{O}_4$ — $\text{BaC}_6\text{H}_4\text{O}_4$ aq bluish black needles

Di-methyl ether MeA' [c 220°] Obtained by methylation Prepared also from $\text{C}_6\text{H}_4(\text{NO}_2)_2(\text{OMe})$, by reduction followed by oxidation with FeCl_3 (Nietzki a Reehberg, *B* 23, 1216) Got also by oxidation of acetyl-di methyl pyrogallol $\text{C}_6\text{H}_4(\text{OMe})(\text{OAc})$ (Hofmann, *B* 11, 332) Yellow needles Yields, on reduction, colourless $\text{C}_6\text{H}_4\text{O}_2$ [166°]

Di-ethyl ether $\text{C}_6\text{H}_4(\text{OEt})_2$ [183°] Got by oxidising the di ethyl ether of di-amido-hydroquinone with FeCl_3 (N a. B.) Sulphur-

yellow plates (from water) Yields a crystalline dioxim $\text{C}_6\text{H}_4(\text{OEt})_2(\text{NOH})_2$, which may be reduced by SnCl_2 to $\text{C}_6\text{H}_4(\text{OEt})_2(\text{NH}_2)_2$

Di-oxy-quinone *Di-methyl ether* $\text{C}_6\text{H}_4(\text{OMe})_2$ [249°] A product of the oxidation of $\text{C}_6\text{H}_4(\text{OMe})_2$ [1 2 3] by nitric acid (Will, *B* 21, 608) Prisms, v sol hot HOAc May be sublimed Reduced by SnCl_2 to $\text{C}_6\text{H}_4(\text{OH})_2(\text{OMe})_2$ [158°] Gives $\text{C}_6\text{Br}_2(\text{OMe})_2$ [176°]

Tri-oxy-quinone $\text{C}_6\text{H}_4(\text{OH})_3$ Made from tri amido resorcin by the action of FeCl_3 , the resulting amido-di-imido-resorcin being heated with HClAq at 150° (Merz a Zetter, *B* 12, 2035) Nearly black powder, insol water, sl sol alcohol Yields a crystalline tri acetyl derivative. — BaA''' , nearly black pp — PhA''' , — AgA''' , black pp

Tetra-oxy-quinone $\text{C}_6(\text{OH})_4\text{O}_2$ *'Dehydro-carboxylic acid'* Formed by the action of alcohol, air, and HCl on the black mass containing $\text{C}_6(\text{OK})_2$ got by combination of potassium with CO (Lerch, *A* 124, 20) Formed also by atmospheric oxidation of a solution of hexa-oxy benzene (Nietzki a Benckser, *B* 18, 507, 1836, 1855) It is also a product of the action of HNO_3 on mosite (Maquenne, *A Ch* [6] 12, 112) Steel-blue monoclinic needles and plates, v sol alcohol and hot water, sl sol ether Oxidised in alkaline solution by the air to croconic acid. Nitric acid forms C_6O . Aniline forms the compound $\text{C}_6(\text{OH})_4\text{O}_2(\text{NPh})(\text{NHPh})$, crystallising in red needles, with green lustre Phenylene-*o*-diamine yields $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$, sol HClAq (Kehrmann, *B* 23, 2448) *o*-Tolylene diamine forms black crystals of $\text{C}_6\text{O}(\text{OH})_2 \begin{smallmatrix} \diagup \text{N} \\ \diagdown \text{NH} \end{smallmatrix} \text{C}_6\text{H}_4$ (Nietzki a Kehrmann, *B* 20, 3150) — $\text{K}_2\text{C}_6\text{H}_4\text{O}_2$ stable in the air — $\text{K}_2\text{C}_6\text{O}_2$ Readily oxidised by air to $\text{C}_6(\text{OK})_2\text{O}_2$ — $\text{NaC}_6\text{H}_4\text{O}_2$ dark needles with metallic lustre Sl sol water, forming a dark-yellow solution — $\text{BaC}_6\text{H}_4\text{O}_2$ (dried at 100°): dark red pp

Di-acetyl derivative $\text{C}_6(\text{OH})_2(\text{OAc})_2$ [5 3 6 4 1] [205°]. Yellow plates, sl sol water

Tetra benzoyl derivative $\text{C}_6(\text{OBz})_4\text{O}_2$ Yellow needles, sol hot BaCl (Maquenne, *Bl* [2] 48, 64, *C R* 104, 1719)

Anilide $\text{C}_6(\text{OH})_4\text{O}(\text{NPh})$ Made from $\text{C}_6(\text{OH})_4$, aniline, and alcohol Red plates with golden lustre, v sl sol ordinary solvents

References —DI-BROMO and DI-CHLORO, *de-oxy quinone*

OXY-QUINONE OXIM v NITROSO RESORCIN
DI-OXY-QUINONE DICARBOXYLIC ETHER

$\text{C}_6\text{O}_2(\text{OH})_2(\text{CO}_2\text{Et})_2$ [151°] Formed by passing dry nitrous acid gas into an ethereal solution of di-oxy terephthalic ether (Hantzsch a Loewy, *B* 19, 26, 2393, 20, 1306, 1311) Got also by dissolving $\text{C}_6\text{Cl}_2\text{O}_2(\text{CO}_2\text{Et})_2$ in NaOHAq, and by atmospheric oxidation of tetra-oxy-terephthalic ether in presence of NaOHAq (Böninger, *B* 22, 1284) Greenish-yellow monoclinic prisms (from alcohol) or yellow triclinic plates (from xylene), sl sol cold water Acid to litmus Its solutions are yellow Has no action on phenyl cyanate (Goldschmidt, *B* 23, 265) SO_2 yields $\text{C}_6(\text{OH})_2(\text{CO}_2\text{Et})_2$ Hydroxylamine produces $\text{C}_6\text{O}_2(\text{ONH}_2\text{OH})_2(\text{CO}_2\text{Et})_2$ [170°] Phenyl-hydrazine forms $\text{C}_6\text{O}_2(\text{ONH}_2\text{HPh})_2(\text{CO}_2\text{Et})_2$ [184°] Hot NaOHAq yields an amorphous sodium salt

$\text{Na}_2\text{C}_6\text{H}_4\text{O}_2$, 2aq, decomposed by hot HCl aq yielding $\text{C}_6\text{H}_4(\text{OH})_2\text{O} - \text{Na}_2\text{C}_6\text{H}_4\text{O}_2$, 2aq heavy yellow powder — $\text{Na}_2\text{C}_6\text{H}_4\text{O}_2 \cdot \text{EtOH} - \text{MgC}_6\text{H}_4\text{O}_2$, 3aq orange pp — $\text{MnCl}_2 \cdot \text{H}_2\text{O}$, 1aq — $\text{Ag}_2\text{C}_6\text{H}_4\text{O}_2$, 1aq
Acetyl derivative $\text{C}_6\text{H}_4(\text{OAc})_2(\text{CO}_2\text{Et})_2$, [174°] Needles (from HOAc) (Böninger, *B* 22, 1284)

OXY-QUINOXALINE Dihydrate

$\text{C}_6\text{H}_4 \begin{smallmatrix} \text{NH} \text{CH}_3 \\ \text{N}=\text{COH} \end{smallmatrix}$ [o 130°] Made by reduction of *o* nitro phenyl amido acetic acid with tin and HCl (Plöchl, *B* 19, 8) Prisms (containing aq), sol alcohol, ether, acids, and alkalis Melts at 94° when hydrated

Di-oxy-quinoxaline $\text{C}_8\text{H}_6\text{N}_2\text{O}_2$ *1e*

$\text{C}_8\text{H}_6 \begin{smallmatrix} \text{N} \text{COH} \\ \text{N} \text{COH} \end{smallmatrix}$ Formed by heating with HCl at 150° the compound of phenylene *o* diamine and cyanogen (Bladin, *B* 18, 674, *Bl* [2] 42, 104) Needles (containing aq), sl sol water Not melted at 290°

DI-OXY DIQUINOYL $\text{C}_8\text{H}_6\text{O}_4$ *1e* $\text{C}_6(\text{OH})_4\text{O}_2$

Rhodronic acid 'Carboxylic acid' Formed by treatment of $\text{C}_6(\text{OK})_2$ with dilute alcohol and air (Heller, *A* 24, 1, 34, 232, Lerch, *A* 124, 32, Will, *A* 118, 189) Formed also by atmospheric oxidation of $\text{C}_6\text{O}_2(\text{OK})_2$ and by reduction of C_6O_4 with SO_2 (Nietzki, *a* Benckiser, *B* 18, 513, 1838, 20, 323, 23, 3136) The hydroxyls are probably in the *o*- position Colourless crystals, forming a colourless aqueous solution

Reactions — 1 Oxidised by HNO_3 to triquinoyl C_9O_2 — 2 Air and Na_2CO_3 aq yield oronic acid — 3 *Phenylene o* diamine forms reddish-brown needles of the azine $\text{C}_8\text{H}_4\text{N}_2\text{C}_6(\text{OH})_4\text{O}_2$ (Nietzki, *a* Schmidt, *B* 21, 1227) — 4 *Tolylene-o*-diamine forms $\text{C}_8(\text{OH})_4\text{O}_2 \cdot \text{N}_2\text{C}_6\text{H}_4$, which crystallises from HOAc in yellowish brown needles
Salts — $\text{Na}_2\text{C}_8\text{O}_4$ violet needles, forming an orange aqueous solution — $\text{K}_2\text{C}_8\text{O}_4$ red powder, or small blue black needles

DI-OXY RICINOLEIC ACID $\text{C}_{18}\text{H}_{34}\text{O}_4$ *Trioxyleic acid* [64°] Made from ricinoleic acid and H_2SO_4 (Liechti, *a* Suida, *B* 16, 2455) Insol water, v e sol alcohol

OXY-SALICYLIC ACID *v* **DI OXY BENZOIC ACID**

OXY-SALTS This name is sometimes used to distinguish salts which contain O from those which do not, *1e* it is applied to salts which are not haloid salts (including cyanides), thio (or sulpho-) salts, nor salts of acids composed of H, halogen, and metal or non metal (*v* **SALTS** in vol 14) M M P M

OXY SEBACIC ACID $\text{C}_{16}\text{H}_{32}\text{O}_4$ [143°] Made by boiling di bromo sebaccic acid with water (Claus, *a* Steinkauler, *B* 20, 2886) Granules, m sol cold water — $\text{Na}_2\text{A}'$ crystalline powder, v e sol water

Di-oxy-sebacic acid $\text{C}_{16}\text{H}_{32}\text{O}_4$ [130°] Made from di bromo sebaccic acid, water, and Ag_2O (C a S) Nodules, v e sol water — $\text{Na}_2\text{A}'$ v e sol water

DI-OXY-SHIKIMIC ACID Dihydrate

$\text{CH}(\text{OH}) \begin{smallmatrix} \text{CH}(\text{OH}) \text{CH}(\text{OH}) \\ \text{CH}_2 - \text{CH}(\text{OH}) \end{smallmatrix} \text{C}(\text{OH}) \text{CO}_2\text{H}$ [156°] $[\alpha]_D = -28^\circ$. Formed from bromo shikimolactone and baryta (Eykman, *B* 24, 1294) Long needles, m sol cold water

OXY-SORBIC ACID $\text{C}_{10}\text{H}_{16}\text{O}_4$ [85°] Made from pyridine (*a*) carboxylic acid by treatment

with sodium amalgam (Weidel, *B* 12, 2001). Very deliquescent needles Reduces Fehling's solution — BaA' , — CdA' ,

***o*-OXY-STEARIC ACID** $\text{C}_{18}\text{H}_{34}\text{O}_4$ *1e* $\text{C}_{18}\text{H}_{32}\text{O}_4$ $\text{CH}(\text{OH}) \text{CO}_2\text{H}$ [81°] (G a S) [85°] (S) S (alcohol) 9.63 at 20°, 2.3 at 20° (S)

Formation — 1 A mixture of H_2SO_4 (1 mol) with oleic acid (1 mol) at 0° yields $\text{C}_{18}\text{H}_{32}\text{O}_4$ $\text{CH}(\text{SO}_3\text{H}) \text{CO}_2\text{H}$, a liquid acid soluble in ether, water, and alcohol, and forming the salts $\text{K}_2\text{A}'$, $\text{Na}_2\text{A}'$, $(\text{NH}_4)_2\text{A}'$, $\text{Ba}(\text{HA}')_2$, and $\text{Cu}(\text{HA}')_2$. This acid is decomposed by boiling dilute acids into H_2SO_4 and *o* oxy stearic acid (Geitel, *J pr* [2] 37, 74, cf Frey, *A* 33, 15, Ssabanejeff, *B* 19, 239 Ref, Saytzeff, *J p* [4] 35, 369) — 2 By the action of moist Ag_2O on iodo stearic acid prepared from oleic acid, P, and I (Saytzeff, *J pr* [2] 33, 310, 35, 378, *Bl* [2] 47, 169)

Preparation — H_2SO_4 (32g) is gradually added to olive oil (88 pts) in the cold, and the mixture boiled with alcoholic potash. The product is acidified by hydrogen chloride, and the separated acids crystallised from ether (Geitel). In this preparation there is also formed the acid $(\text{C}_{18}\text{H}_{32}\text{O}_4) \text{CH}(\text{CO}_2\text{H})_2\text{SO}_3$ [24°], which yields *o* oxy stearic acid on boiling with dilute acids

Properties — White six sided plates, m sol alcohol, v sol ether. At 200° it forms a syrupy anhydride, which is also formed by heating with fuming HCl aq at 100° for 12 hours. Does not unite with Br. Reduced by HI to stearic acid

Salts — NaA' — CaA' , small crystals (G) — CaA'_2 aq (C a S) — BaA'_2 , — ZnA'_2 , — CuA'_2 , green powder — PbA'_2 , — AgA'_2

o Oxy-stearic acid

$\text{C}_{18}\text{H}_{32}\text{O}_4$ $\text{CH}(\text{OH}) \text{CH}_2 \text{CO}_2\text{H}$ The lactone $\text{C}_{18}\text{H}_{34}\text{O}_4$ [48°] is one of the products of the action of H_2SO_4 on oleic acid. After boiling with potash it yields $\text{Ca}(\text{C}_{18}\text{H}_{31}\text{O}_3)_2$ and $\text{Pb}(\text{C}_{18}\text{H}_{31}\text{O}_3)_2$, whence acids at once set free the lactone

Di oxy-stearic acid $\text{C}_{18}\text{H}_{34}\text{O}_4$ [136°] S (alcohol) 6 at 19° S (ether) 19 at 18° (Spiridonoff, *J pr* [2] 40, 243) Formed from dibromo stearic acid (oleic acid dibromide) by treatment with moist Ag_2O (Overbeck, *A* 140, 72) Got also by boiling oxyoleic acid with potash (O) Prepared by oxidising oleic acid with alkaline KMnO_4 (Saytzeff, *J pr* [2] 31, 541, 33, 304, *Bl* [2] 45, 255) Probably identical with *o* oxy stearic acid [181°] got by oxidising tallow with KMnO_4 (Groger, *B* 22, 620) Tables, insol water, v sol hot alcohol, v sl sol ether. Converted by HI into iodo stearic acid. Reduced by alcohol and zinc to stearic acid. Distilled under 100 mm it gives an acid [c 79°], which may be its anhydride $\text{C}_{18}\text{H}_{32}\text{O}_4$. This acid forms the salts $\text{C}_{18}\text{H}_{30}\text{AgO}_4$ and $\text{C}_{18}\text{H}_{30}\text{NaO}_4$. Yields octoic, sebaccic, and azelaic acids on oxidation by KMnO_4

Salts — NaA' — KA' — CaA'_2 aq — BaA'_2 , ZnA'_2 , — AgA'_2

Di-acetyl derivative Syrup, sol ether *Methyl ether* [106°] S (alcohol) 3.45 at 18° S (ether) 1.04 at 19° Plates

Ethyl ether [100°] S (alcohol) 4.8 at 16°, 4.95 at 18° S (ether) 1.78 at 18° Plates

Di-oxy-stearic acid $\text{C}_{18}\text{H}_{34}\text{O}_4$ [100°] Formed by oxidising elaidic acid with alkaline KMnO_4 (Saytzeff, *J pr* [2] 33, 316) More sol alcohol

and ether than the preceding isomeride —NaA' —AgA'

Di oxy stearic acid $C_{18}H_{34}O_4$ [78°] Got by the action of A_2O on the dibromide of iso-oleic acid [45°], which is formed from iodo stearic acid and alcoholic potash (Saytzeff, *J pr* [2] 37, 276) Crystalline powder, v sol alcohol and ether HI yields an iodo stearic acid reduced by tin and HCl to stearic acid

Tri-oxy stearic acid $C_{18}H_{32}O_5$ 'Ricinoic acid' [141°] Occurs among the products of the oxidation of castor oil with alkaline MnO_2 (Hazura a Grussner, *M* 9, 476) —KA' —NaA' 3ag

Tri oxy stearic acid $C_{18}H_{32}O_5$ 'Ricinoic acid' [111°] Occurs together with the preceding isomeride, among the products of oxidation of castor oil by $KMnO_4$ (H a G)

Tri oxy stearic acid $C_{18}H_{32}O_5$ [115°] Formed by oxidising ricinoleic acid with alkaline $KMnO_4$ (Hazura a Grussner, *M* 10, 199) Tri metric prisms, insol cold water, v sol HOAc and ether

Tetra oxy stearic acid $C_{18}H_{30}O_6$, i.e. $C_{18}H_{30}(OH)_4O_6$ 'Sativic acid' [173°] A product of the oxidation of linoleic acid by alkaline $KMnO_4$ (Hazura, *M* 9, 190) Long prisms Converted by HI into $C_{18}H_{34}I_2O_6$ and finally into stearic acid

Hexa-oxy stearic acid $C_{18}H_{26}O_8$ 'Linusic acid' [203°] Got by oxidising linoleic acid with alkaline $KMnO_4$, being derived from linoleic acid, which is present in linoleic acid (Hazura, *M* 7, 637, 8, 155, 267) Minute needles (from water) More sol water and less sol alcohol than sativic acid Yields a hexa acetyl derivative

Hexa oxy stearic acid $C_{18}H_{26}O_8$ 'Isolinusic acid' [175°] Occurs in small quantity, together with sativic and linusic acids, in the product of the oxidation of linoleic acid by alkaline $KMnO_4$ Needles, insol ether, v sol hot water Forms a hexa acetyl derivative, sl sol ether

OXY STILBENE v OXY DI PHENYL ETHYL ENI

DI-o OXY-DI STYRYL DIKETONE $C_{18}H_{16}O_4$, i.e. $CO(CH=CH-C_6H_4-OH)_2$ [160°] Got by heating the glucoside with dilute H_2SO_4 Brownish powder, sol alcohol

Glucoside $CO(CH=CH-C_6H_4-OC_6H_5)_2$ [257°] Formed, together with the compound $CH_3COCH=CH-C_6H_4-OC_6H_5$, by condensation of helicin with acetone in presence of a little alkali (Tiemann a Kees, *B* 18, 1907) Colourless crystals (containing aq), sl sol alcohol, nearly insol water, insol ether

Tetra-oxy di styryl ketone *Di methylene derivative* $CO(CH=CH-C_6H_4-O-CH_2)_2$ [185°] Made from piperonal, acetone, and NaOHAq (Haber, *B* 24, 617) Yellow needles, insol water, m sol alcohol Colours H_2SO_4 a deep blue

o OXY STYRYL METHYL KETONE $C_{18}H_{16}O_4$, i.e. $C_6H_4(OH)CH=CHCOCH_3$ [139°] Got by hydrolysis of its glucoside by emulsion (Tiemann a Klees, *B* 18, 1904) Formed also from salicylic aldehyde, acetone, and dilute NaOH (Harries, *B* 24, 8180) Long needles (from alcohol), sl sol water $FeCl_3$ colours its aqueous solution blue Sodium amalgam reduces it to $C_6H_4(OH)CH=CHCH(OH)CH_3$ [48°].

Yields a benzoyl derivative $C_6H_4(OBz)COCH_3$ [88°], an oxim $C_6H_4(OH)C(ONH)CH_3$ [85°], and a phenyl hydrazide [160°]

Glucoside $CH_3COCH=CH-C_6H_4-O(C_6H_5)_2$ [192°] Made by adding a few drops of caustic soda solution to a mixture of acetone and helicin $C_6H_4(OC_6H_5)_2CHO$ Slender needles (containing aq), v sol hot water Lævorotatory Yields an oxim [173°]

p-Oxy-styryl methyl ketone *Methyl derivative* $C_6H_4(OMe)CH=CHCOCH_3$ [73°] Made by allowing anisic aldehyde, acetone, and aqueous NaOH to stand in the cold (Einhorn a Grabfield, *A* 243, 863) Plates, v sol alcohol

Di-oxy styryl methyl ketone *Methyl derivative* $CH_3COCH=CH-C_6H_4(OH)(OMe)$ [143°] Got from its glucoside by the action of emulsion Yellow needles, v sol alcohol

Glucoside $CH_3COCH=CH-C_6H_4(OMe)(OC_6H_5)_2$ [207°] Got by heating the glucoside of vanillin with acetone and NaOHAq (Tiemann, *B* 18, 3491) Pale yellow needles (containing 2aq), m. sol water Lævorotatory

Methylene derivative $CH_3COCH=CH-C_6H_4-O-CH_2$ [107°] Made from piperonal, acetone, and NaOHAq (Haber, *B* 24, 618) Prisms, sl sol warm water Changed by steam into an isomeride (?) [111°] Yields a yellow oxim [186°] and phenyl hydrazide [160°] The isomeride [111°] yields a colourless oxim [183°] and phenyl hydrazide [163°]

DI-OXY-STYRYL m PYRAZOLE $C_{11}H_8N_2O_4$, i.e. $CO<NHCO<NHCH=CHCHPh$ *Di oxy styryl-glyoxaline Styryl hydantoin* [172°] Made by the action of boiling dilute hydrogen chloride upon $CHPhCH=CHC_6H_5NHCONH_2$, which is got from cinnamic aldehyde cyanhydrin, and urea (Pinner a Lifschutz, *B* 20, 2353, 22, 685) White plates, changing on fusion to an isomeride [195°]

Reactions —1 On heating with alcoholic potash it yields the isomeride $CO<NHCO<NHCH=CHCHPh$ which decomposes at 300° and, with KOH and EtBr, yields $C(NH)<NEtCO<NHCH=CHCHPh$ [280°]

2 Alcoholic potash and EtBr at 100° from $CO<NEtCO<NHCH=CHCHPh$ [162°] —3 **Bromine** in $CHCl_3$ forms $C_{11}H_8N_2O_4Br_2$ [200°] **Bromine** water produces $CO<NHCO<NHCH=CHCH(OH)CHBrPh$ [220°], whence NaOHAq forms tri oxy styryl-metapyrazole $CO<NHCO<NHCH=CHCOCH_2Ph$ a crystalline powder [185°]

Acetyl derivative $CO<NACCO<NHCH=CHCHPh$ [185°] Small white prisms **o-OXY-STYRYL-PYRIDINE** $C_{13}H_{11}NO$, i.e. $C_6H_4(OH)CH=CHC<NHCH=CH$ [132°]

Formed by heating (a) methyl pyridine (10 g) with salicylic aldehyde (13 g) and water (7 g) at 140° (Butter, *B* 23, 2697) Small crystals (from dilute alcohol) Yields a dibromide Reduced by Na and alcohol to $C_6H_4(OH)C_2H_4C_6H_5N$ [94°] Salts — B_2H_3PtCl [188°] — $B'HgSO_4$ [e 170°] Salts of the ethyl derivative

$(C_6H_5)_2(OEt)_2N_2 \cdot H_2HgCl_4$ [92°] Light-yellow needles — $(C_6H_5)_2(OEt)_2N_2 \cdot H_2PtCl_4$ [183°]

Ethyl-o-tolide of the ethyl derivative
 $C_6H_5(OEt)NEtI$ [218°] Golden crystals

Oxy-styryl-pyridine Methyl derivative
 $C_6H_5(OMe)CH(OH)C_6H_4N$ [97°] Formed from anisic aldehyde and methyl pyridine (Schuffen, B 23, 2719) Plates — $B_2H_2PtCl_4$ [184°]. Yellow plates

p-OXY (Py 3)-STYRYL QUINOLINE

$C_{11}H_{11}NO$ *s.s.* $C_6H_4 \cdot N \equiv C \cdot OH \cdot CH \cdot C_6H_4 \cdot OH$ [258°] Formed from *p*-amido-styryl-quinoline by the diazo-reaction (Eulach, B 22, 286) Formed also from *p*-oxybenzoic aldehyde, quinaldine, and $ZnCl_2$ (Wallach, B 16, 2009) Yellow plates

o-Oxy-(Py 1)-styryl-quinoline [215°] Made from salicylic aldehyde, lepidine, and $KHSO_4$ (Heymann & Königs, B 21, 1429, 2172) Yellow crystals

m-Oxy-(Py 1)-styryl-quinoline. [255°] Got from *m*-amido-styryl quinoline Brownish-yellow crystals (from alcohol)

p-Oxy-(Py 1)-styryl quinoline [249°] Got from *p*-oxy benzoic aldehyde, lepidine, and $KHSO_4$ (H. & K) Yellow crystals (from alcohol)

OXYSUBERANIC ACID $C_8H_8O_4$ *s.s.* $C_6H_5(OH)CO_2H$ [90°] Made from suberone cyanhydrin and conc $HClAq$ (Spiegel, A 211, 118) Tables (containing 2aq) Melts at 50° when hydrated V sol alcohol and hot water

OXYSUBERIC ACID $C_8H_8O_4$ [112°] Made by boiling bromo-suberic acid with $NaOHAq$ (Hell & Rempel, B 15, 149, 18, 817) Nodules (from ether) HNO_3 oxidises it to adipic and oxalic acids — MgA'' aq — CuA'' — ZnA'' 2½aq — Ag_2A'' crystalline pp

Ethyl derivative $C_8H_{11}(OEt)(CO_2H)_2$ Made from bromo suberic acid and alcoholic potash. Syrup, v sol water and alcohol — BaA'' — ZnA'' — PbA'' — Ag_2A'' amorphous pp

Oxy-isosuberic acid $C_8H_8O_4$ A sticky mass got by saponification of its ether, which is a product of the action of silver on bromo butyric ether (Hell & Muhlhauser, B 18, 477) $HIAq$ at 160° reduces it to β isosuberic acid — Ag_2A''

Di-oxy-suberic acid $C_8H_8O_6$ Made from di-bromo-suberic acid and KOH (Gay & Gay-Lussac, A. 155, 251) Amorphous

Di-ethyl derivative $C_8H_{10}(OEt)_2(CO_2H)_2$ Made from di bromo suberic acid and alcoholic potash (H. & R.) Syrup, v sol water, alcohol, and ether — Ag_2A'' amorphous pp

OXY-SUCCINIC ACID *v* **MALIC ACID**

Di-oxy-succinic acid v **TARTARIC ACID**

Tetra-oxy-succinic acid

$C_4H_4O_8$ *s.s.* $CO_2H \cdot C(OH) \cdot C(OH) \cdot CO_2H$ or $CO_2H \cdot CO \cdot CO \cdot CO_2H$ 2aq *Di-oxy tartaric acid*
Carboxytartaric acid [98°] Formed by passing nitrous acid into an ethereal solution of protocatechuic acid (Grüber, B 12, 514), of pyrocatechin (Barth, M. 1, 869), of guaiacol (Hering, M. 8, 825), or of 'nitro'-tartaric acid (Kekulé, A 221, 240). The free acid is got by decomposing the dry sodium salt in dry ether with HCl gas (W. L. Miller, B 22, 2015). White crystals, v sol. water The salt $Na_2C_4H_4O_8 \cdot 2aq$ is nearly insol water It splits up on heating into CO_2 and sodium tartronate. With $NaHSO_4$,

at 90° it yields glyoxal (Hinsberg, B 24, 3235). The salt $Ba_2(C_4H_4O_8)_2 \cdot aq$ is a crystalline pp. $HClAq$ and zinc reduce it to a mixture of racemic and inactive tartaric acids Yields hydantoin when the Na salt is rubbed up with urea and dilute $HClAq$ at 55° (Anschütz, A 254, 258)

Ethyl ether Thick liquid (Anschütz, A 261, 130). Converted by urea into the ureide $C_4H_4N_4O_6$, which crystallises in needles, sl sol cold water, decomposing at 245°

(*B*)-*Oxim* $CO_2H \cdot C(NOH) \cdot C(NOH) \cdot CO_2H$ [145°–150°] Got from the Na salt, hydroxyamine and HCl Colourless prisms, v sol water and alcohol, insol benzene (Müller, B 16, 2985, Söderbaum, B 24, 1223) After crystallisation from water it melts at 70°–75° It yields the salts CaA'' aq and Ag_2A'' and a crystalline diacetyl derivative, v sol water Conc $HClAq$ converts the oxim into an isomeride [145°–150°] crystallising in nodules, which are v sol water and yield the salts CaA'' 8aq and Ag_2A'' aq Ag_2O decomposes this (a) oxim into cyanogen and CO_2

Phenyl hydrazide $C_{10}H_8N_2O_4$ *s.s.* $CO_2H \cdot CO \cdot C(N_2HPh) \cdot CO_2H$ *Monophenylisone dioxytartaric acid* [218°] Made by mixing a solution of the acid (1 mol) with phenyl hydrazine (1 mol) dissolved in $HClAq$ (Ziegler & Locher, B 20, 835) Feathery needles, insol cold water, v sol hot alcohol Coloured red by $FeCl_3$ — $BaC_{10}H_8N_2O_8 \cdot 3aq$ — Na_2A'' — Ag_2A'' orange yellow pp

Di-phenyl di-hydrazide
 $CO_2H \cdot C(N_2HPh) \cdot C(N_2HPh) \cdot CO_2H$ *Diphenylisone dioxytartaric acid* [above 200°] Made from tetra-oxy succinic acid (1 mol) and phenyl hydrazine (2 mols) Orange-yellow powder, v al sol water, v sol warm alcohol On heating with Ag_2O it yields $O < CO \cdot C \cdot N_2HPh$
 $CO \cdot C \cdot N_2HPh$ [c 234°], which

crystallises in red needles, v sol Ag_2O — $(NH_4)_2A''$ colourless plates — $(NH_4)HA''$ brick red needles With silver nitrate it gives

$AgN < CO \cdot C \cdot N_2HPh$ of a vermilion colour

Na_2A'' lemon-yellow plates — $NaHA''$ brick red needles — The ethyl ether $C_{10}H_{12}N_2O_4$ [121°] is got from phenyl hydrazine and tetra oxy succinic ether (A & G), it forms canary yellow crystals

Di-p-sulpho di-phenyl-di-hydrazide
 $CO_2H \cdot O(NH_2CH_2SO_3H) \cdot C(N_2HPh) \cdot CO_2H$
 Formed from sodium tetra-oxy succinate, sodium phenyl-hydrazine *p*-sulphonate, and $HClAq$ The Na salt is an orange-yellow powder, v sol water, insol alcohol, and is used as a yellow dye (tartrazine)

Di-phenyl-hydrazide [158°] Made from the acid and N_2H_5Ph Yellow pp, turning blue in the air

Tetra phenyl-di hydrazide
 $CO_2H \cdot C(N_2Ph) \cdot C(N_2Ph) \cdot CO_2H$ [177°] Made from the acid (1 mol.) and diphenylhydrazine (2 mols) (Ziegler & Locher, B 20, 841). Yellowish plates (from hot alcohol), insol. water. Conc H_2SO_4 forms a red solution, becoming green On fusion with resorcin it gives a crimson mass, coloured blue by $NaOH$, hydroquinone and pyrogallol give green and blue masses respectively. Bromine gives a crystalline bromo-

derivative Ac_2O forms $\text{O} \begin{smallmatrix} \text{CO} \text{C} \text{N} \text{Ph}_2 \\ \text{CO} \text{C} \text{N} \text{Ph}_2 \end{smallmatrix}$ [222°] crystallising in ruby red prisms with green lustre
 Converted into the imide $\text{NH} \begin{smallmatrix} \text{CO} \text{C} \text{N} \text{Ph}_2 \\ \text{CO} \text{C} \text{N} \text{Ph}_2 \end{smallmatrix}$ [192°] by NH_3 — $\text{Na}_2\text{A}''$ rosettes of needles (from water) or plates (from alcohol)— CuA'' — PbA'' . white pp

m-Nitro-phenyl-hydrazide [175°] Made by using *m* nitro phenyl hydrazine (Bischler a Brodsky, *B* 22, 2814) Sl sol hot water and alcohol

Di-m nitro di-phenyl-dihydrazide [α 22°] Made from *m* nitro-phenyl-hydrazine (2 mols) and tetra oxy-succinic acid (1 mol). Sl sol hot water

OXY-SULPHIDES Compounds of an element, or positive compound radicle, with O and S The term is generally restricted to compounds of metals with O and S Oxy-sulphides of metals are not numerous, and they have not been much studied They are produced in various reactions, of which the following are the chief by acting on the sulphide with water, *eg* oxy-sulphide of Ba, by heating the oxide with S, *eg* Bi oxy-sulphide, by boiling the oxide and sulphide with water, *eg* Ca oxy-sulphide, by partially reducing the sulphate by H, *eg* oxy-sulphides of Co and Mn, by heating the oxide in H_2S , or by passing H_2S into an aqueous solution of the oxide, *eg* oxy-sulphides of Fe and Os, by adding a little alkali sulphide to the solution of a salt, *eg* Cu oxy-sulphide **M M P M**

OXY-SULPHO-BENZOIC ACID $\text{C}_6\text{H}_4\text{SO}_3 \cdot e$ $\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})\text{CO}_2\text{H}$ *Sulphosalicylic acid* [120°] Made by sulphonation of salicylic acid (Mendius, *A* 103, 45, Remsen, *A* 179, 107) Long thin needles, v e sol water and alcohol Gives a reddish-violet colour with FeCl_3 Yields phenol and salicylic acid on fusion with potash— NaHA'' 2aq— $\text{Na}_2\text{A}''$ 3aq— KHA'' 2aq— $\text{K}_2\text{A}''$ 2aq— $\text{K}_2\text{HA}''$ 1aq— KNaA'' 4aq— CaA'' 1aq— $\text{Ba(EA}'')$ 4aq— MgA'' 3aq— ZnA'' 8aq— PbA'' — CuA'' — $\text{Cu}_2\text{A}''(\text{OH})$ 1aq— $\text{Ag}_2\text{A}''$ 1aq crystalline powder, v sol hot water

Ethyl ether EtA'' [58°]. Crystals

Oxy-sulpho benzoic acid

$\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ [4 3 1] Made from *p*-oxy benzoic acid by treatment with SO_2 (Kölle, *A* 164, 150) or by digesting with H_2SO_4 at 100° (Klepl, *J pr* [2] 28, 196) Deliquescent needles, v e sol water and alcohol, insol ether FeCl_3 gives a red colour Potash-fusion yields protocatechuic acid— KHA'' 1aq crystals, sl sol water (Klepl)— $\text{K}_2\text{A}''$ 1aq (Kölle)— $\text{K}_2\text{C}_6\text{H}_3\text{SO}_3$ 2aq (Kölle)— BaA'' 4aq— $\text{Ba}_2(\text{C}_6\text{H}_3\text{SO}_3)_2$ amorphous (Kölle)— CdA'' 8aq— $\text{Ag}_2\text{A}''$ small prisms

Methyl derivative

$\text{C}_6\text{H}_3(\text{OMe})(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ Made from fuming H_2SO_4 and anisic acid at 160° (Zervas, *A* 108, 388, Lmprecht, *Gm* 13, 128) Needles, insol ether— BaA'' 1aq— PbA'' 1aq: needles, sl sol Aq

Oxy-sulpho-benzoic acid

$\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ [4 2 1] Formed by the diazo-reaction from (4,2,1)-amido sulpho-benzoic acid (Hedrick, *Am* 9, 416) Crystalline, sol water, alcohol, and ether— $\text{Ba(HA}'')$, insol dilute HOAc — BaA'' — CaA'' 5aq triclinic prisms, sol hot water.— CoA'' 7aq— CdA'' 8aq— ZnA'' 8aq (Pisanello).

Imide of the ethyl derivative

$\text{C}_6\text{H}_3(\text{OEt}) \begin{smallmatrix} \text{CO} \\ \text{SO} \end{smallmatrix} \text{NH}$ [268°] Made by oxidising $\text{C}_6\text{H}_4\text{Me}(\text{OEt})\text{SO}_2\text{NH}_2$ with KMnO_4 and ppg with HCl (Remsen a Palmer, *Am* 8, 227) Concentric groups of needles— $\text{KC}_6\text{H}_4\text{NSO}_4$ — $\text{AgC}_6\text{H}_4\text{NSO}_4$ lustrous needles, sl sol water.

Oxy-sulpho-benzoic acid

$\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ [3 4 ? 1] Formed from *m* oxy-benzoic acid and SO_3 (Barth, *A* 148, 38, Senhofer, *A* 152, 102) Yellowish green needles (containing 1/2 aq), v sol alcohol Coloured red by FeCl_3 Yields protocatechuic acid and an acid [189°] when fused with potash— BaA'' 4/3 aq— $\text{Cd(HA}'')$ 2aq— $\text{Pb}_2(\text{C}_6\text{H}_3\text{SO}_3)_2$ reddish amorphous mass

Oxy-sulpho benzoic acid

$\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})\text{CO}_2\text{H}$ Got by dissolving *m* diazo benzoic acid in warm H_2SO_4 (Griess, *Z* 1864, 538) White laminae (from water) Perhaps identical with the preceding acid— BaA'' .

Oxy-disulpho-benzoic acid

$\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})_2\text{CO}_2\text{H}$ [146°] Made from salicylic acid and ClSO_3H at 180° (Pisanello, *G* 18, 346) Deliquescent needles (containing 4/3 aq) Gives a red colour with FeCl_3 — $\text{Na}_2\text{A}''$ 3aq— $\text{K}_2\text{A}''$ 3aq— $\text{Ca}_2\text{A}''$ 12aq— $\text{Ba}_2\text{A}''$ 6 1/2 aq prisms, sl sol water— $\text{Pb}_2\text{A}''$ 10aq— $\text{Cd}_2\text{A}''$ 18aq— $\text{Cu}_2\text{A}''$ 12aq— $\text{Zn}_2\text{A}''$ 15aq plates

Oxy-disulpho-benzoic acid $\text{C}_6\text{H}_3\text{S}_2\text{O}_6$ Got by boiling trisulpho *m* oxy benzoic acid with BaCO_3 (Kretschy, *B* 11, 862)— BaA'' 8aq

Oxy-trisulpho-benzoic acid

$\text{C}_6\text{H}_3(\text{OH})(\text{SO}_3\text{H})_3\text{CO}_2\text{H}$ Made by heating *m*-oxy-benzoic acid with H_2SO_4 , SO_3 , and P_2O_5 at 250° (Kretschy, *B* 11, 858) Hygroscopic syrup (containing 4/3 aq at 100°) FeCl_3 gives a red colour— $\text{K}_2\text{C}_6\text{H}_3\text{S}_3\text{O}_6$ 2aq monoclinic prisms— $\text{K}_2\text{A}''$ 2aq $\text{Pb}_2(\text{C}_6\text{H}_3\text{S}_3\text{O}_6)_2$ 6aq— $\text{Pb}_2\text{A}''$ 8aq— $\text{Cd}_2\text{A}''$ 3aq— $\text{Ba}_2\text{A}''$ 4aq colourless plates

Di-oxy-sulpho-benzoic acid

$\text{C}_6\text{H}_3(\text{OH})_2(\text{SO}_3\text{H})\text{CO}_2\text{H}$ Formed from (4, 2, 1)-di oxy benzoic acid and H_2SO_4 (Zehenter, *M* 2, 468) Hygroscopic needles (containing 2aq) FeCl_3 colours its aqueous solution red—**Salts**— $\text{K}_2\text{A}''$ 8 1/2 aq— BaA'' 2aq— PbA'' 2aq— $\text{Cu}_2(\text{C}_6\text{H}_3\text{SO}_3)_2$ 5aq— $\text{Ag}_2\text{A}''$ 2aq needles

Di oxy-sulpho-benzoic acid

$\text{C}_6\text{H}_3(\text{OH})_2(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ [5 2 x 1] Made by heating (5, 2, 1)-di oxy-benzoic acid with H_2SO_4 and P_2O_5 at 180° (Senhofer a Sarlay, *M* 2, 454) Needles— $\text{K}_2\text{A}''$ 1aq— $\text{Ba(HA}'')$ 8 1/2 aq— BaA'' 2aq— PbA'' 2aq crystalline powder

OXY SULPHO-ISOCUMINIC ACID

$\text{CMe}_2(\text{OH})\text{C}_6\text{H}_3(\text{SO}_3\text{H})(\text{CO}_2\text{H})$ Made by oxidising the sulphonic acids of cymene and *m*-isocymene by KMnO_4 (R Meyer, *A* 220, 7, 29)— $\text{K}_2\text{A}''$ 5aq— BaA'' 1aq—minute plates— PbA''

OXY - SULPHOCYANO - ACETOACETIC

ETHER. *Anhydride* $\text{O}(\text{C}(\text{Ac}(\text{SCy})\text{CO}_2\text{Et}))_2$ [α 163°] Made by heating equivalent weights of barium sulphocyanide and dichloro-acetoacetic ether (207°) (Zürcher, *A* 250, 293) Yellow crystalline powder (from alcohol), insol ether.

OXY-SULPHO-NAPHTHOIC ACID

$\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})\text{CO}_2\text{H}$ Made from (α)-oxy-naphthoic acid and H_2SO_4 at 60° (König, *B* 22, 787, 28, 806) Needles (containing 5aq), v sol water and alcohol Its alkaline solutions fluoresce blue HNO_3 yields di-nitro-naphthol [188°]. Diazobenzene chloride forms the azo-compound

$C_{10}H_7(OH)(N_2Ph)SO_3H - NaHA''$ needles, v sol water $- Na_2A''$ zaq $- Ba(HA'')_2$

Oxy-di-naphtho-naphthoic acid

$C_{10}H_7(OH)(SO_3H)_2CO_2H$ Formed from (o) oxynaphthoic acid and fuming H_2SO_4 (K) Stellate groups of needles (containing 4aq) $- K_2A'' - Ba_2(C_{10}H_7S_2O_6)_2$ needles, m sol water

OXY-SULPHYDRO-ALLYL-QUINAZOLINE

$C_8H_7 \begin{smallmatrix} \diagup CO \ N \ C_2H_5 \\ \diagdown NH \ CS \end{smallmatrix}$ *Allylthio benzoylurea* [199°]

Formed from o amido benzamide and allyl thio carbimide (Stewart, *J pr* [2] 44, 416) Needles Its benzene solution fluoresces blue

OXY SULPHYDRO DI-METHYL-GLYOXALINE *Di methyl derivative*

$NMe \begin{smallmatrix} \diagup C(OMe) \ CMe \\ \diagdown C(SMe) \ N \end{smallmatrix}$ Formed from di methylthiohydantoin [167°], alcoholic potash, and MeI (Marckwald, *B* 24, 3293) Syrup $- B'HCl$ syrup $- B'H_2SO_4$ crystalline $- B'H_2PtCl_6$

The isomeride $NMe \begin{smallmatrix} \diagup CO \ CMe_2 \\ \diagdown C(SMe) \ N \end{smallmatrix}$ formed from tri methyl thiohydantoin, alcoholic potash, and MeI yields the crystalline salts $B'H_2SO_4$ [138°] and $B'H_2PtCl_6$ [150°]

OXY-SULPHYDRO-PHENYL-METHYL-GLYOXALINE *Di-methyl derivative*

$NPh \begin{smallmatrix} \diagup C(OMe) \ CMe \\ \diagdown C(SMe) \ N \end{smallmatrix}$ [90°] Formed from phenyl methyl thiohydantoin, alcoholic KOH, and MeI (Marckwald, *B* 24, 3290) Crystals $- B'HCl$ [140°] $- B'H_2PtCl_6$ [213°] $- B'C_2H_5N_3O_6$ [192°]

The isomeric compound $NPh \begin{smallmatrix} \diagup CO \ CMe_2 \\ \diagdown C(SMe) \ N \end{smallmatrix}$ [223°] from phenyl-di methyl thiohydantoin [67°] forms the salts $B'HCl$, $B'H_2PtCl_6$ [132°] and $B'C_2H_5N_3O_6$ [174°]

OXY-SULPHYDRO-PHENYL-QUINAZOLINE

$C_8H_7 \begin{smallmatrix} \diagup CO \ NPh \\ \diagdown NH \ CS \end{smallmatrix}$ [199°] Formed from o-amido benzamide and phenyl thiocarbimide (Stewart, *J pr* [2] 44, 416) Satiny tables

OXY-SULPHYDRO-QUINAZOLINE

$C_8H_7 \begin{smallmatrix} \diagup CO \ NH \\ \diagdown NH \ CS \end{smallmatrix}$ [281°] Formed from o amido benzamide and thio urea (Stewart, *J pr* [2] 44, 416) Nodules (from alcohol)

OXY-SULPHYDRO-THIAZOLE $C_8H_7NS_2O_2$

$NH \begin{smallmatrix} \diagup OS \ S \\ \diagdown CO \ CH_3 \end{smallmatrix}$ [167°] Formed by heating

$NH \begin{smallmatrix} \diagup C(NH) \ S \\ \diagdown CO \ OH_2 \end{smallmatrix}$ with OS_2 in alcohol at 160° (Miolati, *A* 262, 84) Formed also from chloro acetic ether, ammonium dithiocarbamate, and alcoholic HCl, and from sulphocyanosacetic ether by successive treatment with H_2S and HCl

OXY-SULPHYDRO-o-TOLYL-METHYL GLY-

OXALINE *Di methyl derivative*

$C_8H_7MeN \begin{smallmatrix} \diagup C(OMe) \ CMe \\ \diagdown C(SMe) \ N \end{smallmatrix}$ [120°] Got from o-tolyl-methyl-thiohydantoin, alcoholic potash, and MeI (Marckwald, *B* 24, 3292) Plates, v sol alcohol Yields the following salts $B'HCl$ [120°], $B'H_2PtCl_6$, $B'H_2SO_4$ [205°], $B'HNO_3$, and the picrate $B'C_2H_5N_3O_6$ [200°]

The isomeric $C_8H_7MeN \begin{smallmatrix} \diagup C(SMe) \ N \\ \diagdown CO \ CMe_2 \end{smallmatrix}$ from o-tolyl di methyl thiohydantoin yields the salts $B'HCl$ [118°], $B'H_2PtCl_6$, $B'H_2SO_4$ [208°], and $B'C_2H_5N_3O_6$ [212°].

Oxy-sulphydro-p-tolyl-methyl-glyoxaline *Di-methyl derivative* [109°] Plates Yields $B'HCl$ [123°], $B'H_2PtCl_6$, and $B'C_2H_5N_3O_6$ [180°]

The isomeric $[4 \ 1] C_8H_7MeN \begin{smallmatrix} \diagup C(SMe) \ N \\ \diagdown CO \ CMe_2 \end{smallmatrix}$ yields $B'H_2SO_4$ [210°], $B'H_2PtCl_6$ [162°], and $B'C_2H_5N_3O_6$, decomposing at 190°

DI-OXY TARTARIC ACID v **TETRA OXY-SUCCINIC ACID**

OXY TEREBIC ACID $C_8H_7O_3$ [100°-120°] Made by boiling chloro terebic acid with water and $CaCO_3$ (W Roser, *A* 220, 244) Syrup, crystallising with difficulty, v sol water $- CaA'$, $- AgA'$ needles, v sol water

OXY TEREPHTHALIC ACID $C_8H_7O_3$ $is C_8H_7(OH)(CO_2H)_2$ Formed by the diazo reaction from amido terephthalic acid (De la Rue a Müller, Burkhardt, *B* 10, 144, 1273) Prepared also by potash fusion from bromo terephthalic acid (Fischli, *B* 12, 621), from oxy aldehyde benzoic acid (Tiemann a Landshoff, *B* 12, 1335), from p xyleneol, from carvacrol, and thymol (Jacobsen, *B* 11, 570), from oxy p toluic acid (Hall a Remsen, *B* 12, 1433), and from rufigallic acid (Schreder, *M* 1, 439)

Properties—Crystalline powder, sl sol water, v sol alcohol Not melted at 300° $FeCl_3$ colours its solution reddish violet Yields CO_2 and phenol when strongly heated On fusion with NaOH it gives salicylic acid and some p-oxy benzoic acid (Barth a Schreder, *B* 12, 1260) Yields m oxy benzoic acid on heating with $HClAq$ at 120° Forms a di nitro derivative [179°]

Salts $- BaA''$ 3½ aq lamina (from water) $- Ag_2A''$ white pp, insol water

Methyl ether Me_2A'' [94°] Leaflets Yields an acetyl derivative $C_8H_7(OAc)(CO_2Me)_2$ [76°]

Methyl derivative $C_8H_7(OMe)(CO_2H)_2$ [279°] Got by oxidation of methoxy toluic acid and of methyl thymol Small prisms

Methylether of the methyl derivative $C_8H_7(OMe)(CO_2Me)_2$ [65°] Concentric needles

Ethyl derivative $C_8H_7(OEt)(CO_2H)_2$ [254°] Got by oxidation of the ethyl ether of thymol (Paterno a Canzoneri, *G* 9, 460) Stellate groups of minute crystals, insol water

Benzyl derivative $C_8H_7(OCH_2Ph)(CO_2H)_2$ [230°-240°] Made from $C_8H_7(ONa)(CO_2Me)_2$ and benzyl chloride, the product being saponified (Bayer a Tutein, *B* 22, 2188) Slender needles

Tetrahydride $C_8H_7(OH)(CO_2H)_2$ Got by reducing the acid with sodium amalgam (Bayer a Tutein, *B* 22, 2180) Yellowish white needles, sl sol cold water Coloured bluish violet by $FeCl_3$ Its methyl ether forms feathery needles [77°] Hydroxylamine converts the tetrahydride into $C_8H_7O_2(NOH)$ [170°], while phenyl hydrazine forms $C_8H_7O_2(N_2HPH)$ [125°] converted by $HClAq$ into $NH \begin{smallmatrix} \diagup C_8H_7 \\ \diagdown \end{smallmatrix} CO_2H$, a crystalline

body [230°] giving off a faecal odour when heated The tetrahydride, heated at 120°, loses CO_2 and forms $C_8H_7O(CO_2H)$, whence NaA' and $C_8H_7(OH)CO_2H$ [180°-140°] may be prepared, the latter body yielding the crystalline acid $C_8H_7(OH)(CO_2H)_2$ on saponification

Di-oxy-terephthalic acid $C_8H_6O_4$ \pm $C_8H_4(OH)_2(CO_2H)_2$ [5 2 4 1] or

Quinone hydro dicarboxylic acid Hydroquinone dicarboxylic acid [above 300°]

Formation—1 By passing a current of air through a solution of the dihydride of its ether (succinyl succinic ether) containing excess of alkali (Herrmann, *B* 10, 107, *A* 211, 335)—2 By the oxidising action of KMnO_4 on $C_8H_4Me_2(OPO_4K)_2$, a derivative of thymoquinone, and on $C_8H_4Me_2(OPO_4K)_2$, a derivative of hydro *p* xyloquinone (Heymann *a* Königs, *B* 20, 2392)—3 By the action of PCl_5 on succinylsuccinic ether (Levy *a* Curchod, *B* 22, 2108)—4 By saponifying its ether

Properties—Interlaced needles (containing 2aq) (from water) or yellow plates (from alcohol), sl sol alcohol and ether, v sl sol water. Its alcoholic solution shows blue fluorescence. FeCl_3 gives a deep blue colour. When distilled it yields hydroquinone. Bromine water yields tetrabromquinone. Chlorine passed into its alcoholic solution forms tetra chloro quinone (Loewy, *B* 19, 2394)

Salts— $\text{K}_2\text{A}''$ yellow needles, forming a solution with green fluorescence— KHA'' — $\text{Na}_2\text{A}''$ 2aq— NaHA'' 2aq— $\text{Na}_2\text{A}''(\text{OH})_{10}\text{aq}$ crystals ppd by conc NaOHaq — $(\text{NH}_4)_2\text{A}''$ 2aq (Duisberg, *A* 213, 1(3)— BaA'' — CaA'' 5aq— $\text{Ca}(\text{HA}'')_2$ 5aq— PbA'' — $\text{Ag}_2\text{A}''$ green yellow pp

Mono ethyl ether EtHA'' [184°] Made by the action of dilute KOH on the di ethyl ether in the cold. Pale yellow needles (from water), sl sol water, alcohol, and ether— $\text{Ba}(\text{EtA}'')_2$ 5aq— $\text{Ca}(\text{EtA}'')_2$ 5aq greenish yellow needles

Di ethyl ether Et_2A'' [133°] S (ether) 16 at 20°. Prepared by adding bromine to a solution of its dihydride in CS_2 , or to the dihydride suspended in water (Herrmann, *A* 211, 327, *B* 19, 2229). Formed also by the action of sodium on di bromo acetoacetic ether dissolved in ether (Wedel, *A* 219, 74)

Properties—Greenish yellow trimetric tables (from benzene) or needles (from ether). May be sublimed. Its alcoholic solution shows blue fluorescence. FeCl_3 gives a bluish green colour. Does not react with phenyl cyanate (Goldschmidt *a* Meissler, *B* 23, 259). Does not react with phenyl hydrazine or hydroxylamine. Sol alkalis, forming a yellow liquid, from which it is ppd by CO_2 , and, as a scarlet pp, $\text{Na}_2C_2H_2O_4$, by conc NaOHaq . Ac_2O has no action at 510°

Reactions—1 Reduced to its dihydride by *zinc* and HClAq (Baeyer, *B* 19, 428)—2 *Bromine vapour* forms $C_8H_4Br_2O_4(\text{CO}_2\text{Et})_2$ [157°] and afterwards $C_8Br_2O_4(\text{CO}_2\text{Et})_2$ (Herrmann, *B* 19, 2234, Böninger, *B* 21, 1758)—3 *Dry nitrous acid gas* passed into its solution in absolute ether oxidises it to di oxy quinone dicarboxylic ether (Hantzsch *a* Loewy, *B* 19, 26), an intermediate crystalline powder $C_8H_4NO_6$ or $C_8H_4NO_6$ [148°] giving a violet colour with alkalis being first formed (Loewy, *B* 19, 2393)

Hydrate of the ether $C_8H_4O_4$ is

Formed, together with the ether, by the action of bromine on the dihydride (succinyl-succinic ether) (Hantzsch *a* Zeckendorf, *B* 20, 2800). Yellow needles. On boiling with alcohol it changes to the ether $C_8H_4O_4$ [133°]. Hydroxylamine reduces it to $C_8H_4H_2O_4$ [128°]

Di acetyl derivative of the ether $C_8H_4(\text{OAc})_2(\text{CO}_2\text{Et})_2$ [154°] Got by the action of AcCl on the ether or on $C_8H_4(\text{ONa})_2(\text{CO}_2\text{Et})_2$ (Wedel, *A* 219, 81, Nef, *A* 258, 306). Monoclinic crystals. Not attacked by Br . Its alcoholic solution is not fluorescent

Di benzoyl derivative of the ether $C_8H_4(\text{OBz})_2(\text{CO}_2\text{Et})_2$ [174°] Made from the ether, NaOHAq , and BzCl . Colourless needles (from alcohol). Not attacked by Br in CHCl_3 . Conc H_2SO_4 sets free $C_8H_4(\text{OH})_2(\text{CO}_2\text{Et})_2$. Zinc dust and conc HClAq form three isomeric dihydrides $C_8H_4(\text{OBz})_2(\text{CO}_2\text{Et})_2$, melting at 165°, 85°-95°, and 100°-110°

Di methyl derivative $C_8H_4(\text{OMe})_2(\text{CO}_2\text{H})_2$ [265°] Formed by saponification of $C_8H_4(\text{OMe})_2(\text{CO}_2\text{Et})_2$ (*v infra*) with alcoholic potash (Nef, *A* 258, 298). Colourless needles. Its aqueous solution shows bluish-violet fluorescence— $(\text{NH}_4)_2\text{A}''$ sol water. Not fluorescent

Di methyl derivative of the ethyl ether $C_8H_4(\text{OMe})_2(\text{CO}_2\text{Et})_2$ [101 5°] Made from $C_8H_4(\text{ONa})_2(\text{CO}_2\text{Et})_2$ and MeI at 100° (Nef, *A* 258, 297). Colourless tables. Its solutions show bluish violet fluorescence. Not reduced by zinc dust and HOAc

Di benzyl derivative of the ethyl ether $C_8H_4(\text{OCH}_2\text{Ph})_2(\text{CO}_2\text{Et})_2$ [96 5°] Monoclinic needles (from alcohol), insol KOHaq

Oxy-amide $C_8H_4(\text{OH})_2(\text{CO}_2\text{NH}_2)_2$ Formed by the action of hydroxylamine on the ether (Jeaurenand, *B* 22, 1278). Prisms (containing 2aq), sol water and alcohol

Dioxyterephthalic acid dihydride $C_8H_6O_4$, Succinyl succinic acid S 015 at 19 5° Got from its ether and the calculated quantity of cold NaOHAq . Minute needles, decomposed by heat, yielding $C_8H_6O_4$ [78°] and CO_2 . FeCl_3 colours its solution violet (Baeyer *a* Noyes, *B* 22, 2168)— BaA' 2 1/2 aq— $(\text{NH}_4)_2\text{A}'$ 2aq

Methyl ether $\text{Me}_2\text{A}''$ [132°] Made by the action of sodium on methyl succinate (Ebert, *A* 229, 50). Got also from bromo acetoacetic ether and ammonia (Geuther, *A* 244, 204). Sol. alcohol and ether

Mono ethyl ether EtHA'' [98°] Got from the di ethyl ether and cold NaOHAq (Herrmann). Yellowish prisms (from ether). Its alcoholic solution shows blue fluorescence. FeCl_3 gives a violet colour. Decomposed by boiling water into CO_2 and $\text{C}_8\text{H}_4\text{EtO}_4$

Di-ethyl ether $\text{Et}_2\text{A}''$ is

$$\text{CO}_2\text{Et} \text{ CH} \begin{array}{c} \diagup \text{CH} \text{CO} \\ \diagdown \text{CO} \text{CH}_2 \end{array} \text{ CH CO}_2\text{Et} \text{ or } \text{CO}_2\text{Et} \text{ CH} \begin{array}{c} \diagup \text{CH}=\text{C}(\text{OH}) \\ \diagdown \text{C}(\text{OH}) \text{CH} \end{array} \text{ CH CO}_2\text{Et} \quad [127^\circ]$$

 S G Ψ 141 S (ether) 16 at 17°

Formation—1 By the action of K or Na on ethyl succinate (Fehling, *A* 49, 186, Herrmann, *A* 211, 306, Duisberg, *B* 16, 133)—2. By the action of NaOEt (free from alcohol) on succinic ether (Volhard, *B* 16, 134)—3 From bromo-acetoacetic ether by the action of alcoholic NH_3 (Duisberg, *A* 218, 183) or of NaOEt

(Wedel, *A* 219, 92) —4. By reducing di oxy-terephthalic ether with zinc and HClAq (Baeyer, *B* 19, 428)

Properties—Green triclinic crystals with blue fluorescence (from ether), v sl sol. hot water Insol NH₄Aq, but forms a yellow solution in NaOHAq Its alcoholic solution shows blue fluorescence FeCl₃ gives a red colour Decomposed by excess of KOHAq, yielding black products containing syrupy 'succinyl-propionic' acid C₆H₄O₄ and a crystalline acid C₆H₄O₄ [139°], which forms BaA'' 2aq The alkaline solution is turned brown by oxygen Does not react with phenyl cyanate (Goldschmidt & Meissler, *B* 23, 258)

Reactions—1 Converted by bromine into di-oxy terephthalic ether Bromine and potash yield brominated quinones —2 Nitrous acid forms a di nitroso-derivative C₆H₂(N₂O)₂ [114°], a white powder, insol water and alcohol, decomposed by boiling alcohol with formation of di-oxy-terephthalic ether, and by boiling water with formation of the oxim of pyruvic ether —3 Hydroxylamine in presence of NaOHAq form C₆H₄(NOH)₂CO₂Et, crystallising from alcohol in plates which begin to decompose at 160° (Jeaurenaud, *B* 22, 1282) An alcoholic solution of phenyl-hydrazine forms the white hydrazo-compound C₆H₄(NH NHPH₂)(CO₂Et)₂ [165°] whence bromine produces the diazo compound C₆H₄(N₂Ph)₂(CO₂Et)₂ [126°], which on saponification yields the acid C₆H₄(N₂Ph)₂(CO₂H)₂ [over 250°] The white hydrazo-compound is accompanied by C₆H₄(NH NHPH₂)(CO₂Et)₂ [208°], a yellow isomeride identical with Knorr's body [206°] (Baeyer, *B* 24, 2690) —4 Phenyl hydrazine (2 mols) forms in presence of toluene and some glacial acetic acid, the four following compounds C₆H₄(N,NHPh)(CO₂Et)₂ [160°], C₆H₄(N,NHPh)₂(CO₂Et)₂ [206°], C₆H₄N₂O₂ [212°], and C₆H₄N₂O₂, decomposing above 300° (Knorr & Bulow, *B* 17, 2654) The last body yields a di-methyl derivative C₆H₄(Me₂N)₂O₂ and is converted by nitrous acid into a blue substance C₆H₄N₂O₂ —5 PCl₅ forms the chlorides of dichloro dihydroterephthalic and dioxyterephthalic acids (Levy & Curchoff, *B* 22, 2106)

Salts—Na₂Et₂C₆H₄O₄2EtOH Got from the ether by ppg with alcoholic soda (Remsen, *B* 8, 1409) Red, on drying it changes to colourless Na₂Et₂C₆H₄O₄ (Hantzsch & Herrmann, *B* 21, 1756) —K₂Et₂C₆H₄O₄ Colourless —K₂Et₂C₆H₄O₄ orange —MgEt₂C₆H₄O₄ 2aq dark red amorphous mass —BaCl₂H₄O₄ aq red pp —CaCl₂H₄O₄ aq

Di-acetyl derivative of the ether C₆H₄(OAc)₂(CO₂Et)₂ [171°] Made from the ether and AcCl Needles (by sublimation) Its solutions are not fluorescent

Di-benzoyl derivative of the ether C₆H₄(OBz)₂(CO₂Et)₂ [165°] Formed from C₆H₄(ONa)₂(CO₂Et)₂ and BzCl (Nef, *A* 258, 810) Formed also, together with two isomerides [188°] and [102 5°], by reducing the di-benzoyl derivative of di-oxy-terephthalic ether with zinc and HClAq The three isomerides may be separated by crystallisation from ether-ligroin The three compounds are converted into C₆H₄(OH)₂(CO₂Et)₂ by H₂SO₄, and into C₆H₄(OBz)₂(CO₂Et)₂ by Br in CS₂.

(a)-**Di-benzyl derivative of the ether** C₆H₄(OCH₂Ph)₂(CO₂Et)₂ [169°] Made in small quantity (5 pc) from C₆H₄(OCH₂Ph)₂(CO₂Et)₂ by reducing with Zn and HCl (Nef, *A* 258, 801) Colourless needles May be sublimed

(β)-**Di-benzyl derivative of the ether** C₆H₄(OCH₂Ph)₂(CO₂Et)₂ [148 5°] Made, together with a (γ)-isomeride [140 5°], by the action of benzyl chloride on C₆H₄(ONa)₂(CO₂Et)₂ at 100° Less sol alcohol than the (γ)-isomeride H₂SO₄ converts it into a crystalline polymeride [272°] Hydroxylamine and phenyl hydrazine have no action

Di-ethyl derivative C₆H₄(OEt)₂(CO₂H)₂ [126 5°] Got, with EtBr, by heating bromo-ethyl acetate ether at 100° (Wedel, *A* 219, 104) Trimetric octahedra, *a* *b* *c* = 245.1 641 Sol water and alcohol, forming acid solutions, coloured red by FeCl₃ —(NH₄)₂A'' —Na₂A'' 2aq —K₂A'' aq —BaA'' 2aq —CaA'' aq —MgA'' 2aq —ZnA'' 3aq —MnA'' 4aq —PbA'' —Et.A''

Di-oxy-terephthalic acid tetrahydride C₆H₄O₄ & C₆H₄(OH)₂(CO₂H)₂ [191°] Made by the action of hydroxylamine on dioxyterephthalic ether (Jeaurenaud, *B* 22, 1279) Prisms, sl sol cold water, v e sol alcohol and ether FeCl₃ gives a brown colour —(NH₄)₂A'' needles —BaA'' white powder —Ag₂A'' 2aq needles

Ethyl ether Et.A'' [128°] Made by the action of hydroxylamine on the hydrate of di-oxyterephthalic ether [113°] (Hantzsch & Zeckendorf, *B* 20, 2801) Yelow crystalline body

Di-oxy-terephthalic acid hexahydride C₆H₄(OH)₂(CO₂H)₂ **Di oxy hexamethylene dicarboxylic acid** The salt BaA'' 3aq is got by saponifying the nitrile with baryta water (Baeyer & Noyes, *B* 22, 2177) Thick prisms or needles, v sl sol water

Nitrile C₆H₄O₄(CN)₂ [180°] Made from quinone tetrahydride (diketohexamethylene) and HCl Colourless, v sol hot water and alcohol

c-Di-oxy-terephthalic acid C₆H₄(OH)₂(CO₂H)₂ [1 2 3 4] [290°] Formed from sodium pyrocatechin and CO₂ (Schmitt & Hahle, *J pr* [2] 44, 1) Thin needles (containing aq) forming solutions with deep blue fluorescence FeCl₃ gives a blue colour —Na₂A'' 2aq fluorescent prisms —Pb₂C₆H₄O₄ —Ag₂A''

Methyl ether Me.A'' [145°] Needles

Ethyl ether Et.A'' [90°] Tables

Tetra-oxy terephthalic acid C₆H₄O₄ & C₆(OH)₂(CO₂H)₂ **Ethyl ether Et.A''** [178°] Formed by passing SO₂ into a feebly alkaline solution of di-oxy-quinone dicarboxylic ether (Loewy, *B* 19, 2388) Golden plates (from chloroform), v sl sol water, alcohol, and ether In presence of NaOHAq it is oxidised by air to di-oxy-quinone dicarboxylic ether (Böniger, *B* 22, 1284) Phenyl cyanate (4 mols) and some chloroform at 170° yield C₆(O CO NHPh)₂(CO₂Et)₂ [264°], an orange powder, insol most solvents (Goldschmidt & Meissler, *B* 23, 266) Ac₂O yields the tetra acetyl derivative C₆(OAc)₄(CO₂Et)₂ [202°], a colourless crystalline powder (Hantzsch & Zeckendorf, *B* 20, 2798) Hydroxylamine forms C₆(O NH₂OH)₂(CO₂Et)₂ [170°] Alcoholic phenyl-hydrazine forms, on boiling, the corresponding salt C₆O₂(O N₂H₂Ph)₂(CO₂Et)₂ [184°] (Böniger)

Reference—DI CHLORO-DI-OXY-TEREPHTHALIC ACID

DI OXY-TETRADECANE *v* BUTYRO PINACONE
and Di isobutyl-pinacone

DI OXY-TETRADECANOIC ACID $C_{14}H_{26}(OH)_2O_2$ [60°] A product of oxidation of oil of millet by $KMnO_4$ (Kassner *Ar Ph* [3] 25, 1081) Insol water, *v* sol alcohol and ether

OXYTETRIC ACID, formed by heating methyl acetoacetic ether with bromine and a little water, is identical with Mesaconic acid (Cloeze, *Bl* [3] 3, 598, *C R* 110, 583, Walden, *B* 24, 2033, Gorbhoff, *J R* 1887, 605)

o-OXY-THIENYL-ACETIC ACID

$C_6H_5S \cdot CH(OH)CO_2H$ [115°] Formed by reducing thienyl-glyoxylic acid with sodium amalgam (Ernst, *B* 19, 3280) Needles (from benzene), *v* sol water, alcohol, and ether Yields thiophenic aldehyde on boiling with MnO_2 Reduced by HI and P to thienyl acetic acid— $BA'A'$, *zaq*— $CA'A'$, *zaq* *v* sol water— Ag_2A' white pp

o-OXY THIOBENZOIC ACID $C_6H_5SO_2$ *ie*

$C_6H_4(OH)CO_2SH$ Made from *o*-oxy benzoyl chloride and KSH (Carius, *A* 129, 11) Brownish-yellow amorphous mass, insol water— $BA'A'$

Methyl derivative of the ethyl ether

$C_6H_4(OMe)CO_2SEt$ (198° at 80 mm) Made from $C_6H_4(OMe)CO_2OPh$ and $NaSEt$ in ether (Seifert, *J pr* [2] 31, 475) Oil, smelling like mercaptan

o Oxy-thiobenzoic acid $C_6H_4(OH)CSOH$

Amide $C_6H_4(OH)CSNH_2$ [118°] Made by fusing salicylamide with P_2S_5 (Spilker, *B* 22, 2767) Colourless needles, *v* sol alcohol $FeCl_3$ colours its aqueous solution violet Slowly converted into $C_6H_4(OH)CONH_2$ by boiling water

Di oxy dithio benzoic acid $C_6H_4(OH)_2CS_2H_2$ [4 2 1] Made by heating resorcin with potassium xanthate at 100° (Lippmann, *M* 10, 618) Yellow needles (containing aq) Melts at 131° when hydrated, but decomposes at 124° when anhydrous Potash fusion yields (4,2,1)-di-oxy-benzoic acid

Tri oxy di-thio-benzoic acid

$C_6H_4(OH)_3CS_2H_2$ [4 3 2 1] [154°] Made by heating pyrogallol with potassium xanthate and alcohol (L) Yellow crystals (containing aq), *v* sol alcohol and ether Yields *c*-tri-oxy benzoic acid when fused with potash

OXY THIONAPHTHENE $C_{10}H_8SO$ *ie*

$CH \cdot C(=O)CH \cdot CH$ [72°] Made by heating thiophenic aldehyde with sodium succinate and Ac_2O at 135° (Biedermann, *B* 19, 1618) Needles (by sublimation), *sl* sol water, *v* sol $NaOHAq$ Gives the indophenine reaction Chloroform and $KOHAq$ give a bluish-green colour on warming

OXY THYMOQUINONE $C_{11}H_{10}O_2$ *ie*

$C_6HMe(C_6H_4)(OH)O_2$ [1 4 6 2 5] [165°]

Formation—1 By the oxidising action of $FeCl_3$ on di-amido-thymol (Carstanjen, *J pr* [2] 15, 399, Ladenburg a Engelbrecht, *B* 10, 1218) 2 By dissolving bromo thymoquinone in $KOHAq$ (Carstanjen, *J pr* [2] 8, 57)—3 By the action of H_2SO_4 or $HClAq$ on methylamidothymoquinone (Zincke, *B* 14, 97) or dimethylamidothymoquinone (Schulz, *B* 16, 898)

Properties—Yellow needles, *sol*. alcohol, ether, and hot water Forms a violet red solution in alkalis May be sublimed

Reactions—1 EtI at 100° forms $C_{11}H_{11}EtO_2$

which sublimes in golden plates—2 *Aniline* in alcohol forms $C_6HMe(C_6H_4)(OH)O_2(NHPh)$ [135°], crystallising in violet-black needles, and forming a bluish violet solution in NH_4Aq —3 *p-Tolu idine* yields the corresponding *p*-toluide [165°]

(8) **Oxy-thymoquinone**

$C_6HMe(C_6H_4)(OH)O_2$ [1 4 3 2 5] [183°] Made from di nitro carvacrol by reduction and subsequent oxidation with $FeCl_3$ (Mazzara, *B* 23, 1390) Orange prismatic tables, volatile with steam Na_2CO_3Aq forms a violet solution

Di-oxy thymoquinone $C_6Me(C_6H_4)(OH)_2O_2$

[213°] Formed by boiling chloro-oxy thymoquinone with $KOHAq$ (E a L) and by boiling dimethylamido thymoquinone with alcohol and H_2SO_4 or KOH (Zincke, *B* 14, 95) Red needles or prisms, forming a violet solution in alkalis Phenylene phenyl *o* diamine, in presence of alcohol and $HOAc$, forms oxythymophenindulone

$C_6H_4 \cdot \langle \overset{N}{NPh} \rangle \cdot C_6Me(C_6H_4)(OH)O_2$ as ruby-red crystals [175°] (Kehrmann a Messinger, *B* 24, 590) — $BA'A'$ *aq*— PbA' green pp

Di-acetyl derivative [81°] Needles

Di-benzoyl derivative [163°]

Reference—CHLORO OXY THYMOQUINONE

DI OXY-DITHYMYL ETHANE $C_{22}H_{20}O_2$ *ie*

$CH_3CH(C_6H_4)_2(OH)_2$ [185°] Formed by reducing $CCl_2CH(C_6H_4)_2OH$, with zinc-dust and alcohol (Jager, *C J* 31, 262) and also by adding a mixture of chloroform and $SnCl_4$ to a cooled mixture of paraldehyde and thymol (Steiner, *B* 11, 287) Efflorescent plates (from alcohol)

Di acetyl derivative [100°] Needles

Di benzoyl derivative [191°] Needles

Di ethyl ether $C_{22}H_{20}Et_2O_2$ [72°]

DI OXY-DI THYMYL-ETHYLENE

$CH_3C(C_6H_4)_2(OH)_2$ [171°] Formed, together with the preceding body, by boiling the compound $CCl_2CH(C_6H_4)_2OH$, with zinc dust and alcohol (Jager, *C J* 31, 263) Needles (from $HOAc$) K_2FeCy_4 oxidises it, in alcoholic solution, to $C_6H_4O_2$ [215°], crystallising in green needles Alkaline K_2FeCy_4 forms $C_{22}H_{20}O_2$ [215°], which forms dark-red crystals

DI-OXY DI-THYMYL SULPHIDE

$(C_6H_4)_2(OH)_2S$ [152°] Formed from thymol and $SOCl_2$ (Tassinari, *G* 17, 92)

OXY-TOLUAMIDOXIM

[3 6 1] $C_6H_4Me(OH)C(NO_2)NH_2$ [124°] Formed from the thioamide in alcohol by treatment with hydroxylamine hydrochloride and $NaOHAq$ (Goldbeck, *B* 24, 3662) Yellowish plates (from benzene), *v* sol hot water Coloured cherry red by $FeCl_3$ — $B'HCl$ [215°]

Acetyl derivative Plates (from benzene) gives $C_6H_4(OH)C \cdot \langle \overset{N}{N}O \rangle \cdot CMe$ [45°] on heating with water in a sealed tube

Benzoyl derivative

$C_6H_4(OH)C(NO_2)NH_2$ [182°] Plates, *sl* sol alcohol Coloured green by $FeCl_3$ in acetone

Di-benzoyl derivative [143°]

c-Oxy-toluamidoxim

[3 2 1] $C_6H_4Me(OH)C(NO_2)NH_2$ [126 5°] Formed from the nitrile and hydroxylamine (Paschen, *B* 24, 3670) Tables, *v* sol alcohol and hot water Yields a dibenzoyl derivative $C_6H_4Me(OBz)C(NO_2)NH_2$ [164°], whence KOH forms $C_6H_4Me(OH)C \cdot \langle \overset{N}{N}O \rangle \cdot CPh$ [150°]

OXY-TOLUENE v. CRESOL and BENZYL

ALCOHOL

Di-oxy-toluene $C_8H_8O_2$, $\pm e$

$C_8H_7Me(OH)_2$ [124] *Cresorein Lutorcin* Mol w 124 [104°] (c 269°) Formed from amido *p*-cresol and from amido *o*-cresol [161°] by the diazo reaction (Knecht, *B* 15, 92, *B* 15, 298, Wallach, *B* 15, 2835) Formed also by potash-fusion from the corresponding toluenedisulphonic acid (Nolting, *B* 19, 136) and from bromo *p*-cresol (Vogt & Henninger, *C R* 94, 650) Spherical crystalline groups, v sol water, alcohol, and ether, sl sol benzene and ligroin $FeCl_3$ colours its solutions blue NH_3 with damp air turns it brown, green, and finally blue Bleaching powder gives a yellow colour Its solution in NaOH aq is turned brown by air On heating with chloroform and NaOHAq it gives a rose red colour On heating with phthalic anhydride it forms the phthalein $C_{22}H_{14}O_6$, which is a brick red powder, exhibits green fluorescence in alkaline solution, and yields $C_{22}H_{14}Ac_2O_6$ [260°] Unlike resorcin, cresorein gives no colour when the product got by heating with H_2SO_4 and nitro-benzene is diluted and made alkaline

Di-acetyl derivative $C_8H_8(OAc)_2$ [c 160°]

Di-oxy-toluene $C_8H_7Me(OH)_2$ [126] [63°-66°] Made by the diazo reaction from amido cresol [124°-128°] (Ullmann, *B* 17, 1960) Needles, v sol water and alcohol Coloured red by bleaching powder With phthalic anhydride it gives a compound analogous to fluorescein Reduces cold ammoniacal $AgNO_3$

Isocrescin $C_8H_8(OH)_2$ [87°] (260°) Made by potash fusion from toluene (γ) disulphonic acid (Senhofer, *A* 164, 181) Needles (containing aq) Sol water, alcohol, and ether Tastes sweet $FeCl_3$ gives a brownish green colour Reduces cold ammoniacal $AgNO_3$

Other di-oxy-toluenes are described as Hydrotoluquinone, Isohydrotoluquinone, Orcin, and Methyl pyrocatechin

***o*-OXY-TOLUENE PHOSPHINIC ACID**

$C_8H_7CH(OH)P(OH)_2$ [90°] Formed, together with $(C_8H_7CH(OH))_2PO_3H$ [165°] by heating benzoic aldehyde with hypophosphorous acid (Ville, *C R* 107, 659, 110, 348) Plates, decomposing at 140° with formation of benzoic aldehyde Reduces $AgNO_3$ — $Ba(HA'')_2$ aq small plates

Acetyl derivative $CHPh(OAc)P(OH)_2$ ***o*-OXY-TOLUENE PHOSPHONIC ACID**

$C_8H_7CH(OH)PO(OH)_2$ [173°] Made from benzoic acid by successive treatment with PCl_5 and water (Fossek, *M* 7, 34) Hard crusts (from benzene and HOAc)— BaA'' — $Ba(HA'')_2$

OXY-TOLUENE SULPHONIC ACID v**CRESOL SULPHONIC ACID****OXY *o*-TOLUIC ACID** $C_8H_8O_3$, $\pm e$

$C_8H_7Me(OH)CO_2H$ [231] *Oxy methyl-benzoic acid* Mol w 152 [183°] Formed by the diazo-reaction from amido *o*-toluic acid [191°], and by potash-fusion from sulpho *o*-toluic acid (Jacobsen, *B* 16, 1963, 17, 163) Needles, sol cold water, alcohol, and ether, sl sol chloroform Volatile with steam $FeCl_3$ gives a brown pp

Methyl derivative $C_8H_7Me(OMe)CO_2H$ [146°] Needles, sl sol cold water— CaA' , 2aq

Oxy-*o*-toluic acid $C_8H_7Me(OH)CO_2H$ [241] [179°] *Formation*—1 By potash fusion from the corresponding aldehyde (Tiemann & Schotten, *B* 11, 778), and from the corresponding

$C_8H_7Me(SO_2NH_2)CO_2H$ (Jacobsen, *B* 14, 40)—2 By heating *m*-cresol with CCl_4 and alcoholic NaOH (Schall, *B* 12, 819)—3 From amido-*o*-toluic acid [c 165°] by the diazo reaction (Jacobsen, *B* 17, 164)

Properties—Needles (containing $\frac{1}{2}$ aq), v sol hot water, alcohol, and ether, insol cold chloroform Not coloured by $FeCl_3$ Yields *m*-cresol on distillation— CaA' , 2aq crystals, v sol water

Methyl derivative $C_8H_7Me(OMe)CO_2H$ [176°] Needles (from water)

Oxy-*o*-toluic acid $C_8H_7Me(OH)CO_2H$ [251] [172°] Formed by potash fusion from the corresponding $C_8H_7Me(SO_2NH_2)CO_2H$, and also from amido *o*-toluic acid [196°] by the diazo reaction (Jacobsen, *B* 14, 41, 17, 163) Prisms, sol alcohol, ether, and hot water, v sl sol chloroform Volatile with steam $FeCl_3$ gives a brown pp The Cu salt forms bluish green plates

Oxy-*o*-toluic acid $C_8H_7Me(OH)CO_2H$ [261] [168°] S 143 at 25° Formed by potash-fusion from bromo *o*-toluic acid (Jacobsen, *B* 16, 1962) Long needles, v sol hot water, alcohol, and ether Volatile with steam At 200° it yields *m*-cresol $FeCl_3$ gives a bluish violet colour

Oxy-*m*-toluic acid $C_8H_7Me(OH)CO_2H$ [221] *Homosalicylic acid* (β) *Cresotic acid* [164°]

Formation—1 By the action of CO_2 on sodium *o*-cresol (Engelhardt & Latschneff, *Z* 1869, 623, Kekulé, *B* 7, 1006, Ihle, *J pr* [2] 14, 456)—2 By heating *o*-cresol with CCl_4 and NaOH at 100° (Schall, *B* 12, 86)—3 By means of potash fusion from the corresponding $C_8H_7Me(SO_2NH_2)CO_2H$ (Jacobsen, *B* 11, 902)—4 From *c*-amido toluic acid (Jacobsen, *B* 14, 2354)

Properties—Long needles, sl sol cold water, v sol chloroform Volatile with steam $FeCl_3$ gives a violet colour Poisonous (Dunstan & Black, *Ph* [3] 21, 429)

Methyl derivative $C_8H_7(OMe)CO_2H$ [81°] Feathery needles

Ethyl ether MeA' (235°) SG $\frac{33}{3}$ 1 1444 (Pinner, *B* 23, 2938)

Ethyl ether EtA' (248°) SG $\frac{33}{3}$ 1 1020 With benzamide it forms $C_{22}H_{11}N_2O$ crystallising in yellowish needles, insol acids and alkalis (Pinner, *B* 23, 2939)

Nitrile $C_8H_7(OH)CN$ [885°] Got from its acetyl derivative, which is formed by the action of Ac_2O on the oxim of *c*-toluic aldehyde (Paschen, *B* 24, 3669) Tables, v sol alcohol

Oxy-*m*-toluic acid $C_8H_7Me(OH)CO_2H$ [341]

Formation—1 By potash fusion from the corresponding $C_8H_7Me(SO_2NH_2)CO_2H$ (Jacobsen, *B* 11, 897, Remsen & Iles, *Am* 1, 87, *B* 11, 462, Mahon, *Am* 4, 186), from bromo *m*-toluic acid and from chloro *m*-toluic acid [210°] (Jacobsen, *B* 14, 2351, 18, 1761)—2 By heating *o*-cresol with CCl_4 and NaOH, the yield being 40 p c (Schall, *B* 12, 816)—3 By the diazo reaction from amido *m*-toluic acid (Remsen & Kuhara, *Am* 8, 428)—4 By oxidation of the corresponding aldehyde (Tiemann & Schotten, *B* 11, 777)

Properties—Long needles (containing $\frac{1}{2}$ aq), sol hot water, alcohol, and ether, insol cold chloroform Gives no colour with $FeCl_3$ Yields *o*-cresol when heated with HCl aq at 180° Gives a nitro-compound [85°].

Salts — CaA' , 3aq minute needles — BaA' , 3aq — CuA' , 1½aq blue flocculent pp

Methyl derivative $\text{C}_6\text{H}_4\text{Me}(\text{OMe})\text{CO}_2\text{H}$ [193°] Minute needles Got by saponifying $\text{C}_6\text{H}_4\text{Me}(\text{OMe})\text{CO}_2\text{Me}$ [67°] (Schall) The amide $\text{C}_6\text{H}_4\text{Me}(\text{OMe})\text{CONH}_2$ [144°] is prepared from $\text{C}_6\text{H}_4\text{Me}(\text{OMe})$ [1 q], ClCONH_2 , and AlCl_3 (Gattermann, *A* 244, 64)

Ethyl derivative $\text{C}_6\text{H}_4\text{Me}(\text{OEt})\text{CO}_2\text{H}$ [199°] Obtained by saponification of the amide $\text{C}_6\text{H}_4\text{Me}(\text{OEt})\text{CONH}_2$ [167°] which is got from $\text{C}_6\text{H}_4\text{Me}(\text{OEt})$ and ClCONH_2 (G) — CaA' , 2aq (Brown, *Am* 4, 375)

s Oxy m toluic acid

$\text{C}_6\text{H}_3\text{Me}(\text{OH})\text{CO}_2\text{H}$ [3 5 1] [208°] Formed from m toluic acid by sulphonation followed by potash fusion, the resulting acid being freed from its isomeride by steam distillation (Jacobsen, *B* 14, 2357) Formed also by the action of baryta water on $\text{C}_{12}\text{H}_{10}\text{O}_8$ [90°], which is obtained from acetyl pyruvic ether and NaOHaq (Claisen, *B* 22, 3271) Needles or prisms, v sol hot water, not volatile with steam — CaA' , 2aq prisms — SrA'_2

Methyl ether MeA' [93°] Needles.

Oxy m toluic acid

$\text{C}_6\text{H}_3\text{Me}(\text{OH})\text{CO}_2\text{H}$ [3 6 1] *p*-Homosalicylic acid

(a) *Cresotic acid* [151°]

Formation — 1 By passing CO_2 over *p* cresol in which sodium has been dissolved (Engelhardt a La'schmoff, *Z* 1869, 622, 712, Kolbe a Lautemann, *A* 115, 203, *Ihle, J pr* [2] 14, 455) 2 By heating *p* cresol with CCl_4 and NaOH (Schall, *B* 12, 816) — 3 By potash fusion from chloro m xylene sulphonic acid (Voigt, *Z* [2] 5, 577, *B* 2, 284), from m xylene sulphonic acid (E a L), from (1,3,4) xylenol or its (8) sulphonic acid, from bromo m toluic acid, and from sulpho-m toluic acid (Jacobsen, *B* 11, 374, 14, 2352, Staedel a Holz, *B* 13, 2919) — 4 By oxidation of the corresponding aldehyde (Tiemann a Schotten, *B* 11, 778) — 5 From amido toluic acid [172°] by the diazo reaction (Panaotovic, *J pr* [2] 33, 64)

Properties — Colourless trimetric prisms (from water), sl sol water, v sol alcohol, ether, and chloroform Volatile with steam Its aqueous solution is turned violet by FeCl_3 , Conc HClaq at 180° yields *p* cresol POCl_3 , forming various dehydration products (Schiff, *A* 245, 43) Distillation with As_2O_3 yields $\text{C}_{12}\text{H}_{10}\text{O}_8$ [148°] (Kostanecki, *B* 18, 1988)

Salt — BaA' , 2aq leaflets

Methyl ether MeA' (242°) SG $\frac{2}{3}$ 1 1438 Liquid (Pinner, *B* 23, 2938)

Ethyl ether EtA' (251°) SG $\frac{2}{3}$ 1 1037 Reacts with benzamidine, forming $\text{C}_{12}\text{H}_{11}\text{N}_3\text{O}$ crystallising in yellowish needles (P)

Amide $\text{C}_6\text{H}_3\text{Me}(\text{OH})\text{CONH}_2$ [178°] Got from the acid by treatment with POCl_3 at 60° followed by alcoholic NH_3 at 160° (Schiff, *G* 17, 559, *A* 245, 43), and from the ether and NH_3 (Goldbeck, *B* 24, 3659) Needles (from alcohol) P_2O_5 forms $\text{C}_6\text{H}_3(\text{OH})\text{CSNH}_2$ [127°]

Anilide $\text{C}_6\text{H}_3(\text{OH})\text{CONHPh}$ [53°] Plates

Nitrile $\text{C}_6\text{H}_3(\text{OH})\text{CN}$ v sol alcohol Its acetyl derivative [57°] is got by the action of Ac_2O on the oxim of toluic aldehyde

Methyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{OMe})\text{CO}_2\text{H}$ [70°] (L), [67°] (Schall, *B* 22, 749) Long needles — AgA'

Amide of the methyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{OMe})\text{CONH}_2$ [163°] Made from $\text{C}_6\text{H}_3\text{Me}(\text{OMe})$ and ClCONH_2 in presence of AlCl_3 (Gattermann, *A* 244, 66) Needles (from hot Aq)

Nitrile of the methyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{OMe})\text{CN}$ (270° uncor) Made by warming diazotised amido *p* cresol with CuCy , (Limpach, *B* 22, 351) Oil

Amide of the ethyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{OEt})\text{CONH}_2$ [152°] Made from $\text{C}_6\text{H}_3\text{Me}(\text{OEt})$, ClCONH_2 , and AlCl_3 (G) Silky needles (from dilute alcohol)

Oxy p toluic acid $\text{C}_6\text{H}_3\text{Me}(\text{OH})\text{CO}_2\text{H}$ [4 2 1].

(7) *Cresotic acid m-Homosalicylic acid* [177° cor] **Formation** — 1 By passing CO_2 into *m* cresol in which sodium has been dissolved (E a L, Biedermann a Pike, *B* 6, 323) — 2 By oxidation of the corresponding aldehyde (Tiemann a Schotten, *B* 11, 777) — 3 By heating *m* cresol with CCl_4 and NaOHaq (Schall, *B* 12, 816) — 3 By potash fusion from *p* xylenol (Jacobsen, *B* 11, 570)

Properties — Needles (from water) or monoclinic prisms (from alcohol), m sol hot water, v sol alcohol and chloroform Volatile with steam FeCl_3 gives a red colour HClaq at 170° yields *m* cresol

Salts — CaA' , 3aq — BaA' , 3aq prisms

Methyl ether MeA' (243°) SG $\frac{2}{3}$ 1 1395 (Pinner, *B* 23, 2938)

Ethyl ether EtA' (254°) SG $\frac{2}{3}$ 1 0973 Converted by benzamidine into $\text{C}_{12}\text{H}_{11}\text{N}_3\text{O}$ crystallising in needles [235°]

Methyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{OMe})\text{CO}_2\text{H}$ [104°] Leaflets, sol hot water (Schall)

Ethyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{OEt})\text{CO}_2\text{H}$ [109°] Got by oxidising the ethyl derivative of thymol (Paterno, *J* 1879, 519)

Oxy p toluic acid $\text{C}_6\text{H}_3\text{Me}(\text{OH})\text{CO}_2\text{H}$ [4 3 1] [207° cor]

Formation — 1 By potash fusion from sulpho *p* toluic acid or its mono amide (Flesh, *B* 6, 481, Remsen a Hall, *Am* 2, 54, Weinreich, *B* 20, 981), and from chloro or bromo *p* toluic acid (Gerichten, *B* 11, 368) — 2 From nitro-toluic acid [190°] by reduction, followed by the diazo reaction (Fittica, *B* 7, 927)

Properties — Needles, sol hot water, alcohol, and ether, insol chloroform Volatile with steam Not coloured by FeCl_3 Gives *o* cresol on distillation with lime

Salts — CaA' , 4aq — PbA' , 2aq needles

Ethyl ether EtA' [75°] Prisms

Methyl derivative $\text{C}_6\text{H}_3\text{Me}(\text{OMe})\text{CO}_2\text{H}$ [156°] Needles (by sublimation) — BaA' , 4aq

o Oxy o toluic acid $\text{CH}_3(\text{OH})\text{C}_6\text{H}_3\text{CO}_2\text{H}$ [118°] Made by dissolving phthalide in boiling NaOHaq (Hessert, *B* 10, 1446, 11, 237) Powder, v sl sol cold water, v sol alcohol and ether Changes on fusion, and on boiling with water, into its anhydride — BaA' , — AgA' octahedra

Anhydride v PHTHALIDE

o Oxy p toluic acid $\text{CH}_3(\text{OH})\text{C}_6\text{H}_3\text{CO}_2\text{H}$ *Oxymethyl-benzoic acid* [181°] Formed, together with terephthalic acid and $\text{C}_6\text{H}_3(\text{CH}_3\text{OH})$, by boiling terephthalic aldehyde with NaOHaq (Löw, *A* 231, 373) Formed also by boiling CH_3Br , $\text{C}_6\text{H}_3\text{CO}_2\text{H}$ with baryta-water (Kekulé a Dittmar, *A* 162, 342) Plates or needles, v sol water and ether Not reddened or resublimed by H_2SO_4 — AgA'

Di-oxy-o-toluic acid $C_6H_4Me(OH)_2CO_2H$ [3 5 3 1] *Cresorsellic acid* Mol. w 168 [145°] S 86 at 0° Formed by fusing di sulpho o-toluic acid with potash (Jacobsen, *B.* 16, 1960) Long needles, v sol alcohol and boiling water $FeCl_3$ gives a brownish-black colour Reduces alkaline Ag and Cu solutions Conc H_2SO_4 gives a bright red colour on heating $-NH_4A'$ 2aq prisms

Di oxy-toluic acid *Methyl derivative* $C_6H_4Me(OMe)(OH)CO_2H$ [1 3 4 5] *Creosol carboxylic acid* [182°] Obtained by the action of CO_2 upon sodium creosol (Wende, *B.* 19, 2324) Concentric needles Sublimable V sol alcohol, ether, and chloroform, sl sol water, nearly insol benzene Gives a blue colouration with $FeCl_3$

Salts — NH_4A' needles — KA' small readily soluble needles — BaA'_2 small needles — PbA'_2 white pp — CuA'_2 yellow powder

Methyl ether MeA' [92°], small colourless trimetric crystals, $abc = 5285 \ 1 \ 0 \ 7384$ Gives a bluish green colour with $FeCl_3$

Ethyl ether EtA' [77°], small needles

Di oxy-m-toluic acid $C_6H_4Me(OH)_2CO_2H$ [1 2 4 5] *Cresorcin carboxylic acid* [208°] Made by boiling cresorein (di oxy toluene) (1 pt) with $NaHCO_3$ (4 pts) and water (8 pts) (Kostanecki, *B.* 18, 3203) Prisms (containing aq), v e sol water — KA'_2 2aq prisms, v sol water

Di - oxy p-toluic acid $C_6H_4Me(OH)_2CO_2H$ [4 5 3 1] [176°] Formed by heating disulpho p-toluic acid with KOH (Weinreich, *B.* 20, 981) Needles, v sol water, alcohol, and ether

Di - oxy - toluic acid $C_6H_4Me(OH)CO_2H$ *Hydrotoluquinone carboxylic acid* [206°-210°] S 07 at 8° Formed by heating hydrotoluquinone with $KHCO_3$ and conc K_2SO_4 aq at 160° (Brunner, *M.* 2, 458) Trimetric plates (from alcohol) or indistinct crystals (containing $\frac{1}{2}$ aq) (from water), m sol hot water and alcohol $FeCl_3$ gives a blue colour Reduces ammoniacal $AgNO_3$ in the cold Yields hydrotoluquinone on fusing Conc H_2SO_4 at 160° yields tetra oxy di methyl anthraquinone, a dark red powder — CaA'_2 2aq — BaA'_2 2aq — PbA'_2 2aq crystalline *Ethyl ether EtA'* [98°] Needles

Di oxy p-toluic acid $C_6H_4Me(OH)_2CO_2H$ *Orselllic acid* *Orsellinic acid* *Orsellitic acid* [176°] S (ether) 22 at 20° Formed by boiling lecanoric acid or erythrin with lime water, baryta water, or $NaOHAq$ (Stenhouse, *P.M.* [3] 32, 300, *Pr.* 12, 263, *A.* 68, 61, Hesse, *A.* 117, 312, 139, 35) Prisms (containing aq), v e sol alcohol, sol water Splits up on fusion, or on boiling with water, into CO_2 and orcin $FeCl_3$ gives a purple colour Bromine gives tri bromo orcin $POCl_3$ acting on the anhydrous acid at 90° forms a blue liquid which, when poured into water, ppts $C_{10}H_8P_2O_{11}$, a blue substance with coppery lustre resembling indigo The solutions of this 'phosphorsellic acid' in water and alcohol are intensely blue, and it is pptd from aqueous solution by HCl , by H_2SO_4 , and by $NaCl$ Phosphorsellic acid forms $C_{10}H_8Pb_2P_2O_{11}$ and $C_{10}H_8Pb_2P_2O_{11}$, an anilide $C_{10}H_8(NHPh)_2P_2O_{11}$ which gives $C_{10}H_8Pb_2(NHPh)_2P_2O_{11}$, and an acetyl derivative $C_{10}H_8Ac_2P_2O_{11}$ as a dark violet mass which gives $C_{10}H_8(PbOH)_2Ac_2P_2O_{11}$ (Schiff, *A.* 228, 56)

Salt — $Ba(C_6H_3O)_2$ 2aq prisms

Methyl ether MeA' Made by boiling

lecanoric acid or erythrin with $MeOH$ Silky needles (from boiling water)

Ethyl ether EtA' [182°] Got in like manner (Heeren, *Schw.* *J.* 59, 841, Liebig, *P.* 21, 32, Kane, *Tr.* 1840, 237, 279, Schunck, *A.* 41, 160, 61, 72, Rochleder & Heldt, *A.* 48, 5, Stenhouse, *C.* *J.* 20, 224, Strecker, *A.* 68; 111, Hesse, *A.* 117, 297) May be prepared by repeatedly exhausting *Roccella tinctoria* with boiling alcohol and evaporating the extract Thin needles, nearly insol cold water, v sol alcohol and alkalis Yields $C_6Cl_2Me(OH)_2CO_2Et$ [162°] on chlorination

Isoamyl ether C_5H_{11}A' [76°] Prisms

Di oxy - o - toluic acid $C_6H_4Me(OH)_2CO_2H$ [6 4 2 1] *Paraorsellic acid* [172°] S 17 in the cold Formed by heating orcin with a solution of ammonium carbonate, $KHCO_3$, or $NaHCO_3$ (Senhofer a Brunner, *M.* 1, 236, Bistrzycki a Kostanecki, *B.* 18, 1986), or by heating potassium orcin in a current of CO_2 at 250° (Schwarz, *B.* 13, 1643) Needles (containing aq), sl sol water, v sol alcohol and ether $FeCl_3$ gives a blue colour Boiling water decomposes it into CO_2 and orcin $POCl_3$ followed by water gives $P_2(C_6H_3O)_6$, a chrome-green powder (Schiff, *A.* 228, 56) — KA' — BaA'_2 6aq — $Ba_2(C_6H_3O)_6$ 8aq — CuA'_2 4aq — AgA'_2 nearly insol water

Di oxy-m-toluic acid

$CH_3(OH)C_6H_4(OH)CO_2H$ [3 2 1] [142°] Formed by reduction of aldehyde o-oxy-benzoic acid with sodium-amalgam (Reimer, *B.* 11, 792) Prisms, v sol water, alcohol, and ether $FeCl_3$ gives a violet colour H_2SO_4 gives a red colour Boiling HCl aq resinifies it

Di oxy-p-toluic acid

$CH_3(OH)C_6H_4(OH)CO_2H$ [5 2 1] [above 270°] Formed by reduction of aldehyde p oxy benzoic acid (R) White powder, sl sol water Not coloured by $FeCl_3$, or by H_2SO_4

Di oxy m-toluic acid

$CH_3(OH)C_6H_4(OH)CO_2H$ [3 6 1] Made by reducing aldehyde o oxy benzoic acid (R) Prisms (from ether), sl sol water, m sol alcohol and ether $FeCl_3$ gives a violet colour Oxidised by $KMnO_4$ to oxy isophthalic acid, and by aqueous $K_2Cr_2O_7$ to aldehyde oxy benzoic acid

References — **DI-BROMO OXY-TOLUIC ACID** and **DI-iodo-ORSELLIC ACID**

OXY-O-TOLUIC ALDEHYDE $C_6H_4O_2$ 1 e $C_6H_4Me(OH)CHO$ [2 4 1] [110°] Prepared, together with the (4,2,1) isomeric, by heating m cresol with chloroform and $NaOHAq$ (Tiemann a Schotten, *B.* 11, 773) Flat leaflets (from water), not volatile with steam $FeCl_3$ gives a red colour

Phenyl hydrasile

$C_6H_4Me(OH)CHN_2HPh$ [151°] (Paschen, *B.* 24, 3671)

Oxy m-toluic aldehyde $C_6H_4Me(OH)CHO$ [3 4 1] [115°] Formed, together with the (3,2,1) isomeric, by the action of chloroform and potash on o cresol (Tiemann a Schotten, *B.* 11, 772) Long prisms (from water), not volatile with steam $FeCl_3$ gives a bluish violet colour Yields a nitro-derivative [152°]

Acetyl derivatives $C_6H_4(OAc)CHO$ [40°] (275°) Needles (Staats, *B.* 13, 138, Barbier, *Bl.* [2] 33, 52, *C.R.* 90, 37).

Oxy-m-toluic aldehyde $C_6H_4Me(OH)CHO$ [3 2 1] [17°] (209°) Formed as above (T. a S.).

Crystals, volatile with steam. FeCl_3 gives a bluish colour. Forms a yellow solution in NH_4Aq .

Acetyl derivative $\text{C}_9\text{H}_9\text{O}_2$, [267°] (B).

Oxism. [98°] (Paschen, B 24, 3668)

Phenyl hydrazide [95°] Tables

Oxy-m-toluic aldehyde $\text{C}_8\text{H}_7\text{Me}(\text{OH})\text{CHO}$ [8 6 1] [56°] [218°] Formed by the action of CHCl_3 and KOH on *p*-cresol (T & S). White leaflets. FeCl_3 gives a green colour. Yields a nitro-derivative [141°]

Acetyl derivative $\text{C}_8\text{H}_7\text{Me}(\text{OAc})\text{CHO}$ [57°] Long needles. Made by the action of Ac_2O on the ethereal solution of the K salt. Combines with NaHSO_3 . With Ac_2O it unites in the cold, forming $\text{C}_8\text{H}_7\text{Me}(\text{OAc})\text{CH}(\text{OAc})_2$, which crystallises in prisms [94°] and does not combine with NaHSO_3 .

Methyl derivative $\text{C}_8\text{H}_7\text{Me}(\text{OMe})\text{CHO}$ (254°) Colourless liquid

Oxism. $\text{C}_8\text{H}_7\text{Me}(\text{OH})\text{CH NOH}$. [105°] Needles (Goldbeck, B 24, 3658)

Oxy-p-toluic aldehyde $\text{C}_8\text{H}_7\text{Me}(\text{OH})\text{CHO}$ [4 2 1] [54°] [223°] Made, together with the (2,4,1)-isomere, by the action of chloroform and potash on *m*-cresol (T & S). Crystals, volatile with steam. FeCl_3 gives a violet colour.

Di-oxy o-toluic aldehyde $\text{C}_8\text{H}_6\text{Me}(\text{OH})_2\text{CHO}$ [6 4 2 1] *Orcyl aldehyde* [178°] Formed by heating orcin with chloroform and potash (The mann & Helkenberg, B 12, 999), and also by potash-fusion from methyl umbelliferone (Pechmann & Welsh, B 17, 1646). Needles, sol alcohol and hot water. FeCl_3 gives a reddish-brown colour. Aniline forms the compound $\text{C}_8\text{H}_6\text{Me}(\text{OH})_2\text{CH NPh}$ [126°], crystallising in yellow prisms.

Di-oxy m-toluic aldehyde *Methyl derivative* $\text{C}_8\text{H}_6\text{Me}(\text{OH})(\text{OMe})\text{CHO}$ [5 2 3 1] [270°-275°] Formed by the action of chloroform and NaOH upon cresol (Tiemann & Koppe, B 14, 2026). Oil, sol alcohol. FeCl_3 colours its alcoholic solution green.

OXY-TOLUIDINE v AMIDO CRESOL

OXY-TOLUQUINOLINE v OXY-METHYL-QUINOLINE

DI-OXY-TOLUQUINONE $\text{C}_9\text{H}_6\text{Me}(\text{OH})_2\text{O}_2$ [177°] Made by digesting oxy phenylamido-toluquinone anilide with dilute KOH (Hagen & Zincke, B 16, 1562). Brownish yellow plates, v sol most solvents. May be sublimed.

Tri-oxy toluquinone $\text{C}_9\text{H}_5\text{Me}(\text{OH})_3\text{O}_3$ Formed from tri-amido-orcin by treatment with FeCl_3 , the resulting amido dimido-orcin being heated with HClAq at 150° (Merz & Zetter, B 12, 2044). Dark crystals, nearly insol cold alcohol. Yields a crystalline tri acetyl derivative.

Reference — *Di-bromo-* and *Di-chloro-* **OXY-TOLUQUINONE**

OXY-TOLUQUINOXALINE

[8] $\text{C}_8\text{H}_6\text{Me} \begin{smallmatrix} \text{N COH} \\ \text{N OH} \end{smallmatrix}$ [267°] Formed by oxidation of its dihydride [o 127°], which is got by condensing tolylene diamine with chloroacetic ether (Hinsberg, B 18, 2870, A 248, 76), or by reducing nitro-tolyl amido acetic acid (Plöchl, B 19, 6). Yields a methyl derivative [71°], and an ethyl derivative [67°].

Isomeric v **OXY METHYL-QUINOXALINE**

Di-oxy-toluquinoxaline $\text{C}_8\text{H}_5\text{Me} \begin{smallmatrix} \text{N COH} \\ \text{N COH} \end{smallmatrix}$ [above 300°] Formed by heating tolylene-c

diamine with oxalic acid at 150° (Hinsberg, B 18, 2690, A 287, 348) by reducing nitro-tolyl-oxamic acid, and by heating tolylene-diamine dicyanide with HClAq at 150° (Bladin, B 18, 670). Needles — NaHA — AgA — HA — HOAc . Plates.

DI-OXY-DITOLYL

[8 4 1] $\text{C}_9\text{H}_6\text{Me}(\text{OH})_2\text{C}_8\text{H}_6\text{Me}(\text{OH})$ [1 8 4] *o-Di-cresol* [157°] (H), [161°] (G). Made from di-amido-ditolyl by the diazo-reaction (Gerber, B 21, 749, Hobbs, B 21, 1067). Needles, sl sol hot water, v sol alcohol and ether. Yields a di-nitro derivative [273°]

Di-acetyl derivative $\text{C}_{12}\text{H}_{12}(\text{OAc})_2$ [131°]

Di-benzoyl derivative [185°] Needles

Di-ethyl ether $\text{C}_{11}\text{H}_{10}(\text{OEt})_2$ [156°] Made, together with ditolyl, by the action of alcohol on di-amido-ditolyl (Schultz, B 17, 468). White plates, sol hot alcohol.

Di-propyl ether [115°] Leaflets.

Di-isooamyl ether [69°]

Tetra-oxy-ditolyl $\text{C}_8\text{H}_4\text{O}_4$ *ie*

[1 2 5 6] $\text{C}_8\text{H}_4\text{Me}(\text{OH})_2\text{C}_8\text{H}_4\text{Me}(\text{OH})_2$ [6 1 2 5] [202° uncor] Formed by oxidising hydrotoluquinone, dissolved in HOAc with MnO_2 and H_2SO_4 in the cold (Brunner, M 10, 174). FeCl_3 oxidises it to the quinhydrone $\text{C}_{10}\text{H}_8\text{O}_2$, crystallising in violet scales [220° uncor], and finally to the quinone $\text{C}_6\text{H}_4\text{O}_2$ [163°], crystallising in yellow prisms.

Tetra acetyl derivative

$\text{C}_{12}\text{H}_{10}(\text{OAc})_4$ [135°] Made by heating with NaOAc and Ac_2O at 160°. Needles

Anhydride $\text{C}_{12}\text{H}_8\text{Me}_2(\text{OH})_2\text{O}$ [232°] Got by heating $\text{C}_{12}\text{H}_8\text{Me}_2(\text{OMe})_2\text{O}_2$ with HClAq at 180° (Nietzki, B 11, 1281). Colourless plates (containing aq) (from dilute alcohol).

Di-methyl ether $\text{C}_{12}\text{H}_{10}\text{Me}_2(\text{OMe})_2(\text{OH})_2$ [173°] Formed by partial methylation. Colourless needles, quickly oxidised in alcoholic solution by air. Yields a di acetyl derivative $\text{C}_{12}\text{H}_8(\text{Me}(\text{OMe})(\text{OAc}))_2$ [6 1 2 5], crystallising in needles [123°] (Noelting & Werner, B 23, 3248).

Dehydride of the di-methyl ether $\text{C}_{11}\text{H}_9\text{O}_2$ *ie* $\text{C}_{12}\text{H}_8\text{Me}_2(\text{OMe})_2\text{O}_2$ [153°] Formed by oxidation of the di-methyl ether of hydrotoluquinone by chromic acid mixture (Nietzki, A 215, 161). Dark-red needles (from alcohol).

Tetra-methyl ether $\text{C}_{12}\text{H}_{10}(\text{OMe})_4$ [129°]

Di-ethyl ether $\text{C}_{12}\text{H}_{10}(\text{OEt})_2(\text{OH})_2$ [138°] Formed by the action of alcoholic ammonium sulphide on the dehydride (or quinone) $\text{C}_{11}\text{H}_9(\text{OEt})_2\text{O}_2$, which crystallises in green-black needles [139°], and is made by oxidising $\text{C}_8\text{H}_6\text{Me}(\text{OEt})_2$ with chromic acid mixture (Noelting, B 23, 3247, B [3] 4, 806). White needles.

α-OXY m-TOLYL-ACETIC ACID $\text{C}_8\text{H}_7\text{O}_3$ *ie*

[1 3] $\text{C}_8\text{H}_6\text{Me} \begin{smallmatrix} \text{CH}(\text{OH}) \text{CO}_2\text{H} \\ \text{m-Methyl mandelic acid} \end{smallmatrix}$ [84°] Formed from *m*-toluic aldehyde, KCr , and HCl (Bornemann, B 17, 1469). Small plates (from benzene), v sol water.

α-OXY-p-tolyl-acetic acid

[1 4] $\text{C}_8\text{H}_6\text{Me} \begin{smallmatrix} \text{CH}(\text{OH}) \text{CO}_2\text{H} \end{smallmatrix}$ [146°] Made by reduction of *p*-tolyl-glyoxylic acid by zinc dust and ammonia (Claus & Krosenberg, B 20, 2050). Tables (from water) — NaA — KA — aq — CaA — BaA — aq

Ethyl ether EtA [77°] Needles.

α-OXYTOLYL-ALLYL-THIO-UREA

[1 2] $\text{C}_8\text{H}_6(\text{CH}_2\text{OH})\text{NH CS NH C}_6\text{H}_5$ Formed from *o*-amido benzyl alcohol and allyl

thiocarbamide in benzene Oil, changed by warming with HClAq to $\text{C}_6\text{H}_4\text{CH}_2\text{NC}_6\text{H}_5$. [91°] Converted by HgO in alcohol to oxy allyl-quinoxaline dihydride $\text{C}_6\text{H}_4\text{CH}_2\text{NC}_6\text{H}_5$, which crystallises in four sided prisms [78°], and yields $\text{B}^1\text{H}_2\text{PtCl}_6$ [171°] (Söderbaum a. Widmann, *B* 22, 1870, 2937)

OXY-TOLYL-BENZYLIDENE-TOLYLENE-DIAMINE $\text{C}_{12}\text{H}_{16}\text{N}_2\text{O}$ *te* $\text{C}_6\text{H}_4\text{NHCH}_2\text{NCH}_2\text{C}_6\text{H}_4\text{OH}$ [160°] Made from *o*-amido di *p* tolyl amine and salicylic aldehyde (O Fischer a Sieder, *B* 23, 3801) Yellow crystals, sl sol water, v sol benzene

OXY-*p*-TOLYL BENZYL-METHYL-PYRIMIDINE $\text{C}_8\text{H}_8\text{MeC} \begin{smallmatrix} \text{N CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{C CH}_3\text{Ph}$ [240°] Made from *p* tolenyl amidine hydrochloride and benzyl aceto acetic ether (Pinner, *B* 23, 3826) Slender needles (from pyridine), insol water, v sl sol hot alcohol

OXY-TOLYL CARBINOL $\text{C}_6\text{H}_4\text{Me(OH)CH}_2\text{OH}$ [5 2 1] [105°] *S* 67 at 15° Made by reduction of (2,5,1) oxytoluol aldehyde with sodium amalgam (Schotten, *B* 11, 784) Colourless leaflets

TRI-OXY TRI TOLYL CARBINOL *Anhydride* $\text{C}_{18}\text{H}_{18}\text{O}_3$, *te* $(\text{C}_6\text{H}_4\text{Me(OH)})_3\text{C} \begin{smallmatrix} \text{O} \\ \text{O} \end{smallmatrix} \text{C} \begin{smallmatrix} \text{O} \\ \text{O} \end{smallmatrix} \text{C}_6\text{H}_4\text{Me}$

Cresaurin Formed by heating *p* cresol with formic acid and ZnCl_2 at 110° (Nencki, *J pr* [2] 25, 275) Red amorphous powder, insol water, v sol HOAc Forms a crimson solution in alkalis
DI-OXY-DITOLYL DICARBOXYLIC ACID $\text{C}_{16}\text{H}_{14}\text{O}_6$ Made by heating sodium di oxy ditolyl with CO_2 in a closed vessel at 160° (Deninger, *B* 21, 1639) Crystals, insol water, sl sol alcohol and ether Not melted at 290° FeCl_3 gives a blue colour Yields a di acetyl derivative $\text{C}_{16}\text{H}_{12}\text{O}_6$ [163°]

OXY-TOLYL-CROTONIC ACID *Anhydride* *v* **DI METHYL COUMARIN**

Di oxy-tolyl crotonic acid *Anhydride* $\text{C}_6\text{H}_4\text{Me(OH)} \begin{smallmatrix} \text{CMe CH} \\ \text{O} \text{---} \text{CO} \end{smallmatrix}$ *Di methyl umbelliferone* [250°] Made by the action of H_2SO_4 on a mixture of acetoacetic ether and orcin (Pechmann a. Cohen, *B* 17, 2188) Needles (from alcohol), nearly insol water On boiling with NaHSO_4 it forms a solution coloured red by FeCl_3
Acetyl derivative $\text{C}_{11}\text{H}_{14}\text{AcO}_2$ [195°] Needles, v sol alcohol

TRI OXY-TRI-TOLYL ETHANE $\text{C}_6\text{H}_4\text{Me(OH)CH}_2\text{CH(C}_6\text{H}_4\text{Me OH)}$ Three isomerides with this formula are got by warming di-chloro-ethyl ether with *o*, *m*, and *p*-cresol respectively (Brückner, *A* 257, 322) They are amorphous powders, v sol alcohol and ether, insol water, and yield tri acetyl derivatives which are oxidised by FeCl_3 to anhydrides $(\text{C}_6\text{H}_4\text{Me(OH)CH}_2\text{C(OHMe(OH))})_3\text{O}$

OXY-TOLYL-HYDRAZINE *Methyl derivative* [1 4 3] $\text{C}_6\text{H}_4\text{Me(OMe)NH NH}_2$ [45°] Got from the methyl ether of amido *p* cresol by treatment with nitrous acid and subsequent reduction (Lumpach, *B* 22, 351) Crystalline

Oxy-*om*-di-tolyl-hydrazine *Ethyl derivative* [2 1] $\text{C}_6\text{H}_4\text{Me NH NH C}_6\text{H}_4\text{Me(OEt)} [1 3 4]$ [78°] Made by reducing the azo-compound

with alcoholic ammonium sulphide (Noelting a. Werner, *B* 23, 3260, *BI* [2] 4, 796) White crystals, insol water, sol alcohol

The isomerides

[2 1] $\text{C}_6\text{H}_4\text{Me NH NH C}_6\text{H}_4\text{Me(OEt)} [1 5 2]$ [138°], [4 1] $\text{C}_6\text{H}_4\text{Me NH NH C}_6\text{H}_4\text{Me(OEt)} [1 3 4]$ [77°], and [4 1] $\text{C}_6\text{H}_4\text{Me NH NH C}_6\text{H}_4\text{Me(OEt)} [1 5 2]$ [153°] are formed in like manner

DI OXY-DI TOLYL KETONE $\text{C}_{12}\text{H}_{14}\text{O}_2$, *te* $\text{C}_6\text{H}_4\text{Me(OH)CO C}_6\text{H}_4\text{Me(OH)}$ [138°] Got by potash-fusion from *o* cresol benzoin, which is a product of the action of benzotrichloride on *o* cresol (Schroeter, *A* 257, 74) Colourless needles, v sol alcohol and ether

Di oxy di tolyl ketone $\text{CO(C}_6\text{H}_4\text{Me OH)}_2$ [104°] Made from *p* cresol phthalen $\text{C}_6\text{H}_4\text{O}$, by potash fusion (Drewson, *A* 212, 344) Yellow needles (from alcohol), insol water, v sol alkalis

OXY *p* TOLYL METHYL ETHYL PYRIMIDINE $\text{C}_8\text{H}_8\text{MeC} \begin{smallmatrix} \text{N CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{C Et}$ [218°] Made from *p* tolenyl amidine and ethyl acetoacetic ether (Pinner, *B* 23, 3826) Hair like needles, m sol hot alcohol

OXY-TOLYL METHYL KETONE $\text{C}_6\text{H}_4\text{O}_2$, *te* [1 2 5] $\text{C}_6\text{H}_4\text{Me(OH)CO CH}_3$ [104°] Formed from amido *m* tolyl methyl ketone by the diazo reaction (Klingel, *B* 18, 2699) Flat white prisms, v sol alcohol and hot water FeCl_3 gives a yellowish brown colour

Di oxy tolyl methyl ketone $\text{C}_6\text{H}_4\text{Me(OH)CO CH}_3$ [146°] Made from orcin, HOAc , and POCl_3 (Rasinsky, *J pr* [2] 26, 59) Needles, v sol alcohol, ether, and HOAc FeCl_3 colours its aqueous solution black

OXY *o* TOLYL METHYL PYRAZOLE

$\text{C}_{11}\text{H}_{11}\text{N}_2\text{O}$, *te* $\text{C}_6\text{H}_4\text{MeN} \begin{smallmatrix} \text{CO CH} \\ \text{N} \end{smallmatrix} \text{CMe}$ [183°] Formed by heating *o* tolyl hydrazine with acetoacetic ether at 140° (Knorr, *B* 17, 549) Colourless crystals With KOH and MeI it yields $\text{C}_{11}\text{H}_{11}\text{MeN}_2\text{O}$ [97°]

Oxy *p* tolyl methyl pyrazole $\text{C}_{11}\text{H}_{11}\text{N}_2\text{O}$ [140°] From *p* tolyl hydrazine and acetoacetic ether (K) Yields a methyl derivative [137°] The compound $\text{C}_6\text{H}_4\text{N} \begin{smallmatrix} \text{CO C NHC}_6\text{H}_4 \\ \text{N} \end{smallmatrix} \text{CMe}$ [217°]

is formed, together with $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_2$ by heating *p* tolyl hydrazine with thio acetoacetic ether (Buchka a Sprague, *B* 22, 2555, *C J* 59, 340)

OXY TOLYL METHYL PYRIMIDINE

$\text{C}_8\text{H}_8\text{MeC} \begin{smallmatrix} \text{N CMe} \\ \text{N C(OH)} \end{smallmatrix} \text{CH}$ [216°] Made from tolenyl amidine and acetoacetic ether (Glock, *B* 21, 2658) Long white needles, m sol hot alcohol — Salts $\text{B}^1\text{H}_2\text{PtCl}_6 \cdot 2\text{aq}$ [241°] — $\text{B}^1\text{H}_2\text{CrO}_7 \cdot 7\text{aq}$ [c 170°] Yellow plates — $\text{B}^1\text{C}_6\text{H}_4\text{N}_2\text{O}$ [196°] Yellow needles

***o* OXY TOLYL-DIPHENYL-ETHYLIDENE-AMINE** $\text{C}_{12}\text{H}_9\text{N CPh CHPh OH}$ [141°] Made by heating benzoïn with *o* toluidine at 150° (Bandrowski, *M* 9, 693) Canary yellow needles

OXY-TOLYL-PROPIONIC ACID $\text{C}_{10}\text{H}_{11}\text{O}_3$, *te* $\text{CH}_2\text{C(C}_6\text{H}_4\text{OH)CO}_2\text{H}$ Got from di bromo oxy tolyl-propionic acid $\text{CHBr}_2\text{C(C}_6\text{H}_4\text{OH)CO}_2\text{H}$ by reducing with sodium amalgam (Böttlinger, *B* 14, 1598) Long four sided tables, v sol water

OXY-DI *p*-TOLYL PYRAZINE *Tetra-*

hydride $C_6H_4Me \cdot N < \begin{smallmatrix} CH_2 & CH_2 \\ | & | \\ CH_2 & CO \end{smallmatrix} > N \cdot C_6H_4Me$

'*Di-tolylmonooxypyrazine*' [168 5°] Made from *p*-toluidine by successive treatment with ethylene bromide and a mixture of chloro-acetic acid and NaOAc (Bischoff, *B* 22, 1785, 23, 2035) Crystals, v sol water and ether

Di-oxy-di-o-tolyl-pyrazine Dihydride
 $C_6H_4Me \cdot N < \begin{smallmatrix} CH_2 & CH_2 \\ | & | \\ CO & CO \end{smallmatrix} > N \cdot C_6H_4Me$ *Di-tolyl-di-*

acopyrazine [184°] Formed from di-o tolyl-ethylene-diamine and oxalic acid at 200° (Bischoff, *B* 22, 1805, 23, 2034)

Di oxy di p tolyl pyrazine dihydride [268°] Made by dissolving oxy di-*p* tolyl pyrazine tetrahydride in HOAc and oxidising with nitrous or chromic acid (B) Colourless plates, v sol. aniline and alcohol, sl sol ether and hot water. Alcoholic potash yields di tolyl ethylene-diamine [97°] and oxalic acid

Di oxy s di o tolyl pyrazine Dihydride
 $C_6H_4Me \cdot N < \begin{smallmatrix} CO & CH_2 \\ | & | \\ CH_2 & CO \end{smallmatrix} > N \cdot C_6H_4Me$ [160°]

Formed by heating *o* tolyl-amido acetic acid at 220° (Bischoff a Nastvogel, *B* 22, 1787) and by the action of potash on the product of the action of chloro acetyl chloride on *o* toluidine (Widman, *J pr* [2] 58, 293, 305) Rectangular plates (from alcohol), insol water, sol conc HClAq

Reactions —1 PCl_5 forms the compound $C_6H_4N < \begin{smallmatrix} CO & CCl \\ | & | \\ CCl & CO \end{smallmatrix} > N \cdot C_6H_4$, crystallising from alcohol in white needles [201°] —2 *Alcoholic potash* forms $C_6H_4N(CH_2CO_2H)COCH_2NHC_6H_4$, a white crystalline solid [129°] decomposed by conc HClAq at 160° into MeCl, *o* toluidine, and $C_6H_4NHCH_2CO_2H$

Salt —($C_6H_4N_2O_2$) $_2H_2PtCl_4 \cdot 4aq$ [176°]

Di oxy di p tolyl-pyrazine Dihydride [253°] Formed from oxalic acid and *p* tolyl amido-acetic *p* toluide (B & N) Made also by boiling the bromo acetyl derivative of *p* toluidine with alcoholic potash, or by heating *p* tolyl amido acetic acid at 200° (Abenius, *J pr* [2] 40, 433) Long white needles, insol water, m sol alcohol

Di oxy op di-tolyl pyrazine Dihydride

[1 2] $C_6H_4Me \cdot N < \begin{smallmatrix} C(OH) & OH \\ | & | \\ OH & C(OH) \end{smallmatrix} > N \cdot C_6H_4Me$ [1 4]

[180°] Made by heating *p*-toluidine with the chloro acetyl derivative of *o* tolyl amido acetic acid at 140° (Abenius, *J pr* [2] 40, 448) White matted needles, v sol hot alcohol, insol ether

Tetra-oxy di phenyl-pyrazine. Dihydride of the di-ethyl derivative

[1 4] $C_6H_4(OEt) \cdot N < \begin{smallmatrix} CH_2 & CO \\ | & | \\ CO & CH_2 \end{smallmatrix} > N \cdot C_6H_4(OEt)$ [4 1]

[265°] Slender needles

*OXY *p*-TOLYL QUINAZOLINE* $C_{13}H_{11}N_3O_2$
 $C_6H_4 \cdot N < \begin{smallmatrix} CH \\ | \\ CO \end{smallmatrix} N \cdot C_6H_4Me$ [146°] Made by oxidising *p*-tolyl quinazoline dihydride with $KMnO_4$ (Laal a Busch, *B* 22, 2698) Plates (from dilute alcohol) or needles (from ether), sl sol. hot water Does not react with hydroxylamine or phenyl-hydrazine — $BHCl$ [214°] Needles — $B' \cdot H_2PtCl_6$ [above 800°] Golden plates, sol alcoholic HCl

*OXY-(*Py* 8) TOLYL-QUINOLINE* $C_{13}H_{11}NO$
 $C_6H_4 \cdot N < \begin{smallmatrix} CH & CH \\ | & | \\ N & O \end{smallmatrix} C_6H_4Me(OH) \cdot$ ψ - *Flavemol*.

Vol. III.

[196°] Got by the diazo reaction from (4,3,1)-amido tolyl-quinoline (Weidel a Bamberger, *M* 9, 104) Small plates (from alcohol) Yields (*Py* 8) tolyl-quinoline on distillation with zinc-dust. Reduction followed by potash-fusion yields oxy-isophthalic acid — $B'HOl$ 2aq — $B' \cdot H_2PtCl_6$ (dried at 105°) Yellow needles

Acetyl derivative $C_{13}H_{11}NO_2$ [106°]

Di-oxy-tolyl-quinoline $C_{13}H_{11}NO_2$ [89°]

Formed, as well as oxy-tolyl quinoline, by the above method of preparation Plates (from alcohol), sol. benzene

DI-OXY-DI-o TOLYL SULPHIDE $C_{11}H_9SO_2$
 $2e$ $8(C_6H_4Me(OH)(214))$. *Dioxytoluene*

[135°] Formed from di-amido di-tolyl sulphide by the diazo-reaction (Truhlar, *B* 20, 676) Amorphous, sl sol water, alcohol, and ether

Di oxy-di-tolyl sulphide [210°-215°]. Formed from *m* cresol by treatment with SO_2 in CS_2 (Tassinari, *G* 17, 92, *C C* 1888, 1354) Yields an acetyl derivative [44°], which forms, on oxidation, the corresponding sulphone [268°], which on saponification gives $SO_2(C_6H_4OH)_2$ [133°]

Di oxy-di-tolyl sulphide [118°] Formed from *p* cresol and SO_2 . Yields an acetyl derivative [84°] which is oxidised by $KMnO_4$ to a sulphone [209°], which on saponification gives $SO_2(C_6H_4OH)_2$ [209°] (Tassinari, *Rend Accad Linc* [4] 4, 47)

OXY-o TOLYL-THIO-UREA $C_8H_9N_3SO_2$
 $C_6H_4Me \cdot NH \cdot CS \cdot NH \cdot OH$ [92°] Formed from *o* tolyl thiocarbimide and hydroxylamine in chloroform solution (Tiemann, *B* 22, 1939, Voltmer, *B* 24, 381) Slender needles, almost insol chloroform and water, sol alcohol, ether, and KOHAq $FeCl_3$ colours its alcoholic solution violet Yields *o* tolyl-cyanamide on long standing

Benzyl ether $C_8H_9Me \cdot NH \cdot CS \cdot NH \cdot OCH_2Ph$ [125°] Made from benzyl hydroxylamine and *o* tolyl-thiocarbimide

OXY-o TOLYL-UREA $C_8H_9N_2O_2$
 $CH_2(OH)C_6H_4 \cdot NH \cdot CO \cdot NH_2$ [180°] Formed from amido benzyl alcohol, potassium cyanate, and HCl (Söderbaum a Widman, *B* 22, 1668) Tables or prisms, in sol boiling water, v sl sol alcohol Decomposes on fusion, yielding di-oxy-di-tolyl-urea $CO(NH \cdot C_6H_4 \cdot CH_2OH)_2$ [108°], which crystallises in needles

OXYTROPINE C_8H_9NO [242°] A base occurring in crude belladonnine (Merling, *B* 17, 384, Ladenburg, *B* 17, 153) Crystalline — $B' \cdot H_2PtCl_6$ 2aq red prisms

OXY TRUXILLIC ACID

$(C_6H_4(OH)CH \cdot CH \cdot CO_2H)_2$ [273°]. Formed by potash fusion from (α)-sulpho truxillic acid (Liebermann a Bergami, *B* 22, 783) Prisms, m sol cold water Probably a polymeride of *p* coumaric acid An isomeric acid, formed from the amido-acid by the diazo-reaction, does not melt at 360° It yields an acetyl derivative [244°] (Homans, *B* 24, 2591)

OXY-URAMIDO-BENZOIC ACID Methyl derivative $NH \cdot CO \cdot NH \cdot C_6H_4(OMe) \cdot CO_2H$
Amsuramic acid S 05 at 100° Formed from potassium cyanate and a solution of the hydrochloride of amido-amic acid (Menschutkin, *A* 158, 99) Needles (from water) — CaA , 7aq

OXY-UREA $NH_2 \cdot CO \cdot NH \cdot OH$ [180°] Formed from aqueous hydroxylamine nitrate and potas-

s E

sium cyanate in the cold (Dressler & Stein, *Z.* [2] 5, 202) Needles (from alcohol) v. s. sol Ag. Decomposed by heating, yielding urea Reduces AgNO_3 , FeCl_3 gives a blue-violet colour — $\text{KH}(\text{CH}_2\text{N}_3\text{O})_2$ crystalline pp, got by adding alcoholic potash to the alcoholic solution (Hodges, *A* 192, 214) — $(\text{Ph}_3\text{H}(\text{OAc})_2)(\text{CH}_2\text{N}_3\text{O}_2)_2$ crystals — $(\text{CuCH}_2\text{N}_3\text{O}_2)_2 \cdot \text{H}_2\text{OAc}$ green mass

Benzyl ether $\text{NH}_2\text{CO NH OCH}_2\text{Ph}$ [188°] Formed from (a) benzyl hydroxylamine hydrochloride and potassium cyanate (Behrend & Leuchs, *A* 257, 203) Needles

Oxy-biuret $\text{C}_2\text{H}_4\text{N}_4\text{O}_2$ [134°] Formed from conc hydroxylamine sulphate and potassium cyanate, the mixture being evaporated with alcohol Minute four sided prisms, sol water and alcohol Gives a white pp with AgNO_3 Reduces warm ammoniacal AgNO_3 , FeCl_3 gives no colour — $\text{KOC}_2\text{H}_4\text{N}_4\text{O}_2$ minute needles

(a) **OXY-UVITIC ACID** $\text{C}_8\text{H}_8\text{O}_4$ 18 $\text{C}_8\text{H}_7\text{Me}(\text{OH})(\text{CO}_2\text{H})_2$ [1235] *Cresol dicarboxylic acid* [285°] (B) [295°] (H & R) [278°] (J) Formed from (a)-amido-uvitic acid by the diazo reaction (Böttinger, *B* 9, 804, 13, 1934, *A* 189, 177) and by potash-fusion from sulpho-uvitic acid (Jacobsen, *A* 206, 187, Hall & Remsen, *Am* 2, 137) Needles (from alcohol), v sol alcohol, insol chloroform Decomposes on fusion Conc HClAq at 200° yields o cresol FeCl_3 gives a purple colour — $\text{Ca}(\text{HA}')_2 \cdot 2\text{aq}$ — $\text{CaA}'_2 \cdot 2\text{aq}$ — $\text{CaA}'_4 \cdot 4\text{aq}$ — $\text{Ca}_2(\text{C}_8\text{H}_7\text{O}_4)_2 \cdot \text{Ag}_2\text{A}''$

Methyl ether $\text{Me}_2\text{A}''$ [126°] Needles

Mono-ethyl ether $\text{EtHA}''\text{aq}$ Needles

(b) **Oxy-uvitic acid**

$\text{C}_8\text{H}_7\text{Me}(\text{OH})(\text{CO}_2\text{H})_2$ [1435] [225°–235°] (J) [220°] (B) 8 13 at 12°, 52 at 100° (J) Formed by the action of nitrous acid on (b)-amido uvitic acid (Böttinger) Formed also by potash-fusion from s mesitol $\text{C}_8\text{H}_7\text{Me}_2\text{OH}$ and from oxy mesitylenic acid (Jacobsen, *A* 195, 285) Needles (from water), v sol alcohol and ether FeCl_3 gives a red colour HClAq at 200° forms p cresol (J) — $\text{Ag}_2\text{A}''$ prisms

Methyl ether $\text{Me}_2\text{A}''$ [79°] Needles

Oxy-uvitic acid $\text{C}_8\text{H}_7\text{Me}(\text{OH})(\text{CO}_2\text{H})_2$

[1346] Got by saponification of its ether which is formed from sodium acetoacetic ether by the action, in presence of NaOEt , of chloroform, chloral, trichloro acetic ether, or CCl_4 (Oppenheim & Pfaff, *B* 7, 929, 8, 884, 9, 321, Conrad & Guthzeit, *A* 222, 249) Needles, sl sol cold water, v sol alcohol and ether FeCl_3 gives a reddish violet colour Softens at 290°, decomposing at the same time Yields m cresol on distillation with lime PCl_5 forms a mixture of chlorides, whence water forms oxyuvitic acid and $\text{C}_8\text{H}_7\text{O}_4$ crystallising in needles — $\text{K}_2\text{A}''\text{aq}$ — $\text{BaA}''_2 \cdot 1\frac{1}{2}\text{aq}$ — $\text{CaA}''_2 \cdot 1\frac{1}{2}\text{aq}$ — CuA''_2 — $\text{Ag}_2\text{A}''$

Methyl ether $\text{Me}_2\text{A}''$ [108°] Plates

a OXY-VALERIC ACID $\text{C}_5\text{H}_{10}\text{O}_4$ 18

$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{OH})\text{CO}_2\text{H}$ [31°] Formed by the action of HClAq on its nitrile, which is the cyanhydrin of n-butyric aldehyde (Menozzi, *G* 14, 46) Got also by boiling a-bromo-butyric ether with aqueous Na_2CO_3 (Jushin, *B* 17, 2504) Silky hygroscopic laminae; v sol water, alcohol and ether — $\text{BaA}''_2 \cdot 1\frac{1}{2}\text{aq}$ plates — CaA''_2 8 36 at 100° — $\text{ZnA}''_2 \cdot 2\text{aq}$ 8 1 01 at 100° — CdA''_2 — CuA''_2 — $\text{Ag}_2\text{A}''$ small scales, sl sol cold water.

Ethyl ether EtA'' (190°). Oil.

a-Oxy-isovaleric acid

$(\text{CH}_3)_2\text{CH CH}(\text{OH})\text{CO}_2\text{H}$ [38°].

Formation — 1 By heating bromo isovaleric acid with Ag_2O and water (Clark & Fittig, *A* 189, 199) or with KOHAg (Ley & Popoff, *A* 174, 61, Schmidt & Schutleben, *A* 193, 87) — 2 By digesting chloro-isovaleric acid with baryta, water (Schlebusch, *A* 141, 322) — 3 From its ether, which is a product of the action of zinc and isopropyl iodide on oxalic ether (Markownikoff, *Z* 1870, 517) — 4 From its nitrile, which is made by combination of HCy with isobutyric aldehyde (Lipp, *A* 205, 24)

Properties — Rectangular tables, v sol water, alcohol, and ether Not deliquescent Volatile with steam Dilute H_2SO_4 at 140° splits it up into isobutyric aldehyde and formic acid

Salts — NaA' — BaA'_2 — ZnA'_2 — $\text{CaA}'_2 \cdot \text{aq}$ — $\text{CaA}'_2 \cdot 1\frac{1}{2}\text{aq}$ — $\text{CaA}'_2 \cdot 4\text{aq}$ — $\text{MgA}'_2 \cdot 2\text{aq}$ — $\text{CuA}'_2 \cdot \text{aq}$ — AgA' feathery crystals (from hot water)

Ethyl ether EtA' (175°) Oil

Anhydride $\text{C}_5\text{H}_8\text{O}_4$ **Valerolactide** [126°] (220°–240°) Made by heating the acid in sealed tubes at 200° Needles, v sol alcohol and ether Not attacked by dilute alkaline solutions

Amide $\text{Pr CH}(\text{OH})\text{CONH}_2$ [104°] Got from the nitrile and HClAq Crystals

Nitrile $\text{Pr CH}(\text{OH})\text{CN}$ SG § 96 Oil, decomposed at 186° into isobutyric aldehyde and HCy

a-Oxy-valeric acid $\text{CMeEt}(\text{OH})\text{CO}_2\text{H}$ [68°] (M) [66°] (B)

Formation — 1 By saponification of its ether, which is made by the action of zinc on a mixture of MeI , EtI and oxalic ether (Frankland & Duppa, *A* 135, 37) — 2 By boiling $\text{OEtMeBr CO}_2\text{H}$ with baryta water (Böcking, *A* 204, 14) — 3 From methyl ethyl ketone by combination with HCy and saponification of the resulting nitrile (B) — 4 By oxidation of $\text{CMeEtH CO}_2\text{H}$ with dilute KMnO_4 (Miller, *A* 200, 282)

Properties — Needles (by sublimation), v e sol water, alcohol, and ether Oxidised to methyl ethyl ketone by chromic acid mixture Reduced by HI to $\text{CMeEtH CO}_2\text{H}$ Rotates on water

Salts — ZnA'_2 — AgA' Nodules

Ethyl ether EtA' (165.5°) SG § 977

V D 498 (calc 5.04) Liquid, sol water

B-Oxy-isovaleric acid

$(\text{CH}_3)_2\text{C}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$

Formation — 1 By oxidation of the alcohol $\text{CMe}_2(\text{C}_2\text{H}_5)\text{OH}$ with cold chromic acid mixture (Saytzeff, *A* 185, 168, 197, 78), or with KMnO_4 at 0° (Schirokoff, *J pr* [2] 23, 206) — 2 By the action of zinc on a mixture of acetone and chloro acetic ether (Reformatsky, *B* 20, 1210) — 3 By oxidation of tri oxy hexane by KMnO_4 (Reformatsky, *J pr* [2] 40, 404)

Properties — Syrup, v sol water, alcohol, and ether Not volatile with steam Reduced by HI to isovaleric acid

Salts — $\text{CaA}'_2 \cdot 12\text{aq}$ — CuA'_2 — $\text{CuA}'_2 \cdot 2\text{aq}$ — AgA' monoclinic crystals, sl sol water.

Ethyl ether EtA' (180°)

B-Oxy-valeric acid

$\text{CH}_3\text{CH}(\text{OH})\text{CHMe CO}_2\text{H}$ Formed by reduction of methyl-acetoacetic ether with sodium amalgam (Rohrbeck, *A* 193, 229) Syrup, resolved by distillation into water and methyl-crotonic acid [62°] — NaA' (dried at 100°). [210°] (Miller, *A*

900, 269) Crystalline powder—BaA', aq—AgA laminae, sl sol hot water

(γ)-Oxy-valeric acid

$\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ The salts of this acid are made by dissolving the lactone in bases. The free acid quickly changes back to the lactone

Salts—The Ba and Ca salts are deliquescent amorphous masses—AgA' trichioneneedles

Ethyl ether EtA' Oil

Lactone $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CO}$ (208° i v)

SG 2 1072 Occurs in crude wood vinegar (Grodski, F 17, 1369) Prepared by boiling γ-bromo valeric acid with water (Messerschmidt, A 208, 96), and by reduction of acetyl propionic (levulic) acid with sodium amalgam (Wolff, A 208, 104) Formed also by heating γ-oxy propylmalonic acid (Hjelt, A 216, 56), and by the action of NaOHAq on nitroso oxy methyl pyrrole dihydride (Tafel, B 22, 1884) Liquid, miscible with water Neutral to litmus Separated from solution by K_2CO_3 Reduced by HI and P at 250° to n-valeric acid Oxidised by HNO_3 to succinic acid Boiling alcoholic NaOEt forms $\text{C}_6\text{H}_5\text{O}$, [c 32°] (Fittig, A 256, 126) Phenyl hydrazine forms $\text{C}_{11}\text{H}_{11}\text{N}_2\text{O}$, [76°-79°], crystallising in needles, v sol water (W Wislizenus, B, 20, 402)

Amide $\text{CH}_3\text{CH}(\text{OH})\text{CH}_2\text{CH}_2\text{CONH}_2$, [56°] Formed by heating the lactone or the ether with NH_3 Aq Thin plates, v e sol water and alcohol, sl sol ether At 170° it is split up into NH_3 and the lactone (Neugebauer, A 227, 97)

Di-oxy-valeric acid

$\text{CH}_3\text{CH}(\text{OH})\text{CMe}(\text{OH})\text{CO}_2\text{H}$ Di-methyl glyceric acid [107°] Formed by the action of water at 99° on di methyl glycidic acid

$\text{O} < \text{CMeCO}_2\text{H}$ [62°], which is formed from

tiglic acid $\text{CH}_3\text{CH}(\text{OH})\text{CMeCO}_2\text{H}$ by successive treatment with HCl and boiling KOHAq (Meli koff, A 234, 228, B [2] 47, 166)—KA'—AgA'

Tetra-oxy-valeric acid $\text{C}_6\text{H}_5\text{O}_4$

$\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$ Arabinic acid $[\alpha]_D = -67^\circ$ Formed by allowing arabinose (10 g), water (75 g), and Br (20 g) to stand for 36 hours (Bauer, J pr [2] 30, 379, 34, 46, Kihani, B 19, 3081, 20, 344) Hygroscopic crystalline mass—CaA', 5aq—SrA', 5aq prisms

References—Bromo and Chloro-oxy-valeric acid

TETRA-OXY-VALERIC ALDEHYDE

$\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CH}(\text{OH})\text{CHO}$ Arabanose [160°] Mol w 150, by Raoult's method (Brown a Morris, C J 53, 619) H C p 557, 100 H.F 259, 400 (Berthelot, C R 111, 12) A product of the hydrolysis of ARABIC ACID (q v) (Scheibler, B 1, 58, 108, 6, 612, 17, 1731, Kihani, B 13, 2804, 15, 87, 19, 3031, 20, 344, Claesson, B 14, 1271, O'Sullivan, C J 45, 41) Trimetric prisms, v sol hot water, nearly insol alcohol and ether Dextrorotatory (v vol 1 p 297) Tastes sweet Does not undergo alcoholic fermentation Yields a phenylhydrazide [158°] Arabum $\text{C}_6\text{H}_{11}\text{O}_5$ is an anhydride of this aldehyde (O'Sullivan, C J 57, 59).

OXY-VALERO-CYAMINE v α-GUANIDO-VALERIC ACID

OXY-VINYL-BENZOIC ACID Anhydride v. METHYLENE-PHTHALIDE

OXY-XANTHONE v OXY-DIPHENYLENE KETONE OXIDE

OXY-XYLENE v. XYLENOL and TOLYL-CARBINOL

Di-oxy-xylene The (6,3,2,1)-, (5,2,3,1)-, and (5,2,4,1) di oxy-xylenes are described as HYDROXYLQUINONES OXY-TOLYL-CARBINOL is an α-endo-di-oxy xylene (5,3,4,1)-Di-oxy-xylene is described as BEXOROLIN

Di-oxy-m-xylene $\text{C}_8\text{H}_6\text{Me}_2(\text{OH})_2$, [184-6], Xylorcin Mol w 188 [125°] (278°) Formed from amido m xynolol [161°] by the diazo-reaction (Kostanecki, B 19, 2324) White monoclinic plates (from chloroform), v sol water, alcohol, and ether Not affected by air containing NH_3

Di-acetyl derivative $\text{C}_8\text{H}_4(\text{OAc})_2$, [45°] (286°) Prisms, insol cold water

Di oxy-xylene $\text{C}_8\text{H}_6\text{Me}_2(\text{OH})_2$, [120°] Got by potash fusion from chloro m xylene sulphonic acid (Gundelach, B [2] 28, 345) Gives a red colour with bleaching powder solution

Di-oxy-m-xylene $\text{C}_8\text{H}_6\text{Me}_2(\text{OH})_2$, [182-4] [146°] Formed from m-xylene by heating with H_2SO_4 at 150°, converting the resulting disulphonic acid into chloride and fusing the $\text{C}_8\text{H}_6\text{Me}_2(\text{SO}_2\text{Cl})_2$ with potash (Wischni, B 23, 3113) White needles (by sublimation), v sol water, alcohol, and ether FeCl_3 colours its solution deep violet Fusion with phthalic anhydride forms a fluoresein

Di-α-oxy-o-xylene $\text{C}_8\text{H}_4(\text{CH}_2\text{OH})_2$, Phthalalcohol o Tolylene alcohol Xylylene alcohol. Di methyl benzene glycol [64°] 8 (ether) 25 at 18° Formed by the action of sodium amalgam upon a boiling solution of phthalyl chloride in HOAc (Hessert, B 12, 646) Formed also by boiling di α-bromo-o-xylene with Na_2CO_3 Aq (Baeyer a Perkin, jun, B 17, 124, C J 53, 6; Colson, C R 98, 1643, B [2] 43, 6, 45, 6; A Ch [6] 6, 106) Tables (from ether), v e sol water and alcohol HBr forms $\text{C}_8\text{H}_4(\text{CH}_2\text{Br})_2$ and HCl acts in like manner KMnO_4 oxidises it to phthalic acid Resinified by cold H_2SO_4 Hot H_2SO_4 forms amorphous insoluble $(\text{C}_8\text{H}_4\text{O})_n$ and syrupy $\text{C}_8\text{H}_4\text{O}_2$ (Hjelt, B 19, 1588) HNO_3 forms phthalide

Di acetyl derivative $\text{C}_8\text{H}_4\text{O}_4$, [37°] Di ethyl ether $\text{C}_8\text{H}_4(\text{OEt})_2$, (249°) at 720 mm Liquid (Leser, B 17, 1325)

Di-α-oxy m-xylene $\text{C}_8\text{H}_6(\text{CH}_2\text{OH})_2$, [47°] SG (liquid) 11 161, 22 1385 Formed by boiling $\text{C}_8\text{H}_4(\text{CH}_2\text{Br})_2$, [77°] (1 mol) with water containing K_2CO_3 (1 mol) (Colson, A Ch [6] 6, 112, C R 99, 40) Got in like manner from $\text{C}_8\text{H}_4(\text{CH}_2\text{Cl})_2$ (Colson a Gautier, B [2] 45, 6) Crystalline solid, with bitter taste, v e sol water and alcohol, m sol ether HBr regenerates di-α-bromo-m-xylene Gives isophthalic acid on oxidation

Ethyl ether $\text{C}_8\text{H}_6(\text{CH}_2\text{OEt})_2$, (248°) at 712 mm Got by boiling $\text{C}_8\text{H}_4(\text{CH}_2\text{Br})_2$ with alcoholic potash (Kipping, B 21, 46, C J 53, 46) Oil Yields isophthalic acid on oxidation

Di-α-oxy-p-xylene $\text{C}_8\text{H}_6(\text{CH}_2\text{OH})_2$, p-Xylylenol alcohol, [113°] Formed from $\text{C}_8\text{H}_4(\text{CH}_2\text{Cl})_2$ (1 pt.) by heating with water (80 pts) at 175° (Grimaux, A 155, 342, Colson a Gautier, B [2] 45, 7) It is one of the products of the action of boiling NaOHAq upon terephthalic aldehyde (Löw, A 231, 374) Needles, v. sol. water, al-

cohol, and ether. Yields terephthalic acid on oxidation.

Acetyl derivative $C_8H_7(OH, OAc)$, [47°] Made from $C_8H_7(OH, Cl)$, and $KOAc$ in alcohol.

Benzoyl derivative $C_8H_7(OH, OBz)$. Needles, v sol alcohol and ether (Grimaux).

Mono-ethyl ether $C_8H_7(OH, OEt)$ (251°). Oil. Formed from di- α -chloro-*p*-xylene and conc alcoholic potash at 100° (G). Successive treatment with $POCl_3$ and water converts it into terephthalic aldehyde (Colson, *C R* 99, 975).

Tri-oxy-xylene $C_8H_6(OH)_3$, [122°]. Formed by reducing oxy-isoxylquinone with aqueous SO_2 (Fittig a Siepermann, *A* 180, 87). Crystallises from water in tables (containing aq). Melts at 90° when hydrated. Colours the skin brown. On spontaneous evaporation of the aqueous solution in air it forms a quinoxaline as dark lustrous needles [143°]. Yields *m*-xylene on distillation with zinc dust.

Tri-acetyl derivative [99°]. Prisms. Reference—TETRA CHLORO DI OXY-XYLENE.

DI-OXY-XYLENE CARBOXYLIC ACID $C_8H_6(OH)_2CO_2H$ [1 3 4 6 5]. *Xylorcan carb oxylie acid* [196°]. Got by heating *m*-xylorcan with $NaHCO_3$ and some water at 180° (Kostanecki, *B* 19, 2328). Prisms from dilute alcohol, sl sol water. Gives off CO_2 on fusion. $FeCl_3$ gives a deep blue colour.

Oxy-*m*-xyloquinone $C_8H_6(OH)O_2$, [108°]. Formed by distilling di-amido mesitylene with chromic acid mixture and water, Me being displaced by OH (Fittig, *B* 8, 16, *A* 180, 27). Orange needles, smelling like quinone, m sol hot water, v sol alcohol and ether. Volatile with steam. Its alkaline solution is reddish violet. Reduced by SO_2 to tri-oxy-xylene. Acetyl chloride at 100° forms a crystalline body [124°], insol water— $C_8H_6O_2(OK)$. Small black needles, v s. sol. Aq, m sol alcohol, insol ether— $(C_8H_6O_2)_2Ba$. Brownish-red pp.

α -OXY-XYLYL-ACETIC ACID [1 3,4] $C_8H_6Me_2CH(OH)CO_2H$ [119°]. Got by reducing (1,3,4)-xylyl glyoxylic acid (Claus, *J pr* [2] 48, 148). Rhombohedra (by sublimation), v. sl. sol. cold water, v sol alcohol and ether.

α -Oxy-xylyl-acetic acid [1 4 2] $C_8H_6Me_2CH(OH)CO_2H$ [114°]. Got in like manner from [1 4 2] $C_8H_6Me_2COCO_2H$ (Claus). Needles or prisms, v sol hot water.

DI-OXY-XYLENE-DI-METHYL-DI-PYRIMIDINE $C_8H_4(CH_3)_2C \begin{smallmatrix} N(OH) \\ NMe \end{smallmatrix} > CH_3$, [above 250°]. Made from acetoacetic ether and *p*-phenylene-diact imido- ether (Glock, *B* 21, 2861). Crystalline mass, insol ordinary solvents.

OXY-XYLYL-METHYL-PYRAZOLE $C_8H_6Me_2N \begin{smallmatrix} C(OH)CH \\ N=CH \end{smallmatrix}$ [159°]. Got from the product $C_8H_6N_2O_4$ of the action of (1,3,4)-xylyl-hydrazine on acetoacetic ether by heating with conc HCl aq at 150° (Klauber, *M* 12, 215). Small white needles— B^*HCl [185°]— $B^*H_2FeCy_2$, white crystals.

Oxy-xylyl-di-methyl-pyrazole $C_8H_6Me_2N \begin{smallmatrix} CO-CH \\ NMe \end{smallmatrix}$ [118°]. Made by heating the compound $C_8H_6N_2O_4$ (*v supra*) with MeI and $MeOH$ at 180° (K). Small white needles, v sol alcohol and ether, sol cold water.

Reduces Fehling's solution. $FeCl_3$ gives a violet red colour— B^*HCl [35°]. Small crystals.

DI-OXY-DI-XYLYL-PYRAZINE DIHYDRIDE $C_8H_6Me_2N \begin{smallmatrix} CO \ CH_2 \\ CH_2 \ CO \end{smallmatrix} N C_8H_6Me_2$, [203°]. Formed by boiling bromo acetyl (1,1',2) xylidine with alcoholic potash (Abenius, *J pr* [2] 40, 486). Flat needles, insol water and ether.

OZOKERIT. A fossil resin, consisting chiefly of a hydrocarbon called lekene (*q v*). On chlorination in presence of $BrCl_3$ at 360° it yields CCl_4 , C_2Cl_6 , C_3Cl_8 , and C_4Cl_{10} (Hartmann, *B* 24, 1019) (*V* also PARAFFIN).

OZONE O_3 , Mol w 47.91. A blue gas (Hautefeuille a Chappuis, *C R* 91, 522), it usually occurs mixed with oxygen, and possesses a characteristic odour (−106°) (Olszewski, *M* 8, 69, *W* 87, 337). *VD* 24 *S* at 760 mm. 366 at 18° (Schöne, *B* 6, 1224), 834 at 1° (Carius, *A* 174, 80), and 2745 at 14° (McLeod, *C J* 49, 607). Andrews states that it is insoluble in water.

Occurrence.—Ozone is believed to be a normal constituent of pure air. Hartley (*C J* 39, 111), Chappuis (*C R* 91, 985, 94, 858), and E Schöne (*J R* 1884 2, 250), who have examined the absorption spectrum of ozone, have attributed the blueness of the sky to its presence. But the recent observations of Laveag a Dewar (*P M* [5] 26, 286) show that the absorption spectrum of compressed oxygen exhibits certain bands identical with those of the solar spectrum, which Angstrom found to be equally strong whether the atmosphere was wet or dry, and that daylight when observed through a column of oxygen 18 m in length and at 90 atmos possesses a blue tint (*v* also Olszewski, *W* 42, 663). The proportion of ozone in the air varies very considerably, and is supposed by many observers to be greater at high than at low altitudes (*v* also Thorpe, *C J Proc* 72). Houzeau judges the maximum proportion at ordinary levels to be $\frac{1}{10000}$ by volume (*C R* 74, 712). Andrews found that a temperature of 250° destroys the constituent of the air which exhibits the reactions of ozone, whereas air containing traces of chlorine, or of the higher oxides of nitrogen, is not so affected by heat (*Pr* 16, 68). On the other hand, Hovsøy (*Bl* [3] 2, 877) and Schöne (*B* 13, 1503) conclude that the presence of ozone in the air is still unproved.

Formation.—1. Ozone is formed in the electrolysis of dilute sulphuric acid (Schönbein, *P* 50, 616, Margnac, *C R* 20, 808, Meidinger, *A* 88, 57, *C J* 7, 251, Baumeit, *P* 89, 38, Andrews, *T* 146, 1, Soret, *Arch des Sciences*, 16, 218, *C R* 56 390, Berthelot, *C R* 86, 71, *A Ch* [5] 14, 345, Schöne, *B* 6, 1224, Carius, *A* 174, 1, Brodie, *C J* 17, 293, McLeod, *C J* 49, 591). Berthelot and Schönbein also obtained ozone by the electrolysis of other acid solutions. It has been supposed that the ozone formed in electrolysis is accompanied by H_2O_2 , but Brodie (*C J* 17, 281), and, more recently, McLeod (*loc cit*), have shown that the oxidising body which remains in solution is probably S_2O_8 . The proportion of ozone present in electrolytic oxygen appears to depend to a great extent on current-density. By using a positive electrode of very small area McLeod obtained O containing 17.4 per cent of ozone, when electrodes of large

area are used the yield of ozone is sometimes very small.—3 When air or oxygen is exposed to the electric discharge, especially if it be the silent discharge, the O is partly converted into ozone. If air be used, oxides of N may be formed and mistaken for ozone. According to Berthelot (*C R* 92, 82) and Hautefeuille a Chappuis (*C R* 92, 80, and 184), oxides of N may be formed to a slight extent even by the silent discharge, and H and O have obtained a new and unstable oxide of nitrogen in this way. Giannetti a Volta (*G* 5, 439) found that with the discharge from a Holtz machine the yield of ozone is increased by using a wire brush as negative electrode. Bichat a Guntz (*C R* 107, 534, *A Ch.* [6] 19, 131), who used an ozone generator consisting of a wire stretched along the axis of a metallic tube, found that the negative effluve produced by far the greatest yield of ozone. Thus they attribute to its higher temperature. It has been suggested that the production of ozone by the electric discharge is an effect of a condition of electro static stress. But Thomson a Threlfall (*Pr* 40, 329) find that oxygen is only converted into ozone when there is an actual luminous discharge. This has been confirmed by Bichat a Guntz, and some experiments by the writer seem to show that even when oxygen is illuminated by the ultra violet rays ozone is only formed by actual luminous discharge. Dewar has obtained a body giving the reactions of ozone from air by passing a current of water through a glass tube, surrounded by a larger tube of platinum which was heated by the oxyhydrogen flame, the air from the annular space between the hot and cold tubes being sucked into the inner tube by the stream of water through a minute hole in the glass tube, and collected and examined. If the substance thus obtained was really ozone, this result seems to confirm the idea that the action of the electric discharge on oxygen is due to temperature (v. also Elster a Geitel, *W* 39, 321, and Hoesvay, *Bl* [3] 2, 734).

The formation of ozone from O by electric discharge is greatest at low temperatures and under high pressure (von Babo, *A* 1863 *Suppl.* 11, Hautefeuille a Chappuis, *C R* 91, 228). But the exact influence of temperature and pressure have probably not yet been made out. Hautefeuille a Chappuis have noticed that at a pressure of about 50 mm. ozone is alternately produced and destroyed by the silent discharge (*C R* 94, 646). Von Babo a Claus, and Hautefeuille a Chappuis, consider that prolonged action of the discharge is favourable to ozonification. But Brodie, with the apparatus described below, found that the maximum effect was quickly reached. The writer's experience agrees with that of Brodie, and tends to show that observations to the contrary effect have been due to the irregular working of the machine employed.

Bichat a Guntz, using the apparatus described above, have failed to find any simple quantitative relation between the potential difference of the discharging surfaces and the yield of ozone, though they, and also Giannetti a Volta (*G* 5, 439) and Berthelot, find that an increase of potential produces an increased yield of ozone. (For details on various points v. Marignac a. De la Rive, *Arch. of Elect.* 5, 5; Fremy a Bec-

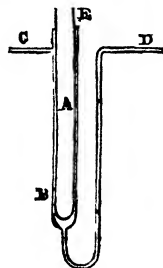

querel, *A Ch.* [8] 85, 62, Andrews; *T.* 146, 1; 150, 113, Brodie, *T* 162, 435, Berthelot, *C R* 88, 50, *A Ch.* [5] 12, 448, Hautefeuille a. Chappuis, *C R* 92, 80, 134, 94, 646, Shenstone a. Cundall, *C J* 51, 610.) Hautefeuille a. Chappuis (*C R* 91, 762) find that the production of ozone by the action of the electric effluve on oxygen is prevented by the presence of Cl, but that N, H, and SiF₄ are favourable to its production.

3 Brodie (*T* 164, 88), by the action of the silent discharge on carbon dioxide, under the most favourable conditions, obtained as much as 85 p.c. of the liberated oxygen in the form of ozone.

4 Ozone has long been regarded as one of the products of various cases of oxidation such as the slow oxidation of P, Et₃O, and turpentine, the decay of organic matter, and the combustion of compounds containing H in the air, Thorpe a Tutton observe that it is not formed in the oxidation of P₂O₃ (*C J* 57, 569). It is possible, however, that ozone is less frequently formed in such changes than has been supposed, and that the reactions attributed to ozone may often have been due to H₂O₂. The experiments of Kingzett (*C J* 37, 792) and McLeod (*C J* 37, 118), however, seem to make it certain that ozone is produced in the slow oxidation of P (v. also Hoesvay, *Bl* [8] 2, 860, 4, 707, Leeds, *C. N* 39, 157, 40, 70, 41, 164, 42, 17, Cundall, *C J* *Proc* 78, 26, Loew, *B* 22, 8325).

Heat of formation— $3O_2 = 2O_3 = -59,200$ (Berthelot, *C R* 82, 1281), —66,720 (Mulder a van der Meulen, *B* 15, 511).

Preparation.—1 From oxygen. The following method, which was introduced by Siemens and Brodie, is perhaps the most convenient. A tube, A, is sealed into a slightly larger tube B,

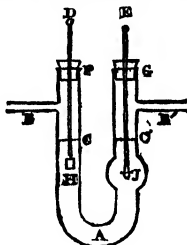

at E, before the blowpipe, or by means of solid paraffin. A and B should be of thin glass, and two narrow tubes, O and D, should be attached to B. A is filled with dilute H₂SO₄, and the apparatus is then immersed in dilute acid to the level OD, the electrodes of a Ruhmkorff coil, or of an electric machine, are respectively connected with the acid in A, and the contents of the cylinder, and a slow current of O is led through the apparatus from D to C while the discharge passes. The liquid in the cylinder should be cooled by ice, or it may be replaced by a freezing mixture, in which case a platinum wire should be wrapped round the outside of B. The gas which escapes at C is well charged with ozone. The ozonised oxygen may be collected over oil of vitriol. It must not be brought into contact with india-rubber; joints that will bear contact with ozone may be made by slipping a wider tube over the

ends of those that are to be connected, warming them, and running a little melted paraffin between the inner and outer tubes

The character of the discharge in the ozone generator has been studied by Hautefeuille & Chappuis (*C. R.* 91, 281), Thomson & Threlfall (*Pr.* 40, 829), Shenstone & Cundall (*C. J.* 51, 622), and by Bichât & Guntz (*A. Ch.* [6] 19, 181)

2 By electrolysis When dilute H_2SO_4 is electrolysed with electrodes of considerable area the proportion of ozone in the O is usually small McLeod (*C. J.* 49, 591) recommends the following method Place dilute H_2SO_4 (*S. G.* 11) in a U tube, A, attach delivery tubes to the

arms B B' Let the negative electrode H be a sheet of Pt foil suspended by the glass D from a cork closing the mouth at F, and let the positive electrode J consist of two fine wires, sealed into a glass tube E, which is afterwards filled with mercury On connecting D and E with a galvanic battery, O highly charged with ozone will escape at B' It is best to immerse the U tube in ice cold water McLeod has obtained O containing as much as 17.3 p.c. of ozone by means of this apparatus

3 To prepare ozone by the oxidation of phosphorus Place clean sticks of P half submerged in water in a series of flasks, and conduct a rather slow stream of air through the flasks, and then through a little water A temperature of 24° – 25° gives the best results H_2O_2 is also formed, but it remains dissolved in the water (Kingzett, *C. J.* 37, 792)

Properties and Reactions—Ozone is more strongly magnetic than common oxygen (Bequerel, *C. R.* 92, 348) Its rate of diffusion is near to that required for the density 24 (Sorêt, *A. Ch.* [4] 13, 257) It is entirely destroyed at 270° (Andrews, *T.* 150, 113) by contact with platinum black at ordinary temperatures (Mulder & van der Meulen, *B.* 1, 167), and on contact with pure Hg (Hg is not visibly oxidised if both be perfectly dry, Shenstone & Cundall, *C. J.* 51, 619) Ozone is also decomposed by dry Ag, the silver being but slightly oxidised, and by contact with MnO_2 (Andrews) Volta (*G.* 9, 521) states that Au, Pt, Pd, and dry Ag are without action on ozone Brodie came to a similar conclusion in regard to Au, Al, and Cu Berthelot (*C. R.* 86, 76) and others have considered that dry ozone has no fixed pressure of dissociation If suddenly compressed, or compressed without cooling, it explodes with a yellowish flame (Hautefeuille & Chappuis, *C. R.* 91, 522). The action of ozone on salts has been studied by Maquenne (*C. R.* 94, 795), and by Mailfert (*C. R.* 94, 860). The latter has also

studied its action on S, Se, Te, and several sulphides, and on CH_4 , C_2H_4 , C_2H_6 , C_3H_8 , C_4H_{10} , C_2H_5OH , and C_2H_5I (*C. R.* 94, 1186) Ozone oxidises alcohols of small molecular weight more readily than the polyhydric alcohols (A Renard, *A. Ch.* [5] 16, 289) Liquid ozone explodes violently on corking into contact with C_2H_4 (Olszewski, *A. Ch.* [2] 37, 887) It acts as a strong bleaching agent on vegetable colours, and quickly destroys india rubber, its action on cork is much less rapid It does not oxidise CO at 300° (Remsen, *Am.* 4, 50) It oxidises NH_4Ag , forming ammonium salts of nitrous and nitric acid (Carius, *A.* 174, 31), unless the solution is dilute (Hartley, *C. J.* 39, 123) It is believed to be completely absorbed by turpentine and oil of cinnamon (Sorêt, *A. Ch.* [4] 7, 113), peroxidised compounds being formed which react with water (Kingzett, *C. J.* 37, 800) When ozonised O acts on $KIAg$, I is set free and the ozone is destroyed, but the volume of the gas remains unaltered With neutral solutions the initial action may correspond to the equation $2KIAg + O_3 = K_2OAq + O_2 + I_2$, but usually KIO , is a final product of the change P glows freely in ozonised air (Thorpe & Tutton, *C. J.* 57, 571) Ozone oxidises $TiOH$ and As_2O_3 , the latter action has been used in determining its heat of formation It is destroyed by solutions of KHO , BaO , and CaO to a certain extent (Andrews) Hartley has observed the formation of peroxide of potassium by its action on solid KOH (*C. J.* 39, 124) But it is unaffected by solution of Na_2CO_3 (Brodie) It readily attacks I, forming periodic acid and lower oxides of I (Ozier, *C. R.* 86, 722) It converts ether into an ozonised substance which acts with water to form H_2O_2 (Kingzett, *C. N.* 34, 127, Berthelot, *C. R.* 86, 71, Dunstan & Dymond, *C. J.* 57, 584) Several observers have concluded that it arrests putrefaction of animal matter, and have proposed its use as a preservative for meat When present in the air in large quantities it frequently produces irritation of the mucous membrane

Although its general action is that of a strong oxidiser, in certain cases ozone acts as a reducing agent Thus when ozone acts with Na_2O_2 , an expansion occurs which is due to the simultaneous decomposition of the two bodies in equivalent proportions (Brodie, *T.* 162, 454), probably according to the following equation— $Na_2O_2 + O_3 = Na_2O + 2O_2$ Probably other unstable oxides, such as H_2O_2 , react with it similarly under favourable conditions Its action on blood has been said to resemble that of a reducing agent (Dogiel, *C. C.* 1875, Binz, *C. C.* 1882) It changes the red colour of the compound formed when sulphamic acid is mixed with naphthyl amine to orange yellow (Ilosvay, *Bl.* [1] 2, 351)

Detection—Paper impregnated with $TiOH$ is turned brown by ozone even when dry (Schöne, *B.* 13, 1508) The similar change of colour produced by nitrous acid is destroyed by excess The colour is also permanent when ozone is mixed with a relatively small proportion of nitrous acid (Ilosvay) The action of ozone on the red compound of naphthylamine and sulphamic acid (*see Properties*) also affords a test for ozone, even in the presence of traces of nitrous acid (Ilosvay, *Bl.* [3] 2, 860) Ozone may be distinguished from H_2O_2 by not yielding water when strongly heated, and by the absence

of any action with titanio acid or chromic acid, also by resisting the action of Na_2CO_3 , which destroys H_2O_2 . Papers saturated with solutions of KI and starch are often used for the detection of ozone, but are only trustworthy when the absence of Cl and of oxides of nitrogen can be assured. Houshau employed test papers steeped in faintly acid solution of litmus and then treated with KI. These he found to be insensitive to O_3 , to traces of oxides of nitrogen, and to H_2O_2 . When exposed to ozone, however, they are turned blue by the alkali that is set free.

Estimation.—1 Rough estimations of ozone are frequently made by comparing the tints produced by exposing some of the test papers mentioned above with a scale of tints. Such methods are not very satisfactory.—2 Thénard has estimated the proportion of ozone in the air volumetrically by means of a standard solution of As_2O_3 in HClAq of such strength that 1 c.c. is equivalent to 1 mgrm. of O . 10 or 20 c.c. of the solution are thoroughly agitated with the sample of gas, 30 c.c. of a 1 p.c. solution of H_2SO_4 are added, and it is then titrated in the usual manner with permanganate. For 8 grms. of O absorbed 24 grms. of O_3 are destroyed (Berthelot, *C R* 82, 1251). As oxides of nitrogen and H_2O_2 , if present, tend to reduce the amount of ozone found, this method gives the minimum, and not the maximum, amount of ozone present.—3 If a solution of potassium arsenite containing 73 grm. per litre, with an excess of pure KI, be agitated with air containing ozone, part of the arsenite is converted into arsenate by the ozone, and the amount of unaltered arsenite can be found by titrating with very dilute I solution after adding some ammonium carbonate and starch. This method is strongly recommended by Hartley (*C J* 39, 120). The solution of the arsenite should be acidified for keeping, and neutralised before use with KHCO_3 .—4 The action of ozone on KIAq may also be employed to estimate ozone. The iodide must be perfectly free from iodate, and must be thoroughly brought into contact with the gas. When the action is complete, and *not before*, the product must be acidified with dilute HClAq or $\text{H}_2\text{SO}_4\text{Aq}$. The liberated I may then be titrated in the usual manner. The O equivalent to the I liberated, multiplied by three, gives the amount of ozone.—5 The amount of ozone produced in the electrification of oxygen may also be calculated from the contraction that occurs under the influence of the discharge (*v. Babo, A Suppl.* 2, Andrews, *T* 150). Shennstone, a Cundall (*C J* 51, 610) have devised an apparatus for this purpose. S & O have shown that if the ozonised gas comes into contact with oil of vitriol in such a process, the acid should be previously thoroughly treated with ozone, otherwise the results are likely to be high.

History.—The earliest known record concerning ozone relates to an observation by van Marum, 1785, that air or O when submitted to the electric spark acquires a characteristic odour. About fifty years later, 1840, Schönbein, who published about sixty papers on this subject, published his first memoir on ozone in Poggen-dorff's *Annalen*. As the result of his numerous observations, Schönbein recognised ozone as a distinct form of matter, ascertained that it could be obtained by the electrolysis of dilute acid, by

means of the electric discharge on O , and in the slow oxidation of P. And it is interesting to note that these still constitute the chief methods for the production of ozone. He also observed many of its chief properties. For several years after Schönbein's original discovery, comparatively little progress was made in ascertaining the nature of ozone till the experiments of Marignac and De la Rive, 1845 (*Arch. of Elect.*), and of Fremy and Becquerel, 1853 (*A Ch.* [3] 35, 62), showed that the purest O then obtainable could be entirely converted into ozone, provided that the action of the spark took place in the presence of excess of KI, or of moist silver, which appeared to be capable of completely absorbing ozone. But it was not till a much later period that the researches of Andrews (*T* 146, 1) and Soret (*C R* 58, 390) finally showed that ozone from all sources is identical. Although the researches of Marignac & De la Rive, and of Fremy & Becquerel, thus established the character of ozone and its production from oxygen, the exact relation of the two bodies was still imperfectly understood, and ozone seems to have been regarded as differing from oxygen either in regard to its electrification, or, by some, in being a compound of oxygen and water, until in 1860 Andrews and Tait (*loc. cit.*) examined the volumetric relations of ozone and oxygen, and by a masterly research showed that the ozonising of oxygen is accompanied by a contraction in the volume of the gas, and that, on the other hand, the reproduction of O from the ozone by heat causes the gas to recover its original volume. In this research A and T also showed that the iodine titre of a sample of ozonised oxygen corresponds in every case to the contraction that has occurred on ozonising it, a fact which, in the hands of Soret and Brodie, materially contributed to the further elucidation of the subject. Andrews and Tait also observed that when ozonised oxygen acts with KIAq , the gas remains unaltered in volume after the action is complete. The true bearing of these facts was not, however, perceived till Odling (*Manual of Chemistry*) pointed out, in 1861, that they were consistent with the adoption of O_3 as the simplest formula for ozone. This interpretation was afterwards supported by the experiments of Soret and Brodie. The former showed that when ozonised oxygen is allowed to act on turpentine, a contraction occurs that is equal to about twice the iodine titre of the gas, *i.e.* is about twice as great as the contraction which accompanies its formation, from which, if it be assumed that the ozone formed is wholly absorbed by the turpentine, it follows that two volumes of gaseous ozone contain three volumes of gaseous oxygen. Soret's experimental numbers did not agree very closely with this hypothesis. But the hypothesis was confirmed by subsequent experiments, in which he compared the rates of diffusion of ozone, O_2 , and CO_2 , and found that the rate of diffusion of ozone approximates to that of a gas having the SG 24 (*A Ch.* [4] 18, 257). Finally, in 1872, Brodie (*T* 162, 435), as one of the results of a beautiful series of experiments, found that, while in some cases, as in that of neutral KIAq , the oxidation caused by ozone is unaccompanied by any contraction in the volume of the gas, in other cases various degrees of con-

traction occur. Thus the oxidation of HIAq is attended by a diminution in the volume of the gas equal to half the volume that would be occupied by the weight of gas that is absorbed, and the action of the gas on turpentine and on $\text{Na}_2\text{S}_2\text{O}_3\text{Aq}$ is accompanied by a diminution of volume equal to two-thirds of the volume that the O absorbed would occupy in the free state. Intermediate contractions were observed, but in no case did the contraction seem to be greater than in the action of turpentine, a result which afforded strong confirmation of the views of

Soret and Odling. An account of the early work on ozone exists in the *Handwörterbuch der Chemie*, 5, 835 (Braunschweig, 1853) (For later work v Odling, *R I* 1872).

Antozone This name was formerly given to a substance whose action with ozone resulted in their mutual decomposition. Before the relations of ozone and oxygen were established, these bodies were by some supposed to consist of oxygen in opposite conditions of electrification. Antozone was probably hydrogen peroxide. W A S

P

PACHYMOSE $\text{C}_{12}\text{H}_{22}\text{O}_{14}$. A substance, probably a glucoside, occurring in *Pachyma pinctorum*, a Chinese fungus (Champion, *J* 1872, 789). Insol water, sol alkalis, forming a solution ppd by Ca and Pb salts.

PACHYRHIZIDE A substance, not containing nitrogen, extracted from the seeds of *Pachyrhizus angulatus* (Greshoff, *B* 23, 3539). V sol alcohol, ether, and HCl , v sl. sol water and KOH . Tastes bitter, and is extremely poisonous, especially to fishes. Begins to melt at 61° , and decomposes at 161° . Yields salicylic and protocatechuic acids on fusion with potash. The alcoholic solution is acid in reaction. Probably identical with a similar body in the root-bark of *Derris* (*Pongamia elliptica*).

PÆONOL $\text{C}_{12}\text{H}_{16}\text{O}_4$, $\text{C}_6\text{H}_5\text{CO C}_6\text{H}_5(\text{OH})(\text{OMe})$ [124] [50°]. Got from the bark of *Pæonia montana* of Japan (Nagai, *B* 24, 2847). White needles (from alcohol). Yields an acetyl derivative [46.5°], a phenyl hydrazide [107°], and a crystalline oxim (Tiemann, *B* 24, 2855). Potash forms resacetophenone $\text{CH}_3\text{CO C}_6\text{H}_5(\text{OH})$, HIAq at 150° forms the same body.

PALISANDER RESIN $\text{C}_{12}\text{H}_{16}\text{O}_2$? [95°] SG 1.266. Extracted by alcohol from palisander wood, a red dye wood from Madagascar (Terreil a Wolff, *Bl* [2] 33, 435, cf Arnaudon, *Cemento*, 8, 278).

PALLADIUM Pd. At w 106.3. Mol w unknown. Melts between 1360° and 1380° (Bequerel, *C R* 57, 855), at c 1500° (Violle, *C R* 87, 981). SG 11.4 at 22.5° (Deville a Debray, *P M* [4] 50, 651). For other numbers v Clarke's *Table of Specific Gravities*, 2nd edit, 15. SH = 0.582 at 0° , = $0.582 + 0.0002t$ at t° (Violle, *l.c.*). Heat of fusion = 363 cal. CE (linear) = 0.0001176 at 40° (Fizeau, *C R* 63, 1125). EC. 12.64 at 17.2° (Ag at $0^\circ = 100$) (Matthiessen, *P* 103, 428). Volatilises in green vapour at c. 2000° . SVS c 9.3. For chief lines in emission-spectrum v *B A* 1884 434.

Occurrence—In small quantities, about 2 p.c., as metal alloyed with Pt, Ir, Os, Ru, and Rh. Certain kinds of South American gold contain from 5 to 10 p.c. Pd. Occurs also, with gold and lead selenide, in the Harz (Zinken, *P* 16, 491), and in small quantities in some specimens of silver (Röseler, *A* 180, 240). In 1803 Wollaston (*T* 1804, 428; 1805 216) separated two

new metals from Pt ore, to one of these metals he gave the name *palladium*, in allusion to the discovery, made about the same time, of the planet Pallas, and the other he called *rhodium*, because of the rose-coloured solutions of its salts (*rose* = a rose).

Formation—1 By heating PdCy_2 ,—2 By heating $\text{PdCl}_2 \cdot 2\text{KCl}$ and washing out the residual KCl —3 By ppn from solutions of its salts by means of Zn, Cu, or Fe—4 By reducing $\text{PdCl}_2 \cdot 2\text{KClAq}$ by oxalic or formic acid.

Preparation—When P. ore is heated in *aqua regia*, the Pd goes into solution, along with most of the Pt, as PdCl_2 . From this solution Pd is obtained by various processes. 1 The solution is made as nearly as possible exactly neutral by Na_2CO_3 , and HgCy_2Aq is added, PdCy_2 is ppd, along with Cu_2Cy_2 , if the ore contained Cu, the pp is washed, dried, and strongly heated, whereby Pd is obtained, mixed with Cu, the metallic residue is dissolved in HNO_3Aq , the solution is neutralised by Na_2CO_3 , and heated with HCO_2KAq and $\text{H}_2\text{C}_2\text{O}_4\text{Aq}$, whereby CO_2 is evolved plentifully, and Pd is deposited in lustrous plates, while Cu remains in solution (Dobereiner), or the metallic residue obtained by heating the cyanides may be dissolved in HNO_3Aq , the solution evaporated to dryness, and the residue strongly heated. By now treating with conc HClAq , CuO is dissolved away, while Pd remains.—2 NH_4Cl is added to the solution in *aqua regia*, and the liquid is filtered from $\text{PtCl}_2 \cdot 2\text{KCl}$, the filtrate may contain Ir, Rh, Ru, some Pt and Cu, besides Pd. These metals are ppd by addition of Zn or Fe. The pp is treated in various ways. Wilm (*B* 15, 241, v also *B* 13, 1198, 14, 629) recommends to dissolve the ppd metals in *aqua regia*, to boil the solution with excess of NaOHAq (von Schneider, *A Suppl* 5, 261), whereby the perchlorides of the metals, except that of Pt, are reduced to the lower chlorides, to acidify with HClAq , and add excess of NH_4Cl , in order to ppt $\text{PtCl}_2 \cdot 2\text{KCl}$. The filtrate from this pp. is boiled with excess of NH_4Aq , filtered, and excess of HClAq is added. After some time a yellow pp. forms, which is either almost pure $\text{PdCl}_2 \cdot 2\text{NH}_4\text{Cl}$, or if somewhat dirty-yellow in colour, it may contain $\text{Rh}_2\text{Cl}_6 \cdot 10\text{NH}_3$. This pp is treated with cold NH_4Aq , in which the Rh salt is insoluble,

and pure $\text{PdCl}_2 \cdot 2\text{NH}_4\text{Cl}$ is pptd by adding HClAq to the solution. The ppt is collected, washed with absolute alcohol, dried, and heated strongly: a grey spongy mass of Pd is obtained.

This process may be used for purifying commercial Pd.

For other methods of preparing Pd v Bunsen (A 146, 265), Philpp (D P J 220, 95), Guyard (O R 56, 1177), Rössler (Z 1866 175), Opifcius (D P J 224, 414).

Pd may be prepared from palladium containing gold by dissolving in *aqua regia*, pyg with HgCy_2Aq , and proceeding as described under 1 above. Or the ore may be fused with an equal weight of Ag and some KNO_3 , the regulus granulated, and treated with HNO_3Aq (Cook, P M [2] 23, 16), Ag pptd by addition of NaCl , and Pd pptd with other metals by Zn, the Pd may then be separated from this ppt as described under 2 above.

Properties—As prepared by heating $\text{PdCl}_2 \cdot 2\text{KCl}$ or PdCy_2 , or by pptn from solutions, Pd forms a grey metallic sponge which can be pressed together, more easily than Pt, to a compact mass. This compact form is also obtained by melting spongy Pd, Pd is a white metal, fairly malleable, ductile, and hard (somewhat softer than Pt). Compact Pd may be polished highly, it can be hammered into thin plates, and drawn into fine wire. In Brazilian gold ore Pd is found in regular octahedra, and in specimens of ore from the Harz it forms hexagonal plates. Joly (N 43, 541) obtained it in cubic octahedra by dusting Pd ribbon with powdered topaz and heating to bright redness for some time by an electric current. Heated in the O H flame to c. 2000° , Pd volatilises in greenish vapours, and condenses again to a brownish sublimate which is a mixture of metal and oxide. When the metal is melted in presence of O it absorbs O, which it gives up again on cooling (Deville a. Debray, A Ch [3] 56, 385). When strongly heated in air Pd is oxidised superficially, but the film of oxide is reduced at a higher temperature. Heated in an alcoholic flame, Pd black absorbs C and increases largely in volume. Pd absorbs H, it causes the combination of H and O when brought into electrolytic gas. Heated Pd foil brought into a mixture of NH_3 and O causes formation of NH_4NO_3 and NO_2 . Pd is more easily acted on by acids than any other of the Pt metals, it is dissolved by cold HNO_3Aq .

The at w has been determined by analysing $\text{PdCl}_2 \cdot 2\text{KCl}$ (Berzelius, P 13, 456), and by estimating Pd in PdNH_4Cl_2 by reducing in H (Keiser, Am 11, 398).

In its chemical relations Pd is closely allied to Ru and Rh, and less closely to Os, Ir, and Pt (v Noble metals, this vol p 628).

On account of its silver-like appearance, and its resistance to the action of H_2S , Pd is used for making scales and division-marks on scientific instruments, and also for coating and preserving silvered metallic ware. Pd wire is used in dentistry, an alloy with steel is used in making parts of physical instruments, and an alloy with steel, Cu, and small quantities of Au, Ni, Pt, Rh, and Ag is used in watch-making, as it is non-oxidisable, hard, and non-magnetic. Finely divided Pd is used in gas analysis for absorbing H from mixtures, and for effecting

the gradual combination of H or hydrocarbons with O (Hempel, B 23, 636, 1006).

Reactions and Combinations—1 When Pd is heated in air or oxygen Pd_2O is formed, but this oxide is reduced to Pd and O at a higher temperature.—2 Heated in hydrogen to c. 100° much H is absorbed, probably with formation of a hydride Pd_2H (v Hydrogen, vol 11 p 720).—3 Brought into a mixture of hydrogen and oxygen, in the ratio $2\text{H}_2\text{O}$, Pd black causes formation of H_2O without explosion (Coquillon, O R 83, 709).—4 Heated with sulphur Pd_2S is formed.—5 PdSe is formed by heating Pd with selenium.—6 Digested with bromine and water, PdBr_2 is produced.—7 With iodine tincture PdI_2 is produced.—8 Glowing Pd wire causes the decomposition of many hydrocarbons into C and H (Coquillon, C R 84, 1503, Wilm, B 14, 874).—9 In an alcoholic flame Pd becomes covered with C, spongy Pd increases largely in volume, probably with formation of a carbide (Wöhler, A. 184, 128).—10 Heated Pd foil brought into a mixture of ammonia and oxygen causes formation of NH_4NO_3 and NO_2 without explosion (Kraut, B 20, 1118).—11 Pd is oxidised to PdSO_4 by fusion with potassium-hydrogen sulphate.—12 Pd dissolves in acids more easily than any other of the Pt metals in nitric acid, even in the cold, it dissolves to $\text{Pd}(\text{NO}_3)_2$, in hydrochloric acid, especially when Cl is passed in, PdCl_2 is formed, in hydrotic acid, PdI_2 is produced, PdBr_2 is obtained by dissolving in hydrobromic acid, with a little HNO_3Aq , in sulphuric acid, with a little HNO_3Aq , PdSO_4 is produced, Pd dissolves in *aqua regia* to form PdCl_2 , PdCl_2 being perhaps produced at first.

Qualitative discrimination between palladium and platinum—If a drop of an alcoholic solution of I is dropped on to Pd, a black stain of PdI_2 is formed, and this stain disappears on heating, as Pt is not acted on by I tincture, this reaction serves to distinguish between the two metals.

Palladium, alloys of Alloys of Pd with several metals have been prepared. The alloy formed by heating equal weights of Pd and lead, and removing the excess of Pb, is a steel-grey powder, SG 11 255, agreeing in composition with the formula Pd_2Pb (Bauer, B 4, 451). Tin forms an alloy which seems to be a compound Pd_2Sn , (Deville a. Debray, A Ch [3] 56, 385). Alloys with Sb, As, Ba, Bi, Cu, Au, Hg, Ni, Pt, and Ag have been described (v Graham, C R 68, 1511, Mallet, C N 46, 216, Fischer, S 51, 197).

Palladium, ammonio-salts of, or Palladium-ammonium salts (*Palladamures* or *Ammoniacal palladium bases*) When HClAq is added to PdCl_2Aq containing an excess of NH_3 , the salt $\text{PdCl}_2 \cdot 2\text{NH}_3$ separates, by treatment with Ag_2O and H_2O , this salt gives the strongly alkaline base $\text{Pd}(\text{OH})_2 \cdot 2\text{NH}_3$, and by neutralising this base with acids various salts are obtained, e.g. $\text{PdSO}_4 \cdot 2\text{NH}_3$, $\text{PdCO}_3 \cdot 2\text{NH}_3$, &c. When a large excess of NH_3 is added to PdCl_2Aq and the solution is evaporated, or when a solution of $\text{PdCl}_2 \cdot 2\text{NH}_3$ in NH_4Aq is evaporated, the salt $\text{PdCl}_2 \cdot 4\text{NH}_3$ separates. Similarly, when PdSO_4 is dissolved in a large excess of NH_4Aq , the salt $\text{PdSO}_4 \cdot 4\text{NH}_3$ is obtained by evaporating this solution; decomposition of the sulphate with

BaOaq. and evaporation, gives the strongly alkaline base $\text{Pd}(\text{OH})_2 \cdot 4\text{NH}_3$, which yields salts by neutralisation with acids, e.g. $\text{PdCO}_3 \cdot 4\text{NH}_3$, $\text{PdSO}_4 \cdot 4\text{NH}_3$, &c. The compounds $\text{Pd}(\text{OH})_2 \cdot 2\text{NH}_3$ and $\text{Pd}(\text{OH})_2 \cdot 4\text{NH}_3$ represent the two series of palladium ammonio-salts. The reactions of these compounds and their derivatives lead to their representation as, in one case, compounds of the radicle PdN_2H_4 —derived from N_2H_4 by replacing 2H by Pd—and, in the other case, compounds of the radicle PdN_2H_3 —derived from PdN_2H_4 by replacing 2H by 2NH_3 . The two series of salts may be called *pallados diammonium compounds*, $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2$, &c., and *ammonium pallados diammonium compounds*, $\text{Pd}(\text{NH}_2\text{NH}_2\text{NH}_2\text{NH}_2)_2\text{Cl}_2$, &c. The members of the first series are also sometimes called *palladosamine compounds*, and those of the second series *pallado diamine compounds*. It is to be observed that both series are obtained from palladosochloride, PdCl_2 (cf. Iridium ammonio-salts, this vol p 47). The palladium ammonio salts have been examined chiefly by Kane (T 1842 275), Fehling (P 13, 466), Fischer (P 71, 431), and Hugo Müller (A 86, 341).

I PALLADOS DIAMMONIUM COMPOUNDS

$\text{N}_2\text{H}_4\text{PdX}'_2$, or $(\text{NH}_2\text{NH}_2)_2\text{PdX}'_2$, or perhaps $\text{NH}_2(\text{NH}_2)_2\text{PdX}'_2$

Pallados-diammonium chloride, $\text{N}_2\text{H}_4\text{PdCl}_2$ (simplest formula $\text{PdCl}_2 \cdot 2\text{NH}_3 = \text{di ammonio-palladium dichloride}$). This salt is known in two forms. 1 *Yellow crystals* are obtained by adding HClAq to PdCl_2 in excess of NH_3Aq , these crystals are scarcely sol water, sol with difficulty in cold acids, more sol hot acids, easily sol NH_3Aq , from which solution acids reppt the salt unchanged. The salt dissolves in KOH Aq , but no NH_3 is evolved even on heating, when the salt is suspended in water and Cl is passed in, solution is effected, addition of NH_3Aq now ppts the red form of the salt, and boiling with KOH Aq evolves NH_3 and leaves a liquid from which crystals of $\text{PdCl}_2 \cdot 2\text{NH}_3\text{Cl}$ separate. The continued passage of Cl produces $\text{PdCl}_2 \cdot 2\text{NH}_3\text{Cl}$, and finally PdCl_2Aq . 2 *A red salt* of the same composition is obtained by dissolving the yellow salt in conc HClAq and adding NH_3Aq , also by adding a slight excess of NH_3Aq to a rather dilute cold solution of PdCl_2Aq . The yellow salt is produced by dissolving the red variety in NH_3Aq and adding excess of HClAq , also by heating the red salt to 200° . Jørgensen (Gm K 3, 1242) regarded the red salt as polymeric with the yellow, and gave it the formula $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2 \cdot \text{Cl}_2\text{Pd}$. The salts may be isomeric, one being $\text{PdNH}_2\text{ClNH}_2\text{Cl}$ and the other $\text{PdNH}_2\text{Cl}_2\text{NH}_2$.

Pallados-diammonium hydroxide,

$\text{N}_2\text{H}_4\text{Pd}(\text{OH})_2$ (simplest formula $\text{Pd}(\text{OH})_2 \cdot 2\text{NH}_3 = \text{di ammonio palladium hydroxide}$). This base is obtained by decomposing the corresponding chloride with moist Ag_2O in presence of water, or the sulphate with BaO Aq , the solution thus obtained is yellowish, odourless, and has a strongly alkaline taste and reaction. The base is obtained as a curdy crystalline mass by evaporating at the ordinary temperature in absence of air. The solid rapidly absorbs CO_2 from the air, forming $\text{N}_2\text{H}_4\text{PdCO}_3$, it is decomposed by heating to somewhat above 100° . The base is sol. water, the solution decomposes NH_3 salts,

and ppts $\text{CuO} \cdot \text{H}_2\text{O}$ and Ag_2O from solutions of salts of Cu and Ag. The solution may be boiled with very slight change, on boiling with alcohol, Pd is pptd. The other salts of this series which have been described are as follows $\text{M} = \text{PdN}_2\text{H}_4$, —bromide MBr , carbonate MCO_3 , fluoride $\text{MF}_3(?)$, iodide MI , nitrate $\text{M}(\text{NO}_3)_3$, nitrite $\text{M}(\text{NO}_2)_3$, sulphate MSO_4 , and sulphite MSO_3 .

II AMMONIUM PALLADOS DIAMMONIUM COMPOUNDS $\text{N}_2\text{H}_4(\text{NH}_2)_2\text{PdX}'_2$, or perhaps $(\text{NH}_2\text{NH}_2)_2\text{PdX}'_2$

Ammonium pallados diammonium chloride $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2$, (or $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2 = \text{pallado diamine chloride}$, simplest formula $\text{PdCl}_2 \cdot 4\text{NH}_3 = \text{tetrammonio palladium dichloride}$). This salt is obtained in large, colourless, monoclinic prisms, with one molecule of water of crystallisation, by evaporating a solution of yellow $\text{N}_2\text{H}_4\text{PdCl}_2$ with excess of NH_3 , or a solution of PdCl_2 in considerable excess of NH_3Aq . Heating the salt to 120° , or adding acid to a solution of the salt, causes formation of yellow $\text{N}_2\text{H}_4\text{PdCl}_2$. Addition of PdCl_2 to a solution of the salt causes pptn of flesh red $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2 \cdot \text{PdCl}_2$ (Kane, Fehling). Treatment of $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2$ with NH_4Cl and *aqua regia* is said to produce $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{Cl}_2 \cdot \text{PdCl}_2$ (Croft, C N 16, 53).

Ammonium pallados diammonium hydroxide $\text{Pd}(\text{NH}_2\text{NH}_2)_2(\text{OH})_2$, (or $\text{Pd}(\text{NH}_2\text{NH}_2)_2(\text{OH})_2 = \text{pallado diamine hydroxide}$, simplest formula $\text{Pd}(\text{OH})_2 \cdot 4\text{NH}_3 = \text{tetrammonio palladium hydroxide}$). Obtained as a crystalline mass by decomposing a solution in water of the sulphate $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{SO}_4 \cdot \text{H}_2\text{O}$, produced by adding large excess of NH_3Aq to PdSO_4Aq and evaporating with BaO Aq , filtering and evaporating. The solution is odourless, it is strongly alkaline, and ppts hydroxides from solutions of salts of Al, Co, Cu, Fe, and Ni, but not from salts of Ag, it sets NH_3 free from NH_4ClAq . The solution absorbs CO_2 from the air, it is decomposed by boiling with organic matter. If this base is neutralised exactly by acids, salts of the base are obtained, e.g. $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{CO}_3$, $\text{Pd}(\text{NH}_2\text{NH}_2)_2\text{SO}_4$, &c., excess of acid, especially of a haloid acid, causes decomposition into a pallados ammonium salt and a salt of NH_3 , e.g. $\text{Pd}(\text{NH}_2\text{NH}_2)_2(\text{OH})_2 + 4\text{HClAq} = \text{PdN}_2\text{H}_4\text{Cl}_2 + 2\text{NH}_4\text{ClAq} + 2\text{H}_2\text{O}$. The other salts of this series which have been described are as follows $\text{M} = \text{Pd}(\text{NH}_2\text{NH}_2)_2$, —bromide MBr , and the double compound $\text{MBr} \cdot \text{PdBr}$, carbonate MCO_3 , fluoride $\text{MF}_3(?)$, iodide MI , nitrate $\text{M}(\text{NO}_3)_3$, double nitrate $\text{M}(\text{NO}_2)_3$, $\text{Pd}(\text{NO}_3)_3$, silicofluoride $\text{MSiF}_6(?)$, sulphate MSO_4 , sulphite MSO_3 .

The reactions of such substituted ammonias as NH_2Me , NH_2Et , and NH_2Ph on salts of Pd produce compounds analogous with the ammoniacal bases described above, e.g. *pallados diethylammonium chloride* $\text{N}_2\text{H}_5\text{Et}_2\text{PdCl}_2$, and *pallados diphenylammonium chloride* $\text{N}_2\text{H}_5\text{Ph}_2\text{PdCl}_2$, have been described (Müller, A 86, 341).

The substitution of *tri ethylarsine* and *tri-ethylphosphine* for ammonia, in the reactions with Pd salts, produces compounds similar to the N-containing bases, e.g. *pallados di-ethylphosphonium chloride* $\text{P}_2\text{Et}_2\text{PdCl}_2$.

(Cahours a Gal, *C R* 70, 897), and *pallados di-ethylarsonium chloride* $\text{As}_2\text{Et}_4\text{PdCl}_2$ (*C a G*, *C R* 71, 208)

Palladium, bromide of Only one bromide of Pd is known, and that has not been prepared free from impurities

PALLADIUM DIBROMIDE PdBr_2 (*Palladous* or *palladoso bromide*) The brownish solid obtained by dissolving Pd in a mixture of HBrAq and HNO_3Aq , or digesting finely divided Pd with BrAq , and evaporating, probably has the composition PdBr_2 , but it has not been obtained pure. **Double compounds of PdBr_2 with bromides of Ba, Mn, K, and Zn** have been prepared, but not fully examined, by von Bonsdorff (*P* 19, 347, 431), the K salt, K_2PdBr_4 , crystallises in thick rhombic forms (Joannis, *C R* 95, 295)

Palladium, chlorides of Two chlorides of Pd have been isolated, PdCl and PdCl_2 , a third, PdCl_3 , is known in combination. As none of these chlorides has been gasified, the formulæ are not necessarily molecular (*v* PALLADIUM, HALOID COMPOUNDS of, *post*) None of the chlorides has been formed by the direct union of Pd and Cl

PALLADIUM DICHLORIDE PdCl_2 (*Palladous* or *palladoso chloride*) By dissolving Pd in HClAq , Cl being passed into the liquid or a little HNO_3 being present, evaporating repeatedly with HClAq to remove HNO_3 , and finally concentrating, red brown prismatic needles of $\text{PdCl}_2 \cdot 2\text{H}_2\text{O}$ are obtained, at a moderate temperature H_2O is given off, and PdCl_2 remains as a black brown crystalline solid (Kane, *T* 1842 275, Bottger, *P* 106, 495) PdCl_2 is also obtained, partly as a sublimate and partly as a garnet red crystalline residue, by heating Pd_2S in a stream of Cl (Schneider, *P* 141, 519) PdCl_2 dissolves in water to form a dark red liquid, from which some oxychloride, $\text{Pd}_2\text{O}_2\text{Cl}_2$, separates on evaporation. In water containing HCl , PdCl_2 dissolves very readily. The solution is dark brown, and on treatment with bases it gives salts of the form M_2PdCl_4 —*chlorpalladites* (*v infra*), this solution may be supposed to contain *pallados chlorhydric acid* H_2PdCl_4

Double salts, chlorpalladites $\text{PdCl}_2 \cdot 2\text{MCl}$ or M_2PdCl_4 . These salts are obtained by the reaction of various oxides with PdCl_2 in dilute HClAq , or by adding various chlorides to conc PdCl_2Aq

Ammonium palladium dichloride or *Ammonium chlorpalladite* $\text{PdCl}_2 \cdot 2\text{NH}_4\text{Cl}$ or $(\text{NH}_4)_2\text{PdCl}_4$. Olive-green needles with a bronze coloured lustre, e sol water, insol conc alcohol. When strongly heated gives residue of finely divided Pd. Obtained by adding NH_4Cl to PdCl_2Aq containing HCl (Kane, *T* 1842 275, Wilm, *B* 18, 1202)

Potassium palladium dichloride, or *Potassium chlorpalladite* $\text{PdCl}_2 \cdot 2\text{KCl}$ or K_2PdCl_4 . Golden yellow needles formed by adding KClAq to conc PdCl_2Aq . The crystals are quadratic prisms (Joannis, *C R* 95, 295), they are fairly sol. in cold water, and much more sol. in hot water. Alcohol ppts the salt from a hot conc aqueous solution. An aqueous solution boiled with alcohol or SO_2 gives a pp of Pd, the dry salt is very slow, decomposed by heat to KCl and Pd, the decomposition is slow even in presence of oxalic acid (Rössler, *Z* 1866 175), but rapid in a stream

of H. The other chlorpalladites which have been described are $\text{PdCl}_2 \cdot \text{AlCl}_3 \cdot 10\text{H}_2\text{O}$ (Welkow, *B* 7, 803), BaPdCl_4 (von Bonsdorff, *P* 19, 347, 431), $\text{BePdCl}_4 \cdot 6\text{H}_2\text{O}$ (W, *lc*), CdPdCl_4 , CaPdCl_4 , MgPdCl_4 , MnPdCl_4 , NiPdCl_4 , ZnPdCl_4 , $\text{Co}_2\text{Cl}_2 \cdot 12\text{NH}_3$, 2PdCl_2 (Gibbs, *Am S* [2] 37, 58), $\text{Co}_2\text{Cl}_2 \cdot 10\text{NH}_3$, 2PdCl_2 (Carstanjen, *Gm K* 3, 1254), $\text{PdCl}_2 \cdot \text{Hg}_2\text{Cl}_2 \cdot 5\text{NH}_4\text{Cl}$ (Wilm, *B* 13, 1202)

PALLADIUM SUBCHLORIDE PdCl or Pd_2Cl_3 . Small quantities of this chloride are said to be formed, as a dark reddish brown crystalline solid, when PdCl_2 is heated to redness, the chloride deliquesces in air, and always contains PdCl_2 , and Pd (Kane, *T* 1842 275)

PALLADIUM TETRACHLORIDE PdCl_4 (*Palladi* or *pallados chloride*) This chloride probably exists in a solution of Pd in *aqua regia*, or of PdO_2 in conc HClAq , the compound has not been isolated. As this solution yields salts of the form M_2PdCl_6 when treated with various metallic chlorides, it perhaps contains *palladichlor hydric acid* H_2PdCl_6

Double salts, chlorpalladates $\text{PdCl}_2 \cdot 2\text{MCl}$ or M_2PdCl_4 . These salts are formed by adding metallic chlorides to a solution of Pd in *aqua regia*, or of PdO in conc HClAq , or to a solution of PdCl_2 in HClAq into which Cl has been passed, some of them are also produced by passing Cl into a solution of the corresponding chlorpalladite

Ammonium palladium tetrachloride or *Ammonium chlorpalladate* $\text{PdCl}_2 \cdot 2\text{NH}_4\text{Cl}$ or $(\text{NH}_4)_2\text{PdCl}_6$. A bright red pp obtained by adding NH_4Cl to conc PdCl_2Aq saturated with Cl or treated with conc HNO_3Aq *S G* 2 418 (Topsoë, *J* 1870 393). Reduced with difficulty, treated with NH_3Aq , N is evolved and $\text{PdCl}_2 \cdot 2\text{NH}_3$ is formed (H Müller, *A* 86, 341)

Potassium palladium tetrachloride or *Potassium chlorpalladate* $\text{PdCl}_2 \cdot 2\text{KCl}$ or K_2PdCl_6 . A cinnabar red powder, consisting of small regular octahedra, *S G* 2 738, obtained by mixing KClAq with PdCl_2Aq saturated with Cl, or with Pd in *aqua regia*, also formed by treating $\text{K}_2\text{PdCl}_4\text{Aq}$ with Cl (Topsoë, *J* 1870 393, Croft, *C N* 16, 53). When the aqueous solution is treated with NH_3Aq , N is evolved and K_2PdCl_6 is formed

The other chlorpalladates which have been described are $\text{BePdCl}_6 \cdot 8\text{H}_2\text{O}$ (Welkow, *B* 7, 38), $\text{MgPdCl}_6 \cdot 6\text{H}_2\text{O}$ (Topsoë, *J* 1870 393), $\text{NiPdCl}_6 \cdot 6\text{H}_2\text{O}$ (*T, lc*), $\text{ZnPdCl}_6 \cdot 6\text{H}_2\text{O}$ (*T, lc*)

Palladium, cyanides of, and **Double cyanides**, *v* vol II p 343

Palladium, fluoride of, PdF_2 . This compound is produced, according to Berzelius, by adding HFAq to conc $\text{Pd}(\text{NO}_3)_2\text{Aq}$, it is described as a brown pp scarcely sol. water or HFAq , and as forming double salts with alkali fluorides

Palladium, haloid compounds of The haloid compounds of Pd have not been at all fully investigated. The following table presents the compositions of those which have been isolated —

PdX	PdX_2	PdX_3
PdCl	PdF	PdCl_2
	PdBr	PdI
		in solution and combination

The compounds PdX_2 form double salts $\text{PdX}_2 \cdot 2\text{MX} = \text{M}_2\text{PdX}_4$, and PdCl_3 forms $\text{PdCl}_3 \cdot 2\text{MCl} = \text{M}_2\text{PdCl}_6$, the acids H_2PdCl_6 and

H_2PdCl_4 , probably exist in solution. The chloropalladates M_2PdCl_4 are not very easily reduced, the chloropalladites M_2PdCl_4 are readily oxidised to chloropalladates. None of the haloid compounds has been gasified, the formulae are the simplest that express the composition, but they are not necessarily molecular. $PdBr_2$ is formed by digesting together finely-powdered Pd and Br in presence of water. $PdCl_2$ and $PdCl$ are easily soluble in water, PdF_2 , $PdBr_2$, and PdI_2 are insoluble or but slightly soluble in water.

Palladium, hydride of Pd absorbs H very freely. A piece of Pd foil which has been strongly heated *in vacuo* absorbs 648 times its volume of H at 90° – 97° . When electrolytically *ppd.* Pd is used as the negative pole in the electrolysis of water, it absorbs 962 vols H. The physical properties of Pd charged with H make it very probable that a definite compound is formed, and that this compound has the composition Pd_2H (for details *v* HYDROGEN, vol. II. P 720).

Palladium, hydroxide of, *v.* Palladium, oxides and hydrated oxides of

Palladium, iodide of, PdI_2 . When $KIAq$ is added to $PdCl_2Aq$ or $Pd(NO_3)_2Aq$, an almost black *pp* of $PdI_2 \cdot H_2O$ is obtained, which loses H_2O *in vacuo* (Lassaigne, *J Chim méd* 11, 57). PdI_2 is scarcely sol water, alcohol, or ether, slightly sol $HIAq$, easily sol $KIAq$, from which solution dark-red deliquescent crystals of potassium iodopalladate, K_2PdI_4 , separate on concentration. As PdI_2 is scarcely sol water, the *ppn* of this salt may be used in the quantitative estimation of I in presence of Cl and Br. PdI_2 is decomposed to Pd and I at somewhat above 350° , the last traces of I are not removed by heat alone, but by heating in H (Berzelius).

Palladium, oxides and hydrated oxides of
Three oxides have been isolated, Pd_2O , PdO , and PdO_2 , another, Pd_2O_3 , intermediate between PdO and PdO_2 , seems to exist. PdO and PdO_2 seem to form hydrates, but the exact composition of these is not settled. These oxides all react with acids to form salts corresponding with PdO , Pd_2O at the same time forming Pd, and PdO_2 evolving O. It is, however, possible that some salts may be obtained corresponding with PdO_2 . All the oxides are reduced to Pd when strongly heated. The examination of the oxides of Pd is very incomplete.

PALLADIUM SUBOXIDE Pd_2O A black powder obtained by heating to low redness the *pp* formed by adding Na_2CO_3 to solution of a salt of PdO (Kane, *T* 1842 276), or by heating Pd black in a stream of air (Wilm, *B* 15, 2225). Decomposed to Pd and O by heating to full redness, reduced by H at ordinary temperatures, reacts with acids to form salts of PdO with excess of Pd.

PALLADIUM MONOXIDE PdO (Palladous oxide) A black powder, prepared by heating $Pd(NO_3)_2$ or by very gently heating a Pd salt with K_2CO_3 or Na_2CO_3 , and washing the residue with water. Reduced very easily by H (Wöhler, *A* 174, 160), gives Pd and O when heated to full redness. Soluble in acids with difficulty, forming salts PdX ($X = SO_3, 2NO_3, CO_3$, &c).

Hydrated palladium monoxide The dark-brown *pp* obtained by adding K_2CO_3 or Na_2CO_3 to solution of a salt of PdO was described

by Berzelius as $PdO \cdot H_2O$, but it may be a basic carbonate, heated to low redness this *pp* gives Pd_2O .

PALLADIUM DIOXIDE PdO_2 (Palladic oxide) A black powder, obtained by *ppg* $PdCl_2Aq$ or K_2PdCl_4Aq with excess of $KOHAc$, washing acid boiling with water, and drying at 100° , also by the action of ozone on compounds of Pd, and by the decomposition of water using Pd as the positive pole (Wöhler, *A* 146, 375, Maillet, *C R* 94, 860, 1186). At low red heat gives PdO and O, and at a higher temperature all O is given off. Treated with dilute $HClAq$, gives $PdCl_2Aq$ and Cl, with conc $HClAq$, probably forms $PdCl$. No corresponding salts have been isolated with certainty.

Hydrated palladium dioxide The *pp* obtained by adding excess of $KOHAc$ to $PdCl_2Aq$ or K_2PdCl_4Aq is probably $PdO_2 \cdot xH_2O$, but the exact composition of this *pp* is not known.

PALLADO PALLADIC OXIDE $Pd_2O_3 = 4PdO \cdot PdO_2$ According to Schneider (*P* 141, 519), an oxide of this composition is obtained by melting K_2PdS_2 or Na_2PdS_2 with KNO_3 and KOH , washing with water, and treating the residue with *aqua regia*. It is described as a dull brown powder, which gives off all its O when heated to redness in air, and is reduced by H at the ordinary temperature.

Palladium, salts of. Compounds obtained by replacing hydrogen of acids by Pd All the salts of Pd which have been isolated with certainty correspond with the oxide PdO , the salts of Pd are generally obtained by dissolving Pd in the various acids, with a little HNO_3Aq added, or in some cases by double decomposition from $PdCl_2Aq$ or $Pd(NO_3)_2Aq$. Only a very few salts have been examined, besides the salts of the haloid acids, the carbonate, nitrate, nitrite, sulphate, and sulphite have been isolated (*v* CARBONATES &c). $PdCl_2$, corresponding with PdO_2 , probably exists in solution, and several compounds of this salt—the chloropalladates—have been obtained (*v* Palladium tetrachloride, p 795).

Palladium, selenide of, $PdSe$ A grey in fusible solid, resembling osmium, with which it is perhaps isomorphous (Rössler, *A* 180, 244), formed by heating together Pd and Se (Berzelius).

Palladium, sulphides of Three sulphides are known, corresponding with the three oxides. The highest sulphide, PdS_2 , reacts with sulphides of more positive elements as a sulphanydride, forming *sulpho-palladates* M_2PdS_2 .

PALLADIUM SUBSULPHIDE Pd_2S A grey, hard solid, SG 7.803 at 15° . Prep red by fusing together, for 15–20 minutes over a blow-pipe, 100 parts yellow $N_2H_4PdCl_2$ (p 794), or 5 parts PdS , with 6 parts dry K_2CO_3 or Na_2CO_3 , 6 parts S, and 3 parts NH_4Cl , the fused mass is treated with water, and the lustrous blue-violet crystals of $K_2Pd_2S_3$, which are mixed with the Pd_2S , are removed by agitating with water. Pd_2S is very stable, it is not acted on by acids, scarcely by *aqua regia*, melts at a red heat without change, loses S slowly when very strongly heated (Schneider, *P* 141, 519).

PALLADIUM MONOSULPHIDE PdS (Palladous sulphide) Obtained by heating Pd, or certain

Pd salts, with S, also by ppg a salt of PdO by H₂S. Prepared in the dry way, PdS forms a blue white, lustrous, metal-like, very hard solid, prepared in the wet way, it is a black powder. Heated in air, slowly oxidises to a basic sulphate, heated in Cl forms PdCl₂ and S₂Cl₂ (Fellenberg, P 50, 66). A colloidal soluble form of PdS was obtained by Winkinger (Bl [2] 49, 462) by ppg from an extremely dilute solution and dialysing.

PALLADIUM DISULPHIDE PdS₂ (*Palladic sulphide*). A dark-brown powder, scarcely acted on by HNO₃Aq soluble *aqua regia* without separation of S (Schneider, P 141, 519), heated in a stream of CO, forms PdS and then Pd₂S. Obtained by decomposing solution of a sulphopalladate by dilute HClAq, and washing the pp *eg* Na₂PdS₂Aq + 2HClAq = 2NaClAq + PdS₂ + H₂S. This sulphide reacts as an acid anhydride with the sulphides of several of the more positive metals.

Sulphopalladates. These salts belong to two series, M₂PdS₂ and M₂Pd₂S₂ = M₂PdS, Pd₂S (Schneider, P 141, 519, 148, 625).

Sodium sulphopalladate Na₂PdS₂ (*Sodium-palladium sulphide*). This salt has not been obtained pure, as prepared by fusing 1 part N₂H₄PdCl₂ (p 794), or 5 part PdS, with 6 parts dry Na₂CO₃ and 6 parts S, to full redness, and washing the residue with water, it forms reddish-brown needles, which dissolve in water to form a brown liquid decomposed by HClAq with ppn of PdS₂.

Silver sulphopalladate Ag₂PdS₂. A black brown powder obtained by adding the Na salt to an alcoholic solution of AgNO₃.

The members of the other series of sulphopalladates, M₂Pd₂S₂, may be looked on as double compounds of M₂PdS₂ and Pd₂S, or as the salts of a hypothetical sulphopalladic acid H₂Pd₂S₂. These salts may perhaps be termed *meta sulphopalladates*.

Potassium meta-sulphopalladate, K₂Pd₂S₂, or K₂PdS₂Pd₂S. Formed by melting 2 parts N₂H₄PdCl₂ (p 794), or 1 part PdS, with 12 parts K₂CO₃ and 12 parts S, at a red heat, and washing the fused mass with water (Schneider, P 141, 519). Six sided, blue-violet, metal like crystals, insol water, treated with HClAq, K is removed but no H₂S is evolved, and the crystals become steel-grey, perhaps H₂Pd₂S₂ may be formed, but if so this soon decomposes, and a sulphide, said to be Pd₂S₂, remains (Schneider, P 141, 625). Another compound, which may perhaps be K₂PdS₂ (corresponding with the hypothetical acid Pd(SH)₂) is formed, along with Pd, by heating in H.

Silver meta-sulphopalladate Ag₂Pd₂S₂, or Ag₂PdS₂Pd₂S. A white-grey, lustrous, crystalline pp obtained by treating the K salt with an alcoholic solution of AgNO₃.

Palladium, sulphocyanides of, *vol ii*, p 350.

Palladium, thio. salts of, *cf. Sulphopalladates under Palladium, sulphides of, supra*.

M M P M.

PALM OIL. Extracted from the fruit of *Elais guineensis*. Soft orange mass containing palmitic and oleic acids and their glycerides (Pelouze a. Boudet, A 29, 42, Guibourt, J. Chem Med. 1, 177, Henry, J. Ph. 51, 241).

From palm kernels an oil is obtained containing the glycerides of oleic, stearic, palmitic, myristic, lauric, decolic, oleic, and hexoic acids (Oudemans, J pr [2] 2, 898).

PALMELLIN. A substance resembling hæmoglobin, which occurs in *Palmella cruenta*, a red fungus (Phipson, C R 89, 816, 1078, C N. 41, 216).

PALMITIC ACID C₁₆H₃₂O₂. Mol w 256. [80.75°] (Reissert, B 23, 2248) (271.5°; *v* at 100 mm) (Krafft, B 12, 1670, 16, 1721) (339°–356°) (Carnelley a. Williams, B 12, 1360) S G. (liquid) ²² 853 S (alcohol) 9.2 at 19.5° (C a. S) H C (solid) 2,371,788 (Longuine, A Ch [6] 11, 223). Occurs as glyceride in a very large number of animal and vegetable fats and fixed oils (Chevreul, *Recherches sur les corps gras*, Fremy, A 36, 44, Stenhouse, A 36, 50, Stahmer a. Meyer, A 43, 335, Schwarz, A 60, 69, Heintz, A 80, 299, 88, 298, 92, 291, von Böck, J pr. 49, 295, Berthelot, A Ch [3] 41, 216, 432, 47, 297, Maskelyne, C J 8, 1). Its myrcyl ether occurs in bees wax (Brodie, A 71, 150), and in human fat (Heintz), and its cetyl ether in spermaceti (L Smith, A 42, 241). Occasionally occurs in the free state, as in palm oil, and in *Lycopodium* spores (Langer, Ar Ph [3] 27, 625).

Formation—1 By saponification of palmitin, spermaceti, and melissin—2 By heating cetyl alcohol with potash lime (Dumas a. Stas, A Ch [2] 73, 113)—3 Together with acetic acid by fusing oleic or elaidic acid with potash (Varentz, A 36, 209)—4 By saponifying bird-lime with alcoholic potash (Divers a. Kawakita, C J 53, 271)—5 By saponifying the wax of *Myrica cerifera* (Chittenden a. Smith, Am 6, 217).

Preparation—1 Japanese wax (3 pts) is saponified with KOH (1 pt) and water (1 pt), the solution ppd by HClAq, and the acid rectified *in vacuo* (Krafft, B 21, 2265)—2 The fatty acids obtained by saponifying fats are dissolved in alcohol, and fractionally ppd with an alcoholic solution of lead acetate or a conc aqueous solution of barium or magnesium acetate (*cf. vol i* p 56).

Properties—Small hard crystals (from alcohol), insol water, *v* sol boiling alcohol and ether. Slightly decomposed on distillation. Chlorination, in presence of SbCl₃, yields CCl₄, C₂Cl₄, and C₃Cl₄ [224°] (Hartmann, B 24, 1018). Oxidation by alkaline KMnO₄ yields oxalic, succinic, adipic, acetic, butyric, hexoic, oxyvaleric, and dioxypalmitic acids (Gröger, M 8, 486). Oxidation by nitric acid (S G 136) yields succinic and glutamic acids (Carette, C R 102, 692). The Ba salt distilled with NaOMe yields pentadecane (Mai, B 22, 2133).

Salts—(NH₄)HA', —KA' pearly scales (from alcohol), insol ether. Dissolves in a small quantity of water, but a larger quantity ppt. KHA', which crystallises from alcohol in pearly scales [100°] (Schwarz)—NaA' laminae.—NaHA'. Got by adding hot water (1500 pts) to NaA'. Insol water, *v* sol hot alcohol.—BaA', S. (alcohol) 0035 at 20°. Pearly crystalline powder.—CaA', S (alcohol) 0103 at 20°.—MgA', [120°] (H)—PbA', [112°] Powder.—CuA', greenish blue powder.—AgA', amorphous, sl. sol water. Blackened by light.

Methyl ether MeA' [38°] (Berthelot)

Ethyl ether EtA' [24°] (Heintz)
Isoamyl ether $\text{C}_5\text{H}_{11}\text{A}'$ [9°] (Berthelot),
 [18-5°] (Duffy, *C J* 5, 814) Waxy

Octyl ether $\text{C}_8\text{H}_{17}\text{A}'$ [86°] Formed from the octyl alcohol of castor oil

Dodecyl ether $\text{C}_{12}\text{H}_{25}\text{A}'$ [41°] (K.).

Tetradecyl ether $\text{C}_{14}\text{H}_{29}\text{A}'$ [48°]

Hexadecyl ether $\text{C}_{16}\text{H}_{33}\text{A}'$ [54°] (Krafft, *B* 16, 3023) Probably identical with the *cetyl ether* $\text{C}_{16}\text{H}_{33}\text{A}'$ [49°], which is the chief component of spermaceti, from which it is prepared by crystallisation from boiling alcohol

Octadecyl ether $\text{C}_{18}\text{H}_{37}\text{A}'$ [59°]

Ceryl ether $\text{C}_{20}\text{H}_{41}\text{A}'$ [79°] The chief constituent of poppy wax (Hesse, *B* 3, 639)

Myrcyl ether $\text{C}_{20}\text{H}_{41}\text{A}'$ [72°] The constituent of bees wax that is insoluble in alcohol (Brodie, *A* 71, 159)

Glyceryl derivatives or Palmitins v vol ii p 621

Phenyl ether $\text{C}_6\text{H}_5\text{A}'$. [45°] (250° at 15 mm) (Krafft a Burger, *B* 17, 1379)

p-Tolyl ether $\text{C}_6\text{H}_4\text{A}'$ [47°] (258° at 15 mm)

Chloride $\text{C}_{16}\text{H}_{33}\text{OCl}$ [c 12°] (192.5° at 15 mm) (Krafft a Burger)

Amide $\text{C}_{16}\text{H}_{33}\text{CONH}_2$ [107°] Formed by the action of NH_3 on the chloride or ether, and also by heating tetradecyl malonic amide (Carlet, *Bl* 1859, 175, Krafft a Stauffer, *B* 15, 1730, Hell a Jordanoff, *B* 24, 990)

Anilide $\text{C}_{16}\text{H}_{33}\text{CONHPh}$ [90.5°] (283° at 17 mm) Made by boiling palmitic acid with excess of aniline (Hell a Jordanoff, *B* 24, 943) Silky needles (from alcohol), v e sol ether

Anhydride $(\text{C}_{16}\text{H}_{31}\text{O})_2\text{O}$ [64°] (Villier, *B* 9, 1932)

Nitride $\text{C}_{16}\text{H}_{31}\text{ON}$ [31°] (252° at 100 mm) $\text{SG } \frac{1}{2}$ 8186, $\frac{1}{2}$ 778 Formed by distilling the amide with P_2O_5 (K a S), and also by heating cyano palmitic acid (H a J) Six-sided tables Reduced by alcohol and sodium to hexadecylamine (Krafft, *B* 22, 811)

57, 986). Silvery plates, v sol alcohol and benzene Does not unite with NaHSO_3 (Lumprecht, *A* 94, 246) Bromine forms $\text{C}_{16}\text{H}_{32}\text{Br}_2\text{O}$ [55°] (Herez, *A* 186, 269)

Oxim $(\text{C}_{16}\text{H}_{31})_2\text{CNOH}$ [59°] Needles

PALMITOXYLIC ACID $\text{C}_{16}\text{H}_{32}\text{O}_3$ [67°]

Formed, together with suberic acid and suberic aldehyde by the action of fuming HNO_3 on palmitic acid (Schröder, *A* 143, 35) Laminæ (from alcohol), insol water, v sol ether — AgA' white pp, turned violet by light

PANAQUILONE $\text{C}_{16}\text{H}_{32}\text{O}_3$ Occurs in the root of *Panax quinquefolius* (Garrigues, *A* 90, 231) Amorphous powder, v sol water, and alcohol, insol ether Has a bitter sweet taste

Its solution is ppd by tannin H_2SO_4 forms a purple solution from which water ppts panacone $\text{C}_{16}\text{H}_{32}\text{O}_3$ (?) a crystalline powder HClAq also forms CO_2 and panacone on heating

PANICOLE $\text{C}_{16}\text{H}_{32}\text{O} + \text{C}_2\text{H}_5\text{OMe}$ [285°]

A crystalline substance in oil of millet (Kassner, *Ar Ph* [2] 25, 395, 26, 536) HClAq at 160° forms MeCl and $\text{C}_{12}\text{H}_{24}\text{O}$ [78°]

PAPAIN v PROTEIDS

PAPAVERINE $\text{C}_{20}\text{H}_{21}\text{NO}_4$ *fa.*

C(OMe)CHCCHCHN
 C(OMe)CHCCHCHN

$\text{C(OMe)CHCCHCHNCH}_2\text{C}_6\text{H}_4\text{(OMe)}$ [13.4] (Goldschmidt, *M* 9, 330, 349) [147°] S (ether) 4 at 10° Occurs in opium (Merck, *A* 66, 125, 73, 50, Anderson, *T E* 21, Pt 1, Hesse, *A* 153, 75, Suppl 8, 261, Z [2] 7, 641)

Preparation — 1 The aqueous extract of opium is ppd with Na_2CO_3 , the pp dissolved in ether and shaken with dilute HOAc The acetic acid solution is ppd by NaOH The pp digested with oxalic acid solution yields crystalline papaverine oxalate It is better, however, to dissolve the pp in acetic acid, remove thebaine by tartaric acid, ppt the mother liquor with ammonia, wash the pp with alcohol, and then treat with oxalic acid The oxalate is recrystallised from hot water, ppd by CaCl_2 , the filtrate ppd by NH_3 and the papaverine recrystallised from alcohol (Hesse) — 2 A solution of the hydrochlorides of the opium bases is ppd with conc NaOAc The pp, consisting of narcotine and papaverine, is dissolved in HClAq and diluted till it contains only 25 pc of narcotine K_2FeCy_6 is then added and, after 24 hours, the pp of papaverine ferrioyanide is collected and decomposed by NaOHAq (Plugge, *Ar Ph* [3] 25, 343)

Properties — Trimetric prisms (from ether alcohol), $a b c = 32.1 : 42$ Narcotic Nearly insol hot water, v sol hot alcohol and chloroform, m sol hot benzene Cannot be sublimed Inactive to light (Goldschmidt, *M* 9, 42) Conc H_2SO_4 forms a colourless solution, becoming dark violet on warming On adding dilute H_2SO_4 , HCl , or HNO_3 to a solution of papaverine in acetic acid, the sulphate, hydrochloride, or nitrate is ppd A solution of papaverine in conc H_2SO_4 gives a pp of sulphate on adding water Papaverine is a weak base, its solutions do not affect litmus With ammonium selenite dissolved in conc H_2SO_4 it gives a bluish colour changing to red (Ferreira da Silva, *Bl* [3] 6, 87, *C R* 112, 126)

Reactions — 1. **Potash-fusion** yields methylamine, $\text{C}_6\text{H}_5\text{Me(OMe)}$ [13.4], and protocatechuic acid (Goldschmidt, *M* 4, 704, 6, 969) — 2 Yields

MeCl on heating with HClAq—3 Aqueous KMnO₄ oxidises it to papaveric, veratric, m-hempic, pyridine (a) tri carboxylic, dimethoxy-sinchoic, dimethoxy phthalic, and oxalic acids, hemipic iso imide NH₂, papaveraldine and CO₂. Papaveric acid (*v infra*) is the main product (Goldschmidt, *M* 6, 372, 8, 510)

Salts—B'HCl [220°] S 27 at 18° Large monoclinic crystals, $abc = 83.1 \times 58$, $\beta = 92^\circ 20'$ (Foullon, *M* 6, 675)—B'₂H₂PtCl₂ 2aq [198°]—B'₂H₂ZnCl₂ white dimetric crystals, $ac = 1.84$ —B'₂H₂Cl₂ZnI₂ plates (from alcohol)—B'₂H₂CdCl₂ [176°]—B'₂H₂Cl₂CdBr₂ [185°] (Jahoda, *M* 7, 506)—B'₂H₂Cl₂CdI₂ [180°]—B'₂H₂HgCl₂ triclinic prisms—B'HBz [214°] Monoclinic crystals, $abc = 83.1 \times 58$, $\beta = 92^\circ 60'$ —B'HI [200°] Monoclinic, sometimes isomorphous with the hydrochloride, but when crystallised from alcohol $abc = 18.1 \times 12.2$, $\beta = 91^\circ$ —B'HI, Purple monoclinic prisms—B'HI, thin reddish needles—B'₂H₂HgI₂—B'HNO₃ monoclinic tables, $abc = 82.1 \times 55$, $\beta = 94^\circ 9'$ —B'H₂SO₄ monoclinic prisms, $a, b, c = 83.1 \times 1.38$, $\beta = 92^\circ 29'$ —B'H₂Cr₂O₇ Flat orange needles—B'H₂C₂O₄ S 26 at 10° Prisms—B'C₂H₃N₃O₇ [179°] Golden tables (from alcohol)—Succinate B'₂C₂H₂O₄ [171°]—Benzoate B'C₂H₂O₄ [145°]—Salicylate B'C₂H₂O₄ [130°]—Meconate B'C₂H₂O₄ aq prisms, al sol alcohol—Ferrocyanide B'₂H₂FeC₆ (Plügge, *Ar Ph* [3] 25, 793)

Methylo-iodide B'MeI 4aq Melts at 195° when anhydrous 55°-60° when hydrated Insol ether, sol water and alcohol Moist Ag₂O forms a caustic hydroxide, capable of giving a carbonate (Claus, *J pr* [2] 38, 496, Goldschmidt, *M* 10, 673) The following compounds have been prepared from the methylo iodide (Stransky, *M* 9, 751) B'MeOH 2aq Melting at 215° when anhydrous, B'MeCl [75°], B'MePtCl₂ 3aq, B'MeCr₂O₇ [85°], and the picrate B'MeC₂H₂N₃O₇ [205°]

Ethyl bromide B'EtBr 4aq [140°-145°] (Goldschmidt, *M* 6, 667) or B'EtBr 4aq [111°] (Claus a Huethlin, *B* 18, 1576) Trimetric needles, $abc = 70.1 \times 64$ Boiling KOHAq forms the alkaline oxide (B'Et)₂O, al sol cold water

Ethyl-chloride B'EtCl 4aq prisms [80°] Gives B'Et₂PtCl₂ 3aq [223°]

Ethyl-iodide B'EtI [216°]

Ethyl-nitrate B'EtNO₃ 3aq Prisms

Ethyl chromate B'Et₂Cr₂O₇ [78°]

Ethyl picrate B'EtC₂H₂N₃O₇ [175°]

Benzyl chloride B'CH₂Cl 7aq [165°] KMnO₄ oxidises it to veratric acid, benzyl-papaveraldine, papaveraldine, and hemipic iso benzyl imide Aqueous (20 p c) KOH forms (B'C₂H₂)₂O [165°]—B'₂(C₂H₂)₂PtCl₂ crystalline pp—B'C₂H₂Cr₂O₇ [185°]—B'₂(C₂H₂)₂Cr₂O₇ [85°]

o-Nitro-benzyl-chloride

B'C₂H₂(NO₂)Cl Crystallises with 4aq, 6aq, and 9aq (Seutter, *M* 9, 859)—(B'C₂H₂(NO₂)Cl)₂PtCl₂ crystalline pp—B'C₂H₂(NO₂)NO₃ 1½aq prisms.—(B'C₂H₂(NO₂)₂)Cr₂O₇ yellow prisms—B'C₂H₂(NO₂)₂H₂N₃O₇ yellow prisms (from alcohol)

Phenacylo-bromide B'CH₂BzBr 2½aq Efflorescent pyramids (Seutter, *M* 9, 1035) Forms the derivatives: B'CH₂BzCl 6aq yellow

needles—(B'CH₂Bz)₂PtCl₂—B'CH₂BzNO₂ 2aq—(B'CH₂Bz)₂Cr₂O₇ and B'CH₂BzC₂H₂N₃O₇ [182°] An aqueous solution of the phenacylo-bromide gives with dilute NaOHAq a pp. B'CH₂BzOH, whence boiling alcohol produces (B'CH₂Bz)₂O [186°], crystallising in colourless needles

Tetrahydride C₂₀H₂₂NO₄ [201°] Made by reducing papaverine with tin and HCl (Goldschmidt, *M* 7, 497) Small prisms (from dilute alcohol), m sol hot water, al sol ether—B'HCl 3aq [290°] Monoclinic needles, with very bitter taste, causes albuminuria when injected internally—Salts B'₂H₂PtCl₂ 3aq—B'H₂SO₄ 7aq—B'H₂C₂O₄ 6aq—B'₂H₂Cr₂O₇—B'C₂H₂N₃O₇ [270°] Yellow needles, v al sol alcohol

Bromo-papaverine C₂₀H₂₂BrNO₄ [145°] Got by adding bromine-water to a solution of papaverine hydrochloride Monoclinic crystals, insol water, v al alcohol and ether—B'HBz

Nitro papaverine C₂₀H₂₂N₃O₇ aq [163°] S (ether) 03 at 12° Made by boiling papaverine with dilute nitric acid (S G 1 06) (Hesse, *A. Suppl* 8, 292) Pale yellow prisms (from dilute alcohol) Violently decomposes when quickly heated—Salts B'HCl 1½aq S 35 at 16°—B'₂H₂PtCl₂—B'HI v al sol hot water—B'HNO₃ aq—B'H₂SO₄ 8aq—B'H₂C₂O₄ 2aq yellow prisms, v al sol water

Papaveraldine C₂₀H₂₂NO₄ s.e. [43 1] C₂H₂(OMe)₂CO C₂H₂(OMe)₂N [210°] Made by oxidation of papaverine with KMnO₄ and dilute H₂SO₄ (Goldschmidt, *M* 6, 954, 7, 486) Yellowish crystalline powder (from alcohol), insol water and alkalis, v sol hot HOAc H₂SO₄ gives a red colour, changing to dark violet on warming Potash fusion splits it up into veratric acid and dimethoxyisouquinoline Tin and HCl reduce it to papaverine tetrahydride—B'HNO₃ 2aq lemon yellow needles—B'HCl 2aq yellow crystals, decomposed by water—B'₂H₂PtCl₂ aq orange prisms—B'H₂SO₄—B'C₂H₂N₃O₇ [209°]

Methylo-iodide B'MeI 3aq [135°]

Ethyl-bromide B'EtBr 3aq [above 270°]

Benzyl-hydroxide B'C₂H₂OH or its anhydride (B'C₂H₂)₂O is a product of the oxidation of papaverine benzyl chloride by dilute (2 p c) KMnO₄ at 45° (Goldschmidt, *M* 9, 327) It crystallises from boiling water or alcohol in slender colourless needles [154°], converted by boiling HClAq into papaveraldine.

Ozim C₂₀H₂₂NO₄(NOH) [245°]. White needles, sol hot benzene

Phenyl-hydrazide C₂₀H₂₂NO₄(N₂HPH) [81°] Reddish yellow nodules (from alcohol)

Papaveroline C₂₀H₂₂NO₄ s.e. [43 1] C₂H₂(OH)₂CH₂C₂H₂(OH)₂N Formed by boiling papaverine (3 pts) with HIAq (25 pts of S G 1 96) and red P for 10 hours (G, Krauss, *M* 11, 851) White crystalline powder (containing 2 aq), insol water, m sol alcohol, al sol ether, v sol acids. Yields (a)-methyl-isouquinoline on distillation with zinc-dust—Salts B'HCl white needles—B'H₂SO₄ 8½aq—B'HI 2aq—B'₂H₂C₂O₄ 3aq needles, m sol hot water

Papaveric acid C₂₀H₂₂NO₄ s.e. C₂H₂(OMe)₂CO C₂H₂N(CO₂H)₂ [233°] Formed by oxidising papaverine with KMnO₄ (Goldschmidt, *M* 6, 890, 10, 158, 691). Minute

right-angled tables (containing aq), al sol water, alcohol, and ether, m, sol dilute alcohol. Its solutions are acid in reaction. Decomposes on fusion into CO_2 and pyropapaveric acid $\text{C}_{17}\text{H}_{11}\text{NO}_4$ [280°]. Potash-fusion forms protocatechuic acid.

Salts— KHA' 2½ aq white leaflets, v e sol. water— KHA' 2 aq needles— CaA'' 1½ aq— BaA'' — $\text{Cu}_2\text{A}''$ (OH) 6 aq— $\text{Ag}_2\text{A}''$ 2½ aq— $\text{AgH}_2\text{A}''$ aq— $\text{H}_2\text{A}'$ HCl 2½ aq yellow needles.

Anhydride. [170°]. Got by boiling papaveric acid with Ac_2O (Goldschmidt, M 10, 159).

Mono-ethyl ether EtHA'' [188°]. Got by boiling the anhydride with alcohol. Converted by NH_4Aq into the amic acid.

Oxym $\text{C}_{17}\text{H}_{11}\text{NO}_4(\text{NOH})$ [e 156°]. Small needles (from alcohol) (Goldschmidt, M 10, 692).

Phenyl-hydrazide $\text{C}_{17}\text{H}_{11}\text{NO}_4(\text{N}_2\text{HPh})$ [190°]. Yellow needles (from dilute alcohol).

Nitro-papaveric acid $\text{C}_{17}\text{H}_{11}(\text{NO}_2)\text{NO}$ [215°]. Formed by dissolving papaveric acid in conc HNO_3 . Golden needles (containing aq)— $\text{Ag}_2\text{A}''$.

Pyropapaveric acid $\text{C}_{17}\text{H}_{11}\text{NO}_4$ [230°]. Formed by fusing papaveric acid. Minute white leaflets— CaA'' 4 aq groups of needles— BaA'' 4 aq— HA' HCl aq orange red needles— AgA' crystalline pp.

Oxym $\text{C}_{17}\text{H}_{11}\text{N}_2\text{O}_5$ [226°]. Needles (from alcohol)— B' HCl aq yellow needles.

Phenyl-hydrazide $\text{C}_{17}\text{H}_{11}\text{NO}_4(\text{N}_2\text{HPh})$ [228°]. Yellow prisms— B' HCl.

PAPAVEROSINE An alkaloid in dried poppy heads of *Papaver somniferum* (Deschamps, A Ch [4] 1, 453). Nacreous needles (from alcohol). Coloured red by H_2SO_4 .

PAPAYOTIN An amorphous hygroscopic powder ppd by adding alcohol to an aqueous extract of the juice of *Carica papaya* (Peckholt, Ph [3] 10, 343). It has an astringent, slightly sweet taste.

PARABANIC ACID $\text{C}_6\text{H}_7\text{N}_2\text{O}_4$ + e

$\text{CO} < \text{NH CO}$ Oxalyl urea Mol w 114 S
 $\text{CO} < \text{NH CO}$ 47 at 8° H C 212,700 H F 2,200 (Matignon, C R 113, 198).

Formation—1 By dissolving uric acid (1 pt) in nitric acid (7 pts of S.G. 1.3) at 70° and evaporating to a syrup, when parabanic acid crystallises out on cooling (Liebig & Wöhler, A 26, 285, Menshutkin, A 172, 74)—2 By oxidation of alloxan—3 A product of the action of HOCl on guanine (Strecker, A 118, 156)—4 From uric acid by heating with MnO_2 and dilute H_2SO_4 (Wheeler, Bl [2] 7, 521) or with KNO_3 and H_2SO_4 (Gibbs, B 1, 341)—5 A product of the action of HCl and KClO_4 on uric acid (Laurent & Gerhardt, A Ch [3] 24, 175)—6 By the action of POCl_3 on oxaluric acid $\text{NH}_2\text{CO NH CO CO}_2\text{H}$ at 200° (Grimaux, C R 77, 1548)—7 By the action of PCl_5 on a mixture of oxalic acid and urea (Ponomareff, Bl [2] 18, 97)—8 By heating nitro-pyruvic ureide with bromine and water (Grimaux, C R 79, 1478)—9 By the action of Br and water on uric acid (Hardy, Bl [2] 1, 445, Magner, Bl [2] 22, 56).

Properties.—Monoclinic laminae (from water or alcohol); $a b c = 1.665, 478, \beta = 81^\circ 89'$. Decomposed above 200°, forming a white sublimate. Completely oxidised by KMnO_4 and H_2SO_4 to CO_2 and NH_3 . Not attacked by HNO_3 in the cold. Its solution is not ppd by Ca salts,

but on boiling with alkalis it is split up into oxalic acid and ammonia. In the same way lead salts and a little NH_3 gave a pp of lead oxalate (Maly, M 2, 264).

Reactions—1 In aqueous solution the salts rapidly change to oxalates—2 Zinc and HCl reduce it to oxalantin—3 Alcoholic NH_3 at 100° forms oxaluramide—4 Alcoholic EtI at 100° forms $\text{C}_6\text{H}_7\text{NO}_4\text{I}$, crystallising from alcohol in green prisms, nearly insol cold water (Hasiwetz, A 103, 200)—5 Urea (1 pt) at 180° forms $\text{C}_6\text{H}_7\text{N}_3\text{O}_4$, a sparingly-soluble powder (Grimaux, Bl [2] 32, 120).

Salts— $\text{NH}_4\text{A}'$ Crystalline powder, got by adding alcoholic ammonia to a solution of parabanic acid in absolute alcohol. Gives off its NH_3 at 100°. Warm water converts it into ammonium oxalurate— NaA' — KA' Got by using alcoholic KOEt— AgA' Crystalline pp, got by adding AgNO_3 to a solution of KA' — $\text{Ag}_2\text{O}_2\text{N}_2\text{O}_4$ aq Got by ppg a solution of parabanic acid with AgNO_3 . Insol water, sol HNO_3 —Urea salt $\text{CON}_2\text{H}_4\text{HA}'$ Four sided tables, al sol cold water—Phenyl-hydrazine salt $(\text{N}_2\text{H}_5\text{Ph})_2\text{A}'$ aq [170°]. Insol alcohol and ether. Boiling water converts it into $\text{NH}_2\text{CO NH CO CO N}_2\text{H}_5\text{Ph}$ [215°] (Skinner & Ruhemann, O J 53, 550)—Aniline salt [250°] (S A R).

Hydrate $\text{C}_6\text{H}_7\text{N}_2\text{O}_4$ aq S 135 at 8° Formed from uric acid (1 pt) and nitric acid (3 pts of S.G. 1.3) at 60°. The mixture is kept at 35°–55°, and finally heated to 70°, when the hydrate separates in large crystals (Tollens & Wagner, A 166, 321, 175, 227). Formed also by the action of POCl_3 on a mixture of urea and oxalic acid, heat not being applied (P). At 150°–160° it loses water and changes to ordinary parabanic acid.

Methyl parabanic acid $\text{CO} < \text{NMe CO}$
 NH CO

Methyl-oxalyl urea Oxalyl-methyl urea [149°]

Formation—1 By heating nitroso creatinin with HCl at 100° (Dessaignes, A 97, 342, Marcker, A 133, 315)—2 From methyl uric acid and HNO_3 (Hill, B 9, 1093, 13, 739)—3 By the action of AgNO_3 on methyl thioparabanic acid (oxalyl methyl thio urea) (Andreasch, B 14, 1449, M 2, 279)—4 By oxidation of theobromine or caffeine with chromic acid mixture (E Fischer, A 215, 297, Maly & Hinteregger, B 14, 727, M 2, 94).

Properties—Colourless trimetric prisms, sol hot water. Acid in reaction. Not volatile with steam. Decomposed by alkalis, even in the cold, into methyl-urea and oxalic acid.

Salt— AgA' Needles, sol hot water.

Di methyl parabanic acid $\text{CO} < \text{NMe CO}$
 NMe CO

Cholestrophane [146°]. (276°) S 187 at 20°

Formation—1 The final product of the action of chlorine on caffeine in water (Rochleder, A 73, 123)—2 By boiling caffeine with nitric acid (Stenhouse, A 45, 371, 46, 229)—3 By heating dry silver parabanate with MeI at 100° (Strecker, A 118, 174)—4 By oxidation of caffeine with chromic acid mixture (Maly & Hinteregger, B 14, 723)—5 By the action of AgNO_3 on $\text{CS} < \text{NMe CO}$ (Andreasch, M 2, 288).

6. By the action of dilute HClAq on murexolin

(Brunn, *B*, 21, 515) —7. By passing ozonised oxygen through water in which caffeine is suspended (Leipen, *M* 10, 184)

Properties —Trimetric prisms (from alcohol). May be sublimed. Completely decomposed by alkalis. Gives no pp with lead acetate until ammonia is added, when lead oxalate is ppt. Pure HNO_3 has no action (Franchumont, *R. T. C.* 6, 217)

Reactions —1 Alcoholic NH_3 forms dimethyl oxaluramide [225°] on heating —2 HClAq at 200° splits it up into oxalic acid, CO_2 , and methylamine (Calm, *B* 12, 624) —3 Cold alcoholic soda decomposes it into oxalic acid and di-methyl urea ($\text{M} + \text{H}_2$) —4 Zinc and dilute H_2SO_4 reduce it to di-methyl-glyoxyl urea $\text{CO} < \text{NMe} \cdot \text{CH} \cdot \text{OH}$, a crystalline body, melting below 100° decomposed by heating with baryta into glycolic acid, oxalic acid, methylamine, and CO_2 (Andreasch, *M* 3, 436) —5 On warming with water containing BaCO_3 it yields di-methyl-oxamide (Maly a Hinteregger, *M* 2, 88, 132)

Phenyl-parabanic acid $\text{CO} < \text{NH} \cdot \text{CO} < \text{NPh} \cdot \text{CO}$ [208°]

Made from phenyl-urea and $\text{ClCO} \cdot \text{CO}_2\text{Et}$ (Stojentun, *J. pr.* [2] 82, 11) Silky plates, v sol alcohol, ether, and hot water

Di phenyl-parabanic acid $\text{CO} < \text{NPh} \cdot \text{CO} < \text{NPh} \cdot \text{CO}$

[204°] Formed by boiling an alcoholic solution of diphenyl guanidine dicyanide (dicyanomel-aniline) $\text{C}_{12}\text{H}_{11}\text{N}_3$, or (a) tri phenyl-guanidine dicyanide with HClAq (Hofmann, *Pr* 11, 275, *B* 3, 764) Formed also by warming thiocarb-anilido thio oxanilide with alcoholic AgNO_3 , and by the action of $\text{ClCO} \cdot \text{CO}_2\text{Et}$ on di phenyl urea (Stojentun) Needles, insol water, v sol alcohol and ether. Decomposed by boiling KOH aq into oxalic acid, aniline, and CO_2 . Yields with fuming HNO_3 a di nitro di phenyl parabanic acid crystallising in needles

PARACONIC ACID v *Lactone of Oxytyro-BARTARIC ACID*

PARAFFIN Solid, wax like, fatty mixture of hydrocarbons of the $\text{C}_n\text{H}_{2n+2}$ series, very rich in carbon and characterised by a very marked indifference to most reagents

Analysis —

	1	2	3	4	5

1 Anderson, *J* 1857, 480, 2, 3 Brodie, *P. M.* [3] 83, 178, 4 Pawlewski, *B* 23, 327, 5 Gill a Meusel, *C. S. J.* 6, 466 Beilstein states (*Bn* 1, 189) that commercial paraffin usually contains 1 p.c oxygen, which can be removed by heating with Na in a tube Lippmann a Hawliczek (*B* 12, 69), from a sample of brown coal paraffin v sol alcohol [37°] by heating with PCl_5 , formed $\text{C}_{25}\text{H}_{52}\text{O}_4$, hence give formula $\text{C}_{25}\text{H}_{52}$. Bolley (*A* 106, 230), by heating hot paraffin with Cl_2 formed $\text{C}_{25}\text{H}_{52}\text{O}_4$ — $\text{C}_{25}\text{H}_{52}\text{Cl}_{11}$, hence gives formula $\text{C}_{25}\text{H}_{52}$. Gill a Meusel (*Z* 1869, 65) have formed from paraffin by oxidation with CrO_3 , cerotic acid $\text{C}_{25}\text{H}_{52}\text{O}_4$, hence formula $\text{C}_{25}\text{H}_{52}$. Pawlewski, by Reoult's method, using glacial acetic acid, finds $\text{C}_{25}\text{H}_{52}$ — $\text{C}_{25}\text{H}_{52}$, by dilute benzene: and *p*-xylene $\text{C}_{10}\text{H}_{12}$ — $\text{C}_{10}\text{H}_{12}$, and with saturated solutions in benzene and *p*-xylene

Vol. III.

($\text{C}_{25}\text{H}_{52}$)₂ — ($\text{C}_{25}\text{H}_{52}$)₃. It behaves as a colloid in most other solvents

Melting-point [45°–85°] By the action of solvents, small quantities of fractions [38°–45°] have also been obtained (Albrecht, *D. P. J.* 218, 280) Ozokerite paraffin [64°]

Boiling-point Above 300° In crude petroleum the portion (300°–400°) solidifies on cooling. On fractionating, Bolley and Tuschschmid found that the portion [53°] (300°) gave the following fractions (150°) [43°], (200°) [44.5°] and residue [53.5°]

Specific gravity varies from 0.872–0.912 at 17° (Albrecht) Ozokerite paraffin [64°] S.G. 22 0.917 [38°] S.G. 24 0.874 (Beilby, *C. J.* 43, 388) Paraffins expand considerably on melting

Occurrence —Occurs native as fossil wax, hatchettine, and ozokerite. The latter is the most abundant, and is found in Galicia, Roumania, on the island of Tschelen on the east coast of the Caspian Sea, and on the island of Swjatoi at Baku. When bleached it is called ceresine. According to Zawiecki, ozokerite contains a crystalline and amorphous paraffin. It is also found in Etna lava to the extent of 43 p.c in certain geodes (Silvestri, *G* 12, 9) It is obtained by the distillation of brown coal, turf, boghead coal, shales, schists, and natural bitumens, wood, wax, and wax and lime. It can also be obtained from brown coal tar. Details of various methods are given by von Boyen, *Z. f. Angew. Chem.* 1891, 261. Paraffin is also obtained in large quantities from American petroleum, being present in the high boiling portions which form a residue after the lighting oils have been distilled off. Other mineral oils contain appreciable quantities of solid paraffin, e.g. Rangoon oil of Burma, 6 p.c. For the preparation of commercial paraffin from these bodies v Thorpe's DICTIONARY OF APPLIED CHEMISTRY, and for a theory for its formation in nature by the decomposition of animal matter, vide Zawiecki, *D. P. J.* 280, 69, 85, and 133

Properties —Paraffin, when pure, is a solid, colourless, translucent substance, perfectly in odorous and tasteless, somewhat resembling spermaceti. It readily melts, forming a colourless oil, burns from a wick with a bright flame, but does not burn easily in the mass. It is insol water, sol hot alcohol, v sol ether and oils. The solubility of paraffin from ozokerite has been studied by Pawlewski a Fillmonowicz (*B* 21, 2973), who show that the liquid constituents are mostly sol glacial acetic acid, whereas vaseline, ceresine, ozokerite and paraffin are almost insoluble. Pawlewski (*B* 23, 327) also states that ozokerite paraffin is sol formic acid, acetic acid, benzene, *p*-xylene, and chloroform. Thorpe a Young (*A* 165, 1), by heating paraffin in closed vessels at a high temperature, have resolved it into a little gas and hydrocarbons of the $\text{C}_n\text{H}_{2n+2}$ series (C_2H_6 – $\text{C}_{12}\text{H}_{26}$), and others of the $\text{C}_n\text{H}_{2n+2}$ series (C_2H_6 – $\text{C}_{12}\text{H}_{26}$). Higher solid and liquid hydrocarbons were also obtained. Long heating at 150° causes an increase of weight, attributed by Bolley and Tuschschmid to oxygen absorption (*Z* 1868, 500, Jaznowitch, *B* 8, 768). Oxidised products can also be obtained by the action of oxidising agents. Champion (*C. R.* 75, 1576) has shown that nitrosulphuric acid slowly transforms it at

S F

90° into a liquid oil of the composition $C_{11}H_{22}NO_2$ (called paraffinic acid), from which ethereal salts have been obtained, and at the same time yields a white solid $C_{11}H_{22}NO_2$ sol Aq. Fuming nitric acid, according to Fouchet, also acts upon paraffin at 110°, forming a true paraffinic acid $C_{11}H_{21}O_2$ [46°] together with other fatty acids. The acid has a wax-like odour, is insol water, but sol alcohol, ether, and benzene, is easily decomposed by heat, and forms deliquescent salts of the alkaline metals, and yellow, cheesy plates with the earths and magnesia. It is carbonised by sulphuric acid (*Bl* 23, 111, *C R* 79, 320) and nitric acid converts it into nitro-compounds and suberic acid. Champion has also shown that chlorine is absorbed by paraffin in sunlight, producing hydrochloric acid. According to Gill & Meusel (*Z* 1869 65), CrO_3 and dilute HNO_3 oxidise paraffin to a mixture of cerotic $C_{26}H_{54}O_2$, succinic, and other fatty acids. According to Beilstein & Wiegand (*B* 16, 1548), ozokerite contains a solid hydrocarbon of the olefine series. It is formed by distilling the ozokerite *in vacuo*, and, after removing the first portions of only distillate, crystallising the solid portion from a solution of alcoholic benzene. It is called *tekene* [79°] *S G* 0 9392, and is a very stable compound, being unacted upon by CrO_3 , HNO_3 , and $KMnO_4$. It is, however, completely oxidised by acid $KMnO_4$, and slowly forms a bromo-compound when heated with Br and H_2O in a sealed tube. For methods of analysis of paraffin scale, and determination of impurities therein, *vide* B Redwood, *S C I* 3, 430, *Journ Soc Arts*, 1886 56, Sutherland, *S C I* 6, 123, 271, and Stuart Thomson, *ibid* 10, 342 *et seq*. S R

PARAFFIN HYDROCARBONS *v* HYDROCARBONS

PARAFFIN OIL *v* PETROLEUM

PARAGLOBIN *v* PROTEIDS

PARAHEMOGLOBIN *v* HEMOGLOBIN

PARALBUMIN *v* PROTEIDS, *Appendix C*

PARALDEHYDE *v* ALDEHYDE

PARANILINE $C_6H_4N_2$ [192°] A base found by Hofmann (*Pr* 12, 314) in the preparation of crude aniline on a large scale. Long, silky needles (from dilute alcohol) EtI yields $C_{12}H_{11}EtN$, and $C_{12}H_{11}EtN_2$. — $B''H_2Cl$ aq. six-sided plates (from conc. HCl aq.) converted by water into yellow needles of $B''HCl$ aq. sl sol water. — $B''H_2PtCl_6$ yellow prisms. — $B''HNO_3$, — $B''H_2SO_4$, — $B''H_2SO_4$.

Benzoyl derivative $C_{12}H_{11}BzN_2$ Needles

PARAPEPTONE *v* PROTEIDS

PARELLIC ACID $C_8H_8O_4$? An acid sometimes obtained in the preparation of lecanoric acid (Schunck, *A* 54, 274). Needles (containing aq.) v sl sol cold water, sol alcohol and ether. Tastes bitter. Reddens litmus. — PbA' ? white flocculent pp.

PARICINE *v* CINCHONA BASES

PARIDIN $C_{14}H_{24}O_{14}$ *S* 15, *S* (alcohol) 2. A neutral glucoside extracted by alcohol from the leaves of *Paris quadrifolia* (Walz, *Pharm Cent* 1841 690, *N Jahres Pharm* 13, 174, Delius, *ibid* 60, 25). Formed also, together with a sugar, by boiling paristypnin with dilute H_2SO_4 . Thin laminae (containing 4 aq.) (from water) or tufts of needles (from alcohol). Conc. H_2SO_4 turns it red. Boiling HCl aq. decomposes

it, in alcoholic solution, into a sugar and resinous paridol $C_{14}H_{24}O_{14}$.

PARILLIN $C_{16}H_{26}O_{16}$ or $C_{16}H_{26}O_{16}$ [210°]. *S* 008 in the cold, 5 at 100°. Ppd. by adding water to an alcoholic extract of sarsaparilla root (Flückiger, *Ph* [3] 8, 489). Plates or prisms, sol hot alcohol and chloroform. Conc. H_2SO_4 gives a yellow solution. Dilute HCl gives green fluorescence and splits it up into a sugar and parigenin $C_{16}H_{26}O_{16}$, which is insol boiling water.

PARISTYPHININ An amorphous body which accompanies paridin, and may be ppd. by tannin. Boiling dilute acids split it up into a sugar and paridin.

PARPEVOLINE Name given to the hexahydrate of di methyl ethyl pyridine, and to pyridine bases isomeric therewith.

PARSLEY The volatile oil of parsley contains a terpene (162° i v), *S G* 12 865 (Gerichten, *B* 9, 259, Sauer & Grunling, *A* 208, 75). The seeds contain apiol (*q v*). Water extracts *APIIN* (*q v*) from the plant.

PARSNEP The volatile oil of parsnep seeds contains octyl *n*-butyrate (Renesse, *A* 166, 80).

PARVOLINE $C_8H_{11}N$ (c 200°) A product of the putrefaction of horse flesh (Gautier, *Bl* [2] 48, 11). Oil, smelling like hawthorn blossom, v sol alcohol and ether. Resinifies in air. Its platinum chloride forms sparingly soluble flesh coloured crystals.

Parvoline $C_8H_{11}N$ (- 220°) A product of the distillation of cinchonine with potash (Oechsner de Coninck, *C R* 91, 296). — $B''H_2PtCl_6$ brownish yellow powder.

Parvoline $C_8H_{11}N$ (188°) A product of the dry distillation of the bituminous shale of Dorsetshire (Greville Williams, *C J* 7, 97).

Parvoline $C_8H_{11}N$ (188°) *S G* 21 986. Got by distillation of coal (Thenius, *J* 1861 502).

Parvolines of known constitution *v* DIETHYL-PYRIDINE, DI METHYL-ETHYL PYRIDINE, TETRA METHYL PYRIDINE, and METHYL PROPYL-PYRIDINE.

PASSIVE STATE OF METALS *v* Passivity of iron, art IRON, p 52.

PATCHOULI The volatile oil of patchouli, obtained from the leaves of *Pogostemon Patchouli*, contains a sesquiterpene (which yields $C_{15}H_{24} \cdot 2HCl$ [118°]), and a camphor $C_{15}H_{24}O$ [55°], (296°), *S G* 12 1051 (Gal, *C R* 68, 406, Montgolfier, *C R* 84, 88, *B* 10, 234, Wallach, *A* 238, 81). Patchouli camphor crystallises in hexagonal prisms, insol water, v sol alcohol and ether. It is levorotatory $[\alpha]_D = -118^\circ$. On distillation with $ZnCl_2$, or on heating with $HOAc$ and Ac_2O , it yields patchoulene $C_{15}H_{24}$ (254°), *S G* 2 946, $[\alpha]_D = -42^\circ$.

PATELLARIC ACID $C_{11}H_{20}O_{10}$ [above 100°] Occurs in the lichen *Patellaria* (or *Parmelia scruposa*, from which it can be extracted by ether (Knop, Weigelt, *Z* [2] 5, 298). Crystalline mass, insol water, v sol alcohol and ether. Tastes bitter. Decomposed on fusion or on boiling with baryta, with formation of orcin and oxalic acid. $FeCl_3$ gives a purple colour. Cold baryta water forms a salt with transient blue colour.

PAVIN *v* FRAXIN.

PAYTINE $C_{21}H_{21}N_2O$. [156°]. $[\alpha]_D = -49.5^\circ$ in a 45 p.c. alcoholic solution. An alkaloid extracted by alcohol from a white bark of an *Aspidosperma* from Payta in Peru (Hesse, *A* 154, 287, 166, 259, 211, 280, Wulfsberg, *Ph* [R] 11, 269, Arata, *G* 11, 246, *O* J 40, 622) Prisms (containing aq) sl sol water, sol ether, benzene, chloroform, and (unlike aspidospermine) lignin. Tastes bitter, is not poisonous. When heated with soda-lime it yields paytone, a non nitrogenous substance. Conc HNO_3 forms a colourless solution, changing through red to yellow. $FeCl_3$ and conc H_2SO_4 give no colour. Chloride of gold gives a purple pp. $HgCl_2$ gives a yellow amorphous pp. Bleaching powder produces, in an acid solution, a red colour changing through blue to yellow.

Salts— $BHCl$ S 6 at 15° . Prisms— $B \cdot H_2PtCl_6$, dark-yellow amorphous pp., dissolves in hot $HClAq$, forming a red solution changing to blue and depositing a blue pp.

Paytamine $C_{21}H_{21}N_2O$. An amorphous alkaloid accompanying paytine. Unlike paytine, KI does not ppt it from neutral solutions. Its salts are amorphous, and it does not yield paytone.

PECTOLACTIC ACID $C_8H_9O_6$. An acid got by boiling milk sugar with $NaOH$ aq and less CuO than is needful for complete oxidation (Boedeker, *A* 100, 281). Brownish syrup, drying up to a varnish (containing 2 aq). Miscible with water and alcohol, insol ether. Reduces ammoniacal $AgNO_3$, forming a mirror— BaA^{44} aq powder, insol alcohol.

PECTOUS SUBSTANCES. Unripe fleshy fruits and fleshy roots (e.g. pears, carrots, and turnips) contain a substance (pectose) insoluble in water, alcohol, and ether, transformed under the influence of acids into pectin, which is soluble in water, and is ppd as a jelly on adding alcohol or on boiling (Vauquelin, *A* Ch 5, 100, 6, 282, [2] 41, 46, Braconnot, *A* Ch [2] 28, 173, 30, 96, 47, 266, 72, 433, Guibourt, *J Chim Med* 1, 27, Mulder, *J pr* 16, 277, 16, 246, Fremy, *A* Ch [3] 24, 9, Soubeiran, *J Ph* [3] 11, 417, Poumarède a. Figuer, *J Ph* [3] 11, 458, 12, 81, Chodoff, *A* 51, 356, Scheibler, *Z* [2] 4, 433, Reichardt, *Ar Ph* [3] 10, 116, Giraud, *C R* 80, 477, Stude, *A* 131, 244, Rochleder, *Z* [2] 4, 381).

Pectin, obtained from the juice of ripe pears and apples by removing albuminoids by tannin and calcium by oxalic acid, and then ppg with alcohol, is, according to Bauer (*J pr* [2] 30, 370), a mixture of carbohydrates. Different analyses of pectin give C 39.5 to 46 p.c., H 5.5 p.c., O 48.5–55 p.c. Pectous substances differ from cellulose in being stained by methylene blue, but, unlike lignin, the colour is destroyed by acids (Mangun, *C R* 109, 579). By boiling with water pectin is converted into 'parapectin,' a solution of which, unlike pectin, gives a pp with lead acetate. Nitric acid yields mucic acid by oxidation. Boiling dilute acids convert pectin into 'metapectin,' which is acid in reaction and gives a pp with $BaCl_2$ (unlike pectin and parapectin). Boiling alkalis convert pectin into pectic acid.

Pectic acid $C_8H_7O_6$? (Fremy) C 41.4 to 44.9 p.c., H 4.71 to 5.4, O 49.7 to 53.8. Got by boiling an aqueous extract of carrots with Na_2CO_3 and ppg with HCl . Produced also from

pectin in fruit by the action of a ferment (pectase). Jelly, drying up to a horny mass. Acid in taste and reaction, insol. cold water, alcohol, and ether. Converted by boiling water, first into parapectic acid and then into metapectic acid. Boiling dilute acids yield arabic acid.

Salts— $Na_2C_8H_7O_6$, $PbC_8H_7O_6$, $Ag_2C_8H_7O_6$ (Chodoff)— $Ag_2C_8H_7O_6$ (Fremy). Arabic acid, when prepared by hydrolysis of pectic acid, is called metapectic acid, and the arabinose got by the action of $HClAq$ upon it is called pectinose. Pectinose or arabinose is tetra oxy-valeric aldehyde (q.v.).

References—ARABIN and CELLULOSE.

PELARGONIC ACID v. ENNOIC ACID.

PELLETIERINE $C_8H_{17}NO$ (195°). S.G. 2 988 V D 4 88 (calc 4 66) S. 5 Occurs, together with methyl pelletierine, pseudo pelletierine, and isopelletierine in the bark of the pomegranate (Tanret, *C R* 86, 1270, 87, 358, 88, 716, 90, 695, *J Ph* [4] 28, 168, 384). It may be extracted from the powdered bark by shaking with chloroform and milk of lime. If the chloroform is decanted and shaken with a dilute acid, the alkaloids will be taken up by the acid solution. The acid solution is mixed with $NaOH$ and shaken with chloroform, which extracts pelletierine and pseudo pelletierine, which may be separated by crystallisation of their sulphates, the pelletierine is finally distilled in a current of H .

Properties—Colourless liquid, partially decomposed at 195° , but may be distilled *in vacuo*. M sol water, miscible with alcohol, ether, and $CHCl_3$. The sulphate is levorotatory; $[\alpha]_D = -30^\circ$. Resinified by absorption of oxygen. Fumes with HCl .

Methyl pelletierine $C_8H_{17}NO$ (215°) S 4 at 12° . Extracted from an acid solution of the mixed bases by adding $NaHCO_3$ and shaking with chloroform. Liquid, forming very deliquescent salts. V sol alcohol, ether, and chloroform. Its hydrochloride is dextrorotatory $[\alpha]_D = +22^\circ$.

Pseudopelletierine $C_8H_{17}NO$ [46°] (when hydrated) (246°) S 40 at 0° S (ether) 11 at 10° . Crystallises from water in prisms (containing 2 aq), v e sol water, alcohol, and $CHCl_3$. Inactive as regards light. Powerful base, expelling NH_3 from its salts. Gives the alkaloidal reactions. Like pelletierine, it gives an intense green colour with H_2SO_4 and $K_2Cr_2O_7$ — $BHCl$ rhombohedra S 100 at 10° — $B \cdot H_2PtCl_6$ needles— $B \cdot H_2SO_4$ aq v sol water.

Isopelletierine $C_8H_{17}NO$. An inactive liquid, resembling pelletierine in other respects.

PELOSINE $C_{11}H_{21}NO$, 1 aq. An alkaloid contained in the root of *Parera brava* or *Cusampelos Parera* (Wiggers, *A* 27, 29, 33, 81, Bödker, *A* 69, 53, Flückiger, *N J P* 31, 257). Extracted by dilute H_2SO_4 , and ppg by Na_2CO_3 , and dissolved in ether or CS_2 . Amorphous powder, almost insol water. Strongly alkaline in reaction. Yields methylamine, dimethylamine, and a derivative of pyrrole on distilling with KOH (Williams, *Chem Gaz* 1858, 331)— $BHCl$ aq amorphous hygroscopic powder— $B \cdot H_2PtCl_6$ amorphous— $B \cdot H_2CrO_4$ aq. According to Flückiger, pelosine is identical with buxine and bebeerine.

Pellatella $C_{15}H_{11}NO$? A yellow base, insol. ether, either formed from pelosine by atmospheric oxidation or occurring in *Parera* — $B_2H_2PtCl_6$.

PENDECANAPHTHENE or **Pentadecanaphthene** $C_{15}H_{10}$ (247° cor) SG 11 829 Occurs in Russian petroleum (Markownikoff, *J R* 15, 339) Liquid

PENNYROYAL The oil of pennyroyal from *Mentha pulegium* contains pulegone, which may be purified by fractional distillation *in vacuo* (Beckmann, *A* 262, 3, cf Kana, *A* 32, 286)

Pulegone $C_{10}H_{16}O$ (181° at 60 mm) SG 22 982 $[\alpha]_D = +22.9^\circ$ Somewhat viscous oil, smelling like peppermint Darkens in colour even in closed tubes When reduced by Na it gives 40 p.c. of menthol — $C_{10}H_{17}BrO$ [40.5°] $[\alpha]_D = -33.8^\circ$ Made by passing HBr into pulegone dissolved in ligroin Whetstone shaped crystals v sol alcohol and ether This hydrobromide is converted by hydroxylamine into an oxim [38°] crystallising in four sided plates, which on standing lose Br and then melt at 110° This oxim also forms the hydrated oxim [157°] (*v infra*) by taking up water The hydrobromide is re-converted into pulegone by treatment with Ag_2O , while zinc-dust reduces it to pulegone hydride ($\alpha = -17.4^\circ$), which yields an oxim [83°], and can be converted, by the action of Na on its ethereal solution, into levorotatory menthol $[\alpha]_D = -21.3^\circ$, giving a benzoyl derivative [54°]

Hydrated oxim $C_{10}H_{18}O(NO H)$ [157°] $[\alpha]_D = -83.4^\circ$ in alcoholic solution Formed by the action of hydroxylamine on pulegone Long matted needles, sl sol ether, cold alcohol, and benzene Yields an acetyl derivative $C_{10}H_{17}AcNO_2$ [149°] and a benzoyl derivative [138°] — B^*HCl [118°] $[\alpha]_D = -32.4^\circ$ Trimeric crystals, $a b c = 605.1 \times 1048 - B^*HBr$ [111°]

Pulegonamine $C_{10}H_{15}NO$ Made by reducing the foregoing oxim with HI and P Amber coloured liquid, sl sol water, v sol alcohol and ether Tastes bitter Boiling Mel forms $C_{10}H_{15}MeNO$ Phenyl thiocarbimide forms $PhNHCSN(C_{10}H_{15}O)$ [198°] Yields a benzoyl derivative $C_{10}H_{15}BzNO$ [101°] — $(C_{10}H_{15}NO)HCl$ [117°] Long needles, v sol water

PENTADECANE $C_{15}H_{32}$ [10°] (270°) (136° at 10 mm) SG $\frac{1}{4}$ 772, $\frac{2}{4}$ 769, $\frac{12}{4}$ 718 Made by reduction of $C_{15}H_{22}CO_2$, CH_3 or of pentadecanoic acid with HI and P (Krafft, *B* 15, 1700) A pentadecane (114° at 15 mm) is got by distilling barium palmitate with NaOMe (Mal, *B* 22, 2134)

Pentadecane $C_{15}H_{32}$ (260°) SG 12 825 Occurs in American petroleum It yields decane when passed through red-hot tubes (Pelouze & Cahours, *Vohl*, *J* 1865, 841)

PENTADECENOIC ACID $C_{15}H_{28}O_2$? *D-ismylovaleric acid* (300°-308°) A product of the action of CO at 160° on a mixture of sodium isovalerate and NaOOC H_{11} (Geuther & Fröhlich, *A* 302, 304) Liquid

PENTADECENYL ALCOHOL? $C_{15}H_{32}O$? [78°] The portion of the wax of *Ficus gumiflua* that is readily soluble in ether (Kessel, *B* 11, 2114). Nodules (from ether)

PENTADECINENE $C_{15}H_{26}$ (230°-240°) Got by heating the acetyl derivative of di-oxy-penta-

decane (triamylene acetate) with potash (Bauer, *A* 137, 249) Thick liquid. Unites with bromine.

PENTADECOIC ACID $C_{15}H_{30}O_2$ [62°] Formed by oxidation of coccoeryl alcohol $C_{15}H_{30}(OH)_2$ or of coccoeric acid $C_{15}H_{28}O_2$ with CrO_3 and acetic acid, the yield is about 40 p.c. (Liebemann & Bergham, *B* 20, 964) Crystalline solid V sol alcohol, ether, acetic acid, and benzene, less readily in ligroin — A_2Ca and A_2Ba granular pps

Methyl ether A^*Me . [68°], crystalline solid

Pentadecic acid $C_{15}H_{30}O_2$ [51°] (257° at 100 mm) Made by oxidation of methyl penta decyl ketone with chromic acid mixture (Krafft, *B* 12, 1671, 19, 2993) Pearly scales — BaA^* — AgA^*

Pentadecic acid $C_{15}H_{30}O_2$ [70°] Occurs, together with mannite, in the fungus *Agaricus integer* (Thörner, *B* 12, 1636) Small needles, v e sol ether and boiling alcohol, insol water

Isomerides v CERIC ACID and LACTARIO ACID
PENTADECONENE $C_{15}H_{28}$ (220°) Made from $C_{15}H_{28}Br$, and alcoholic potash (Bauer, *A* 147, 255)

Pentadecanone (235°-245°) Made from santonic acid and HI (Cannizzaro & Amato, *B* 7, 1104)

DI PENTADECYL-CARBINOL $(C_{15}H_{31})_2CH(OH)$ [85°] Made by reducing palmitone in boiling alcohol by adding sodium (Kipping, *C J* 57, 987) Silky needles or plates (from alcohol), sol ether, insol water With boiling Ac_2O it yields $(C_{15}H_{31})_2CH O^*c$ [49°], a granular powder, v sol ether

DI-PENTADECYL KETONE v PALMITONE

n-PENTANE C_5H_{12} $\frac{1}{4}$ 6
 $CH_3CH_2CH_2CH_2CH_3$, Mol w 72 (87°) SG $\frac{127}{4}$ 6282 (Schiff), $\frac{11}{4}$ 6337, $\frac{33}{4}$ 6250 (Perkin), μ_2 1.3607 at 65°, $\mu_D = 1.3649$, $\mu_R = 1.3769$ (Gladstone, *C J* 59, 290) M M 5.638 at 17.2° Occurs in American and in Galician petroleum, in coal tar oil, and in resin oil (Greville Williams, *C J* 15, 130, Schorlemmer, *C J* 25, 1085, *Pr* 15, 131, Lachovitch, *A* 220, 190, Renard, *A Ch* [6] 1, 225) Oil. Yields on chlorination two amyl chlorides (106°) and (104°), and finally $C_5H_9Cl_3$ (230°-240°) (Bauer, *C R* 51, 572, Schorlemmer, Lachovitch) CrO_3Cl , followed by water, yields CH_3Cl CO C_4H_9 (Etard) At a red heat it is decomposed with formation of ethylene, propylene, and butylene (Norton & Andrews, *Am* 8, 1)

Isopentane $(CH_3)_2CHCH_2CH_3$, *Tri-methyl-ethane* VD 250 (calc 248) (30°) SG $\frac{11}{4}$ 6248, $\frac{33}{4}$ 6159 (Perkin), $\frac{50}{4}$ 6132 (Schiff, *A* 220, 87), $\frac{11}{4}$ 6375 (Just, *A* 220, 153) SV 117.2 (Schiff) M M 5.750 at 16.4° Occurs in American and in Galician petroleum (Warren, *Z* 1865, 668, Lachovitch) Formed by the action of water on zinc isoamyl, or by heating isoamyl iodide with zinc and water at 140° (Frankland, *A* 74, 47) It is also a product of the action of $ZnCl_2$ on hot isoamyl alcohol, and of zinc on dry isoamyl iodide

The same pentane can be obtained from active amyl iodide by treatment, in alcoholic solution, with zinc and HCl in the cold (Just). Oil with characteristic odour, unlike 'benzoline.' Not attacked by Br or HNO. Chlorine yields

an amyl chloride (100°) Isopentane (1 cc) is oxidised by $K_2Cr_2O_7$ (4 g) and CrO_3 (20 g) in water (2000 cc) in five weeks at 15°-20° to isovaleric acid (Berthelot, *C R* 79, 1435)

Pentane $C(CH_3)_4$, Tetra-methyl-methane [α -20°]. (95°) H.F.p 47.850 H.F.v 44.950 (Thomson, *Zn.*) Formed by the action of $ZnMe_2$ on *tert*-butyl iodide (Lwow, *Z* [3] 6, 520, 7, 257, Naumann, *B* 7, 173) Appears also to be formed from CH_3COI , CH_3I and $ZnMe_2$ (L) Oil or gas

n Pentane tricarboxylic acid
 $CH_3(CO_2H)_2CH_2CO_2H$ [148°] Got by saponifying its ether with alcoholic potash Slender needles, v sol water, alcohol, and ether Splits up at 175° into CO_2 and propyl-succinic acid

Ethyl ether Et_2A''' (280°) S.G. $\frac{1}{2}$ 1.052 Made from ethane tricarboxylic ether $CO_2EtCH_2CH(CO_2Et)_2$, NaOEt, and PrI (Waltz, *B* 15, 608, *A* 214, 58) Oil, miscible with alcohol and ether

Mono-nitrile of the diethyl ether
 $CH_3(CN)(CO_2Et)CH_2CO_2Et$ (205° at 45 mm) Formed from sodium cyano succinic ether and *n*-propyl iodide (Ba. the, *Bl* [8] 1, 805, *C R* 108, 297) Oil

Pentane tri-carboxylic acid, Ethyl ether
 $C_2H_5CH(CO_2Et)_2CMe(CO_2Et)_2$ **Methylbutenyl tricarboxylic ether** (281.5° cor) S.G. $\frac{2}{3}$ 1.0575, μ_D 1.4347 at 20° Formed by the action of Na on a mixture of a bromo butyric ether and sodium methyl-malonic ether (Bischoff, *B* 22, 1817, 8180, 23, 647) Apparently the same acid (281.8° cor), S.G. $\frac{2}{3}$ 1.0523, μ_D = 1.4340 at 20° is got from sodium butane tricarboxylic ether and MeI Both acids yield, on saponification by H_2SO_4 , two methyl ethyl-succinic acids [88°] and [168°]

Pentane tri-carboxylic acid Ethyl ether
 $C_2H_5C(CO_2Et)_2CHMeCO_2Et$ (272.8° cor) S.G. $\frac{2}{3}$ 1.0609 μ_D 1.4374 at 20° Formed by the action of Na on a mixture of a bromo propionic ether and sodium ethyl malonic ether (Bischoff a. Mintz, *B* 28, 648) The same, or an isomeric ether (282.8° cor), S.G. $\frac{2}{3}$ 1.0607, μ_D = 1.4373 at 20° is got from sodium propane tricarboxylic ether and EtI Both acids yield, on saponification with H_2SO_4 , methyl ethyl succinic acid [168°], the acid prepared by the second method yields also the isomeric acid [88°]

Pentane tri-carboxylic acid
 $CH_3(CO_2H)_2CH_2CH(CO_2H)CH_2CH_2CO_2H$ [107°] Formed from pentane tetra carboxylic ether by saponifying with alcoholic potash, and boiling the product with conc. $HClAq$ (Emery, *B* 24, 284) Mass of needles— Ag_2A''' white pp

Pentane tri-carboxylic acid
 $C_2H_5CH(CO_2H)_2CH(CO_2H)CH_2CO_2H$ [148°] Made by the action of fumaric ether on sodium ethyl-malonic ether, the product being saponified (Auer, *B* 24, 810) V sol. water and alcohol

Isopentane tri-carboxylic acid
 $(CH_3)_2CHCH(CO_2H)_2CH_2CO_2H$ [145°] (Hjelt, *B* 18, 2622). Formed from its ether, which is

made from ethane tricarboxylic ether, NaOEt and PrI (Waltz, *A* 214, 60) Yields isopropyl succinic acid on fusion

Ethyl ether Et_2A''' (270°-290°).

Isopentane tri carboxylic acid
 $(CH_3)_2CHCH(CO_2H)_2CH(CO_2H)_2$ **Carbopimelic acid** [160°] Got from its ether by cold alcoholic potash Monoclinic (?) crystals (from water), v sol water, alcohol, and ether Decomposes on fusion into CO_2 and isopropyl-succinic (pimelic) acid.— Ba_2A''' , sticky pp

Ethyl ether Et_2A''' (277°) Made from α -bromo isovaleric ether and sodium-malonic ether (W Roser, *A* 220, 274) Liquid, with bitter taste

Isopentane tricarboxylic acid Ethyl ether
 $CMe_2(CO_2Et)_2CMe(CO_2Et)_2$ (284.5° cor) S.G. $\frac{2}{3}$ 1.0524 μ_D = 1.4333 at 20° Made from sodium methyl malonic ether and α -bromo-isobutyric ether (Bischoff a. Mintz, *B* 23, 649) Yields, on saponification by H_2SO_4 , tri-methyl-succinic acid [105°] and a small quantity of a substance melting between 108° and 122° The same, or an isomeric ether ((277.8° cor), S.G. $\frac{2}{3}$ 1.0575, μ_D = 1.4341 at 20°) is got from sodium isobutane tricarboxylic ether and MeI It yields, on saponification, tri-methyl succinic acid [105°] and α di methyl succinic acid [140°]

Pentane tetracarboxylic acid
 $(CO_2H)_2CHCH_2CH_2CH_2CH(CO_2H)_2$ Oil, split up by heat into CO_2 and π pimelic acid $CO_2HCH_2CH_2CH_2CH_2CH_2CO_2H$

Ethyl ether Et_2A' (260° at 100 mm) Got from sodium malonic ether and trimethylene bromide (Perkin, jun, *C J* 51, 241, *B* 18, 3248) Disodium salt $CH_2(CH_2CNa(CO_2Et))_3$. Amorphous powder, converted by bromine into pentamethylene tetracarboxylic ether

Pentane tetra-carboxylic acid
 $CH_2(CMe(CO_2H))_3$ [164°] Got by boiling its ether with alcoholic potash (Dressel, *A* 256, 183) Crystalline mass, v sol. water, m sol. ether Converted by heating, by itself or in aqueous solution, into $CH_2(CHMeCO_2H)_3$ [90°]

Ethyl ether Et_2A' (191° at 12 mm) Made by the action of MeI on a solution of di sodium propane tetra-carboxylic ether in alcohol Oil

Pentane tetra-carboxylic acid Ethyl ether
 $C(CO_2Et)_2(CH_2CH_2CO_2Et)_2$ (215° at 13 mm) S.G. $\frac{2}{3}$ 1.1084 *A* by-product in the action of NaOEt on a mixture of β -bromo-propionic ether with malonic ether (Emery, *B* 24, 288) Colourless oil

PENTANE PHOSPHONIC ACID v ISOAETHYL PHOSPHINIC ACID

PENTANE SULPHONIC ACID $C_5H_{11}SO_3H$ Formed by the action of nitric acid on isomethyl mercaptan, disulphide, or sulphocyanide (Gerathewohl, *J pr* 34, 447, Henry, jun, *A Ch* [3] 25, 246, Medlock, *A* 69, 225) Deliquescent crystalline mass Chlorine acting on it in sunlight forms $C_5H_9ClSO_3H$ (Spring a. Wunsinger, *Bl* [2] 41, 801) ICl_3 at 180° forms the same body, together with tri- and tetra-chloro-pentanes and $C_5H_9Cl_2(SO_3H)$

Salts.— BaA' , (dried at 100°). Gyrate on water— PbA' , saq colourless laminae— CuA' ,— AgA' plates Double salts with chloropentane sulphonates $BaA'(C_5H_9ClSO_3)_2\text{aq}$.— $Ba_2A'_2(C_5H_9ClSO_3)_2Cl_2\text{aq}$
Chloride $C_5H_9SO_3Cl$. Liquid.

Pentane disulphonic acid $\text{OEt}_2(\text{SO}_3\text{H})_2$. Formed from COI , SO_3H and ZnEt_2 in ether (Ilse, *A* 147, 145) Syrup— $\text{K}_2\text{A}''$ 2aq needles (from alcohol).— BaA'' 2aq *S* 14 in the cold, *c.* 80 at 100° — PbA'' — ZnA'' 4aq plates

PENTA-THIONIC ACIDS *Thionic acids* under SULPHUR, OXYACIDS, or, vol. IV

α -PENTATRIACONTANE $\text{C}_{32}\text{H}_{66}$ [75°]. (381° at 15 mm) *SG* $\frac{1}{2}$ 7816, $\frac{2}{5}$ 777, $\frac{1}{10}$ 766. Formed by reduction of the dichloride of steatone with *H* and *P* (Kraft, *B* 15, 1715)

PENTENE *v* **AMYLENE** The name pentene is also given sometimes to pentamethenyl trihydride

Dipentene *v* **TERPENES**

PENTENOIC ACID $\text{C}_5\text{H}_8\text{O}_2$, *i.e.* $\text{CH}_2\text{CH}(\text{CH}=\text{CH}_2)\text{CO}_2\text{H}$ *Propyldiene acetic acid* (196°) *SG* $\frac{1}{2}$ 998 Made by heating propionic aldehyde with malonic acid, and HOAc at 100° (Kommenos, *A* 218, 166, Zincke a Kuster, *B* 32, 494) Oil— BaA' plates [270°]— CaA' , aq nodules, *v* sol water and alcohol— CuA' , green pp [91°] Yields Cu_2O at 175° — AgA' bulky pp The same acid (*S* $\frac{1}{2}$ 983) appears to be got by adding sodium-amalgam to an alkaline solution of COI , COI , COI , COI , COI derived from pyrocatechin or *o*-amido phenol It combines with bromine.

Pentenolic acid $\text{CMe}_2\text{CH}(\text{CO}_2\text{H})$ *Dimethyl-acrylic acid* [70°] (195)

Formation—1 From CH_3Pr , CO_2H by oxidising to $\text{CMe}_2(\text{OH})\text{CH}(\text{CO}_2\text{H})$ and heating the product with dilute H_2SO_4 (Neubauer, *A* 106, 62, W. von Miller, *A* 200, 261)—2 From *d*-methylallyl-carbinol by oxidising to β -oxy-valeric acid and distilling this acid with dilute H_2SO_4 or treating it with PCl_5 (Semljanitzin a Saytzeff, *A* 197, 72, Ustinoff, *J pr* [2] 34, 478, *Bl* [2] 45, 255)—3 *A* product of the action of alcoholic NaOEt on a bromo-isovaleric ether (Duvillier, *C R* 88, 913, 1209, 112, 1012, *A Ch* [5] 19, 428)—4 The chief product of the action of sodoform on sodium isobutylate (Gorboff, *J pr* [2] 41, 228)

Properties—Monoclinic prisms, *a b c* = 153.1 71, $\beta = 74^\circ 13'$ *Sl* sol water, *v* sol alcohol and ether Bromine combines, forming $\text{C}_5\text{H}_7\text{Br}_2\text{O}_2$ [108°] Converted into isobutylene and CO_2 by heating for 30 hours at 220°

Salts— NaA' — BaA' , 2aq groups of needles— CaA' ,— CaA' , 4aq— ZnA' , 4aq— CuA' , 2aq— PbA' , aq— AgA' .

Isomerides—**ALLYL ACETIC**, **ANGELIC**, **TETRAMETHYLENE CARBOXYLIC**, and **TRIGLIC ACID**

PENTENYL ALCOHOL C_5H_{10} , *i.e.* $\text{CH}_2=\text{CH}(\text{CH}_2)_3\text{OH}$ *Vinyl-ethyl-carbinol*. (114°). *SG* $\frac{1}{2}$ 856, $\frac{2}{5}$ 840 Formed from acrolein by successive treatment with ZnEt_2 and water (Wagner, *J R* 16, 819; *B* 21, 3349, *Bl* [2] 42, 830). Pungent liquid. Yields on oxidation by KMnO_4 propionic and formic acids, CO_2 , and tri-oxy-pentane

Acetyl derivative $\text{C}_5\text{H}_9\text{OAc}$ (182°) at 748 mm. *SG*, $\frac{1}{2}$ 918, $\frac{2}{5}$ 898 Liquid

Pentenyl alcohol $\text{CH}_2=\text{CH}(\text{CH}_2)_3\text{OH}$ *Methyl-allyl-carbinol*. (116°) Formed by the action of zinc on a mixture of allyl iodide and acetic aldehyde (Wagner, *B* 21, 3850) Yields on oxidation a tri-oxy-pentane, formic and acetic acids, and acetic aldehyde.

Pentenyl alcohol $\text{C}_5\text{H}_{10}\text{O}$ *Valerylène hydrate* (115°–120°) Got by treating its acetyl derivative with solid KOH

Acetyl derivative $\text{C}_5\text{H}_9\text{OAc}$ ($\approx 95^\circ$). *A* product of the action of AgOAc on $\text{C}_5\text{H}_{10}\text{O}$, obtained by combination of valerylène with HCl (Reboul, *Z* 1867, 174)

Pentenyl alcohol $\text{CH}_2=\text{CH}(\text{CH}_2)_3\text{OH}$ *Methyl propenyl-carbinol* (118°) Formed by the action of water on the corresponding pentenyl chloride, which is a product of chlorination of $\text{CHMe}(\text{CH}_2)_3\text{H}$ (Kondakoff, *B* 24, 931)

Pentenyl alcohol $\text{CH}_2=\text{CH}(\text{CH}_2)_3\text{OH}$ *Dimethyl-vinyl carbinol* *Isoprenic alcohol* (39°) Formed from $\text{C}_5\text{H}_9\text{Cl}$, which is obtained from isoprene and HCl (Gradziatsky, *Bl* [2] 47, 168) Smells like camphor Dilute H_2SO_4 at 100° forms a hydrocarbon

Acetyl derivative $\text{C}_5\text{H}_9\text{OAc}$ (121°) *A* pentenyl alcohol (125°–135°) is a product of reduction of tiglic aldehyde (Lieben a Zeisel, *M* 7, 57)

References.—**BROMO** and **CHLORO PENTENYL ALCOHOL**

PENTENYL AMIDO-PHENYL MERCAPTAN

$\text{C}_5\text{H}_9\text{N}(\text{S})\text{CH}_2\text{Pr}$ Liquid, formed from *o*-amido phenyl mercaptan and isovaleryl chloride (Hofmann, *B* 13, 8, 1223)— $\text{B}'\text{H}_2\text{PtCl}_5$ needles **PENTENYLAMINE** $\text{C}_5\text{H}_9\text{N}$, *i.e.* $\text{CH}_2=\text{CH}(\text{CH}_2)_3\text{NH}_2$ (85°) Got by reducing nitro-amylene with *azinc* and HCl (Gal, *J* 1873, 333)

Pentenylamine $\text{C}_5\text{H}_9\text{NH}_2$ *Valerylamine* *A* product of the action of NH_3 on chloro amyl alcohol (amylene chlorhydrin) at 100° (Wurtz, *A Suppl* 7, 89)— $\text{B}'\text{H}_2\text{PtCl}_5$ orange crystals

PENTENYL BENZENE $\text{C}_5\text{H}_9\text{C}_6\text{H}_5$ (173°–177°) *SG* 84 Formed, together with a polymeride $\text{C}_{22}\text{H}_{22}$ (*c* 210°), *SG* 23 96, by boiling bromo-amyl benzene $\text{C}_5\text{H}_9\text{CH}_2\text{CHBr}(\text{CH}_2)_3\text{CH}_3$ with water (Dafert, *M* 4, 153, 616) Yields benzene and acetic acids on oxidation

PENTENYL BROMIDE *v* **BROMO-AMYLENE**

PENTENYL THIOCARBIMIDE $\text{C}_5\text{H}_9\text{NCS}$ (190°) Formed from isoamylene bromide by successive treatment with alcoholic NH_3 and CS_2 (Hofmann, *B* 12, 990) Liquid

PENTENYL-THIO-UREA $\text{C}_5\text{H}_9\text{NHCSNH}_2$ [103°] Formed from pentenyl thiocarbimide and alcoholic NH_3 at 100° (Hofmann, *B* 12, 991)

PENTHIOPHENE The homologue of thiophene $\text{CH}_2=\text{CH}(\text{CH}_2)_3\text{CH}=\text{CH}_2$, known in some of its derivatives (Krekeler, *B* 19, 3270)

PENTIC ACID $\text{C}_5\text{H}_8\text{O}_4$, *i.e.* $\text{CH}_3\text{CH}(\text{CO}_2\text{H})_3$ [128°]. *A* product of the action of alcoholic potash on bromo ethyl-acetoacetic ether (Demarçay, *Bl* [2] 27, 483, *C. R* 88, 126) Got also by heating bromo-ethyl-acetoacetic ether at 100° (Wedel, *A* 219, 104) Trimetric crystals, *v* sol. hot CHCl_3

Salts— NaA' , aq— KA' , aq: *v.* *c.* sol water MgA' , 5aq— CaA' , aq— BaA' , 2aq— ZnA' , 5aq— MnA' , 4aq

Ethyl ether $\text{CH}_3\text{CH}(\text{CO}_2\text{H})_3$ *Mol wt* 153 (obs by Raoult's method); (calc 156) (Moscheles a Cornelius, *B* 21, 2607; 22, 244). Liquid.

Phenyl-hydrasido $C_6H_5O_2(N,HPH)$
Crystals (from alcohol)

PENTINENES C_5H_8 , *Pentylenes*, *Pentines*.
Mol w 68 Of the eight possible isomerides, three are derived from acetylene and precipitate ammoniacal silver and cuprous solutions, the remaining five, so far as they are known, give no metallic derivatives The following are known

1 **Propyl acetylene** $CH_3CH_2CH_2C \equiv CH$ (43°-49°) Methyl propyl ketone by action of PCl_5 gives a dichloride, from which alcoholic potash withdraws $2HCl$ (Friedel, *Z* 1869, 124) Forms liquid dibromide (190°) and tetrabromide (275°) (Bruylants, *B* 8, 411)

2 **Isopropylacetylene** $(CH_3)_2CHC \equiv CH$ (28°-29°) The chloride from isovaleric aldehyde (Bruylants, *B* 8, 413) or isopropyl-ethylene bromide, is decomposed by alcoholic potash (Eltekow, Flawitzky, Krylow, *B* 10, 707 and 1102) Oxidised by chromic liquor into acetone, acetic, and isobutyric acids Bromides liquid, C_5H_7Br , (175°), C_5H_7Br , (275°) (Bruylants, *B* 8, 407) The silver compound C_5H_7Ag is white, dissolves slightly in ammoniacal silver nitrate solution, and crystallises therefrom in small prisms Converted by a solution of iodine in KI into the compound C_5H_7I (140°)

3 **Eltekow** (*B* 10, 1904), by treating commercial amylene with sulphuric acid (dil with $\frac{1}{2}$ vol H_2O) at 0°, obtained an insoluble amylene, the bromide of which, by the action of KHO , yielded a mixture of two hydrocarbons, of which one, the smaller amount (35°), gave a pp with ammoniacal silver solution This he believed to be isopropylacetylene, though differing from the compound described above in b p

4 **Valerylene** This name was given to the liquid (44°-46°) obtained by Reboul (*A* 131, 238) from the dibromide prepared from commercial amylene This substance is a mixture from which Eltekow obtained the hydrocarbon described under 3, and a larger quantity of another (51°-52°), which is stated (*B* 10, 2057) to yield acetic and propionic acids by treatment with chromic acid Hence Eltekow ascribes to it the formula, C_5H_8 , $C \equiv CCH_2$, although it does not yield metallic derivatives Reboul's valerylene, heated to 250°-260°, yields a terpene $C_{10}H_{16}$, (180°) (Bouchardat, *Bl* [2] 33, 24) Strong sulphuric acid converts it into a hydrate $C_{10}H_{18}$, H_2O and polymerides $C_{10}H_{22}$, &c (Reboul, *A* 143, 372) Yields a dibromide, which on treatment with alcoholic potash gives C_5H_7Br , C_5H_7 (valylene), and valerylene (Reboul, *A* 135, 372) Valerylene tetrabromide $C_5H_7Br_4$ is liquid.

5 **Piperylene** (42°) (Hofmann, *B* 14, 665) Distinguished by the production of a crystalline tetrabromide, fusible [114.5°] and volatile without decomposition Gives no pp with solutions of silver or copper, and probably has the constitution $(CH_3)_2C \equiv CCH_2$, or β -dimethylallene

6 **Isoprene** (about 37°) Originally obtained (v Gr Williams, *Tr* 1860, 241), along with caoutchouc and heveene, by destructive distillation of caoutchouc (g v) Formed also in notable quantity by the action of very low red heat upon turpentine oil and its isomerides (Tilden, *C J* 45, 410) A colourless, limpid liquid, S G 6823 at 20°. Oxidises rapidly on exposure to air,

forming a syrupy compound which, on being quickly heated, often explodes Contact with strong acids in the cold converts it into a substance apparently identical with caoutchouc Combines violently with bromine, forming a tetrabromide which remains liquid at -20° and is decomposed by distillation Absorbs hydrochloric acid, forming a mixture of mono- and dihydrochlorides $C_5H_8 \cdot 2HCl$ (145°-150°), unstable liquid Oxidised by chromic acid to carbonic, formic, and acetic acids, by nitric acid to oxalic and a small quantity of undetermined acid

Heated to 280° isoprene is converted into dipentene $C_{10}H_{16}$, identical with the product from turpentine (v TERPENES) (Bouchardat, *C R* 87, 654 a 89, pp 361, 1117) W A T

PENTINENE CARBOXYLIC ACID v HEXANOIC ACID

Pentylene tricarboxylic acid $C_5H_8O_6$, *s.s.* $C_5H_8(CO_2H)_3$, CH_2CO_2H

Allyl ethane tricarboxylic acid [151°] Got from its ether, which is made from sodium ethane tricarboxylic ether and allyl bromide (Hjelt, *B* 16, 333) At 160° it splits up into allyl succinic acid and CO_2

Ethyl ether Et.A''' (c 282°)
PENTINOIC ACID $C_5H_8O_4$, [206°] A product of the oxidation of oil of turpentine by HNO_3 (Roser, *B* 15, 293) Tables (from water), sl sol water

PENTINYL ETHYL OXIDE $C_7H_{12}O$, *s.s.* $C_5H_7OCH_2CH_3$, (125°-130°) Formed from C_5H_7Br $EOEt$ and alcoholic potash at 155° (Reboul, *A* 133, 86) Light oil Combines with bromine

PENTOIC ACID v VALERIC ACID

PENTONENE C_5H_8 , (42.5°) S G 808 V D 2.45 Occurs in oil deposited by compressed gas derived from bituminous shale (Etard a Lambert, *C R* 112, 945) Oil polymerises in the cold, becoming $C_{10}H_{16}$, which forms crystal line $C_{10}H_{16} \cdot 2HSO_4$

PENTONYL ETHYL OXIDE $C_7H_{12}O$, *s.s.* $CH_3CH_2C(OEt)CH_2$, (155°) V D 3.87 Got by heating di chloro pentylene $CH_2(Cl)CH_2$, with alcoholic potash (Combes, *A Ch* [6] 12, 223) Colourless liquid, with unpleasant small

PENTOSE Name given to compounds resembling glucose but having only 5 atoms of carbon in the molecule, e.g. tetra-oxy-valeric aldehyde

PENTYL Another name for the radicle **AMYL**

PENTYLENE v AMYLENE and PENTINENE

PENTYLENE GLYCOL v DI-OXY-PENTANE

PENTYLIC ACID IS VALERIC ACID

PENTYLIDENE v AMYLIDENE

PENTYLIDENE ACETONAMINE v ACETONAMINE

PEPPER OIL S G 1.875 The oil of black pepper is levorotatory ($\alpha = -3.2^\circ$) and contains a terpene (165°) which is levorotatory ($\alpha = -7.8^\circ$) and gives a crystalline tetrabromide (Eberhardt, *Ar Ph* [3] 25, 516, cf Dumas, *A* 15, 159, Soubeiran, *A* 34, 327)

PEPPERMINT OIL The essential oil from *Mentha piperita* contains menthol, $C_{10}H_{18}O$, and a liquid terpene The oil obtained by distilling *M. arvensis* deposits crystals of menthol, and appears also to contain $C_{10}H_{18}O$, an inactive product

of oxidation of menthol (Moriya, *C J* 39, 82) The oil from *M. viridis* contains a terpene and $C_{10}H_{16}O$ [225°] (Gladstone, *C J* 17, 1)

PEPSIN The digestive ferment of the stomach (Schwann, Brucke, *Sitz W* 43, 601, Schmidt, *A* 61, 311) It also occurs sometimes in the urine (Stadelmann, *Zeit Biol* 25, 208)

Preparation—1 The glandular layer of the stomach is extracted with dilute phosphoric acid,

with alcohol (Wittich, *J* 1870, 894, Podwysosky, *Pf* 39, 62)

Properties—Amorphous Does not give the xanthoproteic reaction, and is not coloured by H_2SO_4 and sugar It renders insoluble proteins soluble, converting them into peptones, this action is greatly enhanced by the presence of 05 p c HCl Digestion is more rapid at 37° than at 24° Dry pepsin does not lose its power by heating to 100° (Huppe, *C J* 44, 101) According to Gautier (*C R* 94, 1192), pepsin contains some insoluble amorphous granules which also possess digestive power in presence of HClAq (cf Béchamp, *Ch R* 94, 970)

PEPTONES v PROTEIDS

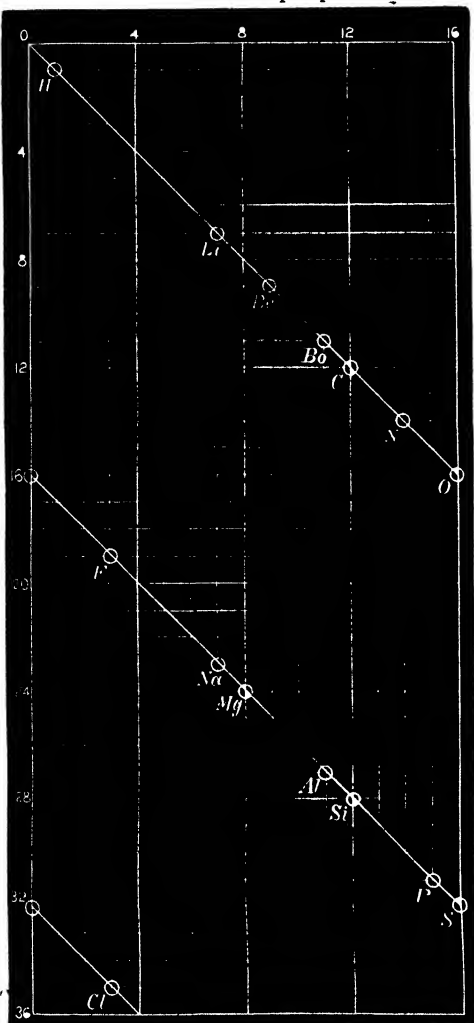

PER Use of this prefix applied to inorganic compounds, for per compounds and per salts v the element the per compound of which is sought for, or the salts to the name of which per is prefixed Thus peroxides are dealt with under OXIDES, peroxide of nitrogen under NITROGEN, oxides of, perchloric acid under CHLORINE, oxyacids of, permanganates under MANGANESE, OXYACIDS OF

PEREIRINE $C_{18}H_{24}N_2O$ [124°] An alkaloid, occurring with geissospermine in the bark of *Pao Pereiro* (*Geissospermum Vellosoi*, Peckolt) It is separated from geissospermine by ether (Hesse, *A* 202 147) Amorphous powder, nearly insol water, v sol alcohol and ether Conc H_2SO_4 gives a violet red and HNO_3 a purple red colour — $B^+H_2PtCl_6$ 4aq yellowish amorphous pp

PERIODIC LAW In the history of modern chemistry we find several attempts to trace connections between the properties of the elements and their atomic weights Dobereiner (*G A* 26, 331) was the first to show that a simple relation exists between the atomic weights of closely related elements Ca, Sr, and Ba are very closely related elements, and the atomic weight of Sr is the mean of those of Ca and Ba Again, Se has an atomic weight equal to the mean of the atomic weights of the closely related elements S and Te This doctrine of triad groups was further extended by Dumas (*J* 1851 291), Kremers (*P* 85, 56), and Lenssen (*A* 103, 121) Lenssen endeavoured to embrace all the elements in a classificatory system composed of 20 triads Pettenkofer (*A* 105, 188) pointed out that the atomic weights of analogous elements, e.g. the alkali metals, form simple arithmetical series, and he emphasised the analogy between such natural families of the elements and the homologous series of organic compounds Kremers (*P* 83, 56), Gladstone (*P M* [4]

5, 313), Cooke (*Am S* (2) 17, 387), and Dumas (*C R* 46, 709) followed with generalisations differing only in detail from that of Pettenkofer

These discoveries did not, however, herald any immediate great advance It was, of course, interesting to find that elements showing gradational similarity of properties possess atomic weights, which are also, so to speak, numerically similar, but the newly discovered relationships

the acid ppd by lime water, and the pp dissolved in dilute HClAq, the solution is then dialysed (Maly, *J pr* [2] 11, 104) — 2 The mucous membrane of pigs' stomachs is macerated with water containing HClAq and the pepsin separated from the filtrate by adding NaCl (Scheffer, *Ph* [8] 2, 761, 783, 843) — 3 The mucous membranes are kept 24 hours after death, and then extracted with glycerin The extract is ppd.

did not result in immediate practical applications, and did little more than emphasise pre-existing natural classifications. The investigations altogether failed to afford a generalisation capable of embracing the groups of related elements in a complete classificatory system. Instead of furnishing one inclusive scheme dealing with all the elements, they rather favoured a classification consisting of a number of isolated and partial systems, each system comprising only very closely allied elements, a classification similar in its imperfections to that which would have resulted in organic chemistry had chemists been content to differentiate empirically alcohols, aldehydes, and acids, without any knowledge of the relationships existing

oblivion from which it has but lately been withdrawn to the light of day (*v N* Dec 26, 1889; *C N* 63, 51).

Newlands was the first to look beyond the relations of analogous bodies merely, and to insist on a relationship of a higher order, connecting the properties and atomic weights of all the elements taken collectively.

This relationship, first roughly indicated by Newlands in 1864 (*C N* 10, 94), was further developed in 1865 under the title of the *law of octaves* as follows —

'If the elements are arranged in order of their equivalent, with a few slight transpositions, as in the accompanying table, it will be observed that elements belonging to the same group usually appear on the same horizontal line —

H	1	P	8	Cl	15	Co and Ni	22	Br	29	Pd	36	I	42	Pt and Ir	60
Li	2	Na	9	K	16	Cu	23	Rb	30	Ag	37	Cs	44	Tl	58
Be	3	Mg	10	Ca	17	Zn	25	Sr	31	Cd	38	Ba and V	45	Pb	54
B	4	Al	11	Cr	19	Y	24	Ce and La	33	U	40	Ta	46	Th	56
C	5	Si	12	Ti	18	In	26	Zr	32	Sn	39	W	47	Hg	52
N	6	P	13	Mn	20	As	27	Di and Mo	34	Sb	41	Nb	48	Bi	55
O	7	S	14	Fe	21	Se	28	Rh and R.J.	35	Te	43	Au	49	Os	51

between these distinct, but closely connected, classes of bodies.

The idea of arranging all the elements in the order of their atomic weights with a view to a more comprehensive classification based on the relations of these magnitudes and the salient properties of the elements, both chemical and physical, seems first to have suggested itself to M A E Déguyer de Chancourtois in the year 1862. His method of exhibiting the relationship was a geometrical one. On a right cylinder with circular base he traced his 'telluric helix' at a constant angle of 45° to the axis. On this curve lengths corresponding to the 'characteristic numbers' (atomic weights) were measured in terms of a unit equal to one sixteenth of the turn of the helix. The extremities of these lengths were the 'characteristic points' for the elements. De Chancourtois enunciated the principle that the relations between the properties of different bodies are manifested by simple geometrical relations between the positions of their characteristic points. For instance, elements with analogous properties fall together on vertical lines parallel to the generatrix. This relation becomes apparent when the cylinder is plane developed as in fig on p 808. It follows from this that the atomic weights of any natural group of elements are expressible in terms of the general algebraic formula $(n + 16m)$, where m is an integer, in other words, that the differences between the atomic weights of allied bodies are, in general, multiples of 16.

$$\begin{array}{cccc} \text{O} & \text{S} & \text{Se} & \text{Te} \\ 16, & 16+16=32, & 16+(4 \times 16)=80, & 16+(7 \times 16)=128 \end{array}$$

Other similar relations were developed by means of secondary helices.

De Chancourtois, evidently absorbed in the numerical relations exhibited by members of the individual groups, omitted to consider sufficiently the relations of the various groups, and so he failed to give clear expression to the periodicity of properties which his telluric helix implies. A mathematician and geologist, de Chancourtois expressed himself in terms not at all calculated to attract the attention of the chemical world at large, consequently his work fell into an

It will also be seen that the numbers of analogous elements generally differ by 7 or some multiple of 7, in other words, members of the same group stand to each other in the same relation as extremities of one or more octaves in music (*C N* 12, 83).

As will be seen, Newlands' law was retrospective rather than prophetic, it recapitulated and co-ordinated old facts, but did not suggest new ones. Though Newlands admitted the probability of the discovery of new elements, his rigid disposition into 8 octaves of the 62 elements then known neither admitted of interpolations nor suggested additions. In his development of the conception of chemical octaves there was a too evident subordination of fact, and chemists gave but little heed to a classificatory scheme which formed octaves at the cost of grouping together elements chemically dissimilar, and then only succeeded in producing octaves varying in range from 8 to 10 constituent elements.

In March 1869 Mendeléeff read a paper on the periodic law before the Russian Chemical Society. This periodic law was nothing else than a generalised and developed form of the law of octaves, the conceptions underlying both laws being practically identical. Yet Mendeléeff's law was the law of octaves so elaborated and expanded that it at once attracted general attention. Operative not only in the realm of the known, but boldly presuming to deal with the unknown, this periodic law clearly indicates methods of testing its own validity. The law states that the properties of the elements, as well as those of their compounds, are periodic functions of the atomic weights of the elements. That is to say, if in a co-ordinate system atomic weights be measured along one axis, and any measurable property along the other, a line joining the loci of the intersections of corresponding abscissae and ordinates will form a sinuous curve showing maxima and minima. As the atomic weight increases the property considered will not increase or diminish indefinitely, but will exhibit periodical waxing and waning in intensity.

The predictions to which Newlands lays claim in the preface to his pamphlet 'The Periodic Law' are founded on theoretical considerations at which he arrived independently of, and prior to, his law of octaves, and which, therefore, do not involve any idea of periodicity.

Contemporaneously with the enunciation of the periodic law by Mendeléeff, but quite independently, L. Meyer (*A Suppl* 7, 854) showed that such a periodic curve results when the relatively measurable property considered is atomic volume (at wt ÷ SG in solid state). In fact, nearly every measurable property—physical and chemical physical—has been investigated, and in every case the law has been substantiated.¹ On examination of the characteristic ultra-violet spectra of the elements, Hartley (*C J* 41, 84) found these to vary periodically in such a way that elements belonging to the same group have analogously disposed spectra, in fact, Hartley made use of this generalisation in assigning Be (*vide infra*) a place in the periodic system (*C J* 43, 816, see also Lecocq de Boisbaudran, *C N* 1896 (2) 4). Laurie (*P M* [5] 15, 42) obtained periodic curves when he plotted out the values of the heats of formation of haloid compounds of the elements in diagrams in which atomic weight was taken as the other variable. In this connection also Carnelley investigated the melting-points, boiling points, and heats of formation, of the halogen compounds of the elements (*P M* [5] 8, 1), the colours of corresponding compounds of the elements (*P M* [5] 18, 180), the occurrence of the elements in nature (*P M* [5] 18, 194), the salient physical properties of the compounds of the elements with alkyl radicals (*P M* [5] 20, 259), and finally the magnetic properties of the elements (*B* 12, 1958). Carnelley and Walker have examined the relation of the phenomenon of the complete dehydration of hydrated oxides to the periodic law (*C J* 53, 59). Prud'homme (*C R* 112, 236) found that the shades produced by using different metallic oxides to fix one and the same colouring matter varied periodically with the atomic weights of the metals. Brauner and Watts found confirmation of the law in studying the molecular volumes of the oxides (*B* 14, 48). Roberts Austen experimented with a like result on the tenacity of gold when alloyed with about 2 per cent of other metals (*Pr* 43, 425). Recently, Sutherland (*P M* [5] 80, 818) has asserted a periodicity of the vibration-periods of the atoms of elements at their melting-points.

For a fairly complete summary of such investigations showing that the atomic weights of the elements are the true variables which determine the properties of matter *v* Meyer's *Modern Theories of Chemistry*, pp 119-154.

At first sight it might seem that the best method of giving detailed expression to this periodic law would be the geometrical one of tracing periodic curves as above indicated, but in the present state of science this is impossible, for we have yet to learn methods of measuring chemical properties. Further, the periodicity which Mendeléeff asserts is peculiar in its discontinuity, and contrasts strongly with the continuous periodic curves of the geometer, such, for instance, as the curve of sines. Conclusions respecting *any* point on such a curve as the curve of sines, where the periodicity may be called continuous, are warranted, but unless geometrical analysis be modified in a special manner

the connecting by a continuous curve of the loci of intersection of ordinates and abscissae in a co-ordinate system, of which properties and atomic weights are the variables, amounts to a virtual negation of the indivisibility of atom, and to an assertion that the number of elements is infinite. No elements intermediate between, *e.g.*, silver and cadmium, and with atomic weights between 107.6 and 112, are known. Even if they existed, we could not for a moment suppose that they would form oxides with formulae containing a fractional number of oxygen atoms. Yet, as will be seen later on, if the periodic law were represented and interpreted geometrically it would certainly involve not only the existence of such intermediate elements, but also the existence of oxides and other compounds incompatible with the fundamental conception of modern chemistry—the conception of the atom.

For these and similar reasons it is not only desirable but imperative that the periodic law should have a non geometrical representation at present. Let the elements (hydrogen excepted) be arranged in order of their atomic weights. It will then be found that the properties vary gradually as the value of the atomic weight increases, that when the eighth element is reached we have reproduced in varying intensity many of the properties characterising the first. The same is true of the fifteenth element. Similarly, in the ninth and sixteenth elements we have the recurrence of the properties of the second in the series, and so on.

If now, instead of this linear disposition, we arrange the elements in two dimensions, placing elements with analogous properties in the same vertical lines, and if we suppose that certain elements exist which have not yet been isolated, we obtain the table on the following page (taken from Brauner (*C J* 41, 68), and differing in slight details from the one first proposed by Mendeléeff), consisting of twelve horizontal rows and eight vertical columns.

The horizontal rows are called 'series,' and consist of elements whose properties vary gradually from one member to the next. It will be seen that hydrogen, on account of the anomalous relations between the value of its atomic weight and those of succeeding elements, is regarded as constituting a series in itself. The vertical columns are called 'groups,' and comprise elements with similar properties, *i.e.* elements which would occur at comparable points on periodic curves, could such be traced as already indicated. The similarity in properties shown by members of a group is a regularly gradationed one, and while in a series the properties of the elements vary in kind, in a group the variation is, speaking widely, one of degree only.

It will be noticed that the perfect symmetry of the table and the analogy which for the first few series it shows with the notes of the diatonic scale disappear when the end of the fourth series is reached. The three elements Fe, Ni, and Co, following upon Mn, and showing no analogies with the elements of Groups I., II., and III. respectively (where, guided solely by considerations of symmetry, we should be inclined to locate them), inaugurate the eighth group of Mendeléeff's table, a group containing many of the more important industrial metals, all very

¹ It should be noted, however, that the specific heats of the elements in the solid state do not vary periodically with the atomic weights.

closely allied from a chemical point of view (*A Suppl* 8, 147), and a group anomalous in that, even series only are represented, three elements occurring in each series. According to Mendeléeff, the metals Cu, Ag, and Au, similar in many respects to the elements of Group I, nevertheless show, in their higher oxidation forms and physical properties, such analogies with the members of Group VIII as to warrant their double representation in the table (*A* *lc* p 152). It should also be noticed that the table is so constructed as to indicate a subdivision of each of the groups I-VII into two sub groups or 'families,' one family in each case being constituted of members of even series only, the other of members of odd series only. This subdivision is more apparent in the following tabular ar-

the hydroxyl derivatives of the paraffins into the minor classes of primary, secondary, and tertiary alcohols—is that, although there is a general similarity between all the members of a group, yet there is a more pronounced similarity between the members of odd series and the members of even series respectively, in other words, alternate members of a group are in general more closely related than successive members.

Nevertheless the advisability of a rigid subdivision of all the groups as indicated is open to question. In the case of Group II this division is undoubtedly warranted. Mg, Ca, Zn, Sr, Cd, Ba, Hg have all certain properties in common. But the family Ca, Sr, Ba, on the one hand, and the family Mg, Zn, Cd, Hg, on the other, have respectively so many similarities that we are

(In this Table O=16 is the starting point of atomic weights. See F W Clarke, *C N* 63, 76.)

angement of the elements which Mendeléeff suggests as a truer representation than the foregoing table of the peculiarly compounded periodicity which obtains.

The reason for this subdivision—which may not inaptly be compared with the subdivision of

justified in making the subdivision in this case (*U CLASSIFICATION*, vol II p 204).

But in the case of Group V. the 'family characteristics' do not so predominate over those of the group. N, P, V, As, Sb, &c., are all so much alike in properties that here a resolution

into families is by some regarded as superfluous. In this group, it is said, is more conveniently studied as a whole, for now the 'group characteristics' predominate over those of the families (v. vol. ii p. 210)

The elements constituting the eighth group have so many characteristic properties in common that subdivision of the group in any way would be artificial and unnecessary

There have been various other methods (di- and tri-dimensional) suggested for representing the periodicity in properties of the elements, but none of them perhaps sums up the facts known more simply and clearly than Mendeléeff's table (v. Meyer's *Modern Theories*, p. 120, Reynolds, N 84, 428, Crookes, *C J* 53, 503, Bayley, *P M* [5] 13, 26, Kremers, *Physikalisch-chemische Untersuchungen*, Wiesbaden, 1869-70, Baumhauer, *Die Beziehungen zwischen den Atomgewichte und der Natur der Elemente*, Braunschweig, 1879)

On inspecting his table in the light of known facts, Mendeléeff was led to make the following generalisations.—

(i) Excluding Series 2, the most markedly non-metallic elements occur in odd series¹

Types		La	Be	B	C	N	O	F	—	—	—	Na	Mg	Al	Si	
P	S	Cl	K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	—
As	Se &c															

(ii) Omitting Series 2, only members of odd series form compounds with organic radicles (the organo metallic compounds)² Just as the hydrides of Pd, Cu, and Nb contrast strongly with the hydrides of elements belonging to odd

		Li	Be	B	C											
N	O	F	Na	Mg	Al	Si										
P	S	Cl	K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	—
As	Se	Br	&c													

series, so organic compounds of members of even series (should such be hereafter discovered) will possess properties very different from those of similar compounds with which we are at present acquainted

Mendeléeff expressly omits Series 2 in making these generalisations. If, excluding the very incomplete Series 10 and 12, we tabulate the differences between the atomic weights of corresponding elements of Series 2 and 4, 4 and 6, 6 and 8, we find that, whereas the mean difference of corresponding elements of consecutive series is about 42, the mean difference for Series 2 and 4 is only 84.5. Since properties and atomic weights are dependent, we should expect from the above relations that the properties of the elements of Series 2 would contrast with the general properties exhibited by the other members of the families which they head. Such is actually the case to a greater or less extent with all the members of Series 2; e.g. Li differs from the other alkali metals, and approaches the alkaline earths in its insoluble phosphate, its easily soluble

bicarbonate, its difficultly soluble carbonate, and in the formation of diglycollic acid by the interaction of LiOH and monochloroacetic acid. N is more closely related to P than to V; O to S than to Cr. Again F and Mn contrast very strongly. On this account Mendeléeff has styled the elements composing Series 1 and 2 *Typical Elements*. Though the differences (averaging about forty) between the atomic weights of Na and Mg (Series 3) and those of the corresponding elements Cu and Zn (Series 5) are greater than those derived from a consideration of Series 2 and 4, yet the properties of Na and Cu on the one hand, and of Mg and Zn on the other, contrast so strongly, in Mendeléeff's opinion, as to induce him to enrol Na and Mg also among the typical elements. It is open to question whether the differences between Mg and Zn are sufficient to justify the classification of the former as a typical element, most chemists would probably find in Na the limit of the typical elements. Meyer, however, insists that the differences between Mg, Al, Si, and the other members of the corresponding groups is such as to justify the enrolment of these three substances among the typical elements, as follows.—

Yet the typical elements, after nitrogen exhibit so little analogy with the groups placed below them in the above scheme that Meyer proposes the following as perhaps a more scientific disposition of the typical elements —

Some go still further than Meyer, and regard H to Cl inclusive as typical elements, but such extreme views can scarcely be regarded otherwise than as unwarranted subordination of fact to considerations of symmetry suggested by Mendeléeff's table

Mendeléeff compares his so called typical elements to the lower members of homologous series in organic chemistry, which, as is well known, possess many properties peculiar to themselves and unrepresented in the higher members. In this connection contrast H_2O and CH_3O with the higher alcohols of the $C_nH_{2n+2}O$ series

While some disapprove of the title 'typical elements,' maintaining that this nomenclature connotes exactly the opposite of what it should, seeing that the typical elements are by no means types (as this word is generally understood) of the groups or even of the families which they head, others attempt to justify Mendeléeff's nomenclature. The former would rechristen the typical elements as anomalous elements, the latter would either find in the typical element of the group a combination of individual characteristics of each of the constituents of the sub-groups (vide vol. ii. p. 207), or in the typical elements as a class a representation of the gamut of variations of chemical properties.

(iii.) The passage from even to odd series is

¹ To render these generalisations unconditional Walker (*C F* 63, 351) has proposed that H to F be regarded as constituting Series 1, Series 2 being regarded as wanting. If this proposal is adopted, it becomes hardly necessary to differentiate typical elements (*C f. p. 2*)

² Recently it has been shown by Winkler (*B. 24*, 872, 1886) that the same generalisation can scarcely be applied to the hydrides also.

accompanied by a more gradual change in the properties of the elements than is the passage from an odd to an even series. This fact is in a manner emphasised in Mendeleëff's second table

(iv.) As the at wt increases in each group —

(a) The elements become more electropositive, and their oxides become more basic. This is well exemplified by the oxides of the types R_2O_3 and R_2O_5 formed by the elements of Gr V

(β) Corresponding compounds of the elements become more easily reduced. This is well instanced in the triplets S, Se, Te, and Cu, Ag, Au

(γ) There is a tendency to form stable oxides (and the salts corresponding to these) containing less O than the maximum salt-forming oxide characteristic of the group (*vide infra*). Thus, the characteristic oxide of Gr V is of the type R_2O_5 , and the haloid and oxyhaloid salts of the lower members of the group P, V, Nb, belong to this form, e.g. PF_5 , $VOCl_3$, $NbCl_5$, but Bi, which is the highest known member of Gr V, forms salts corresponding to the oxide R_2O_3 . Again in Gr IV no oxide of Si having the formula SiO_3 is known, SnO is known but is unstable, while PbO figures as the stable oxide of lead

(v.) Periodicity of valency and limiting forms. It has long been admitted that the atoms of those elements which form hydrides are limited with respect to the maximum number of H atoms which they can hold in combination, but it was only with the introduction of the periodic law that it was noticed that this limited power of combining with H atoms varies in a regularly periodic manner with the atomic weights. Little is as yet known of metallic hydrides, so that we have to look to Groups IV–VII, consisting of what may broadly be called the non-metals, for a confirmation of this periodicity

For instance —

Gr IV	furnishes us with	CH_4 , SiH_4 ,
Gr V	" "	NH_3 , PH_3 , AsH_3 , SbH_3 ,
Gr VI	" "	OH_2 , SH_2 , SeH_2 , TeH_2 ,
Gr VII	" "	FH , ClH , BrH , and IH

In the same way, but more perfectly, the law teaches us that the maximum number of oxygen atoms with which the elementary atoms can severally combine to form definite salt-forming oxides—either acidic or basic, as the case may be—also varies periodically with the atomic weights of the elements. The oxides characteristic of Gr IV are of the type R_2O_3 (or RO_2), those of Gr V of the type R_2O_5 , and so on regularly till we come to the eighth group, which has maximum salt-forming oxides of the type R_2O_7 (or RO_3). In carrying back this regularity to the groups I–IV, consisting for the greater part of metals, we find that it assigns to each of these groups exactly that type of oxide which we know to be characteristic of the individual members of the group. Hence we are justified in broadly asserting that the types of the hydrides (so far as they are already known), as well as those of definite salt-forming oxides, are periodic functions of the atomic weights of the elements. At the present time they are merely considerations of a regular periodicity, and not facts actually known, that lead us to assign B_2O_3 to Group VII as its characteristic oxide. Fluorine, so far as we know, forms no oxides at all; and

the highest halogen oxide is of the type R_2O_7 . In fact, Mn is the only member of the group that has an oxide conforming to the type R_2O_7 . Yet, having regard to the successes (to be detailed later) attendant on other predictions of the law, founded only on considerations of symmetry and general plan, all this is simply tantamount to admitting that the conditions of the existence of such oxides as Cl_2O_7 , I_2O_7 , &c., are legitimate subjects for research. Again, in Gr VIII the only oxides of the form RO , yet isolated are RuO , and OsO ,¹ but chemistry is by no means a completely worked out science wanting nothing, and the periodic law would be at fault did it fail to mirror forth such shortcomings and imperfections as still exist. The forms of complex oxyacids are determined by the forms of the maximum oxides, and may be derived from these by replacing O by its equivalent (OH), or H . Thus from SO_3 we can derive the chief oxyacids of S $SO_3(OH)_2$, $SO_2H(OH)$, and SO_2H_2 .

The highest compounds of the elements with halogens also correspond in type to the maximum oxide forms, and therefore exhibit a regular periodicity. In many cases, however, e.g. $TeCl_4$, ICl_3 , $AsCl_3$, only haloids lower in type than the maximum oxides are known, but in no case is a simple haloid known of higher type than the maximum oxide of the element considered

Against the doctrine of a maximum oxide form peculiar to all the members of each group, and of the types assigned (Table, top p 811), the existence of such oxides as K_2O_3 , BaO_3 , &c., has been adduced. In reply it has been pointed out that these oxides belong to the class of peroxides,² all of which are distinguished by their instability in the presence of the so-called 'contact agents,' as well as by their inability to form corresponding salts with a given basic or acidic oxide, as the case may be, and that a generalisation explicitly extending only to salt-forming oxides, strictly so called, cannot be impugned by considerations originating in the study of a class of bodies lying wholly without the pale of its jurisdiction

Yet this reply is scarcely satisfactory, for in certain cases we are bound, in order to justify the principle advanced, to recognise such bodies as PbO_2 and Bi_2O_5 —oxides currently regarded as peroxides. But PbO_2 is undoubtedly an acidic oxide, forming with basic oxides the corresponding plumbates, and Bi_2O_5 would also seem to have the power of forming with strong basic oxides unstable bismuthates—so unstable, in fact, that their true composition is still very doubtful. Hence Mendeleëff (*B* 15, 242) asserts that the oxides in question are *not* peroxides, for, according to him, true peroxides such as BaO_2 , Cr_2O_3 , ThO_2 , H_2O_2 , cannot form corresponding salts,³ and must of necessity contain relatively

¹ Some of the recently isolated carbonyl compounds of the elements of Group VIII. conform to type MO_2 (*O J W*, 748, 59, 1090, *C R* 119, 1481)

² It seems more than probable that a wider study of the higher forms of oxidation will result not only in the discovery of several new peroxides, but also of a distinct periodicity of type amongst this class of bodies also.

³ The recent isolation of persulphates, M_2SO_8 , by Berthelot (*C R* 112, 1481) and Marshall (*O J W*, 771) does not harmonise with Mendeleëff's views. Nor does Péchard's work (*O R* 112, 730, 1080) on higher oxidised compounds of Mo and W

more O than do the maximum salt-forming oxides (acidic or basic) as defined by the periodic law (v also Piccini, *B* 18, *Ref* 255). Still the case of CuO (which cannot be regarded as a peroxide) presents a difficulty, if Cu is rightly placed in Gr. I, for, in accordance with this position of Cu among the elements, the principle under discussion would lead us to expect a maximum salt-forming oxide of the formula Cu_2O .

In conclusion it may be said that although there undoubtedly is some connection between the at wts of the elements and the types of oxides they form, yet with the imperfect methods which we have of representing the periodic law, and in the absence of any firmly grounded and generally recognised classification of oxides, it is impossible to give a hard-and-fast enunciation of this connection.

We may assert that, so far as we are aware, a single atom of an element combines with at most four atoms of O or four atoms of H. The periodic law teaches us that the hydrogen holding power of the non-metals decreases regularly with increasing at wt, while the oxygen-holding power, as measured by the group oxides, increases regularly in such a way that the sum of the number of equivalents of both is equal to eight. For instance, S combines with two equivalents of H to form H_2S , it cannot, therefore, form a higher salt-forming oxide than SO_2 , which contains six equivalents of O.

Some chemists have proposed to extend this principle to the metals, i.e. to Groups I, II, and III. Since Na combines with one equivalent of O to give a salt-forming oxide, it must, they argue, combine with not more than seven equivalents of H or its equivalent. Similarly Ba combining with two equivalents of O must combine with six equivalents of H, and so on. But Brauner (*Sitz W*, 'Math-naturwiss Classe,' 84, 1165) would go still further. Let X denote a single equivalent of any element or radicle ($\text{X} = \text{H}, \frac{\text{O}}{2}, \frac{\text{S}}{2}, \frac{\text{N}}{3}, \text{OH}, \&c$), then he asserts

that the whole of the compounds of Na will be constituted on the types NaX or NaX_2 , or on types intermediate between these two, that all the compounds of Ba will be constituted on some of the types included in the scheme $\text{BaX}_2, \text{BaX}_3$, and so on. In short he would make out that there are certain limiting forms defining the complexities not only of the binary, but of all the compounds formed by each element, and that the range of these limits varies regularly and periodically with the atomic weights. In order to substantiate this view, recourse has been had to formulae not yet authorised by Avogadro's law, and sweeping assumptions are made as to the dispositions of the constituent atoms or atomic groups in the molecules or reacting masses of the bodies taken to exemplify this doctrine of limiting forms. Thus, out of all the numerous compounds of the alkali metals, the only one that can be found conforming to the type RX , is the substance NaOH $\frac{8\text{H}_2\text{O}}{2}$, and then only provided we manipulate the constituent atoms as follows: $\text{Na}(\text{OH})(\text{OH})\frac{\text{H}_2}{2}$. Si belongs to Group IV, therefore, according to Brauner, all its compounds ought to be of the type RX ,

its oxide SiO_2 , certainly conforms to the rule, but the highly characteristic body SiH_4F_2 , does not. Again, can such compounds of Pt as $\text{PtCl}_2\frac{8\text{H}_2\text{O}}{2}$, $\text{PtCl}_2\frac{2\text{HCl}6\text{H}_2\text{O}}{2}$, &c, be regarded as belonging to the type RX_2 ? These are one or two examples, out of very many, of the kind of difficulties that stand in the way of a full recognition of Brauner's extension of Mendelëff's views (v CLASSIFICATION, vol ii pp 210-13).

The idea that the valencies of the atoms vary regularly and periodically with their weights is one which has often been mooted, but in the absence of any recognised definition of valency it is an idea difficult to criticise.

If, as was originally done, the valency of an element be referred back to some constant objective attribute of the atom, and measured by the number of H atoms with which the given atom can combine, a partial periodicity involving only groups IV-VII is undoubtedly apparent.

Group	IV	V	VI	VII
	CH_4 SiH_4	NH_3 PH_3 AsH_3	OH_2 SH_2 SeH_2	FH ClH BrH
Valency	IV	III	II	I.

This conception of constant valency not only lacks in generality (since out of the 70 or so elements only some 17 combine with H), but for the establishment of its validity demands a division of compounds into the two classes of atomic and molecular—a division altogether too artificial to be admitted. If we forgo the idea of constant valency, and merely attempt to define the valency of an element as a number expressing the maximum number of monovalent atoms (H, F, Cl, Br, I) with which a single atom of the element in question combines to form true gaseous molecules, i.e. if we give a mere name to the maximum number of 'equivalents' represented in an atom, the alleged periodicity is still far from being perfect, as the table on the following page, embracing the latest results, shows.

Regarding this question of valency in the light of what has been said of limiting hydride and oxide forms, it is at least apparent that our crude conceptions of valency do not admit of a satisfactory quantitative interpretation. The sulphur atom fixes 2 equivalents of H and 6 of O, the arsenic atom fixes 3 equivalents of H and 5 of O. Why, we may ask, should we decide to overlook these essential relations exhibited by the oxides, to say nothing of the peroxides, and regard the valencies as deduced from the hydrides and haloids merely as fundamental properties of the atoms?

Mendelëff himself regards the theory of valency as extreme and not very valuable. Originating in the study of carbon compounds, valency finds in the domain of organic chemistry its only legitimate application, for the carbon atom, in accordance with its position in the periodic scheme, combines with *equal* numbers of equivalents of H and O, and, further, carbon compounds do not form so-called molecular compounds. He maintains that the forms of chemical compounds (including here isomerism, and therefore structural formulae) are fully explained, without the spurious aid of a statical

theory of valency, in terms of the periodic principle together with more generalised views on substitution involving the recognition of Newton's third law, which states that action and react on are equal (*v A Suppl* 8, 211, *N* 40, 354)

Uses of the Periodic Law—An induction of any value should be suggestive of deductions admitting in their turn of experimental confirmation. Judged from this standpoint, the periodic law is well worthy the exalted position accorded it among the principles of chemistry, for it has opened up immense fields of research which deduction has already, to a small extent, successfully explored.

In order to maintain a general identity of properties in the vertical columns or groups of Mendeléeff's table, it was found necessary to make gaps here and there, to leave certain series unrepresented in the various groups. It was asserted that these empty places in the scheme were the positions of undiscovered elements for which Mendeléeff proposed a provisional and temporary nomenclature. Thus, in the year 1869, the element next to Ca = 40 with a higher atomic weight was Ti = 48, but Ti could not find a place in Group III Series 4, as its properties resemble those characterising Group IV and show no analogies with those of the other members of Group III. Ti was accordingly placed in Group IV Series 4, and the vacancy in Group III Series 4 was assigned to a then unknown element provisionally styled *ekaboron*. The principles of this nomenclature are very simple. The predicted element takes its temporary name from the one immediately above it in the group family, the Sanskrit prefixes *eka*, *dui*, *tri*, &c. being prefixed according as the unknown element is one, two, &c. removes lower down in the family than the name determining element.

Those elements of a family which stand immediately above and below a gap, together with those which immediately precede and succeed it in the series, are called the *atom-analogues* of

the element to which the gap corresponds. Thus B, Yt, Ca, and Ti are the atom analogues of ekaboron. Now it follows from the very nature of the law that the properties of any given element must be determinable from those of its atom analogues, that the properties of ekaboron, for instance, must be similar to, but intermediate in intensity between, those of B and Yt, and at the same time while dissimilar from those of Ca and Ti, they must show an intermediacy in their dissimilarity. Hence it becomes possible to predict the properties of still undiscovered elements, the mean of means of the properties of the atom-analogues forming the basis of the prophecy. How closely the properties of ekaboron thus predicted by Mendeléeff tallied with the properties of Sc experimentally investigated ten years later by Nilson is shown in the article ATOMIC AND MOLECULAR WEIGHTS (vol 1). Even were this case of ekaboron an isolated one, the wonderfully exact concordance between prediction on the one hand and experimental realisation on the other would go far to establish the periodic law as a generalisation of the highest order. But ekaboron is not an isolated example of the prophetic infallibility of the law which has as strikingly asserted itself in connection with the two recently discovered elements Ga and Ge (*q v* vol 11 597, 610).¹ The periodic law is and will be to the science of chemistry what Newton's law of gravitation was and is to the science of astronomy. Neptune had its place assigned in the worlds around us before it was seen, before they were discovered. Sc, Ga, and Ge had their properties detailed and their places assigned them among the elements, which by means of the periodic law have been raised from the level of 'mere fragmentary and incidental facts in nature'.

The validity of Mendeléeff's generalisation has also been confirmed in connection with the question of atomic weights. Before the enun-

¹ It yet remains to be seen whether the new element, aurtiacum, separated by Branner from tellurium ores, will identify itself with dvi tellurium, whose properties have recently been specified by Mendeléeff.

elation of the periodic law the values for the atomic weights formed a series of isolated and purely empirical numbers, the atomic weight of an element once ascertained, there was nothing in the actual numerical value itself, even when considered along with the properties, either to confirm or cast doubt on it as the true atomic weight. But the periodic law teaches that the atomic weights are by no means disconnected quantities, but that, taken in connection with the properties of the elements, their values constitute a series of mutually corrective numbers; in short, the law gives significance to the expression 'the probability of an atomic weight'.

In dealing with this aspect of the law it will be well to distinguish two sets of cases —

α . Those in which the law has actually fixed certain atomic weights indeterminable at the time by other means

β . Those in which the law has merely served to correct the values of atomic weights inaccurately determined by the usual methods

As illustrative of α we may consider the case of Be¹. The equivalent of Be having by accurate experiment been fixed at 4.51, it follows that the atomic weight must be numerically equal to $n \times 4.51$, where n is an integer. At first chemists were led to assign the formula Be_2O_3 to the oxide of Be on account of its isomorphism and many points of similarity with Al_2O_3 . This taken in conjunction with the analysis of the oxide makes $n=8$, and consequently fixes the atomic weight as 13.5. But Brauner repeatedly emphasised the view that the oxide of Be has the formula BeO , and that Be has therefore the atomic weight 9. The keynote of the many arguments advanced by Brauner in favour of his views was the incompatibility of the existence of an element with an atomic weight of 13.5, and having the properties of Be, with the system of the elements as arranged and classified by the periodic law.

In this system he argued that, not only was there no room for an element at wt 13.5, but that the proved existence of such an element would be totally subversive of the law. On the other hand, he pointed out that a vacancy existed in Series 2, Group II, for an element with an atomic weight equal to 9, and a careful examination of the relations of the members of Series 2 as a whole to those of other series, taken along with the known relations of beryllium to the magnesium group, absolutely demanded in his opinion the filling up of this vacancy with the element beryllium. Brauner's views were fully confirmed by Nilson and Pettersson, who succeeded in taking the vapour density of beryllium chloride, the application of Avogadro's law to their results gave the atomic weight of Be equal to 9 and the formula of the oxide BeO .

We are inclined to wonder that the question of the atomic weight of so rare and comparatively unimportant an element as Be has originated such a large amount of work and stimulated such lively discussion, unless we remember that a question of much greater import than the atomic weight of Be was at issue, the validity of the periodic law itself was at stake. And it is of interest to note that Mendeléeff regards the substantiation of Brauner's views on Be as a confir-

mation of his law of the same order as the discovery by Nilson of Sc, the ekaboron of prophecy. In a similar way the suggestions thrown out by the periodic law as to the atomic weights of U, Ce, and In have all met with corroboration. Up to the date of the periodic law, Pélitot's value 120 (= three times the equivalent 40) was received as the atomic weight of U, but Mendeléeff (*l.c.* 178) suggested six times the equivalent, or 240, as the correct atomic weight, thus conferring on U the distinction, which it is now universally admitted to hold, of being the element with the highest known atomic weight.

In 1870 the recognised atomic weight of Ce was 92 (2×46). Mendeléeff (*l.c.* 163), however, showed that no place existed in the system for an element with this atomic weight, and showing the properties of Ce, but that a suitable vacancy existed in Group IV Series 8, if Ce was regarded as having an atomic weight one and a half times the then accepted value. Mendeléeff's proposal has been fully justified by later work on the cerite metals (*C J* 41, 68).

The equivalent of In is 87.8, and formerly its atomic weight was taken equal to twice this, or 75.6. But Mendeléeff (*l.c.* 174) showed the necessity of trebling the equivalent, thus assigning the value 113.4, which is now accepted, to the atomic weight of this metal. Similarly Mendeléeff suggested, what has not yet been very satisfactorily settled, that the atomic weight of yttrium is three times its equivalent number, 29.87 (*v. EARTHS*).

The investigations on tellurium are fairly illustrative of the cases summed under the heading β . The adoption of the value 128 for the atomic weight of Te as determined by Berzelius would necessitate iodine (at w 126.5) taking precedence of Te in Series 7 of the periodic scheme, iodine being thus separated from the rest of the halogens and falling into Group VI with such elements as S and Se, with which it shows no analogies, and Te falling into Group VII with such elements as Cl, Br, and Mn, with which it in turn shows no kinship. This violation of the principle of identity of chemical behaviour in the groups suggested some grave error in the accepted atomic weight of Te, an error causing this element to succeed iodine in the series instead of preceding it, as the general plan of the law requires. The subject has recently been investigated by Brauner (*C J* 55, 382), who for a second time has vindicated the law in a most striking manner by showing that the *ce-devant* tellurium is probably not elemental, and that the atomic weight of unalloyed tellurium is considerably lower than that of iodine, being equal to about 125.

In much the same way the law has led to the correction of the previously accepted atomic weights of osmium, platinum, and gold.

Formerly the accepted atomic weights of Os, Ir, Pt, and Au were in accordance with the scheme

But from the analogies existing between Os, Ru, and Fe, and the disposition of the first two series represented in Group VIII Mendeléeff (*A. l.c.*) predicted alterations of the atomic weights in accordance with the scheme

¹ In what immediately follows the values given for atomic weights and equivalents are only approximate.

This prediction has been fully confirmed by recent researches, it has not, however, yet been found possible to verify and substantiate the results now accepted for the last three metals by the application of Avogadro's law

As will be seen from the case of tellurium, the periodic law in its relation to atomic weight determinations is broadly suggestive rather than accurately definitive. It may be that ere long the discovery of the exact character of the periodicity, which at present we comprehend only vaguely, will raise Mendeléeff's law to the rank of an instrument for the absolute evaluation of atomic weights.

Mendeléeff has repeatedly emphasised the great advantage accruing to students and chemists generally from an adoption of the periodic classification as a working basis—the

	I	II	III	IV	V	VI	VII	VIII
a	$\left\{ \begin{array}{l} C_2H_4 \\ C_2H_2 \end{array} \right.$	C_2H_2	C_2H_4	C_2H_2	C_2H_4	C_2H_2	C_2H_4	C_2H_2
b	$\left\{ \begin{array}{l} NH_2C \\ \text{or} \\ NH_2(CH_3) \end{array} \right.$	NH_2C	NH_2C	NH_2C	NH_2C	NHC	NC	

advantage lying in the great mnemonic power of the law, which, introduced into the disheartening chaos of accumulated chemical fact, at once resolved the complexities of the apparent and rearranged them so as to exhibit the simplicities of the real. With one mental effort we commit to memory a large mass of facts which previously demanded so many independent but severally no less taxing mental exertions. No longer is phosphorus studied as an element apart from arsenic, but the general scheme of properties of the whole fifth group is learnt, and the facts about P, As, V, &c., are easily mastered by remembering their small individual deviations from this general scheme.

The law is also useful in that it points out the directions which should be taken by future research on the as yet unknown compounds of well known elements. It is well called 'the finger post of modern chemistry.' Examples of its utility in this respect have been indicated when treating of the law in its relation to limiting forms and to atomic weight determinations. In fact, every generalisation made in connection with the law suggests new work, organo-metallic compounds of In and Tl, and of the form MR_n (where R = organic radicle) must be forthcoming (*v. supra*, ii), a suboxide of Os having the formula Os_2O is looked for (*v. iii*), while various new peroxides of Mo and W, also a true peroxide of lead (Pb_2O_3) are very probable realisations of the future (*v. v*).

Theories having their origin in the Periodic Law—Although, according to Mendeléeff (*C J* 55, 684), the periodic law, solely founded as it is on the solid rock of well-ascertained chemical fact, in no way indicates the nature of the elements nor predicates the existence of a unique matter, yet many have made it a peg whereon to hang theories respecting either the compound nature of our elements or the existence of a primordial matter.

The simple relations holding between the

* The existence of Curium's azotimide N_2R was foreseen by Mendeléeff (*B* 29, 2464).

atomic weights of elements constituting some of the natural families, and the analogy between the relations so obtained and those found between the molecular weights of members of homologous series, led Dumas (*C R* 45, 46, 47) and Gladstone (*P M* [4] 5, 313) to suggest that the so called elements are not primary, but are composed of two or more simpler elements.

Pelopidas (*B* 16, 1868) called attention to the fact that the residues of hydrocarbons and nitrogenous organic bodies can be arranged in a periodic system, exhibiting in the number of members constituting the period, as well as in the gradual passage in each period from basic to acidic characters, a close analogy to Mendeléeff's periodic arrangement of the elements. The following are examples of the periods arranged by Pelopidas.—

The monovalent radicles $NH_2(OH_2)$ and C_2H_5 , undoubtedly show many analogies with the alkali metals, and CN has always been compared with the halogens of Group VII. Sulphur, Group VI, forms the acid $SO_2(OH_2)$, so the radicle C_2H_5 forms the acid $C_2H_5O_2(OH_2)$, and so on.

Carnelley (*C N* Nos 1875 and 1878), from a consideration of the fact that the salient physical properties of the normal halogen and alkyl compounds of hydrocarbon radicles exhibit relationships similar to those of corresponding compounds of the elements, develops the view that elements are analogous to the hydrocarbon radicles both in form and function. On the supposition that C and H are true elements, he then attempts to draw up a scheme of compounds of two primary elements, A and B, corresponding to Mendeléeff's scheme of the alleged elements, the compounds possessing the same 'atomic weights' and showing the same periodicity as the accepted elements. In this scheme the elements appear as bodies of the type A_nB_{m+n-2} , where n is the group and m the homologous series to which the element belongs, A is a tetrad element identical with carbon, and B, 'probably the ethereal fluid of space,' is a monad element with atomic weight = -21. These views of Carnelley are as much in advance of the earlier ones of Dumas and Gladstone as is the periodic law in advance of their disconnected schemes of classification, but they cannot be regarded otherwise than as ingenious and bold speculations indicating the directions in which investigations on the *rationale* of the periodic law, and on the nature of the elements, will probably be prosecuted before we arrive at anything approaching the truth, either concerning the law on the one hand or the elements on the other.

The attempt to discover some kind of unity in the sea of apparent diversities by which we are surrounded, or, rather, the natural inclination to assume such a unity, is as old as philosophy itself. Prout merely gave scientific definiteness to the views of the early Grecian philosophers when he suggested that the atomic

weights of all the elements were whole multiples of that of hydrogen, which he identified with the primary matter, and in later years many have in turn thought to find in the periodic law a warranty for resuscitating the principle underlying Prout's law, at the same time either shifting the primary matter lower down in the scale, so that hydrogen itself appears as a highly condensed form of matter, or not attempting in any way to particularise concerning the primary matter.

The application of recent developments in spectroscopy, combined with improved methods of fractionation, has resulted in the view that many of our so called rare elements at least are not strictly elemental (*v* METALS, RARE, and ELEMENTS). At first sight the large increase in the number of recognised elements which this recent work involves would seem to militate against the indications of the periodic law. But Crookes (*C J* 53, 487) has attempted to show that the new views may be brought into complete harmony with the periodic law if we will but admit into chemistry the principle of evolution. Granted that the different forms of matter have been cyclically evolved from a primitive formless fluid (protyle), and that the units of Mendeleeff's generalisation are rather 'elementary groups' than true elements, then the periodic law with its limited accommodation necessarily follows (*v* also Mills, *infra*).

Some attempts have recently been made to express the atomic weights of the elements by means of general algebraic formulæ. While it must be allowed that we are more likely to arrive at clear views regarding the periodicity of the elements through methods founded on the theory of numbers than through methods of a purely geometrical nature, yet many of the researches so far undertaken in this direction do not even promise to help towards the final solution of the periodic law. In a few cases expressions have been obtained which, as they involve constants numerically equal to some of the important constants occurring in the principles of chemistry, may on a more detailed study culminate in a clearer understanding of the nature of the elements and the rationale of the law. Mills (*P M* [5] 18, 393, 21, 151) arranges all the elements according to their atomic weights, and then subdivides this arrangement into sixteen groups. He then finds that all atomic weights are involved in the logarithmic expression $15 p - 15 (9375)^x$, in which x is an integer and p is the group number of the element considered. This expression arrived at empirically is, according to Mills, such as we should expect if we regard the elements as stable, but more or less incomplete, stages in the polymerisation of the primary matter as it cooled. It is also noteworthy that the above expression, in that it points to the existence of an upper limit to our existing system of atomic weights, confirms views originally expressed by Mendeleeff.

Carnelley's attempt (*P M* [5] 29, 97) to give a general expression to the atomic weights of the elements is of more interest in that it is founded, not on a conveniently assumed and artificial

periodicity, but on the natural periodicity as this finds expression in Mendeleeff's schemes.

Carnelley's equation is $A = c(m + \sqrt{v})$, where A = approximate atomic weight, m = a member of an arithmetical progression depending on the series to which the element belongs, v = number of the group of which the element is a member, and c is a constant.

Excluding the elements of the first three series (typical elements), the expression for the atomic weights of all the other elements may be thrown into the more convenient form

$$A = c(3\frac{1}{2}a - 9 + \sqrt{v}),$$

where a is the number of the series to which the element belongs. In his paper, Carnelley notes the following points of interest: the mean value of $c = 6.64$ is nearly identical with the mean value of the atomic heats of the elements. Assume that c in the above formula actually represents atomic heat, then it follows that the specific heats of the elements should be

given by the expression $\frac{1}{m + \sqrt{v}}$, and this is

found actually to be the case. It should be noted, however, that these coincidences may be purely accidental and meaningless, being simply the result of the particular units adopted. *D C*

PERSEITE C_8H_8O , [188°] 8 5 at 18° Mol *w* (by Raoult's method) 179 (calc 212) A body resembling mannite, occurring in the fruit and leaves of *Laurus persca* growing in the tropics (Muntz a Marcant, *C R* 99, 38, *A Ch* [6] 3, 279, Maquenne, *A Ch* [6] 15, 5, *C R* 106, 1235, 107, 583, 658, Dehérain, *C R* 108, 101, cf Avequin a Melsens, *A Ch* [2] 72, 109). Extracted by water at 60°, the extract treated with lead acetate, filtered, freed from lead by H_2S , concentrated, and mixed with $MeOH$. Formed by reduction of mannoheptose by sodium amalgam (E Fischer a Passmore, *B* 23, 2228). Small needles (from alcohol), sl sol cold, *v* sol hot water and alcohol. Its solution becomes dextro rotatory when borax is added. Does not reduce Fehling's solution or undergo alcoholic fermentation. On oxidation by nitric acid it yields mannoheptose $C_8H_{16}O$, and finally oxalic acid. Boiling HI and P give C_8H_{12} (c 104°) and C_8H_{10} (190°–200°). HCl yields C_8H_{11} (92°). An alcoholic solution treated with HCl and benzoic aldehyde yields $C_8H_{12}(CHPh)_2O$, [c 219°].

Acetyl derivative $C_8H_8(OAc)_2$, [119°] Crystalline powder, insol water, sol alcohol. Butyryl derivative $C_8H_8(O C_4H_9)_2$, (c 300° *in vacuo*) Syrup.

Nitrate $C_8H_8(NO_3)_2$, [138°] Made from perseite (1 pt), fuming HNO_3 (5 pts), and conc H_2SO_4 . White needles, insol water, sol hot alcohol. Explodes when struck.

PETROCENE The highest boiling portion of American petroleum contains, according to Hemlin (*B* 9, 1604), a hydrocarbon $C_{12}H_{22}$ [above 300°] crystallising from benzene in yellow laminae. Prunier (*A Ch* [5] 17, 28) found carbopetrocene $C_{12}H_{22}$ [268°] which yielded $C_{12}H_{18}C_6H_5N_2O$, [185°] and $C_{12}H_{18}C_6H_5N_2O$, [135°]. Prunier also found, in petroleum, petrocine $C_{12}H_{22}$? [102°] yielding $C_{12}H_{18}C_6H_5N_2O$, [98°] and a hydrocarbon $C_{12}H_{22}$? [119°]. *V* also PETROLOX.

PETROLOX. *Earth oil, Rock oil, Naphtha, Mineral oil, Erdöl, Steindl, Petrole, Huile de*

* G J Stoney has also arrived at a logarithmic expression for the atomic weights (*G J. Proc.* 1888, 68).

Pierre, Bitume liquide Petroleum is the general name given to the natural oily liquids occurring in the earth at different depths and in many localities. The natural oil is a mixture of several hydrocarbons, has a strong bituminous smell, but differs very considerably in its physical properties and chemical composition. It is found in large quantities in the United States, in the Caucasus, and in the country situated at the mouth of the Danube, in considerable quantities in Burmah and in Galicia, and has been found in Persia, the West Indian islands, Italy, parts of Germany, Switzerland, China, India, France, and England. Its specific gravity ranges from 77 to 11, and its colour from pale yellow to brown, dark green, and black. The colour of crude petroleum not only varies with the locality, but varies from time to time in the same district. B. Redwood has recorded the colours of various kinds of crude petroleum (*Journ Soc Arts*, 34, 823, 878), and Lovibond's tintometer is used for determining the colour of commercial samples. Crude petroleum varies considerably in its composition, that from North America consisting chiefly of hydrocarbons of the C_nH_{2n+2} series, while that from Baku (Caucasus) contains in addition the hydrogenised aromatic hydrocarbons of the general formula C_nH_m (Beilstein & Kurbatow, *B* 13, 1818, 2028) and small quantities of other hydrocarbons (Markownikow & Ogobine, *J R* 15, 237, 307). Galician petroleum contains hydrocarbons of the series C_nH_{2n+2} and C_nH_{2n-4} (Freund, *A* 115, 19), and also the hydrogenised aromatic hydrocarbons of the formula C_nH_m (Lachowicz, *A* 220, 168). Crude petroleum also contains small quantities of compounds containing sulphur, nitrogen, and oxygen. 0.23 per cent of nitrogen has been found in petroleum from Ohio, and 1.11 per cent in that obtained from California. Beilby has also found 0.5 per cent of nitrogen in Baku oil and 0.188 per cent in Galician ozokerite. Crude American petroleum contains at least 0.008 per cent of nitrogen (*S C I* 10, 120). Sulphur amounts to 1.87 per cent in certain Russian petroleum, and is present in that obtained from California, Lima, Ohio, and Canada, but is absent from Pennsylvanian and West Virginian oils (Vohl, *D P J* 216, 47, Woodman, *A C J* [1891] 13, 179). From the variable composition of crude petroleum it follows that its volatility will be very different, the several constituents of crude petroleum extending from the gaseous members of the marsh gas series to solids which boil at 400°. As a rule, the petroleum with lowest specific gravity is the most volatile and inflammable. Crude petroleum also may contain water and sediment, and is tested commercially for its specific gravity, odour, colour, its feel when rubbed between the fingers, and the percentage of naphtha (or portion volatile below 150°) yielded on fractional distillation (Allen, 'Commercial Organic Analysis,' 11, 869, Nawratne, *D P J* 246, 323, 423). The flashing-point and burning point of petroleum are also important factors for ascertaining its commercial value, but these tests are usually applied only to the refined petroleum or kerosene, which consists of the more volatile portions of the crude oil which can be burned with a wick (*Petroleum Act*, 1871, 84 and 85 *Visc. cap.*

105, *Petroleum Amendment Act*, 1879, and for variation of flashing point with climate *S C I* 1, 471, *C N* 40, 305, 49, 196). For calorific values of petroleum, see Deville, *C R* 72, 195, and 68, 848. Co-efficient of absorption of oxygen is higher for petroleum than for water (*Zett Phys Chem* 1, 70). When crude petroleum is distilled, the various fractions are separately collected and used for a variety of commercial purposes. In America the distillation is conducted in large stills, and the first fractions, known as 'cymogene' and 'rhigolene,' are condensed by artificial cold and pressure. The fraction which next comes over, having a density increasing from 636 to 725 or 750, is separately collected, and when re-distilled is termed 'gasoline,' 'naphtha,' and 'benzine.' The next fraction consists of oils of *S G* 75 to 84, and is known as 'kerosene' or 'photogene', while the residue is distilled in other retorts for lubricating oils, *S G* 84-9, and solid paraffin, until coke is left as a residue combustible with difficulty. Petroleum ether is the fraction containing hydrocarbons of *S G* 625-665, and consists of 'rhigolene' and 'gasolene,' while petroleum spirit or benzoline consists of the 'naphtha' and 'benzine' fractions, *S G* 68-745.

In Russia the petroleum is distilled in a series of stills in a continuous process, and yields three fractions: light benzene, *S G* 754, 'gasolene' or heavy benzene, *S G* 787, and kerosene, *S G* 825. The residue on further distillation yields (1) lubricating oils, (2) solar oil, and (3) 'astatki,' which last is either used as fuel or distilled at a red heat, yielding benzenes and anthracene. Baku petroleum contains only traces of solid hydrocarbons, while that from the Caucasus yields about 6 per cent of paraffin (*B Redwood, S C I* 4, 74).

In Germany the crude naphtha is refined into four distinct products:

Petroleum ether (40°-70°) *S G* 0.640-0.650
Benzene (70°-120°) *S G* 0.700
Ligroin (120°-135°) *S G* 0.730
Cleaning oil (130°-160°) *S G* 0.745-0.750
(Schenkel, *Chem Ind* 13, 512)

Further details on the petroleum industry, and the properties and uses of these commercial products, will be found in Thorpe's *DICTIONARY OF APPLIED CHEMISTRY*.

Early Literature—Before 1864 very little accurate knowledge of the chemical constitution of the various petroleum oils was known, the earlier investigations chiefly recording the localities in which the oil had been found, its physical properties, and its behaviour on distillation.

On the next page is a list of the more important of these examinations.

AMERICAN PETROLEUM Pelouze & Cahours (*C R* 54, 124, 56, 505, 57, 62) made a systematic investigation of the Pennsylvanian oil in 1864, and showed that it contained hydrocarbons of the formula C_nH_{2n+2} , including representatives of every member of the series from C_2H_6 to $C_{10}H_{22}$. Ronalds added C_2H_4 , C_3H_6 , and nC_4H_{10} to this list (*C J* 18, 529). Above 280°, the boiling-point of the highest of these hydrocarbons, the oil yields 3 fusible paraffins (45°-85°), and they when distilled in closed vessels were resolved into other C_nH_{2n+2} and C_nH_{2n-4} hydro-

carbons Schorlemmer found small quantities of benzene and its homologues, and Beilstein a Kurbatoff a hydrogenised aromatic hydrocarbon of the C_nH_{2n} series, which they isolated and determined to be hexahydro metaxylene.

The paraffin hydrocarbons above alluded to have also been examined in detail, and in many cases their constitution determined.

In the neighbourhood of the North American oil wells methane is evolved, and is associated with ethane in the gases which issue from the De la Mater well at Pittsburg (Sadler, *Am Ch* 1876, 98, Fouqué, *C R* 67, 1015). Ethane, propane, and n butane exist dissolved in the petroleum. Of the higher paraffins the following have been isolated.

C_5H_{12} , n pentane, dimethyl-propane,

C_6H_{14} , n hexane, ethyl iso butane,

C_7H_{16} , n -heptane and an isomeride;

either dimethyl-diethyl methane or methyl-ethyl isopropyl methane (Schorlemmer, *C J* 26, 319),

C_8H_{18} , n octane and an isomeride,

$C_{10}H_{22}$, two isomerides exist (Lemoine, *Bl* [2] 41, 164)

α (136°) SG 1.0742

β (130°) SG 1.0734

$C_{15}H_{32}$, constitution not known (160°) Pelouze & Cahours, (156°) Wurtz, *Bl* 1863, 300, (160°) SG 1.0753 Lemoine. The solid paraffins $C_{22}H_{44}$, $C_{24}H_{50}$, and $C_{26}H_{54}$ have also been separated (*V* also Greville Williams, *Tr* 1857, 737, *O J* 15, 180, Pelouze & Cahours, *A Ch* [4] 1, 5, *J* 1862, 410, Warren, *Z* 1865, 668, *J* 1868, 380, Warren & Storer, *Z* 1868, 228, Lefebvre, *Z* 1869, 185, Schorlemmer, *Tr* 182, 111, Ronalds, *Z* 1865, 523, *O J* 18, 54, *J pr* 95, 421, Wurtz, *A* 96, 372; and for the occurrence of the same hydrocarbons in boghead coal and seal oil, Schorlemmer, *A* 125, 109, Williams, *A* 125, 107, and for a comparative table showing the C_nH_{2n+2} hydrocarbons found in petroleum, or by distilling paraffin and reducing the fatty acids, Beilstein, vol i 186). Warren also obtained the olefines $C_{14}H_{28}$, $C_{16}H_{32}$, and $C_{18}H_{38}$ from American petroleum, and traces of volatile benzene hydrocarbons and the hydro benzene compounds present in Canadian oil have also been detected in this oil. Canadian petroleum contains a somewhat greater percentage of aro-

matic hydrocarbons, and is further characterised by its large amount of sulphur derivatives.

The action of heat on American petroleum products has been studied by many observers. When the crude oil is heated alone the lower members of the C_nH_{2n+2} series of hydrocarbons are evolved as gas. As the temperature increases the higher paraffin hydrocarbons distil over, but at the same time vapours are evolved which are absorbable by bromine. Le Bel examined this product, and found it to consist of bromides of the olefines C_2H_4 , C_3H_6 , C_4H_8 , C_5H_{10} , C_6H_{12} , and that there are isomeric compounds of the higher members of the series. They have been separated either by fractionating the bromides obtained in this way, or by their different behaviour towards cold HCl. Acetylene and crotonylene are also formed, and other less hydrogenised hydrocarbons. When the vapour of petroleum ether, or the fraction (50°-80°) and containing chiefly C_5H_{10} , C_6H_{12} , and C_7H_{14} , is passed through a red hot tube it yields C_2H_4 and C_3H_6 , and hydrocarbons absorbable by bromine. These, according to Prunier, are acetylenes consisting of crotonylene C_3H_4 , and traces of C_4H_6 , C_5H_8 , and C_6H_{10} .

Petroleum spirit (70°-120°) contains the hydrocarbons C_5H_{10} , C_6H_{12} , and C_7H_{14} , and the rectified oil (150°-280°) the paraffins from C_8H_{18} to $C_{16}H_{34}$, the crude fraction, however, contains hydrocarbons which are dissolved by sulphuric acid. The heavy oil (above 400°), used for lubricating purposes, has not been carefully examined. Vaseline is the next product obtained on distilling the crude oil, the distillation for heavy oil being stopped as soon as acid vapours begin to be evolved. Little is known as to the constitution of its hydrocarbons. When vaseline is not manufactured the distillation is continued until solid paraffin distils over. The solid residue, rich in carbon, also contains hydrocarbons, and in it or in the solid paraffin have been found, besides the higher paraffins, anthracene, phenanthrene, chrysene, pyrene, chrysogen (Fritzsche, *O R* 54, 910), parachrysene (Raschack), benzerythrene (Schultz), and fluoranthrene (Prunier, *Bl* [2] 81, 293). A hydrocarbon $C_{12}H_{24}$ isomeric with acenaphthalene, has also been isolated, and there are indications of the presence of quinones. From the coke Prunier and Varetine have also succeeded, by the action of solvents, in extract-

ing small quantities of hydrocarbons containing a very high percentage of carbon

From a green solid (190° - 240°) obtained from Pittsburg, and called 'petrocene' or the 'new product,' formed by the distillation of the residue after the ordinary paraffin had come over, Pruner isolated hydrocarbons which are called carbozene, carbopetrocene, and thallene. Analysis shows that they contain 96-97.7 p.c. of carbon, and have formulae, therefore, ranging from $(C_6H_4)_n$ to $(C_6H_2)_n$, where n is variable but higher than 4.

Gustavson has studied the action of Al_2Br_6 and HBr on the different fractions of petroleum ether. The fraction (67° - 70°), and chiefly hexane, gave by this treatment a solid from which he obtained an orange liquid $C_6H_5AlBr_2$, which decomposes above 120° and on addition of water it is insoluble in the hydrocarbons from which it is derived, and in CS_2 , but soluble in $EtBr$. The other fractions give similar results, but not such a good yield.

Beilstein and Kurbatoff, by the action of HNO_3 on the fraction (95° - 100°), obtained a nitro-compound $C_6H_5(NO_2)$ (195°), and soluble in KOH . The fraction (115° - 120°) similarly treated also gave acid nitro-products, called by the authors trinitro isoxylene.

Russian petroleum. The Baku oil has been the subject of much investigation, and it apparently is a more complicated mixture than the American product. Its density, according to Mendeleeff, varies from 881-886 at 15° , and its variation with temperature is given by the

$$\text{equation } \frac{d\Delta}{dt} = -[0.00635d - 0.000015d^2 - 1.44],$$

since the co-efficient of variation of density with temperature can be considered constant for any given hydrocarbon. The densities d range between 750 and 900.

Baku petroleum gives off a large volume of inflammable gas, and leaves on distillation a vaseline having all the properties of the American product save that its density is higher. The low boiling portions of the oil contain some hydrocarbons of the C_nH_{2n-2} series, and marsh gas is evolved in the neighbourhood of the Caspian Sea, but Schutzenberger and Ionnine found that the major portion of the hydrocarbons present were characterised by great inertness, and had a composition represented by the formula C_nH_{2n-2} , being isomerides of the olefine series of hydrocarbons. The hydrocarbons were called paraffenes ($C R$ 91, 823), and were found not to form addition products with Br , fuming HNO_3 , nor H_2SO_4 . They found that the vapours, when passed through a red hot tube, produced aromatic hydrocarbons, and at a dull redness gave products which unite energetically with Br , and are converted into resins by H_2SO_4 . Chlorine and a little iodine convert them into unstable chloro compounds, which cannot be distilled without decomposition. Of the several hydrocarbons present they isolated two, (221°) and (231°), and found that the latter had a V.D. corresponding to the formula C_6H_4 . Subsequent investigators have concluded that these paraffenes are the hexahydrides of the benzene series of hydrocarbons which are now called naphthenes, similar to those obtained syn-

thetically by Wreden (A . 187, 161), who described the following—

C_6H_{12} , hexahydrobenzene, S.G. 76 (69°);
 C_6H_{10} , hexahydrotoluene, S.G. 772 (97°);
 and C_6H_8 , hexahydroisoxylene, S.G. 771 (117°)
 Beilstein & Kurbatoff have found the isomeric hexahydrometaxylene (B 13, 1820, $C J$ 40, 159, also Markownikoff & Spady, B 20, 1850) in Russian petroleum, and subsequent investigations have established the presence of a series of naphthenes from C_6H_{12} to $C_{10}H_{18}$. Markownikoff (A 234, 89-115) has also obtained similar results, and has shown that the naphthenes are the chief constituents of the oil boiling below 300° . The fraction distilling (210° - 330°) under 20 mm also contains a large percentage of these C_nH_{2n-2} hydrocarbons. In addition, he isolated in the fraction (35° - 250°) the following aromatic hydrocarbons C_6H_6 , $C_6H_5(CH_3)$, C_6H_4 , isoxylene, p -xylene, C_6H_4 , pseudo cumene and mesitylene, C_6H_4 , durene, isodurene and another (diethylbenzene?), $C_{11}H_{16}$, diethyl toluene and isomerides, and hydrocarbons of the formulae $C_{11}H_{14}$ (styrene?), $C_{11}H_{12}$, $C_{11}H_{10}$, and $C_{11}H_8$. Markownikoff and Oglobine, from the fraction (210° - 330°) under 20 mm obtained evidence of the presence of oxygenated compounds of both acid and neutral characters (B [2] 41, 258), and obtained a denser naphthene $C_{11}H_{16}$. Engler has also confirmed the presence of mesitylene and pseudo cumene (B 18, 2234) in Caucasian petroleum (v also Le Bel, $C R$ 103, 1017-1019).

Aschan has isolated from the Baku oil, acids of low carbon percentage derived from hexa-, hepta-, and octo naphthenes. From the heptanaphthene carboxylic acid by P and HI he has prepared an octonaphthene (117°) under 742 mm S.G. ≈ 0.7706 , identical with that obtained by Markownikow from the Caucasian oil (B 24, 2710, and Zaloziecki, B 24, 1806). On the formation of acid compounds in petroleum v Zaloziecki, $Z f$ *Angew C* 1891 410.

The oil of still higher boiling-point consists of naphthines C_nH_{2n-2} , or hydrocarbons probably derived from the naphthenes by the high temperature, together with C_nH_{2n-4} hydrocarbons and about 10 p.c. of true benzene compounds, which are homologues of styrene. When the naphtha residues are distilled at temperatures above 400° , dissociation of the high boiling products takes place, and fresh low-boiling hydrocarbons are formed. According to Lissenko a Rosenblatt, the best yield of low-boiling products is obtained at a temperature 434° - 437° (Berg, $J R$ 1897, 349), but Nobel gives 400° as the best temperature for maximum dissociation ($D P J$ 266, 226). The Nobel brothers obtain benzene, naphthalene, and anthracene from their petroleum residues at Baku ($D P J$ 246, 429-432). Beilstein & Kurbatoff have studied the action of nitric acid upon Russian petroleum. They find that the fraction (95° - 100°) is oxidised to succinic and several volatile acids, and at the same time a nitro compound $C_6H_5(NO_2)$ (219°) is formed. The corresponding fraction of American petroleum under like treatment yields a nitro-body $C_6H_5(NO_2)$ (195°). The fraction (115° - 120°) gives crystals of α -nitro-isoxylene. Markownikoff & Oglobine isolated the above-mentioned

hydrocarbons chiefly by treating the several fractions of the oil with concentrated H_2SO_4 , and separating the sulphonates produced. About 15-20 per cent of the fraction (180° - 280°) is converted into these sulphonates. Chiefly mono and di-acids derived from the hydrocarbons C_8H_{18} , C_9H_{20} , $\text{C}_{10}\text{H}_{22}$, $\text{C}_{11}\text{H}_{24}$, and $\text{C}_{12}\text{H}_{26}$. The naphthenes are not attacked by conc H_2SO_4 , but fuming acid converts them into resins. The principal sulphonates isolated are $\text{C}_{11}\text{H}_{22}\text{SO}_3\text{H}$, 2 isomers $\text{C}_{10}\text{H}_{20}\text{SO}_3\text{H}$, $\text{C}_9\text{H}_{18}\text{SO}_3\text{H}$, $\text{C}_8\text{H}_{16}\text{SO}_3\text{H}$, $\text{C}_7\text{H}_{14}\text{SO}_3\text{H}$, and $\text{C}_6\text{H}_{12}\text{SO}_3\text{H}$. Schutzenberger has shown that a bright red heat dissociates the low boiling naphthenes into benzene derivatives, while a dull heat determines the formation of butylene, and crotonylene and its homologues. The oil obtained from Tiflis appears to be intermediate in character to that of the American and Baku products. Beilstein a Kurbatoff (*C J* 40, 1020) isolated from samples of this petroleum, n pentane, isopentane, and a butane in the (30° - 35°) fraction, a hexane and naphthenes in the (70° - 75°) fraction, and a heptane, benzene, and toluene in the (95° - 100°) fraction. They also obtained from this oil, by the action of HNO_3 , a dinitro-compound $\text{C}_8\text{H}_6(\text{NO}_2)_2$, [95°] (*v* also Le Bel, *C R* 103, 1018).

The petroleum found in Germany and Galicia is characterised by a large amount of aromatic hydrocarbons, and Kraemar & Bottcher hold that the hydrocarbons of German petroleum and Baku oil differ from coal tar and shale tar oils only in the relative proportions of those hydrocarbons which are attacked by conc H_2SO_4 and HNO_3 (*B* 20, 595-609).

Engler has made a very systematic investigation into the composition of the German oils, and has isolated or identified the following substances: gases CH_4 , CO , CO_2 , N , C_2H_4 , and homologues, in the first fraction (below 150°) C_2H_6 , C_3H_8 , and C_4H_{10} , in the fraction (160° - 182°) pseudo-cumene and mesitylene, and in the higher-boiling portion solid paraffin. The oil from Oelheimer and Wietzer contains saturated hydrocarbons, naphthenes, but no solid paraffin nor volatile products below 150° . The Tegernsee oil is especially rich in aromatic hydrocarbons (Engler, *D P J* 267, 550-570, 592-597, 268, 76-90). Engler has also detected phenols and fatty and oleic acids in many specimens. Boussingault has also isolated from Alsatian petroleum, petrole, and a black colouring matter similar to that found in Alsatian bitumen and in Galician oil (Le Bel, *Bi* 1888, 359).

GALICIAN PETROLEUM contains hydrocarbons of the $\text{C}_n\text{H}_{2n+2}$ and $\text{C}_n\text{H}_{2n-6}$ series (Freund, *A* 115, 91). It has also been examined by Lachowicz (*A* 220, 168), who finds in the low boiling fraction (80° - 125°) the following hydrocarbons: isopentane (30°), n pentane (37°), hexane (60°), n heptane (99°), ennane (148°), SG Ψ 742, two decanes (152°), SG Δ 7187 and (162°) SG Δ 7324, benzene, toluene, xylene, and mesitylene, but no olefines. From the high SG of the benzene fractions he also infers the presence of naphthenes (hexahydro toluene and hexahydro isoxylene). Pawlewski has also found 2 p.c. of aromatic hydrocarbons, principally benzene and p xylene, in Galician oil. According to Bandrowski, this

petroleum contains a small quantity of a basic body resembling the alkaloids (*M* 8, 225), and Weller has also detected the presence of bases in the yellow oil (SG 85) obtained from Saxon petroleum (*B* 20, 2098). On the Galician petroleum industry *v* Redwood, *S O I* 1892.

BURMESE PETROLEUM has only been perfectly examined Romanis has found gas, benzene, and solid paraffin in the crude oil and 5 p.c. of solid paraffin in that refined at Rangoon. It solidifies at 24° , and has a SG 85-9. From another district in Burma (Arracan) a mineral oil is obtained which contains benzene and its homologues, but does not solidify. Its SG is also lower, 825 (*C N* 59, 292).

The origin of petroleum—Mendeléeff has given considerable attention to this subject, and has advanced strong reasons for believing that mineral oils have not been produced like coal from the decomposition of past vegetation. He believes that it is formed in the depths of the earth beneath the very site on which it is found, since it cannot be water borne. The absence of any large masses of organic matter in the oil districts negatives the vegetable origin of petroleum. In Europe the oil wells belong to Tertiary and late geological periods, but in America and Canada the oil bearing sands are found in the Devonian and Silurian formations, and hence below the carboniferous beds. The oil beds also always run parallel to mountain ranges, and Mendeléeff believes that water has found its way through the fissures formed at the upheaval of these ranges to the heated metallic carbides below, resulting in the formation of metallic oxides and hydrocarbons, the chemical composition of which depends upon the conditions of temperature and pressure under which they are formed. This origin of petroleum is supported by the frequent presence of sulphur in crude oils, by the asphaltene containing a mineral ash consisting of oxides of Fe, Al, Cu, Ca (Ag), and by the non saturated nature of many of the hydrocarbons. The occurrence of petroleum in the lavas of Etna lends additional support to this theory (Silvestri, *G* 1877, 1). Hoefer, Engler, Leopold *v* Buch, Sterry Hunt, and many geologists believe that petroleum has been formed by the decomposition of organic matter of animal origin, and advance the presence of nitrogen compounds and direct experiments with animal fats in support of their view. On the origin of petroleum see *Neues Wörterbuch*, iii 39, Byasson (*M* 8 1876, 1077), Mendeléeff (*Revue Scientif* 1877, 409), Anderson (*B A* address, 1889), Engler (*B* 21, 1816-1827), Hoefer (*Mineralindustrie* in *Boiley's Technologie*), Zoloziecki (*D P J* 280, 69, 85, 138), Watson Smith (*S O I* 10, 979) S R

PETROLEUMIC ACID *v* HENDECENOIC ACID.
PETTENKOPFER'S REACTION A blood red colour on warming with cane sugar and conc H_2SO_4 . The colour is produced by the bile acids, cholic acid, and many other bodies. Furfural aldehyde may be used instead of sugar (Mylus, *H* 11, 492, *v* also vol i p 508).

PEUCEDANIN *v* IMPERATORIN.

PEWTER An alloy of Pb and Sn; *v* this vol p 125.

PHACONIN *v* PROTEINIS.

PHASEOMANNITE *v* INOSITE.

PHASOL $C_{15}H_{24}O$ [190°] $[\alpha]_D -30.6^\circ$ in a 4 p c chloroform solution. Found in the husks of peas (*Pisum sativum*) (Lukernik, *B* 24, 188). Groups of tables (from alcohol), insol water, v sol hot alcohol and ether. Gives a purple colour on shaking its chloroform solution with H_2SO_4 of SG 1.74.

PHELLANDRENE A dextrorotatory modification of this terpene occurs in oil of elemi, a levorotatory variety in Australian eucalyptus oil (Wallach, *A* 246, 234). The dextrorotatory variety occurs also in the seeds of *Phellandrium aquaticum*, and in oil of fennel (v TERPENE).

PHENACETURIC ACID $C_{11}H_{11}NO_3$, $\pm C_6H_5CH_2CO.NH.CO_2H$ [143°] S 7 at 11°. Occurs in horses' urine (Salkowski, *B* 17, 3010). Found in urine after taking phenyl acetic acid (Salkowski, *H* 7, 162). Prepared by digesting phenyl acetic anhydride with glycochol and benzene (Hotter, *J pr* [2] 38, 97, *B* 20, 84). White laminae (from water) or cubes (from alcohol). On nitration it gives *p* nitro phenaceturic acid [173°] — CaA' , 2aq S (of CaA') 3 at 11° — CuA' , aq — AgA' amorphous insoluble pp.

Methyl ether MeA' [86.5°] Needles

Ethyl ether EtA' [79°] Prisms

n Propyl ether PrA' [31°] Plates

Amide [174°] Pearly tables

PHENACONIC ACID A name given by Carius to a mixture of maleic and fumaric acids.

PHENACYL The radicle $C_6H_5.CO.CH_2$.

DI PHENACYL ACETIC ACID v DI BENZOYL-ISOBUTYRIC ACID

DI-PHENACYL-ACETOACETIC ETHER

$(CH_2Bz)_2Cac.CO_2Et$ [83°] Made from acetoacetic ether, NaOEt, and phenacyl bromide (Paal & Hoermann, *B* 22, 3225). Monoclinic crystals, sl sol cold alcohol, v sol CS. Alcoholic NH₃ at 125° forms two bodies [136°] and [192°].

Mono-oxim [63°] Flakes

Di-oxim [63°] Flakes

Tri-oxim [68°] Flakes

Di-phenyl di hydrazide $C_{18}H_{15}N_3O_2$ [88°–92°] From the ether and phenyl hydrazine

PHENACYL- α -AMIDO BENZOIC ACID

Formyl derivative

$CH_2Bz.N(CHO).C_6H_4.CO_2H$ [184°] Got by oxidising quinoline phenacylo bromide with $KMnO_4$ (Bamberger, *B* 20, 3342). Tables (from alcohol), sl sol cold water.

PHENACYLAMINE $C_6H_5.CO.CH_2.NH_2$.

ω Amido acetophenone Got by decomposing phenacyl phthalamic acid [160°] with conc HClAq (Goedeckemeyer, *B* 21, 2687). Converted by NH_3 into di-phenyl pyrazine — $B'HCl$ [188°] — $B'H_2PtCl_2$ [c 210°] — $B'C_6H_5N_2O$ [176°] Yellow needles.

PHENACYL ISOAMYL MALONIC ACID

$C_6H_5.CO.CH_2.C(OH)(CH_3)(CO_2H)$ [160°] Made from sodium isoamyl malonic ether and phenacyl bromide, the product being saponified (Paal & Hofmann, *B* 23, 1500). Needles, v sol alcohol. Yields $CH_2Bz.CH(OH)(CH_3).CO_2H$ [103°] on heating — $NH_4C_6H_5O_2$ [185°] Needles.

Ethyl ether EtA'' Oil

Amide Crystalline

PHENACYL-BENZOYL ACETIC ETHER

$CH_2Bz.CHBz.CO_2Et$ *Di-benzoyl-propionic ether* [c 58°] Made from ω -bromo acetophenone and sodium benzoyl-acetic ether (Kapf

a Paal, *B* 21, 1485, 8058). Crystals (from ether), insol water. With aqueous potash it gives benzoyl propionic acid, while alcoholic potash yields $C_6H_5C.CHBz.CO_2H$ [185°] and $CH_2Bz.CH_2Bz$ [145°].

PHENACYL BROMIDE v ω -BROMO ACETOPHENONE

PHENACYL CHLORIDE v ω -CHLORO ACETOPHENONE

PHENACYL CYANIDE v BENZOYL-ACETO

NITRILE

DI-PHENACYL-MALONIC ACID v DI BEN

ZOYL DI METHYL MALONIC ACID

PHENACYL PHTHALMIC ACID

$CO_2H.C_6H_4.CO.NH.CH_2.CO.C_6H_5$ [160°] Made by the action of alcoholic potash on phenacyl-phthalimide (Goedeckemeyer, *B* 21, 2686). Needles, insol water. Decomposed by boiling HClAq into phthalic acid and amido acetophenone.

Phenacyl-phthalimide $C_6H_5.C_6H_4.N.CH_2Bz$ [167°] Made by heating ω -bromo acetophenone with potassium phthalimide at 150° (Goedeckemeyer, *B* 21, 2685). Dimetric plates, sl alcohol and ether, almost insol water and ligroin.

Phenyl-hydrazide

$C_6H_5O.N.CH_2.C(N.HPh).C_6H_5$ [155°] Orange needles, insol water.

PHENACYL SULPHIDE $S(CH_2.CO.C_6H_5)_2$

[77°] Made by adding ω -bromo acetophenone (100 pts) in alcohol (400 pts) to a solution of Na (12 pts) in alcohol (400 pts) saturated with H_2S (Tafel & Moritz, *B* 23, 3474). Prisms (from hot alcohol). Reduces Fehling's solution. Yields a *di oxim* [161°] and a diphenylidyl-drazide [147°].

PHENACYL SULPHOCYANIDE

$C_6H_5.CO.CH_2.S.CN$ *Sulphocyanoacetophenone* [74°] Made by mixing alcoholic solutions of barium sulphocyanide and ω -bromo acetophenone (Arapides, *A* 249, 10). Needles or prisms, v sol ether, insol water. Hot HCl converts it into $CH_2Bz.S.CONH_2$ and finally oxy phenylthiazole.

PHENACYL THIOCARBAMATE

$CH.Bz.S.CONH_2$. A very unstable body got by boiling phenacyl sulphocyanide with conc HClAq until crystallisation begins (Arapides, *A* 249, 12). Yields oxy phenyl thiazole on boiling with HClAq — $B'HCl$ [c 177°] Silky needles — $B'H.PtCl_2$ [c 200°] Yellow crystalline powder.

PHENACYL TOLUIDINE v TOLYL-AMIDO-ACETOPHENONE

Di phenacyl p-toluidine $C_6H_4.Me.N(CH_2Bz)_2$ [255°] Formed from *p*-toluidine and ω -bromo acetophenone in alcohol (Lellmann & Donner, *B* 23, 168). Needles, v sol alcohol.

PHENAMYLAMINE v AMIDO-AMYL-BENZENE

Diphenamylamine $NH(C_6H_5.C_6H_4)_2$ *Di-isoamyl di phenylamine* (320°)

Formed, together with amido isoamyl-benzene $C_6H_5(C_6H_4)_2NH_2$ (260°) by heating $C_6H_5(C_6H_4)_2OH$ with ammoniacal $ZnBr_2$ or with $ZnCl_2$ and NH_4Br or NH_4Cl , the yield being 18 to 25 p c (Lloyd, *B* 20, 1257) — $B'H_2PtCl_2$. *Acetyl derivative* $NaAc(C_6H_4)_2$ [81°]. White glistening plates.

PHENANTHRAQUINONE $C_{14}H_8O$, \pm

$C_6H_5.CO$ or $C_6H_5.CO$ Mol. w. 208 [203°]

(Hayduck, *A* 167, 184) (above 860°) Formed by oxidising the residue left after evaporating the alcoholic washings from the distillate got in preparing anthracene from α -bromo benzyl bromide and Na (Jackson & White, *Am* 2, 392)

Preparation—1 By warming phenanthrene (1 pt) with $K_2Cr_2O_7$ (1 pt), water (8 pts) and H_2SO_4 (1½ pt) and crystallising the product from diluted HOAc (Fittig & Ostermayer, *B* 5, 933, *A* 166, 365)—2 By adding a solution of CrO_3 in HOAc to a hot solution of phenanthrene in HOAc (Graebe, *B* 5, 861, *A* 167, 139) The product is purified by solution in aqueous $NaHSO_4$, followed by ppn with HCl and crystallisation from HOAc—3 By oxidising crude phenanthrene (310°–340°), the following bodies being obtained at the same time, methyl anthraquinone, diphenic acid, carbazole, acridine, and diphenylene-ketone (Anschütz & Schultz, *A* 196, 32)

Properties—Orange needles or prisms (from solvents) or tables (by sublimation), almost insol cold water, sol hot water and cold alcohol, m sol hot alcohol, ether, HOAc, and benzene Conc H_2SO_4 forms a dark green solution but does not sulphate it, even at 100° A solution of phenanthraquinone (1 g) in HOAc (20 cc) mixed with toluene (4 cc) containing methyl-thiophene gives on shaking with H_2SO_4 (16 cc) a bluish-green liquid which, when poured into water and extracted with ether, imparts a purple colour to the ether (Laubenheimer, *B* 8, 224, *V* Meyer, *B* 16, 1624) The colouring matter $C_{12}H_{10}SO$ formed in this reaction gives anthraquinone on distilling with $PbCrO_4$ (Oderheimer, *B* 17, 1338) A solution of phenanthraquinone in wet ether when exposed in closed tubes to direct sunshine is readily reduced to phenanthrahydroquinone, with formation of aldehyde (Klinger, *B* 19, 1869)

Reactions—1 Oxidised by chromic acid to diphenyl di- α -carboxylic acid—2 Alkaline $KMnO_4$ gives oxy-diphenylene acetic acid and diphenylene-ketone (Anschütz & Japp, *B* 11, 212)—3 Reduced to dihydride by warming with aqueous SO_2 —4 Sodium-amalgam acting on its alcoholic solutions forms diphenic acid [228°] (*A* & *S*)—5 Boiling aqueous NaOH yields $C_{12}H_8$ $C(OH)CO_2H$ (*A* & *J*) Boiling baryta-water forms, besides oxy-diphenylene acetic acid, diphenylene ketone and fluorene alcohol—6 Alcoholic potash gradually forms diphenic acid, the solution meanwhile giving out phosphorescent light on shaking (Lachovitch, *B* 16, 332)—7 By passing the vapour over heated lead oxide di-phenylene ketone is formed (Wittenberg & Meyer, *B* 16, 502)—8 Distillation with dry soda-lime gives diphenyl When the soda-lime is moist, fluorene, fluorene alcohol, and diphenylene ketone are also formed—9 Distillation with quick-lime gives fluorene and diphenylene ketone (Anschütz & Schultz, *B* 9, 1400)—10 Distillation with zinc-dust yields phenanthrene—11 An ethereal solution of $ZnEt_2$ decolorises it On adding alcohol, boiling, and filtering, crystals of $C_{12}H_{10}O_2HOEt$, (77°), are formed. These are rectangular plates, insol water Ac_2O converts it into $C_{12}H_{10}O_2Ac$, [108°] (Japp, *C* *J* 85, 526)—12 With PCl_5 it gives $C_{12}H_8$ CCl_2 , C_6H_5 CO , benzene may be used as diluent. The

product 'di-chloro-phenanthrone' may be re-crystallised from benzene It melts at [166°], although at 140° it begins to get brown Alkalis convert it into phenanthraquinone Shaken with alcoholic potash, it is oxidised to diphenic acid, the solution phosphorescing meanwhile Iron and acetic acid reduce it first to chloro-phenanthrone, $C_{12}H_8$ $CHCl$ [128°], and then to

phenanthrone $C_{12}H_8$ CH_2 , [149°] Chloro-

phenanthrone may be recrystallised from glacial acetic acid, and is not decomposed even by boiling alkalis, but HNO_3 (S G 13) converts it into nitro-phenanthraquinone Phenanthrone may be crystallised first from glacial acetic acid, then from butyl bromide (B Lachovitch, *J* *pr* [2] 28, 168)—18 By exhaustive chlorination with $SbCl_5$ it yields perchloro-diphenyl together with a very small quantity of per chloro benzene (Merz & Weith, *B* 16, 2870)—14 Benzoic aldehyde (free from HCl) at 260° forms benzalquin of phenanthrene $C_{12}H_8O$ [329°], which crystallises from CS_2 in rectangular plates and yields benzoic acid and phenanthraquinone on oxidation It gives off no gas with $ZnEt_2$, hence contains no hydroxyl (Japp & Wilcock, *C* *J* 37, 661)—15 Heating with PCl_5 followed by addition of water forms $C_{12}H_8$ CO $C(OH)PO(OH)_2$, crystallising

in flesh coloured plates, sol water, alcohol, and ether (Fossek, *M* 7, 36)—16 Acetone at 200° forms acetone phenanthraquinone $C_{12}H_8O_2$ (vol 1 p 33) By the action of H_2SO_4 on this body a small quantity of $C_{12}H_8O_2$ [238°] is formed (Wadsworth, *C* *J* 59, 105)—17 Ammonia passed into an alcoholic solution forms phenanthraquinonimide $C_{12}H_8NO$ On heating with alcoholic NH_3 in sealed tubes there are formed diphenanthrylene azotide $C_{12}H_8N_2$, two compounds $C_{12}H_8N_2O$ [282°] and [over 300°] and a compound $C_{12}H_8N_2$ [above 285°] (Schmidt, *B* 7, 1365, Anschütz & Schultz, *A* 196, 49, Zincke, *B* 12, 1641, Sommaruga, *M* 1, 146, Japp, *C* *J* 49, 845, 51, 98)—18 Benzoic aldehyde and aqueous NH_3 at 100° quickly forms $C_{12}H_8NO$ or $C_{12}H_8$ O_2 $\langle N \rangle \supset CPh$

This 'benzenyl amido phenanthrol' crystallises from benzene in tufts of silky needles, [202°], v sl sol alcohol, sol conc $HClAq$ and conc H_2SO_4 without change It yields benzoic acid and phenanthraquinone on oxidation $HClAq$ at 200° forms benzoic acid It does not act on $ZnEt_2$ (Japp, *C* *J* 87, 666, 89, 925)—19 Cumic aldehyde and NH_3 forms, in like manner, cumenyl-amido-phenanthrol $C_{12}H_8$ O_2 $\langle N \rangle \supset C_6H_5$ C_6H_5 , [186°], crystallising from benzene in silky needles, and forming in conc H_2SO_4 a yellowish green fluorescent liquid (Japp & Wilcock, *C* *J* 89, 226)—20 Furfuraldehyde and aqueous NH_3 , give $C_{12}H_8$ O_2 $\langle N \rangle \supset C_6H_5O$ [231°], crystallising from isomyl alcohol in needles (*J* & *W*)—21 Salicylic aldehyde (1 mol) and conc NH_3Aq form, on warming, an oxy benzenyl di-amido-phenanthrene $C_{12}H_8$ CNH $C-N \supset C_6H_5$ OH (Japp & Streatfield, *C* *J* 41, 146) This body crystallises from HOAc in slender needles [270°–

276°], and is sl sol alcohol, v sol HOAc. It dissolves in boiling KOHAq, and is pppd by CO₂. Boiling alcoholic potash gives salicylic acid. HClAq at 200° has no action. BzCl yields a benzoyl derivative [220°]—22 *o-Methoxy-benzonic aldehyde* (15 g) heated with phenanthraquinone (30 g) and excess of NH₄Aq at 100° deposits yellow crystals of C₁₄H₈N₂H C₆H₄OMe [208°], while the mother liquor contains C₁₄H₈<N>^OC₆H₄OMe, which crystallises in white needles, v sol hot benzene (Japp a Streatfield, *C J* 41, 154)—23 *p-Oxy benzoic aldehyde* and aqueous 1° H₂ form *p* oxy benzenyl-di amido phenanthrene [ab. ca 350°], crystallising from HOAc in slender needles. It yields an acetyl derivative [205°–210°] (J a S)—24 *Aldehyde ammonia* yields an amorphous base (J a W)—25 *Alcoholic methylamine* forms, on warming, yellow crystals. The mother liquor deposits C₁₄H₈N₂ or C₁₄H₈(NMe)₂, crystallising in colourless prisms [186°], and yielding B'HCl, v sol water, and B'HNO₃, B'H₂SO₄, B'H₂O₂, all crystallising in needles (Zincke, *B* 12, 1643)—26 *Ethylene diamine* and HOAc form the azine C₁₄H₈<N>^NC₂H₄, which crystallises from alcohol in needles [181°]. It yields a platinochloride B'H₂PtCl₄, nearly insol alcohol (Mason, *B* 19, 112, 20, 268)—27 *Propylene diamine* yields C₁₄H₈N₂, crystallising in needles [128°], and yielding B'H₂PtCl₄ (Strache, *B* 21, 2362)—28 *Trimethylene diamine* forms C₂₂H₁₆NO₂, a lemon yellow powder, not melted at 250°. Its alcohol solution is coloured violet by acids—29 *Tetra amido phenazine* and HOAc give

a green crystalline pp, forming a bluish green solution in H₂SO₄, changing on dilution through red to orange (Nietzki a Muller, *B* 22, 450)—30 *Phenylene o-diamine* gives phenanthrazine C₁₄H₈<N>^NC₆H₄, [217°], insol water, v sol alcohol (Hinsberg, *A* 237, 340)—31 *Tolylene-o-diamine* forms C₁₄H₈<N>^NC₆H₃Me [213°]—32 Heating with *acetamide* and HOAc forms the azine C₁₄H₈<N>^NC₆H₄, crystallising in yellowish brown flat needles, [400°], sol aniline, nitro benzene, and phenol (Mason, *C J* 55, 108)—33 *Naphthylene (1,2)-diamine* yields C₁₄H₈<N>^NC₁₀H₆ [264°] (Leuckart, *B* 19, 174)—34 *Phenyl-naphthylene-(1,2)-diamine* boiled with HOAc and phenanthraquinone forms, on adding HNO₃, a pp of C₂₆H₁₈(NO)₂N₂O, whence boiling potash separates C₁₄H₈<N>^NC₁₀H₆ (NPh(OH)) which forms a yellow solution in ether. It forms a blue solution in H₂SO₄, turned orange by dilution (Witt, *B* 20, 1185)—35 *Nitro-o-phenylene-diamine* and HOAc give, on heating, C₂₆H₁₈N₂O₂ [261°] (Heim, *B* 21, 2301)—36 *Isobutyl phenylene-diamine* in HOAc forms C₁₄H₈<N>^NC₆H₄C₂H₅ [147°], crystallising in pale-yellow needles, coloured cherry red by H₂SO₄ (Gelzer, *B* 20, 3253, 21, 2951). The compound C₁₄H₈N₂C₆H₃BrC₂H₅ [154°] also

forms yellow needles (B) *Isobutyl phenylene-diamine* gives an isomeric azine [144°]—37 (6,4,2,1) *Bromo tolylene diamine* in HOAc forms C₁₄H₈N₂C₆H₄MeBr [210°] crystallising in yellow needles (Hartmann, *B* 23, 1050)—38 *1-Tri amido-benzene* (from chrysoidine) yields C₁₄H₈N₂C₆H₄NH₂, as brown crystals [179°] (Witt, *C J* 49, 402, Heim)—39 *Acetoacetic ether* forms, in presence of KOH, phenanthroxylene acetoacetic ether C₁₄H₈EtO, [185°] crystallising in white needles (Japp a Streatfield, *C J* 43, 27)—40 *Acetone* and NH₄Aq form C₁₄H₈NO₂, crystallising in colourless laminæ [c 130°]. This body forms a yellow solution in HClAq, which deposits a dark blue substance and gives, on addition of water to the filtrate, needles of C₁₄H₈O₂ (Japp a Streatfield, *C J* 41, 272)

Combinations—C₁₄H₈O₂NaHSO₄ 2aq. Small colourless plates, v e sol water, which slowly decomposes it—(C₁₄H₈O₂)₂HgCy₂ [223°] Red crystals with green lustre, deposited from a hot saturated solution of phenanthraquinone and HgCy₂ in acetone (Japp a Turner, *C J* 57, 7)—(C₁₄H₈O₂)₂HgCl₂ [223°] Red prisms (from boiling acetone)—C₁₄H₈O₂ZnCl₂. Dark reddish-brown needles got by adding a hot solution of ZnCl₂ in HOAc to a hot solution of phenanthraquinone in HOAc (Japp a Turner, *C J* 57, 5)

Hydrocyanide C₁₄H₈O₂(HCN), tufts of needles, formed by action of 80 p c HCN solution. Decomposed by heat into its components. Conc HCl decomposes it, giving off CO₂ and forming C₁₄H₈NO [241°] and C₁₄H₈NO₂ [183°]. The latter separates from benzene in slender needles. Both dissolve in sodium carbonate, expelling CO₂, the compound [241°] producing C₁₄H₈NaNO₂ 4aq, and also the corresponding (C₁₄H₈NO)₂. Ba7aq whence HCl liberates C₁₄H₈NO (Japp a Miller, *C J* 51, 29)

[158°] Formed by boiling phenanthraquinone with alcoholic hydroxylamine hydrochloride for an hour (Goldschmidt, *B* 16, 2178). Small yellow needles, v sol hot alcohol. Forms coloured pps with metallic salts (Kostanecki, *B* 22, 1347). Boiling NaOHAq forms a green liquid. Conc H₂SO₄ forms a blood red solution and at 100° converts it into diphenylene ketone carboxylic amide HCl, Ac₂O, and HOAc at 100° convert it, by intra molecular change, into a weak base [217°], probably $\begin{smallmatrix} C_6H_4 \\ C_6H_4 \end{smallmatrix} \begin{smallmatrix} \text{CO} \\ \text{CO} \end{smallmatrix} \text{NH}$, and also form prisms [92°] (Wegerhoff, *A* 252, 17). Ac₂O forms C₂₆H₁₈N₂O crystallising in small brownish tables [247°] nearly insol alcohol and ether (Zincke)

by heating an alcoholic solution of phenanthraquinone (1 mol) with hydroxylamine hydrochloride (4 mols) for 30 hours at 100° (Auwers a V Meyer, *B* 22, 1993). Minute yellow prisms (from alcohol or HOAc), insol water, sl sol hot alcohol and ether. Conc H₂SO₄ forms a blood-red solution. NaOHAq forms a yellow solution, depositing the Na salt as pearly plates. Alcohol at 150° forms the anhydride $\begin{smallmatrix} C_6H_4 \\ C_6H_4 \end{smallmatrix} \begin{smallmatrix} \text{C} \\ \text{C} \end{smallmatrix} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix}$ [183°] which crystallises in long yellow needles, insol. NaOHAq. A solution of the dioxim in HOAc

and Ac_2O saturated with HCl in the cold gives the acetyl derivative $\text{C}_{14}\text{H}_8\text{O}(\text{NOAc})_2$ separating from alcohol in minute crystals [184°]

Phenyl-hydrazide $\text{C}_{20}\text{H}_{14}\text{N}_2\text{O}$ [165°] Formed by warming an alcoholic solution of phenanthraquinone with aqueous phenyl-hydrazine hydrochloride (Zincke, *B* 16, 1564) Red needles or plates (from alcohol) Gives a violet solution in H_2SO_4

Di bromo-phenanthraquinone $\text{C}_{14}\text{H}_8\text{Br}_2\text{O}_2$ [230°] (*H*), [238°] (Ostermayer, *B* 7, 1090) Made by heating the quinone with Br and a little water for six hours at 180° (Hayduck, *A* 167, 185) Yellow nodules (from HOAc), sl sol alcohol Yields di bromo diphenyl dicarboxylic acid on oxidation by chromic acid mixture

Nitro-phenanthraquinone

[1 2] $\text{C}_{14}\text{H}_7(\text{NO}_2)_2\text{O}$ Formed from the quinone and boiling HNO_3 (S G 14) (Anschütz a Schultz, *B* 9, 1404, Strasburger, *B* 16, 2346) Orange plates (from HOAc) yields nitro diphenyl dicarboxylic acid [217°] on oxidation By oxidation of (α), (β), and (γ) nitro phenanthrene with CrO_3 and HOAc there are formed (α), (β), and (γ) nitro-phenanthraquinones [215° - 220°], [260° - 266°], and [263°] respectively (Schmidt, *B* 12, 1156)

Nitro-phenanthraquinone [282°] Made by warming chloro-phenanthrone with nitric acid (S G 13) (Lachovitch, *J pr* [2] 28, 172) Orange plates, sl sol HOAc

Di nitro phenanthraquinone

$\text{C}_{14}\text{H}_6(\text{NO}_2)_4\text{O}$ [294°] Made by boiling phenanthrene with fuming HNO_3 or with a mixture of HNO_3 and H_2SO_4 Obtained also, together with a more soluble isomeride, by nitration of phenanthraquinone and of nitro phenanthraquinone [257°] (Graebe, *A* 167, 144, Schultz, *A* 203, 108, Strasburger, *B* 16, 2346) Yellow plates, v sl sol alcohol Yields di nitro diphenyl dicarboxylic acid [258°] on oxidation

Amido-phenanthraquinone

[1 2] $\text{C}_{14}\text{H}_8(\text{NH}_2)_2\text{O}$ Formed by reduction of nitro-phenanthraquinone [257°] with tin and HCl (Anschütz a Meyer, *B* 18, 1943) Violet-black needles, sl sol hot water, forming a reddish violet solution— B^*HCl yellowish red feathery needles

Di amido phenanthraquinone

[1 4 2] $\text{C}_{14}\text{H}_6(\text{NH}_2)_4\text{O}$ Formed by reduction of the di nitro-compound with tin and HCl (A a M., Kleemann a Wense, *B* 18, 2168) Violet black needles, not melted at 310° The hydrochloride forms yellow plates.

Oxy-phenanthraquinone $\text{C}_{14}\text{H}_8\text{O}_2$ Formed by oxidation of phenanthrolquinone

Formed by the action of nitrous acid on amido phenanthraquinone Brownish red needles May be sublimed. Forms a yellowish-green solution in NaOH aq

Acetyl derivative

[200°-210°] **Di-oxy-phenanthraquinone** $\text{C}_{14}\text{H}_6(\text{OH})_2\text{O}_2$ Formed by the action of nitrous acid on di-amido-phenanthraquinone (A a M.) Minute dark-brown needles Yields a di acetyl derivative crystallising in yellowish-red needles.

Hydro phenanthraquinone $\text{C}_{14}\text{H}_{10}\text{O}_2$ $\text{C}_{14}\text{H}_8\text{O}_2$ $\text{C}_6\text{H}_5\text{COH}$ *Phenanthraquinone dihydride* *Phenanthrenehydroquinone* Mol w 210 Formed by heating phenanthraquinone with aqueous SO_2 , or by passing SO_2 into a warm alcoholic solution of the quinone (Graebe, *A* 167, 146) Colourless needles, m sol hot water, v e sol alcohol, ether, and benzene Absorbs oxygen when moist, or in aqueous solution, forming the quinhydrone $\text{C}_{22}\text{H}_{18}\text{O}_2$, which crystallises in black needles [169°], and finally phenanthraquinone FeCl_3 , HNO_3 , and CrO_3 oxidise it in the same way

Mono acetyl derivat

$\text{C}_{14}\text{H}_9(\text{OH})(\text{OAc})$ [170°] Got by boiling phenanthraquinone with HOAc , HI , and red P (Japp a Klingemann, *C J Proc* 6, 31) Formed by the action of sunlight on phenanthraquinone in aldehyde (Klinger, *A* 249, 138) Flat needles

Di-acetyl derivative

$\text{C}_{14}\text{H}_8(\text{OAc})_2$ [202°] Formed from the dihydride and Ac_2O Colourless plates (from benzene), not oxidised by boiling chromic acid mixture Not attacked by heating with KOH aq, unless the solution has a higher SG than 1.3

Benzoyl derivative

$\text{C}_{14}\text{H}_9(\text{OH})(\text{OBz})$ [178°] Got by action of sunlight on phenanthraquinone and benzoic aldehyde (K) White needles (from HOAc)

Valeryl derivative

$\text{C}_{14}\text{H}_9(\text{OH})(\text{O C}_4\text{H}_7\text{O})$ [149°] Got by using isovaleric aldehyde

Ethyl derivative

$\text{C}_{14}\text{H}_{10}(\text{OH})(\text{OEt})$ [80°] On treatment of phenanthraquinone with ZnEt_2 and alcohol successively the compound $\text{C}_{14}\text{H}_{11}\text{O}_2\text{EtOH}$ [77°] is got, from which EtOH can be removed by standing for some months *in vacuo* over H_2SO_4 (Japp, *C J* 37, 408) Gives a mono acetyl derivative $\text{C}_{14}\text{H}_9\text{AcO}$ [103°]

Isomeride of hydro phenanthraquinone

$\text{C}_{14}\text{H}_8(\text{OH})_2$ [143°] Got by heating its diacetyl derivative with alcoholic NH_3 (Fischer a Gerichten, *B* 19, 792) Needles, very oxidisable, its alkaline solution turning green and finally red

Acetyl derivative

$\text{C}_{14}\text{H}_9(\text{OAc})_2$ [159°] Made by boiling morphine methyl iodide with Ac_2O , adding dry AgOAc , filtering, and heating the filtrate at 180° Needles (from ether)

Di amido-hydro phenanthraquinone

$\text{C}_{14}\text{H}_8(\text{NH}_2)_2(\text{OH})_2$ Formed by reduction of di nitro phenanthraquinone with SnCl_2 (Kleemann a Wense, *B* 18, 2168) Very readily oxidised by air, FeCl_3 , or CrO_3 to violet black needles of di-amido phenanthraquinone— $\text{B}^*\text{H}_2\text{Cl}_2$ 3aq

Tetra-acetyl derivative

$\text{C}_{14}\text{H}_6(\text{NHAc})_4(\text{OAc})_2$ Colourless needles, solid at 800° , sl sol alcohol and HOAc

Phenanthraquinone carboxylic acid

$\text{C}_{14}\text{H}_7(\text{CO}_2\text{H})\text{O}$ [315°] Made by oxidation of phenanthrene carboxylic acid with CrO_3 in HOAc (Japp a Schultz, *B* 10, 1861, *A* 196, 14) Orange substance, sol NaHSO_4 aq

Phenanthraquinone sulphonic acid

$\text{C}_{14}\text{H}_7(\text{SO}_3\text{H})\text{O}_2$ Formed from phenanthraquinone and SO_3 (Graebe) Gives a colouring matter resembling alizarin when fused with potash.

Phenanthrone $\text{C}_{14}\text{H}_8\text{O}$ [149°] Formed as above (Reaction 12). Brownish red plates, v.

sol alcohol and ether, does not combine with NaHSO_4 . Its alkaline solution is green

Diphenanthrylene azotide $\text{C}_{14}\text{H}_8\text{N}_2\text{C}_{14}\text{H}_8$ [above 400°] Formed from phenanthraquinone and alcoholic NH_3 at 100°, and also by heating *terphenyl* zinc with soda lime to a red heat (Japp & Bun. on, *C J* 49, 845, 51, 98) Yellow crystalline powder or yellow needles (by sublimation), v sol ether Its solution in H_2SO_4 is deep blue, becoming orange on dilution

Isophenanthraquinone $\text{C}_{14}\text{H}_8\text{O}_2$ [156°] Formed by the further action of CrO_3 and HOAc on an oil formed in the oxidation of phenanthrene, which remains in the alcoholic liquid from which phenanthraquinone has separated (Hayduck, *A* 167, 185) Yellow crystals (from alcohol), sl sol water, v sol hot alcohol

PHENANTHAZINE v PHENANTHRAQUINONE, Reaction 29

PHENANTHRENE $\text{C}_{14}\text{H}_{10}$ *ts*

[1 2] $\text{C}_{14}\text{H}_{10}$ CH Mol w 178 [100°] (Graebe, Schiff), [103°] (Reissert, *B* 23, 2244) (340° i V) S (alcohol) 2 62 at 16°, 10 08 at 78° S (toluene) 33 at 16 5° (Bechi, *B* 12, 1978) S V S 167 05 (Schiff) S V 186 2 (Lossen, *A* 254, 54), 196 7 (Ramsay) H.F (from diamond) -39,400 (Berthelot & Vieille, *A Ch* [6] 10, 446, *Bl* [2] 47, 864), -32,500 (Stohmann, *J pr* [2] 40, 94) H C v 1,699,000 (*B A V*), 1,692,000 (*S*) H C p 1,700,400 (*B A V*), 1,693,500 (*S*) Occurs in coal tar c l (Graebe, *B* 5, 861, *A* 167, 181, Fittig & Ostermayer, *B* 5, 933, *A* 166, 361, Hayduck, *B* 6, 532, *A* 167, 177) and in 'idryl' got by distillation of an Idrian ore of mercury

Formation.—1 Together with toluene by passing s di phenyl ethylene through a red hot tube (Graebe) —2 From s di phenyl ethane, from toluene (Graebe, *B* 7, 49), from a mixture of diphenyl and ethylene, from di methyl di phenyl, and from phenyl tolyl methane (Barbier, *C R* 79, 121) by passing the vapours through red hot tubes Other hydrocarbons are also formed in these reactions —3 Together with anthracene in the action of sodium on [1 2] $\text{C}_6\text{H}_5\text{Br} \cdot \text{CH}_2\text{Br}$ (Jackson & White, *Am* 2, 391) —4 By heating coumarone and benzene to a high temperature (Kraemer & Spilker, *B* 23, 85)

Preparation—By fractional distillation of the portion of hydrocarbons (310°-360°) from coal tar oil, followed by crystallisation from alcohol A solution of crude phenanthrene (3 pts) in hot toluene mixed with picric acid (1 pts) deposits on cooling the picric acid compound in golden needles, which may be subsequently decomposed by alkalis The mixture of phenanthrene and anthracene may also be crystallised from toluene, when anthracene separates first (Wense, *B* 19, 761) Chromic acid mixture attacks anthracene more readily than phenanthrene, so that a small quantity of anthracene may be removed by its means (Anschutz & Schultze, *A* 196, 35)

Properties—Small colourless plates (from alcohol), sl sol cold alcohol, v sol ether, benz, ne, HOAc , and CS_2 May be sublimed Exhibits slight blue fluorescence Its absorption spectrum in the ultra-violet has been studied

by Hartley (*C J* 39, 164) Not reduced in alcoholic solution by sodium amalgam

Reactions—1 Oxidised by chromic acid mixture and by CrO_3 in HOAc to phenanthraquinone —2 HIAq and P at 200° form a tetrahydride —3 Bromine added to its solution in ether or CS_2 forms unstable $\text{C}_{14}\text{H}_8\text{Br}_2$, crystallising in four sided prisms (*F A O*, Hayduck, *A* 167, 180) This dibromide melts with effervescence at 98°, and its alcoholic solution gives a pp of AgBr on adding AgNO_3 By alcoholic KCy it is reconverted into phenanthrene (Anschutz, *B* 11, 1217) —4 By exhaustive chlorination with SbCl_5 it yields per-chloro benzene (Merz & Weith, *B* 16, 2869)

Combinations— $\text{C}_{14}\text{H}_{10}\text{C}_6\text{H}_5\text{N}_3\text{O}$, [143°] S (95 p.c alcohol) 2 7 at 15° Golden prisms — $\text{C}_{14}\text{H}_{10}\text{C}_6\text{H}_5\text{Cl}(\text{NO}_2)_2$ [1 2 4] [44°] Orange needles (Willgerodt, *B* 11, 604) — $\text{C}_{14}\text{H}_{10}\text{C}_6\text{H}_5\text{Cl}(\text{NO}_2)_2$ [88°] Lemon yellow needles (Liebermann, *B* 8, 378)

Tetrahydride $\text{C}_{14}\text{H}_{14}$, [0°] (810° i V) SG 19 1 067 Got by reducing phenanthrene with HIAq and P, or by isomyl alcohol and sodium (Bamberger & Lodter, *B* 20, 3076) Liquid, v sol hot alcohol Yields phenanthraquinone on oxidation by CrO_3 and HOAc

Octohydride $\text{C}_{14}\text{H}_{18}$ (below 300°) Got by heating phenanthrene with HIAq and P at 240° (Graebe) Liquid

Perhydride $\text{C}_{14}\text{H}_{24}$, [-8°] (270°-275°) SG 2° 933 Made, together with a hydride (290°), by heating phenanthrene with HIAq and red P at 250° (Liebermann & Spiegel, *B* 22, 779) Yields phenanthrene and anthracene when distilled with zinc dust. Not attacked by H_2SO_4 , HNO_3 , or Br

Chloro phenanthrenes By passing chlorine into a solution of phenanthrene in HOAc the compound $\text{C}_{14}\text{H}_9\text{Cl}$, [170°] is formed, together with oily $\text{C}_{14}\text{H}_9\text{Cl}$ and $\text{C}_{14}\text{H}_9\text{Cl}_2$ Alcoholic potash converts $\text{C}_{14}\text{H}_9\text{Cl}$ into $\text{C}_{14}\text{H}_8\text{Cl}$ By heating phenanthrene with SbCl_5 , the compounds $\text{C}_{14}\text{H}_8\text{Cl}$, [172°], $\text{C}_{14}\text{H}_7\text{Cl}_2$, [250°], and $\text{C}_{14}\text{H}_6\text{Cl}_3$, [270°-280°] may be obtained (Zetter, *B* 11, 165), the final products being C_6Cl_6 and CCl_4

Bromo phenanthrenes Bromine acting on phenanthrene dissolved in ether forms $\text{C}_{14}\text{H}_9\text{Br}_2$, which at 100° splits up into HBr and $\text{C}_{14}\text{H}_8\text{Br}$, $\text{C}_{14}\text{H}_7\text{Br}_2$

[63°], (above 360°) Bromo phenanthrene crystallises in thin prisms, v sol HOAc and CS_2 , and is converted by oxidation into phenanthraquinone (Zetter, Hayduck, Anschutz) Bromine (4 mols) acting on phenanthrene in ethereal solution also forms two di-bromo phenanthrenes $\text{C}_{14}\text{H}_8\text{Br}_2$, [148°] and [156°] A third di-bromo-phenanthrene [202°] is a crystalline powder insol. ether By heating phenanthrene with bromine the compounds $\text{C}_{14}\text{H}_8\text{Br}_2$, [126°] and $\text{C}_{14}\text{H}_7\text{Br}_3$, [185°] may be got By heating phenanthrene with bromine and iodine the compounds $\text{C}_{14}\text{H}_8\text{Br}_2$, [245°] and $\text{C}_{14}\text{H}_7\text{Br}_3$, [above 270°] are obtained All these bromo-phenanthrenes crystallise in needles

(a) - Nitro - phenanthrene $\text{C}_{14}\text{H}_9\text{NO}_2$, [75°]. Made, together with the two following isomerides, by nitration of phenanthrene (Schmidt, *B* 12, 1153) Yellow needles Gives (a) nitro phenanthraquinone [215°-220°] on oxidation.

(β) Nitro-phenanthrene. [127°] Less soluble than the (α)-isomeride. Yields nitro-phenanthraquinone [260°-266°] on oxidation

(γ)-Nitro-phenanthrene [171°] Small yellow leaflets. Less sol. alcohol than either of its isomerides. Yields on oxidation a nitro-phenanthraquinone [268°]

Di-nitro-phenanthrene $C_{14}H_8(NO_2)_2$. [150°-160°] Made by prolonged action of HNO_3 on phenanthrene (Graebe). Yellow crystals

Bromo-nitro-phenanthrene $C_{14}H_7Br(NO_2)$. [196°] Made by nitration of bromo-phenanthrene (Anschütz, *B* 11, 1218). Long spikes

(α)-Amido-phenanthrene $C_{14}H_9NH_2$. Got by reduction of (α)-nitro-phenanthrene (Schmidt, *B* 12, 1156). Small leaflets, insol. water — $BHCl$ crystalline pp — $B'H_2SO_4$ powder

(β) Amido-phenanthrene. Small leaflets — $BHCl$ sl sol. water

(γ)-Amido-phenanthrene. Got, like the preceding bodies, by reduction of the corresponding nitro-phenanthrene — $BHCl$ glistening needles

Oxy-phenanthrene *v* Phenanthrol

Di-oxy-phenanthrene *v*. Hydro-phenanthraquinone

Pseudophenanthrene $C_{14}H_{12}$. [115°] Occurs in crude anthracene (Zeidler, *A* 191, 295). Large white plates, yielding on oxidation a quinone [170°] which is v sol. alcohol and benzene. The picric acid compound [147°] separates in bright-red needles on mixing saturated alcoholic solutions of pseudophenanthrene and picric acid

A hydrocarbon $C_{14}H_{10}$ or $C_{14}H_{12}$. [104°], possibly a mixture of phenanthrene with pseudophenanthrene, was got by Zeidler (*A* 191, 292) from crude anthracene. It yields an orange picrate [142°], a quinone [205°-209°], insol. $NaHSO_4$ (difference from phenanthraquinone), and a bromide [95°] which changes on fusion to a compound [83°], and on boiling with alcoholic potash forms yellow needles [250°]. The quinone gives Laubenheimer's reaction

(α)-PHENANTHRENE CARBOXYLIC ACID CO_2H $C_{14}H_7$ CH $C_{14}H_7$ CH [266°] Formed by the action

of alcoholic potash on the nitrile which is got by distilling sodium phenanthrene (α) sulphonate (2 pts) with K_2FeCy_4 (3 pts) (Japp & Schultz, *B* 10, 1861, *C* *J* 37, 86). Colourless curved blades (from $HOAc$) or fern shaped leaves (by sublimation), almost insol. water. Yields phenanthraquinone carboxylic acid on oxidation by CrO_3 and $HOAc$ — NaA' 4aq. *S* (of NaA') 68 at 20° — BaA' 7aq. *S* (of BaA') 066 at 20°, 56 at 100°

Phenanthrene (β)-carboxylic acid

$C_{14}H_7$ C CO_2H $C_{14}H_7$ CH [c 252°] Formed in like manner from a calcium phenanthrene sulphonate contained in the mother-liquid from which its (α)-isomeride has crystallised (Japp). Stellate groups of straight needles (from $HOAc$), insol. water, sol. alcohol, ether, and $HOAc$. Yields phenanthraquinone on oxidation — NaA' 5aq. laminae. *S* (of NaA') 62 at 20°, v e. sol. boiling water — BaA' 6aq. rectangular laminae. *S* (of BaA') 27 at 20°, 37 at 100°.

PHENANTHRENE (α) SULPHONIC ACID SO_3H $C_{14}H_7$ CH $C_{14}H_7$ CH Made, together with a (β)-acid

which forms more soluble salts, by heating phenanthrene (1 pt) with H_2SO_4 (1 pt) at 100° (Graebe, *A* 167, 152, Japp, *C* *J* 37, 93, *B* 11, 218). Crystalline mass, m sol. wa' r. Yields phthalic acid on oxidation — CaA' 4aq. small plates, v sol. hot water — PbA' 2aq. crystalline

Phenanthrene sulphonic acid $C_{14}H_7$ SO_3H Got by heating phenanthrene (8 pts) with H_2SO_4 (2 pts) at 170° (Morton & Geyer, *A* *C* *J* 2, 203, *B* 13, 1870). Pearly needles, sol. water and alcohol. Its salts are less soluble than those of the (α)-acid — KA' — BaA' 3r. — PbA' 3aq.

Phenanthrene disulphonic acid $C_{14}H_6(SO_3H)_2$ Formed by heating phenanthrene with fuming H_2SO_4 (E Fischer, *B* 13, 314, Hazura & Julius, *M* 5, 188). Syrup — K_2A' 2aq. powder, v sol. water — BaA' — Ag_2A' yellowish powder

Bromo-phenanthrene sulphonic acid $C_{14}H_6Br(SO_3H)$ Made by sulphonating bromo-phenanthrene (Anschutz & Siemensky, *B* 13, 1179) — KA' needles, sl sol. water — BaA' , in soluble pp — AgA' glistening needles

PHENANTHRIDINE $C_{14}H_9N$ *v* $C_{14}H_8$ CH $C_{14}H_8$ N

V D 65 [104°] (360°) Made by passing the vapour of benzylidene-aniline through a red hot tube (Pictet & Ankersmit, *B* 22, 3339). White needles, v e sol. alcohol, sl sol. hot water. Its aqueous solution shows blue fluorescence. $NaNO_2$ gives a bulky pp of the nitrite. Tin and HCl give a hydride crystallising in needles [100°] — $BHCl$ needles, v sol. water — $B'H_2PtCl_4$ needles — $B'HAuCl_4$ — $B'HHgCl_2$ [190°] — $B'C_6H_5N_3O$, needles — $B'HCrO_3$

Methylo-iodide $B'MeI$ [201°]

Oxy phenanthridine $C_{14}H_7$ CO $C_{14}H_7$ NH Got by reducing *o*-nitro-*o* phenyl benzoic acid with zinc dust and ammonia. It yields phenanthridine on distillation with zinc dust

PHENANTHROL $C_{14}H_9$ OH [112°] Formed by potash fusion from phenanthrene sulphonic acid (Rehs, *B* 10, 1253). Thin laminae (from benzene ligroin), with bluish fluorescence. V sol. alcohol and ether, sl sol. water, v sol. alkalis

Acetyl derivative $C_{14}H_8$ OAc [118°]

PHENANTHROLINE $C_{12}H_8N_2$ *v* CH CH C CH C N CH CH C N CH [78°] (above 360°)

Prepared by heating *m* phenylene diamine or (*B* 3) amido quinoline with nitro benzene, glycerin, and H_2SO_4 (Skraup, *B* 15, 895, *M* 3, 578, 5, 532, La Coste, *B* 16, 674). Got also by heating its carboxylic acid [209°] (Gerdesen, *B* 22, 252). Colourless anhydrous four-sided tables [78°] or needles (containing aq) [66°]. M sol. hot water, v sol. alcohol, v sl sol. ether. Bromine gives in a solution of its hydrochloride a crystalline pp $C_{14}H_8N_2Br$ [149°], converted by hot alcohol into $C_{14}H_7N_2Br$ [178°]. $KMnO_4$ oxidises it to dipyrindyl dicarboxylic acid

Salts — $B'H_2Cl_2$ 2aq. colourless prisms. Its aqueous solution yields on evaporation long prisms of $B'HCl$ 1aq — $B'HBz$ 1aq [280°] — $B'H_2CrO_4$ golden needles — $B'C_6H_5N_3O$ [288°] — $B'H_2PtCl_4$ 1aq — $B'HNO_3$ prisms, m sol. hot water

Methylo-iodide $BMeI_{2aq}$ Golden prisms, sol water, sl sol alcohol, insol ether

Oxy-phenanthroline $C_{12}H_8N_2O$ [160°]. Formed in small quantity, together with phenanthroline, by heating *m* nitro aniline with glycerin, nitro-benzene, and H_2SO_4 (La Coste). Needles (fr *m* benzene) — $B'H.PtCl_2aq$

Methyl-phenanthroline *v* p 355

Di-methyl-phenanthroline

$CH_3CH_2C(CH_3)CH_2CH_2C(CH_3)CH_2CH_2N(CH_3)CH_2CH_2N(CH_3)CH_2CH_2$ [98°] Formed

by the action of paraldehyde and HCl_{aq} at 100° on *m* phenylene-diamine or (*B* 3) amido (*Py* 3)-methyl pyridine (Von Miller & Niederlander, *B* 24, 1740, *Scrifft*, *B* 24, 2127) Colourless needles (from water). Melts at 78° when containing water of crystallisation. *V* sol alcohol, volatile with steam. Yields on reduction a base whence $BzCl$ forms $C_{11}H_{11}BzN_2$ [164°]. — $B'H.PtCl_2$

Di hexyl di amyl-phenanthroline

$C_6H_{11}CH_2CH_2CH_2CH_2CH_2CH_2N(CH_2CH_2CH_2CH_2CH_2CH_2)CH_2CH_2CH_2CH_2CH_2CH_2N(CH_2CH_2CH_2CH_2CH_2CH_2)CH_2CH_2CH_2CH_2CH_2CH_2$ [51°]

Formed by the action of cantharol on an alcoholic solution of *m* phenylene diamine or of amido-hexyl-amyl quinoline at 100° (Von Miller & Gerdeissen, *B* 24, 1731, *cf* Schiff, *A* 253, 322) Needles. Its alcohol solution does not fluoresce — $B'HCl$ — $B'H.PtCl_2aq$ [201°–210°] Orange powder — $B'O.C_6H_5N_2O$, [104°] Needles

Pseudo phenanthroline $C_{12}H_8N_2$, *±* c

$CH_3N(CH_3)CH_2CH_2CH_2CH_2CH_2N(CH_3)CH_2CH_2CH_2CH_2CH_2CH_2$ [173°] Made from

p phenylene diamine, glycerin, H_2SO_4 , and nitro benzene (Skraup & Vorkmann, *M* 4, 569), and from PhN , $C_6H_5NH_2$, glycerin, and H_2SO_4 (Lellmann & Lippert, *B* 24, 2623) Obtained also as a by-product in the preparation of (*B* 3)-nitro-quinoline from *p* nitro aniline (Bornemann, *B* 19, 2377) Crystallises from water in needles (containing 4aq), *v* sol alcohol, sl sol ether. Oxidised by $KMnO_4$ to dipyrindyl dicarboxylic acid

Salts — $B'HCl_{2aq}$ plates — $B'H.Cl_2$ monoclinic prisms — $B'H.PtCl_2$ 2½aq — $B'H.Br$ — $B'H.Br$ — $B'Br$ — $B'I$ — $B'HI$ — $B'H.Cr_2O_7$ 2½aq orange needles, sl sol cold Aq

Methylo-iodides $B'MeI_{2aq}$ lemon yellow needles — $B'MeI_{2aq}$ red tables

PHENANTHROLINE (*B*) CARBOXYLIC

ACID $C_{12}H_7(CO_2H)N_2$ [277°] Formed by oxidation of (*B*) methyl phenanthroline with chromic acid (Skraup & Fischer, *M* 5, 527) Minute needles, sl sol water and alcohol, sol alkalis and acids — Ca_2HA 10aq needles Yields phenanthroline on distillation with alkalis

Phenanthroline- (*Py* 3)-carboxylic acid

$C_{12}H_7(CO_2H)N_2[N(CO_2H)=12]$ [209°] Formed by oxidation of (*a*)-methyl phenanthroline with $KMnO_4$ and H_2SO_4 (Gerdeissen, *B* 22, 250) Pale-yellow needles (containing aq), *v* sl. sol. cold water

Phenanthrone *v* PHENANTHRAQUINONE

PHENANTHROXYLENE - ACETOACETIC

ACID *Ethyl ether* $C_{20}H_{16}O_4$, *±* c . $C_6H_5CO_2CO_2C_2H_5$ Mol *w* (by Raoul's method) C_6H_5CO

287 (calc. 320) [185°] Formed by heating phenanthraquinone with acetoacetic ether and NEt_{3aq} or $KOHAq$ (Japp & Streetfield, *O* J 48, 27, Japp & Klingemann, *O* J 59, 3) White silky needles, *v* sol. hot benzene and alcohol.

Reactions — 1. **Alcoholic potash** forms $C_{11}H_{12}O_2$ crystallising from alcohol, after solution at 100° in sealed tubes, in needles [259°] — 2 **Alcoholic ammonia** at 100° yields lustrous yellow laminae [188°] of $C_{10}H_{12}O_2$ or N_2O_3 — 3 **Alcoholic HCl** yields $C_{12}H_{12}ClO_2$ [146°], whence alcoholic NH_3 produces $C_{12}H_{12}NO_2$ — 4 Heating with $HOAc$ forms three compounds, $C_{12}H_{12}O_2$, decomposing at 285° without melting, $C_{12}H_{12}AcO$, [165°–171°], and $C_{14}H_{16}O_2$, [227°] — 5 **Propionic acid** at 140° yields silky needles $C_{12}H_{12}O_2$, and crystalline $C_{12}H_{12}O_2$, which body is also got by heating with propionic anhydride at 150° — 6 **HI** and **P** yield $C_{12}H_{12}O_2$ [128°], whence potash forms an acid $C_{11}H_{11}O_4$ [255°], which gives BaA''_{2aq} and AgA'' — 7 Heated on the water bath with alcohol containing a few drops of H_2SO_4 , it forms $C_{11}H_{11}O(OEt)(CO_2Et)$ [144°], which yields, with phenyl-hydrazine, $C_{11}H_{11}(N_2HPh)(OEt)(CO_2Et)$ [220°] and, on hydrolysis, $C_{11}H_{11}(OEt)(CO_2H)$, [203°], crystallising in colourless needles — 8 Alcohol containing a large quantity of H_2SO_4 forms $C_{12}H_{12}O_2$, [144°], sol boiling alcohol, and $C_{11}H_{12}O_2$ [277°], insol alcohol

Isophenanthroxylene acetoacetic acid $C_{15}H_{12}O_4$, [269°] Formed by saponifying its ether with $NaOH$ (Japp & Klingemann, *O* J 59, 14) Flat needles (from alcohol) Conc $KOHAq$ at 150° yields $C_{15}H_{12}O_4$ Ac_2O at 150° forms $C_{15}H_{12}O_4$, insol alcohol, and $C_{15}H_{11}O_4$, [226°] — CaA' 9aq

Ethyl ether EtA' [177°] Formed from phenanthroxylene acetoacetic ether by heating with formic acid (*S* G 1 22) at 130° for an hour, or by boiling with H_2SO_4 diluted with twice its weight of water (Japp & Klingemann, *O* J 59, 3) Colourless triclinic prisms (from $EtOAc$), a b c = 964 1 507, α = 78° 6', β = 72° 0', γ = 83° 18', sol alcohol, benzene, and light petroleum

Reactions — 1 Ac_2O at 150° forms the acetyl derivative $C_{15}H_{12}AcO_4$, [165°–170°], crystallising from benzene in needles — 2 **Phenyl hydrazine** in alcoholic solution at 135° yields the compound $C_{20}H_{16}(N_2HPh)O$, crystallising in yellow needles [212°] — 3 **Zinc** and HCl yield a crystalline compound [165°–170°], and also $C_{15}H_{12}O_4$, [123°], a body which yields a phenyl hydrazine $C_{20}H_{16}(N_2HPh)O_2$ — 4 **Bromine** in $CHCl_3$ yields $C_{15}H_{12}BrO_4$, [212°] crystallising in yellow prisms and tables — 5 $HIAq$ at 100° forms $C_{11}H_{12}O$ [215°] crystallising in slender flat needles

PHENAZINE $C_{12}H_8N_2$, *±* c C_6H_5 $\langle N \rangle$ C_6H_5 , **Asophenylene** [171°] (above 360°) *S* (alcohol) 2 in the cold

Formation — 1 By distilling *m*- or *p* azobenzoic acid with excess of lime (Claus, *B* 5, 867, 610, 6, 723, 8, 39, 600, 10, 1303, *A* 168, 1) — 2 By passing aniline over red-hot PbO (Schichutzky, *J* R 6, 248), or merely through a red-hot tube (Bernthsen, *B* 19, 3256) — 3 By heating equal weights of pyrocatechin and *o*-phenylene diamine at 205°, followed by atmospheric oxidation of the resulting dihydride (Ris, *B* 19, 2206) — 4 By heating *o*-amido-phenol and oxidising in the same way (Ris) — 5 From di-amido phenazine by the diazo-reaction (*O* Fischer & Hepp, *B* 22, 358; Nietzki, *B* 23, 1855)

Properties — Long yellowish needles (by sub-

limation), ν sol hot alcohol and ether, ν sl sol. hot water H_2SO_4 forms a blood red solution, becoming yellow on dilution. Volatile with steam. Combines with bromine, forming $C_{12}H_8N_2Br_2$, which separates from benzene in yellow needles, and with chlorine, forming $C_{12}H_8N_2Cl_2$ as unstable red crystals (from alcohol).

Salts— B^+HCl . Tables (from $HClAq$), decomposed by hot water— B^+HAuCl_4 crystals— $B^+H_2HgCl_4$ — $B^+H_2PtCl_6$, 2aq yellow plates— B^+HI Dark-green needles— B^+HBr Brown crystals— $B^+C_6H_5N_3O$, $[180^\circ-190^\circ]$ Long yellow needles, sol cold alcohol— $B^+Hg(NO_3)_2$ ruby-red crystals (from HNO_3)— B^+AgNO_3 .

Dihydrate $C_{12}H_{10}N_2 \cdot 2 H_2O$ $C_6H_5 \begin{smallmatrix} \text{NH} \\ \diagup \quad \diagdown \\ \text{N} \end{smallmatrix} C_6H_5$

Formed by reduction of phenazine with alcoholic NH_3 and H_2S (Olaus, A 168, 8). Trimetric laminae, almost insol water and benzene, ν sl sol cold alcohol. Conc H_2SO_4 forms a green solution, turning red on further addition of H_2SO_4 , and green on cautious addition of water, in this reaction an unstable base $C_{12}H_{10}N_2$ appears to be formed, giving the salts $B^+H_2Cl_2$ and $B^+H_2PtCl_6$, the latter forming in green needles.

Di-chloro phenazine $C_{12}H_8Cl_2N_2$ $[144^\circ]$ Made from phenazine and PCl_5 .

Nitro-phenazine $C_{12}H_8(NO_2)_2N_2$ $[210^\circ]$ Made by nitration. Yellowish green needles.

Amido-phenazine $C_6H_5 \begin{smallmatrix} \text{N} \\ \diagup \quad \diagdown \\ \text{N} \end{smallmatrix} C_6H_5(NH_2) \begin{smallmatrix} 1 \\ 2 \end{smallmatrix} \text{ s}$

$[265^\circ]$ Got by sublimation from a mixture of di amido phenazine and zinc dust (O Fischer & Hepp, B 22, 357). Long red needles with bronze lustre (from alcohol). Strong base. Its dilute solution shows orange red fluorescence— $B^+H_2PtCl_6$, 2 $\frac{1}{2}$ aq.

u-Di-amido phenazine $C_{12}H_{10}N_4$, ν s

$C_6H_5 \begin{smallmatrix} \text{N} \text{ CH } \text{N} \\ \diagup \quad \diagdown \\ \text{N} \text{ CH } \text{N} \end{smallmatrix} C_6H_5$ A product of oxidation of o phenylene-diamine by $FeCl_3$ (Fischer & Hepp, B 22, 355, 23, 841, 2788, cf Griess, B 5, 202, Rudolph, B 12, 2211, Wiesinger, A 224, 353). Formed also from o phenylene diamine and Cyl (cf Hubner, B 9, 777, 10, 1715), and by boiling o phenylene diamine hydrochloride (25 g) with amido-azo benzene (3 g) and acetic acid (30 g of 75 p c) for two hours. Long brownish-yellow needles or yellow plates (by sublimation). Conc H_2SO_4 forms a grass-green solution, turned red on dilution. Its solution in benzene or alcohol fluoresces greenish-yellow. Alcoholic solutions of the salts fluoresce dark orange red. Yields with benzil the quinoxaline $C_{16}H_{10}N_4$ — B^+HCl 3aq— $B^+H_2SO_4$ 3aq.

Di-acetyl derivative $C_{12}H_8Ac_2N_4$ $[c 270^\circ]$ Yellow needles.

Di-formyl derivative Reddish-yellow mass.

Di-amido-phenazine

$\begin{bmatrix} 1 \\ 2 \end{bmatrix} C_6H_5(NH_2) \begin{smallmatrix} \text{N} \\ \diagup \quad \diagdown \\ \text{N} \end{smallmatrix} C_6H_5(NH_2) \begin{bmatrix} 1 \\ 2 \end{bmatrix}$ $[280^\circ]$

Got by heating the tin double salt of tri amido-diphenylamine with water, $CaCO_3$, and MnO_2 (Nietzki, B 23, 1854). Long dark yellow needles, ν e sol alcohol, ether, and hot water. Yields phenazine on elimination of amidogen— B^+HNO_3 , greenish needles— $B^+C_6H_5N_3O$.

Di-acetyl derivative $C_{12}H_8N_4O_4$ $[c 280^\circ]$.

Tri amido-phenazine $C_{12}H_8N_6$, ν s.

$\begin{bmatrix} 4 \\ 2 \end{bmatrix} C_6H_5(NH_2) \begin{smallmatrix} \text{N} \\ \diagup \quad \diagdown \\ \text{N} \end{smallmatrix} C_6H_5(NH_2) \begin{bmatrix} 1 \\ 2 \end{bmatrix}$ $[16, 24 \text{ or } 6]$.

Made by passing a current of oxygen through a solution of triamidobenzene hydrochloride (10 g) and $NaOAc$ (18 g) (E Muller, Z 22, 856, cf Witt, B 10, 658). Brown needles ν sol hot alcohol and water, the solutions showing yellow fluorescence. Conc H_2SO_4 gives a yellow solution, changing violet, red, and finally yellow on dilution. It decomposes when heated to 100° — $B^+(HNO_3)_2$, 2aq needles with green lustre. Forms a crimson solution with yellow fluorescence. The solution becomes yellow on dilution.

Tri-acetyl derivative $C_{12}H_8Ac_3N_6$.

Tetra-amido-phenazine

$NH_2 \begin{smallmatrix} \text{CH} \text{ CH } \text{N} \text{ CH } \text{CH } \text{N} \end{smallmatrix} NH_2$ Formed by passing $NH_2 \begin{smallmatrix} \text{CH} \text{ CH } \text{N} \text{ CH } \text{CH } \text{N} \end{smallmatrix} NH_2$ air through a hot solution of tetra amido benzene hydrochloride (10 g) and $NaOAc$ (20 g) (Nietzki & E Muller, B 22, 447). Brown needles (from hot water or alcohol), or yellow needles containing aniline of crystallisation (from aniline). Its solutions exhibit yellowish green fluorescence. Conc H_2SO_4 forms a yellow solution, passing, on dilution, through blue, violet, and red, to yellow— $B^+(HNO_3)_2$, 2aq lustrous green needles giving a crimson solution.

References—METHYL-PHENAZINE and DI-OXY PHENAZINE.

Tolylene red $C_6H_2(NMe_2) \begin{smallmatrix} \text{N} \\ \diagup \quad \diagdown \\ \text{N} \end{smallmatrix} C_6H_2Me(NH_2)$ is also a phenazine derivative (Bernthsen, A 236, 332).

PHENTRIAZINE $C_6H_5 \begin{smallmatrix} \text{N} \text{ CH} \\ \diagup \quad \diagdown \\ \text{N} \text{ N} \end{smallmatrix}$ $[66^\circ]$

$(235^\circ-240^\circ)$ Formed from the formyl derivative of o nitro phenyl hydrazine, alcohol, $HOAc$, and sodium amalgam (Bischler, B 22, 2806), and by the action of P_2O_5 on o amido phenyl methyl hydrazine (Hempel, J pr [2] 41, 174). Yellow needles, ν sol warm water and cold alcohol, very volatile with steam.

TRIPHENAZINE DIHYDRIDE

$C_{12}H_{12}N_4$, ν s $C_6H_5 \begin{smallmatrix} \text{N} \\ \diagup \quad \diagdown \\ \text{N} \end{smallmatrix} C_6H_5 \begin{smallmatrix} \text{NH} \\ \diagup \quad \diagdown \\ \text{NH} \end{smallmatrix} C_6H_5$ or

$C_6H_5 \begin{smallmatrix} \text{NH} \\ \diagup \quad \diagdown \\ \text{N} \end{smallmatrix} C_6H_5 \begin{smallmatrix} \text{N} \\ \diagup \quad \diagdown \\ \text{NH} \end{smallmatrix} C_6H_5$ *Homofluorine*

dine Formed by heating u di amido phenazine hydrochloride (4 pts) with o phenylene diamine at 205° for 15 minutes (Fischer & Hepp, B 23, 2791). Bluish violet powder or lustrous green needles, ν sl sol alcohol, forming a violet red solution with yellowish red fluorescence. Solutions of its salts are blue, with brownish red fluorescence.

PHENAZOXINE $C_6H_5 \begin{smallmatrix} \text{NH} \\ \diagup \quad \diagdown \\ \text{O} \end{smallmatrix} C_6H_5$ *Oxy*

or *oxido-diphenyl amine* $[148^\circ]$ Obtained by heating together equal quantities of o-amidophenol and pyrocatechin at $260^\circ-280^\circ$. Silvery scales. ν sol alcohol, ether, chloroform, and benzene. Sublimable. Distills, in great part undecomposed. By nitration and reduction the leuco-base of a violet dye stuff is obtained (Bernthsen, B 20, 942).

$C_{16}H_{10}N_2$ $\left\langle \begin{smallmatrix} N \\ N \end{smallmatrix} \right\rangle C_6H_5$, (*αβ*) *Naphthophenazine* [142°]

Formation—1 By mixing equal mols of *o*-phenylene diamine and (*β*) naphthoquinone in 50 p c acetic acid—2 By oxidation of equal mols of *o* phenylene diamine and (*β*) naphthol with alkaline potassium ferriyanide—3 By the decomposition of sulpho benzene azo (*β*)-naphthyl phenyl amine by treatment with boiling dilute mineral acids $C_6H_4(SO_3H)N_2C_6H_5$, NHC_6H_5 , $= C_{10}H_8N_2$, C_6H_5 , + $C_6H_5(NH_2)SO_3H$

Preparation—Fifty grms of the dyestuff are dissolved in 500 c c of boiling water, and 125 c c of conc H_2SO_4 is slowly added to the hot solution, the colour acid, which is first precipitated, redissolves, and on cooling the sulphate of the azine crystallises out in red needles, whilst sulphathionic acid remains in solution

Properties—Glistening yellow needles or prisms Sublimes at about 200° in long flat needles Distils undecomposed above 360° Sl sol alcohol, ether, and cold benzene, *v* sol hot benzene Dissolves in conc H_2SO_4 with a brownish red colour, becoming yellow on dilution

Salts—With each acid it forms two different salts— $B'HCl$ * long reddish yellow needles and warty crystals— $B'_2H_2SO_4$ * red needles and thick garnet-red prisms— $B'HNO_3$ * yellow and red needles, both sparingly soluble (Witt, *B* 20, 572)

PHENOCYANIN C_6H_5NO or $C_6H_5NO_2$ Dark blue mass with coppery lustre, got by atmospheric oxidation of a mixture of phenol and NH_3 (Phipson, *B* 6, 828) Insol water, sol alcohol Coloured red by acids

PHENOL C_6H_5O *αα* C_6H_5OH *Carbolic acid Phenyl hydrate* Mol *w* 94 [41°] (1815°) (Dale & Schorlemmer), (1829°) (Pinette, *A* 248, 82) S 66 at 17° SG ρ 1.0702 (Bruhl), ρ 1.0906 (P) SV 1018 CE (ρ 10°) 0.0083 (P). μ_p 1.6686 (B) R_{20} 45.71 HC *v* 736,500 (Berthelot, *A Ch* [6] 10, 458, 18, 829) HC *p* 787,100

H F 47,841 (Stohmann, *J pr* [2] 83, 471; 28,000 (Von Rechenberg) Occurs in castoreum (Wöhler, *A* 67, 360), and in small quantities in urine of cows, horses, and men (Stadeler, *A* 77, 18, Lieben, *A Suppl* 7, 240, Hoppe Seyler, *C J* 25, 628, Munk, *B* 9, 1596, Salkowski, *B* 9, 1595, Baumann, *B* 9, 54, 1389, 1715) Contained in considerable quantity in coal tar (Runge, *P* 31, 69, 32, 308, Laurent, *A Ch* [8] 3, 195), and in the products of the dry distillation of gum benzoin, quinic acid, wood, and bones

Formation—1 By distilling *o*-, *m*- or *p*-, oxy-benzoic acid alone or with lime (Gerhart, *Rev scient* 10, 210, Rosenthal, *Z* [2] 5, 627)—2 A product of the distillation of glycerin with $CaCl_2$ (Linnemann & Zotte, *A* 174, 87, *Suppl* 8, 254)—3 By heating anisole with conc $HIAq$ or $HClAq$ at 140° (Graebe, *A* 139, 149)—4 From aniline by the diazo reaction (Griess, *A* 137, 39)—5 From benzene sulphonic acid by potash-fusion (Wurtz, *Bl* [2] 8, 197, cf Degener, *J pr* [2] 17, 394)—6 From phenol *p* sulphonic acid by distillation with dilute H_2SO_4 and superheated steam at temperatures above 116° (Armstrong & Miller, *C J* 45, 148)—7 By heating acetylene with fuming H_2SO_4 and fusing the product with potash (Berthelot, *C R* 68, 539)—8 By shaking benzene with palladium that has absorbed hydrogen and air (Hoppe Seyler, *B* 12, 1552)—9 By the direct action of hydrogen peroxide on benzene (Leeds, *B* 14, 975)—10 In small quantity by the action of dry oxygen on boiling benzene containing $AlCl_3$ (Friedel & Crafts, *A Ch* [6] 14, 435, *C R* 86, 884)—11 A product of fermentation of proteids (Baumann, *B* 10, 685, Weyl, *H* 1, 339, Brieger, *J pr* [2] 17, 134)

Preparation—The aqueous solution got by stirring coal tar oil with $NaOHAq$ is diluted with water as long as naphthalene separates The liquid is then exposed to the air, with frequent stirring, for several days, and then fractionally ppd by acid (*e g* CO_2), the last fraction being nearly pure phenol The phenol is dried by heating to boiling in a current of air, and further purified by crystallisation (Hugo Muller, *Z* [2] 1, 270, cf Williamson & Scruggam, *C J* 7, 232) Phenol may also be dried by distilling over dried $CuSO_4$ (Bickerdike, *C N* 16, 188, cf Gladstone, *C N* 2, 98)

Properties—Long deliquescent needles, with strong smell, in sol water, miscible with alcohol and ether Attacks the skin Does not reddden litmus Nearly insol Na_2CO_3Aq , *m* sol NH_4Aq , *v* sol $KOHAq$ and $NaOHAq$ Antiseptic Not affected by distillation with P_2O_5 , lime, or BaO A solution of phenol even in 43,000 pts of water gives a pp of tri-bromophenol on addition of bromine-water (Landolt, *B* 4, 770) $FeCl_3$ gives a violet colour to an aqueous solution, the reaction is prevented by acetic acid and by alcohol (Hesse, *A* 182, 161) Conc H_2SO_4 poured beneath a solution containing phenol and nitric acid (1 p c) gives an intense red ring, with nitrous acid, red and green rings are got, with chlorates, a pale-yellow ring with blue below (Lundo, *C N* 58, 1, 15) An aqueous solution of phenol (4 vols) mixed with ammonia (1 vol) gives on warming with a few drops of bleaching powder solution a blue colour

which becomes red on addition of acids (Salkowski, *Fr* 11, 316) Boiling aqueous mercurous nitrate gives a deep-red colour (Plugge, *Fr* 11, 178) Millon's reagent gives on boiling a yellow pp which dissolves in nitric acid forming a deep red liquid, salicyloic acid behaves in like manner (Almén, *J* 1878, 1079) On adding *p*-oxybenzoic aldehyde and an equal volume of H_2SO_4 , a yellow liquid is got, turned crimson by potash (aurin) Phenol is poisonous (Wöhler, *A* 65, 844, Duplay & Carin, *C R* 112, 627)

Reactions — 1 Decomposed by passing through a red-hot tube yielding benzene, toluene, xylene, naphthalene, anthracene, and phenanthrene (Kramers, *A* 189, 129) When crude phenol is used the product deposits a crystalline hydrocarbon $C_{10}H_{12}$ [82.9°], S G 1.012 (63° at 9 mm) This hydrocarbon is volatile in the cold, smells like camphor, and is sol alcohol, ether, and petroleum-spirit It is resinified by atmospheric oxygen It absorbs bromine, yielding a liquid bromide By heating for 4 hours at 100° *in vacuo* the hydrocarbon is polymerised, yielding a solid [200°–220°] (Roscoe, *C J* 47, 669) — 2 Chlorine forms *o*- and *p*-chloro phenol (4,2,1)-di-chloro-phenol, (6,4,2,1) tri-chloro phenol, and tetra-, pent-, and hexa-chloro-phenols Exhaustive chlorination gives C_6Cl_6 , CCl_4 , C_2Cl_4 , and CO_2 (Ruoff, *B* 9, 1488) An intermediate body is C_6Cl_5O , [825°] (Hugouenq, *C R* 109, 309) $KClO_3$ and HCl yield tri-chloro-phenol and tri- and tetra- chloro-quinone — 3 Chlorine acting on phenol in alkaline solution forms the acid $C_6(OH)CCl_2 > C(OH)CO_2H$ (Hantzsch, *B* 20, 2780, 22, 1238) — 4 Bromine-water forms tri-bromo-phenol Heat (68492 units) is given out in the reaction Br in excess gives $C_6H_3Br_3O$ (Werner, *C R* 100, 799, *Bl* [2] 46, 280) — 5 Iodine and alkali at 60° form $C_6H_2I_2O$ [157°], which is violet red, insol water, and forms a red solution in alcohol and ether It is converted into tri iodo-phenol by boiling with KOH aq (Messinger & Vortmann, *B* 22, 2818) — 6 Chloride of iodine forms mono- and di-, iodo-phenol (Schützenberger, *C R* 54, 197) — 7 Oxidised by nitro *sensu* and dilute NaOH in the cold to oxalic acid and CO_2 (Stegfried, *J pr* [2] 31, 642) — 8 If a rapidly alternating electric current be passed through a solution containing phenol, magnesic sulphate, and magnesic bicarbonate, the following bodies are formed, owing to the rapidly alternating oxidation and reduction: pyrocatechin, hydroquinone, di oxy diphenyl, formic acid, succinic acid, and oxalic acid (E Drechsel, *J pr* [2] 29, 249) Another product is $C_6H_{10}O$, an oil (158°–178°) with aromatic smell which forms a phenyl hydrazide $C_{12}H_{14}N$ [108°] By continuing the alternating current this oil is converted in *n* hexoic acid — 9 Electrolysis with carbon electrodes in aqueous solution rendered slightly alkaline by KOH yields a di-oxy-benzoic acid $C_6H_4O_2$ [98°] and an amorphous acid $C_6H_6O_2$, insol water and ether, sol alcohol The amorphous acid yields picric acid with HNO_3 , and on protracted boiling with dilute HCl aq it yields amorphous infusible $C_{12}H_{10}O_2$, and amorphous $C_{12}H_{10}O$, [60°], sol water, alcohol, and ether In like manner $NaOPh$ yields on electrolysis $C_{12}H_{10}O_2$, separable by hot HCl aq into infusible $C_{12}H_{10}O_2$, insol water and ether, and

$C_{12}H_{10}O_2$, [78°], sol water (Bartoli & Papasogli, *G* 14, 90) — 10 Taken internally it is partly oxidised to hydroquinone and pyrocatechin (Nencki & Giacoso, *H* 4, 825) — 11 H_2O_2 oxidises it to pyrocatechin, hydroquinone, and quinone (Martinon, *Bl* [2] 43, 156) When treated in aqueous solution with NH_3 , H_2O_2 , Na_2CO_3 , and hydroxylamine hydrochloride it yields phenolquinonimide, which colours the liquid bright blue (Wurster, *B* 20, 2934) — 12 CrO_2Cl_2 , followed by water, gives $O(C_6H_4OH)_2$ (Etard) CrO_2Cl_2 and $HOAc$ gave tri- and tetra- chloro-quinone (Carstenjen, *J pr* [2] 2, 82) — 13 Fusion with NaOH yields resorcin, pyrocatechin, and phloroglucin Potash fusion gives *o* and *m*-oxybenzoic acids and two di oxy diphenyls (Born & Schröder, *B* 11, 1332, 12, 417) — 14 PCl_5 forms $PCl_2(OPh)$, $PCl(OPh)_2$, and $P(OPh)_3$, which may be separated by fractional distillation *in vacuo* (Noack, *A* 218, 85; Anschütz & Emery, *A* 239, 810, *A* 253, 110) The compound $PCl_2(OPh)$, (90° at 11 mm), (216° at 760), S G 1.854, is converted by chlorine into $PCl_3(OPh)$, whence SO_2 produces $POCl_2(OPh)$ (122° at 11 mm) Bromine converts $PCl_3(OPh)$ into $PCl_2Br(OPh)$, which is crystalline but very unstable Sulphur at 190° converts $PCl_3(OPh)$ into $PSCl_2(OPh)$, a colourless liquid (120° at 11 mm), S G 1.4059 The compound $PCl(OPh)_2$ (172° at 11 mm) (295° at 760 mm) is converted by chlorine into $PCl_3(OPh)_2$, which is crystalline, and insol ether Bromine converts $PCl(OPh)_2$ in ether into orange yellow crystals of $PClBr_2(OPh)_2$ Sulphur and $PCl(OPh)_2$, at 190° yield $PSCl(OPh)_2$, crystallising in colourless needles [64°], (194° at 11 mm) Tri-phenyl phosphite $P(OPh)_3$ combines with chlorine, forming $PCl_2(OPh)_3$, whence water produces tri phenyl-phosphate $PO(OPh)_3$, [45°] (245° at 11 mm) $P(OPh)_3$ with sulphur at 190° yields $PS(OPh)_3$, [50°] (245° at 11 mm) S G 1.2341 — 15 PCl_5 forms hardly any chloro-benzene (Otto, *A* 145, 817, cf Glutz, *A* 143, 181) — 16 P_2S_5 forms, on heating, phenyl mercaptan, di phenylenedisulphide $C_{12}H_{10}S_2$, and some Ph_3S (Kekulé, *C R* 64, 752, Graebe, *B* 7, 51, 397, Geuther, *A* 221, 57) P_2S_5 forms benzene, Ph_3PO , and H_2S — 17 Aqueous $KMnO_4$ oxidises it to oxalic acid and CO_2 (Tollens, *Z* [2] 4, 715) — 18 Distillation over heated zinc dust yields benzene — 19 H_2SO_4 (1 pt) forms *o* and *p* sulphonic acids (Kekulé, *Z* [2] 3, 197) H_2SO_4 (1½ pts) at 160° forms di oxy di phenyl sulphone (Glutz, *A* 147, 52) $K_2S_2O_8$, heated with a solution of KOC_2H_3 at 65°–70°, forms $C_6H_5O SO_3OK$, which crystallises in tables, S 14 at 15°, sol hot alcohol This salt occurs in urine It is decomposed by boiling with water and dilute acids into phenol and H_2SO_4 At 150° the dry salt changes to the isomeric potassium phenol *p*-sulphonate Phenyl sulphuric acid is also a product of the passage of a rapidly-alternating electric current through a solution of phenol, $MgSO_4$, and magnesic bicarbonate The free acid is very unstable (Baumann, *B* 11, 1907; Brieger, *H* 8, 311, Drechsel, *J pr* [2] 29, 240) — 20 SO_2Cl_2 at 150° forms chloro-phenol (Dubois, *Z* [2] 2, 706) SO_2Cl_2 forms *o*- and *p*-chlorophenols and their sulphonic acids (Armstrong & Pike, *C N* 29, 288) — 21 Nitric acid to *ms* *o*- and *p*-nitro-, di-nitro, and tri-nitro-phenols.—

92 Potassium and sodium dissolve, giving off hydrogen and forming phenylates. These absorb CO_2 , forming $\text{PhO CO}_2\text{K}$ and $\text{PhO CO}_2\text{Na}$, which yield oxy-benzoates when strongly heated (v o oxy benzoate actm) (Kolbe, *J pr* [2] 10, 89) — 23 CrO_3 forms phenoquinone $\text{C}_6\text{H}_4\text{O}_2$ (Wichelhaus, *B* 5, 248, 846) — 24 Nitrous acid forms nitroso phenol, the mono-oxim of quinone (Baeyer, *B* 7, 967) H_2SO_4 , to which 6 p c of KNO_3 has been added, gives when shaken with a mixture of phenol (1 vol) and H_2SO_4 (1 vol) a brown colour, changing to green, and finally to a magnificent blue. On pouring into water brown flakes are deposited (Liebermann, *B* 7, 248 1098). In the action of H_2SO_4 and nitrous acid on phenol there is formed (a) phenol dichroin $\text{C}_6\text{H}_3\text{NO}_2$ or $\text{C}_6\text{H}_4(\text{OH})\text{N}(\text{OPh})_2$, a brown powder, sol ether, and also phenoxyls chrom $\text{C}_6\text{H}_3\text{NO}_2$, which is black and insol ether (Kramer, *B* 17, 1877, Brunner & Chuit, *B* 21, 250) (a) Phenol dichroin is also formed from quinone mono oxim and H_2SO_4 (Baeyer & Caro, *B* 7, 966) Each body yields an amorphous acetyl derivative. Phenol-dichroin forms a blue solution in alkalis and H_2SO_4 . Phenol oxychromin forms a green solution in H_2SO_4 , and a brown solution in alkalis — 25 NOCl forms chlorinated quinones (Tilden, *C J* 27, 851) — 26 Distillation with PbO yields diphenylene oxide $\text{C}_{12}\text{H}_8\text{O}$ and $\text{C}_{12}\text{H}_6\text{O}_2$, crystallising in needles [174°] (Graebe, *B* 7, 396, Behr & Van Dorp, *B* 7, 398) — 27 COCl_2 at 150° forms $\text{CO}(\text{OPh})_2$ and $\text{COCl}(\text{OPh})$ (Kempt, *J pr* [2] 1, 402) — 28 *Ammoniacalising chloride* at 290° forms aniline, diphenylamine, and Ph_2O (Merz & Weith, *B* 13, 1299) 29 *Hydrazine* solution in excess forms a white unstable substance [57°], possibly $\text{C}_6\text{H}_3\text{O}(\text{N}_2\text{H}_4)_2$ (Curtius & Thun, *J pr* [2] 44, 190) — 30 TiCl_4 acting on a benzene solution of phenol forms dark red crystals of $\text{Ti}(\text{OPh})_3\text{HCl}$, decomposed by water into phenol, titanic acid, and HCl (Schumann, *B* 21, 1079) — 31 AlCl_3 gives the solid $\text{AlCl}_2(\text{OPh})_2$, v sol hot CS_2 , insol ligroin, decomposed at once by water into phenol, alumina, and HCl (Claus & Merklin, *B* 18, 2933) On heating phenol (2 pts) with AlCl_3 (1 pt), benzene, Ph_2O , and diphenylene methane oxide are formed (Merz & Weith, *B* 14, 191) Phenol (5g) added to AlBr_3 (10g) forms amorphous $\text{Al}_2\text{Br}_3(\text{OPh})_2$, which is quickly decomposed by water (Gustavson, *J R* 16, 242) — 32 AlCl_3 and CCl_4NO_2 followed by water give aurin — 33 Heating with oxalic acid and H_2SO_4 gives rosolic acid 34 *Cyanic acid vapour* is absorbed by dry phenol forming phenyl allophanate, which crystallises from hot alcohol in unctuous crystals (Tuttle, *J* 1857, 451) — 35 *Benzyl chloride* and zinc form $\text{PhCH}_2\text{C}_6\text{H}_4\text{OH}$ on heating (Paterno, *G* 2, 2) — 36 Phenol (10g) boiled with Ac_2O (30g) and ZnCl_2 (20g) forms phenacetin, a red dye $\text{C}_6\text{H}_4\text{H}_2\text{O}_2$, which is insol benzene, sol alcohol, ether, and HOAc . Its solution in alkalis is raspberry-red (Rasnfski, *J pr* [2] 26, 54) — 37 $\text{C}_6\text{H}_5\text{CCl}_3$ forms benzaurin — 38 *Phthalic anhydride* and H_2SO_4 form phenol phthalein $\text{C}_{20}\text{H}_{14}\text{O}_4$ on heating (Baeyer, *B* 4, 658) — 39 — *Acetamide* and *benzamide* on heating form respectively PhOAc and PhOBz , while NH_3 is given off (Guarechi, *A* 171, 140) — 40 Heated in a alcoholic solution with CCl_4 and KOH or NaOH it yields o- and p- oxy benzoic acids —

41 *Paraldehyde* and stannic chloride form $\text{CH}_3\text{CH}(\text{C}_6\text{H}_4\text{OH})_2$ — 42 *Benzoyl aldehyde*, alcohol, and a few drops of HCl form white resinous $\text{C}_{20}\text{H}_{14}\text{O}_2$, whence amorphous $\text{C}_{20}\text{H}_{14}\text{Ac}_2\text{O}_2$ may be got (Michael & Ryder, *Am* 9, 130) — 43 *Benzene sulphochloride* added to a slightly alkaline solution of phenol forms $\text{C}_6\text{H}_5\text{SO}_2\text{OPh}$ as very stable colourless crystals [36°], sol alcohol, sl sol ether, saponified by alcoholic potash (Georgesen, *B* 24, 417) — 44 *Acetoacetic ether* and H_2SO_4 form (8) methyl coumarin — 45 *Chloro-acetal* and alcoholic NaOPh at 160° form $\text{C}_6\text{H}_5\text{OCH}_2\text{CH}(\text{OEt})_2$ (255°) (Autenrieth, *B* 24, 162) — 46 CCl_4 , COCl_2 and AlCl_3 give diphenyl carbonate (Heutschel, *J pr* [2], 36, 815) 47 o *Oxy-benzoyl aldehyde*, HOAc , and H_2SO_4 form, on warming, oxyaurin $\text{C}_{10}\text{H}_6\text{O}_4$, which greatly resembles aurin (Liebermann, *B* 9, 801, 11, 1436) Zulkowsky (*M* 5, 111) obtained a dyestuff $\text{C}_{20}\text{H}_{14}\text{O}_4$ soluble in aqueous NaHSO_4 , and another dyestuff insol NaHSO_4 — 48 CH_2Cl_2 and dilute caustic soda form $\text{CH}_2\text{C}(\text{OPh})_2$ [98 5°] crystallising in plates, v sl sol water (Heiber, *B* 24, 3678)

Estimation — 1 Titrated by adding bromine water till the solution is yellow, or by adding excess of bromine, KI , and starch, then titrating with $\text{Na}_2\text{S}_2\text{O}_3$. The bromine solution contains 40 grms Br and 20 grms KBr per litre (Degener, *J pr* [2] 17, 880, cf Landolt, *B* 4, 770, Koppeschaar, *Fr* 15, 233, Weinreb & Bondi, *M* 6, 506, Giacosa, *Fr* 6, 45) — 2 14 to 15 grms of pure KOH are dissolved in 1 litre of water and 10 grms of bromine gradually added, the solution is then diluted till 50 c c corresponds to 0.05 gm of pure phenol. To ascertain the strength of any phenol solution 50 grms of the above solution are taken and the phenol added till a drop of the solution ceases to give a blue colouration with KI and starch (Chandelon, *Bl* [2] 38, 69) — 3 2 or 3 grms phenol are dissolved in three times the molecular proportion of caustic soda. The solution is made up to 500 c c, and 10 c c are put into a small flask warmed to 60°, and one tenth normal iodine solution is allowed to flow in until it is coloured strongly yellow by excess of iodine, by shaking, a red pp is formed. The excess of iodine is estimated by sodium thio sulphate. The quantity of iodine taken up by the phenol multiplied by 0.123518 gives the amount of pure phenol (Messinger & Vortmann, *B* 23, 2753) — 4 To separate phenol from mixtures in poisoning cases the substance is triturated with dilute H_2SO_4 and extracted with alcohol, the alcohol evaporated, and the residue extracted with benzene (Dragendorff & Jacobson, *C* 1886, 828), or the alcoholic extract may be mixed with NaOH aq, evaporated to a small bulk, filtered, and the phenol ppd by HCl aq in a graduated tube (Muter & De Koningh, *An* 12, 191, cf Staveley, *Chem Zeit* 13, 1126) — 5 Phenol may be titrated by adding standard NaOH to a solution containing s-tri-nitro benzene as indicator until a red colour appears (Bader, *Fr* 31, 58)

Salts — Phenol behaves as a very weak acid. It dissolves in KOH aq, but does not expel CO_2 from sodium carbonate in the cold. — $\text{C}_6\text{H}_5\text{OK}$. White hygroscopic needles, v sol alcohol, ether, and water. Oxidises rapidly in air — $\text{C}_6\text{H}_5\text{ONa}^+$. Yields Ph_2O and $\text{C}_{12}\text{H}_{10}\text{O}$ when distilled with NaPO_3 (Niederhäusern, *B* 16,

1123) Sulphur at 200° gives $S_2(C_6H_5OH)_2$.— $Ba(OC_6H_5)_2$ 8aq Crystalline crusts, got by boiling phenol with baryta water and evaporating *in vacuo*— $Ca(OC_6H_5)_2$ * Yields diphenylene oxide and a little benzene on distillation— $Pb(OH)OC_6H_5$ Made by boiling phenol with iitharge (Calvert, *C J* 18, 68)— $TiOOC_6H_5$ Crystals, al sol cold water (Kuhlmann, *J* 1864, 254)— $Hg(OC_6H_5)_2$ 4sq Pp got by adding mercurous chloride to a solution of NaOPh (Pouchet, *C R* 106, 276)— $Al(OC_6H_5)_3$ Made by heating phenol with aluminium and AlI_3 and pouring off the liquid product (Gladstone & Tribe, *C J* 89, 9, 41, 5, Hodgkinson, *C N* 1877, 237) Split up on distillation into Al_2O_3 and Ph_2O , other products being phenol and a ketone $C_{12}H_{10}O$ [97°] (c 280°), V.D. 182.2—Aniline salt $C_6H_5ONH_2Ph$ [87°] (181°) Formed by boiling aniline with phenol (Dale & Schorlemmer, *A* 217, 388, Dyson, *C J* 43, 466, Mylins, *B* 19, 1002) Tables (from alcohol)—*p*-Toluidine salt $C_6H_5ONH_2C_6H_4Me$ [81°] Needles (from ligroin) (Dyson)

Combinations—1 With SO_2 phenol forms an unstable compound which may be distilled at 140° (best in a current of SO_2), and which crystallises in rectangular tablets. If exposed to air it absorbs water and gives off SO_2 . The compound melts between 25° and 30° (A. Hölzer, *J pr* [2] 25, 463)—2 With CO_2 If salicylic acid is heated in a sealed tube for two hours at 260° it is resolved into phenol and CO_2 , but on cooling crystals resembling common salt with sides like staircases are formed. These melt at 37° They are decomposed by heat, and also by water, alcohol, ether, and chloroform, into phenol and CO_2 (A. Kleip, *J pr* [2] 25, 464). The same compound is got from phenol and liquid CO_2 (Barth, *A* 148, 49)

Formyl derivative C_6H_5OCHO Liquid, boiling with decomposition at 180° (Seifert, *J pr* [2] 31, 467)

Acetyl derivative C_6H_5OAc *Phenyl acetate* (195°) at 733 mm (Orndorff, *Am* 10, 368) Formed by boiling an alcoholic solution of phenyl phosphate with KOAc (Williamson & Scrugham, *A* 92, 317, Kreyser, *B* 18, 1716) and by the action of $AcCl$ on phenol (Cahours, *A* 92, 816) or of $POCl_3$ (1 mol) on phenol (3 mols) mixed with $HOAc$ (3 mols) (Nencki, *J pr* [2] 25, 282, Seifert, *J pr* [2] 31, 467) Obtained also by boiling phenol with acetamide (Guareschi, *A* 171, 142) Heavy oil, saponified by KOH *Aq* **Reactions**—1 Sodium acts violently, giving off and forming $EtOAc$, phenol, salicylic acid, $C_{10}H_{12}O_2$ [48°] crystallising from alcohol in needles, and $C_{10}H_{14}O$ [188°] nearly insol in alcohol, but crystallising therefrom in yellow needles (Hodgkinson & W. H. Perkin, jun, *C J* 37, 487, 721)—2 Benzyl chloride after heating for 14 days leaves an oil with strong blue fluorescence which when saponified by alcoholic potash forms $C_{10}H_{10}O$ [39°] (c 295°) and benzylphenol $C_{12}H_{14}O$ [81°] (321°) (H. A. P.)—3 Benzyl chloride and $AlCl_3$ give HCl , toluene, anthracene, Ac_2O , and $OH_2PhC_6H_4OAc$ —4 $NaSEt$ forms $PhONa$ and $EtSAc$ (Seifert)—5 PCl_5 at 100° gives phenyl phosphate and $C_6H_5OCCl_2CCl_2$ [26°] (Michael, *Am* 9, 207)—6 Chlorine in the cold forms $AcCl$, *p*-chloro-phenol, and $C_6H_4Cl(OAc)$ Chlorine at 160° yields $AcCl$,

$C_6H_4Cl_2(OAc)$, and mono- and di- chloro phenols (Seelig, *J pr* [2] 89, 175)—7 Bromine forms $AcBr$ and C_6H_4BrOAc Excess of Br gives $C_6H_4Br_2OH$ and $C_6H_4Br_2OAc$ (Seelig)—8 $BzCl$ and a little $ZnCl_2$ give $PhOBz$ (Doebner, *A* 210, 255)

Propionyl derivative C_6H_5OCOEt [20°] (211°) $SG \frac{1}{2}$ 1 0643, $\frac{1}{2}$ 1 0542 Formed by distilling phenol with excess of propionyl chloride (Perkin, *C J* 55, 546) Large transparent prisms PCl_5 at 100° followed by water gives only $C_6H_4Cl_2O$ (116°) (Michael, *Am* 9, 212)

Butyryl derivative $C_6H_5OCO C_2H_5$ (228°) $SG \frac{1}{2}$ 1 0364, $\frac{1}{2}$ 1 0269 Formed from phenol and butyryl chloride (Pérkin)

Benzoyl derivative C_6H_5OBz *Phenyl benzoate* [89°] (314° cor) HF 61,804 (Stohmann, *J pr* [2] 86, 7) Made by melting benzoic acid (11 g) with phenol (10 g) and gradually adding $POCl_3$ (13 g) The product is washed with dilute KOH and crystallised from dilute alcohol, the yield being fair (12 g) (Rasinski, *J pr* [2] 26, 62, cf Ettinger, *A* 53, 87, Stenhouse, *A* 58, 91, Laurent & Gerhardt, *A* 75, 75, List & Limpriht, *A* 90, 190) Formed also by boiling phenol with benzamide (Guareschi, *A* 171, 141) and from phenyl phosphate and NaOBz (Kreyser, *B* 18, 1719) Monoclinic prisms (from ether alcohol) Not saponified by boiling aqueous KOH, but saponified by alcoholic potash

Salicyl derivative *o* $Oxybenzoic acid$

Methyl derivative C_6H_5OMe *Anisole* Mol w 108 (155°) VD 3.79 (calc 3.73) $SG \frac{1}{2}$ 1 0110 (Pinette, *A* 248, 34), $\frac{1}{2}$ 997 (Vincent, *Bl* [2] 40, 106) CE (0°–10°) 00083 SV 125.2 (R. Schiff, *A* 220, 105) SH 405 at 0° (Schiff, *A* 234, 300) R_{∞} 55.33 (Nasini & Bernheimer, *G* 15, 93) HfP 15,860 HfV 13,830 (Thomsen, *Th*), 32,718 $[C_6O_2=94,000, H_2O=69,000]$ (Stohmann, *J pr* [2] 35, 23) Formed by distilling anisole acid or the methyl derivative of salicylic acid with baryta (Cahours, *A Ch* [3] 2, 274, 10, 353, 27, 439) Made also by heating $PhOK$ with MeI at 110° (Cahours, *A* 78, 225) Prepared by heating NaOPh at 200° in a rapid current of MeCl (Vincent, *Bl* [2] 40, 106) Oil with pleasant odour, v sol alcohol and ether Conc $HfAq$ at 140° splits it up into phenol and MeI (Graebe, *A* 139, 149) At 400° it decomposes into phenol and ethylene (Bamberger, *B* 19, 1820) Chlorine in the cold gives rise to $[1\ 2\ C_6H_4ClOMe$ (c 200°), $[1\ 3\ 6\ C_6H_4Cl_2OMe$ [28°], (233°), and $[1\ 3\ 5\ 6\ C_6H_3Cl_3OMe$ [60°] (249°) In presence of iodine, chlorine forms $[1\ 2\ 3\ 5\ 6\ C_6H_3Cl_4OMe$ [100°] (279°) and also C_6Cl_5OMe [107°] (c 289°) Chlorine with I at 60° forms C_6Cl_4 [220°], C_6HCl [87°] and $C_6H_2Cl_3$ [136°] Chlorine with I acting on boiling anisole forms C_6Cl_4 , $COCl$, HCl , and some CCl_4 Chlorine with $SbCl_3$ forms C_6Cl_4OH [187°] and CCl_4 Chlorine with $SbCl_3$ at 100° gives C_6Cl_4O [107°] (Hugouenq, *A Ch* [6] 20, 504) $AcCl$ in CS_2 in presence of $AlCl_3$ forms CH_3Cl , C_6H_5OMe (Gattermann, *B* 22, 1129), $BzCl$ acts in like manner

Ethyl derivative C_6H_5OEt *Phenetole*. (172°) $SG \frac{1}{2}$ 9822 (Pinette, *A* 248, 35), VD 4.27 (calc. 4.21) CE (0°–10°) 00087 SV 148.5 (R. Schiff, *A* 220, 105) SH 429 (Schiff,

A 284, 300 H.F.p 39,775 (Stohmann) Formed by distilling barium ethyl salicylate and by the action of EtI on C_6H_5OK (Cahours, *A Ch.* [3] 27, 468, *Baly*, *A* 70, 269) Formed also by the action of alcohol and $ZnCl_2$ on phenol (Kastrop, *B* 10, 1855) and by the action of dry alcohol on diazobenzene nitrate or sulphate (Remsen & Orndorff, *Am.* 9, 392)

Preparation—Equal volumes of H_2SO_4 and alcohol are mixed and allowed to cool. The liquid is then neutralised with soda and evaporated until Na_2SO_4 begins to crystallise out. The liquid is poured off from the crystals, mixed with a strong solution of sodium phenylate, and heated in an autoclave at 150° under 7 atmospheres' pressure. The sodic phenylate is made by dissolving phenol in caustic soda solution (S.G. 1.33) In calculating the amount of phenol it is assumed that half the alcohol forms sodic ethyl sulphate (Kolbe, *J pr* [2] 27, 425)

Properties—Oil Yields with fuming HNO_3 a di nitro derivative [87°] At 400° it yields phenol and ethylene $BzCl$ in CS_2 in presence of $AlCl_3$ forms $C_6H_5CO_2C_2H_5OEt$, $AcCl$ acts in like manner (Gattermann, *B* 22, 1129)

Propyl derivative C_6H_5OPr (191°) S.G. $\frac{2}{3}$ 9639 C.E. ($0^\circ-10^\circ$) 00086 S.V. 172 (Pinette, *A* 243, 35) H.F.p 46,574 (Stohmann)

Isopropyl derivative $PhOPr$ (176°) S.G. $\frac{2}{3}$ 958 (Silva, *Z* 1870, 249)

Butyl derivative $C_6H_5OC_4H_9$ (210°) S.G. $\frac{2}{3}$ 95 C.E. ($0^\circ-10^\circ$) 00089 S.V. 195.3

Isobutyl derivative $C_6H_5OC_4H_9Pr$ (198°) S.G. $\frac{2}{3}$ 939 (Riess, *B* 3, 780)

Isoamyl derivative $C_6H_5OC_5H_{11}$ (225°) Formed from $PhOK$ and isoamyl iodide (Cahours, *C R* 32, 61) Oil, lighter than water

Heptyl derivative $C_6H_5OC_7H_{15}$ (267°) S.G. $\frac{2}{3}$ 9319 C.E. ($0^\circ-10^\circ$) 00091 S.V. 270.8

Octyl derivative $C_6H_5OC_8H_{17}$ (283°) S.G. $\frac{2}{3}$ 9221 C.E. 00084 S.V. 296.1 (Pinette, *A* 243, 36)

Vinyl derivative $C_6H_5OC_2H_3$ (c 155°) S.G. $\frac{2}{3}$ 992 From the bromo ethyl derivative and alcoholic potash (Sabaneff, *Bl* [2] 41, 253)

Bromo vinyl derivative $C_6H_5OC_2H_3Br$ Formed from CH_2Br_2 , phenol, and alcoholic potash (Sabaneff, *A* 216, 277) Oil, decomposed by distillation

Di bromo vinyl derivative $C_6H_5OC_2H_3Br_2$ [38°] Got from phenol, C_2H_5Br , and alcoholic potash Gives $PhOC_2H_3Br$ [59°]

Tri-chloro vinyl derivative $C_6H_5OCCl_2CCl_2$ [26.5°] (106° at 12 mm) Formed by the action of PCl_5 upon phenyl acetate Also obtained by the action of potassium phenol upon per chloro ethylene Crystalline solid Volatile with steam (Michael, *B* 19, 840, *Am* 9, 307)

Bromo-ethyl derivative $PhOC_2H_4Br$ [39°] ($240^\circ-250^\circ$) Made from ethylene bromide and sodium phenol in alcoholic solution by digesting for 3 hours at 100° Separated from the ethylene-ether, $(PhO)_2C_2H_4$, by distilling with steam, in which it is much more volatile Colourless crystals with characteristic odour, partly decomposes on boiling V sol alcohol and ether (Weddige, *J pr* [2] 24, 242) **Reactions**—1 Heated at 110° with alcoholic NH_3 it gives crystals of $HN(C_6H_5OPh)_2HBr$, [216°], sl sol alcohol Alkalies liberate from

this salt the free base imido di-ethylene di phenyl ether as an alkaline oil. With HCl it forms a salt, $HN(C_6H_5OPh)_2HCl$ [218°] It also forms a nitrate [197°]—2 With *o* nitro phenol potassium it forms $PhOC_2H_4OC_6H_4NO_2$, crystals in prisms, [86°]—3 Heated with sodium *p* oxybenzoic ether in alcoholic solution it forms $C_6H_5OC_2H_4OC_6H_4CO_2Et$ [81°], which, when saponified by alcoholic potash, yields the acid, $C_6H_5OC_2H_4OC_6H_4CO_2H$ melting at $[196^\circ]$ (Wagner, *J pr* [2] 27, 227)

Chloro-ethyl derivative $PhOC_2H_4Cl$ [25°] (221°) Made from C_2H_5ClBr and $KOPh$ Reacts with $KOEt$ forming $PhOC_2H_4OEt$ (230°), S.G. $\frac{2}{3}$ 1.018 (Henry, *C R* 96, 1233, or (252°), S.G. $\frac{2}{3}$ 1.037 (Sabaneff, *Bl* [2] 41, 253)

Penta-bromo ethyl derivative $PhOC_2H_4Br_5$ [103°-106°] From the di bromo vinyl derivative by successive treatment with alcoholic potash and Br (Sabaneff, *A* 216, 282) **Methylene derivative** $CH_2(OPh)_2$ (294°) (Henry, (299°) (Arnhold, *A* 240, 201) S.G. $\frac{2}{3}$ 1.114 (H), $\frac{2}{3}$ 1.092 (A) Formed from CH_2Br_2 and $KOPh$ (Henry, *A Ch* [5] 86, 269)

Ethylene derivative $C_6H_5(OPh)_2$ [98.5°] (Burr, *Z* [2] 5, 165), [95°] (Lippmann, *C C* 1870, 45) Made from C_2H_5Br and $KOPh$ at 140° Crystals, sl sol alcohol Br yields $C_6H_5Br_2O_2$ [c 100°] H_2SO_4 yields a disulphonic acid, whence $C_6H_5(O_2C_6H_4SO_3)_2Pb$ may be got, crystallising from hot water in laminae

Bromo propyl derivative $C_6H_5OC_3H_7$ ($246^\circ-256^\circ$) Formed from phenol, trimethylene bromide, and $NaOEt$ (Lohmann, *B* 24, 2632) Oil Alcoholic NH_3 at 100° forms $(PhOC_3H_7)_2NH$ which distils above 300° and gives B^+HCl [206°], and the nitros amine $(PhOC_3H_7)_2NNO$ [61°] Aniline forms $PhOC_3H_7NHPH$ [32°] which gives B^+HCl [170°] With $NaOMe$ in $MeOH$ it yields $PhOC_3H_7OMe$ (231°), while alcoholic potash solution forms $PhOC_3H_7OEt$ (329° , or probably 239°) The compound $PhOC_3H_7OH$ (250°) is formed by the action of nitrous acid on $PhOC_3H_7NH_2$ (242°) which is itself obtained by the hydrolysis of $PhOC_3H_7NHCO_2C_6H_5CO_2H$

Trimethylene derivative $CH_2(CH_2OPh)_2$ [61°] A by product in the preparation of the bromo propyl derivative

Allyl derivative $PhOC_3H_5$ (194°) From C_2H_5Br and $NaOPh$ (Henry, *B* 5, 455)

Di chloro allyl derivative $PhOC_3H_5Cl_2$ ($114^\circ-118^\circ$ in vacuo) Got from $PhOCOEt$ and PCl_5 (Michael)

Bromo allyl derivative $PhOC_3H_5Br$ (240°) Got from $CH_2CHBrCH_2Br$ and $KOPh$ (Henry, *Bl* [2] 40, 324) Alcoholic potash forms the propargyl derivative (210°)

Benzyll derivative *v* Phenyl ether of BENZYL ALCOHOL

Glucoside $C_6H_5OC_6H_4(OH)_4CHO$ [172°] Formed by adding acetochlorhydrase to an alcoholic solution of $PhOK$ (Michael, *C R* 89, 855, *Am* 1, 306) Long needles (from hot water), v sol water, sol alcohol and $HOAc$ H_2SO_4 forms a yellow solution Acetic anhydride and $NaOAc$ at 100° yield the tetra acetyl derivative $C_6H_5OC_6H_4(OAc)_4CHO$, which crystallises from alcohol in long white needles

$C_6H_5 \begin{smallmatrix} \diagup C(C_6H_5OH)_2 \\ \diagdown CO \end{smallmatrix}$ [c 258°] Formed by

heating phenol with phthalic anhydride and conc H_2SO_4 . Obtained also from di-amido-di-phenyl-phthalide by the diazo-reaction (Baeyer, *A* 202, 36, *B* 9, 1230, 12, 642) Small crystals (from alcohol), *v* sol hot alcohol, sl sol water. Its solutions in alkalis and alkaline carbonates are red, but become colourless on neutralisation, and also on addition of excess of KOHAq but not by NH_3 . The red colour of a solution in very dilute ammonia disappears on standing (Long, *Am* 11, 84) Aniline does not give any colour with phenol-phthalain $AgNO_3$ gives a violet pp

Reactions—1 H_2SO_4 at 100° forms a sulphonic acid, but at 200° it yields oxy-anthraquinone—2 PCl_5 yields di-chloro di phenyl phthalide [156°]—3 Zinc-dust and NaOHAq yield phenol-phthalin $CO_2H \cdot C_6H_4 \cdot CH(C_6H_5OH)_2$ —4 Potash fusion gives dioxybenzophenone and benzoic acid—5 NH_3 at 170° forms $C_{20}H_{14}N_2O_4$ [266°]

Di-acetyl derivative $C_{20}H_{12}Ac_2O_4$ [143°] Colourless tables (from wood spirit)

Anhydride $C_{20}H_{12}O_4$ [175°] A by product in the preparation of phenol-phthalain (Baeyer, *A* 212, 347) Needles, insol NaOHAq. Conc H_2SO_4 forms a solution with green fluorescence. Bromine yields $C_{20}H_{12}Br_2O_4$ [258°] Alcoholic potash and zinc dust reduce it to phthalin $C_{20}H_{14}O_2$

Tetra bromo-phenol phthalain $C_{20}H_8Br_4O_4$, *tc* $C_6H_4 \cdot C_2O_2(C_6H_2Br_2OH)_2$ [220°-280°] Formed by adding Br in HOAc to a solution of phenol phthalain in alcohol. Colourless needles (from ether), sl sol alcohol and HOAc. Alkalis form violet solutions, decolourised by excess H_2SO_4 , produces di bromo-oxy-anthraquinone on heating to 150°. Ac₂O yields a di-acetyl derivative [134°] H_2SO_4 containing KNO_3 forms bromosoquinone $C_{12}H_6Br_2O_8$, separating from alcohol chloroform in red crystals with steel-blue lustre, insol water, forming a violet solution in H_2SO_4 , and converted by boiling alcoholic potash into $C_{12}H_6Br_2O_8$ [264°] NH_3 at 170° forms $C_{20}H_{12}Br_2N_2O_4$ (above 280°), whence nitrous acid produces $C_{20}H_{12}Br_2N_2O_8$, and Ac₂O yields $C_{20}H_{10}Ac_2Br_2N_2O_4$ [241°]

PHENOL-PHTHALIDEIN $C_{20}H_{14}O_4$, *tc*

$C_6H_5 \begin{smallmatrix} \diagup C(OH)(C_6H_5OH) \\ \diagdown CO \end{smallmatrix}$ *Dr-oxy-*

phenyl-oxanthranol [212°]. Formed by oxidation of phenol-phthalidin by dilute alkaline $KMnO_4$ (Baeyer, *A* 202, 100) Monoclinic tables (from HOAc), $a \cdot b \cdot c = 46 \cdot 1 \cdot 49$, $\beta = 69^\circ 5'$, *v* sol alcohol and acetone. It forms a pale-yellow solution in KOHAq, and is reprecipitated by HCl. Conc H_2SO_4 forms a violet solution, and on heating produces oxyanthraquinone and pthalic acid. Reduced by zinc-dust and NaOHAq to phenol-phthalidin. PCl_5 yields di-chloro phenyl-oxanthranol $C_{20}H_{12}Cl_2O_4$ [156°]. Bromine gives $C_{20}H_{12}Br_2O_4$ (above 280°), whence $C_{20}H_{12}Ac_2Br_2O_4$ [182°] may be obtained. On adding phenol to a solution of phenol-phthalidein in H_2SO_4 , the violet colour changes to blood-red, and on addition of water a red amorphous pp is thrown down. This pp forms a deep-violet solution in alkalis, and yields a crystalline bromo-derivative. A mixture of NH_3 and alcohol at 160° converts the red pp into $C_{20}H_{14}N_2O_4$ [260°], crystallising in yellow needles

Acetyl derivative $C_{20}H_{12}Ac_2O_4$ [109°] Monoclinic prisms, $a \cdot b \cdot c = 2 \cdot 78 \cdot 1 \cdot 44$, $\beta = 77^\circ 2'$

PHENOL-PHTHALIDEIN CHLORIDE *v*

Di-CHLORO PHENYL-OXANTHRANOL

PHENOL-PHTHALIDIN *v* Di-OXY-PHENYL

ANTHRANOL

PHENOL-PHTHALIN $C_{20}H_{14}O_4$, *tc*

$CO_2H \cdot C_6H_4 \cdot CH(C_6H_5OH)_2$ *Dr-oxy-tri-phenyl-methane carboxylic acid* [225°] Formed by reduction of phenol-phthalain with zinc-dust and NaOHAq (Baeyer, *A* 202, 80, 212, 350) Small needles. Forms a colourless solution in potash, coloured red by K_2FeCy , through formation of phenol-phthalain. Yields a di-acetyl derivative [146°] Sodium-amalgam yields phenol-phthalol $CH(OH) \cdot C_6H_4 \cdot CH(C_6H_5OH)_2$ [190°], which gives a tri-acetyl derivative [40°]

Anhydride $C_{20}H_{12}O_4$ [217°] Formed by reducing the anhydride of phenol-phthalain. Small needles (from dilute alcohol)

Di-chloro-phenol-phthalin *Anhydride*

$O \begin{smallmatrix} \diagup C_6H_4Cl \\ \diagdown C_6H_4Cl \end{smallmatrix} OH$ $C_6H_5 \cdot CO_2H$ [226°-230°] Got

by the action of zinc and NaOHAq on the compound $C_{20}H_{12}Cl_2O_4$, derived from fluorescein (*v* vol II p 558) Small needles (from dil alcohol)

Tetra-bromo-phenol-phthalin

$CO_2H \cdot C_6H_4 \cdot CH(C_6H_2Br_2OH)_2$ [205°] Formed by bromination. Crystals (from benzene) Yields a di-acetyl derivative [166°] (Baeyer, *A* 202, 80) Conc H_2SO_4 converts it into tetra bromo phenol-phthalidin $C_{20}H_8Br_4O_4$, which crystallises from alcohol in golden needles, and is converted by oxidising agents into tetra bromo-phthalidein $C_{20}H_8Br_4O_4$. Tetra-bromo-phenol-phthalidin is tetra-bromo di-oxy phenyl-anthranol, and its di-acetyl derivative crystallises in needles [256°]

PHENOL-QUINOLINE *v* OXY-PHENYL-QUINOLINE

PHENOLS Compounds containing hydroxyl united to carbon, which forms part of a benzene nucleus (*v* BENZENE and ALCOHOLS) They much resemble the tertiary fatty alcohols, being more acid in character than primary alcohols. Thus phenols and tertiary alcohols form hardly any acetate on heating with HOAc. Phenols in which hydrogen in the *o*- or *p*-position has been displaced by NO_2 , or by a halogen are even more strongly acid in character (*v* *g* picric acid)

Formation.—1. By potash-fusion from sul-

phonic acids —2 By the diazo-reaction from amido-compounds (*v* DIAZO-COMPOUNDS) —3 By distillation of oxyacids either alone or with lime —4. Halogens in a benzene nucleus may sometimes be displaced by hydroxyl by heating with KOHAq in sealed tubes, thus *o*- and *p*-chloro-nitro-benzenes give *o*- and *p*-nitro phenols by this treatment

Properties of Phenol and its homologues — Dissolve in NaOHAq but not in Na₂CO₃Aq Phenols do not give rise on oxidation to an acid or aldehyde containing the same number of atoms of carbon in the molecule They do not exchange H⁺ or K⁺ on treatment with KSH, nor do they form ammonium salts They do not react (like alcohol) with HCl FeCl₃ colours aqueous solutions of phenols, and products of oxidation are often produced. H₂SO₄ to which 6 p.c. of KNO₃ has been added gives with a solution of a phenol in H₂SO₄ a brown colour, changing on warming to green and blue (Liebermann, *B* 7, 248, 806, 1098)

Reactions —1 Readily undergo bromination, chlorination, and nitration —2 H₂SO₄ forms sulphonic acids, the isomeric sulphuric acids being very unstable —3 Sodium and CO₂ form oxyacids on heating (Kolbe) —4 Chloroform and NaOHAq form, on boiling, oxy-aldehydes (Tiemann a Reimer, *B* 9, 824) —5 CCl₄ and alcoholic potash at 100° form oxyacids —6 Ammoniacal ZnCl₂ at 200°–300° converts phenols into amines (Merz a Weith, *B* 13, 1298, 20, 544) —7 Solutions of NaHCO₃ and (NH₄)HCO₃ yield oxyacids on heating with dioxyphe-nols (Kostanecki, *B* 18, 3203) —8 Distillation over zinc-dust reduces the hydroxyl to hydrogen, forming the corresponding hydrocarbons —9 Alkyl chlorides and anhydrides yield alkyl derivatives of phenols, especially if a little powdered zinc be added (Schisparelli, *G* 11, 69) When an alkyl chloride is used oxy ketones are also often formed through the alkyl entering the benzene nucleus —10 Organic acids mixed with phenols readily yield alkyl derivatives of the phenols on adding POCl₃ or on heating in presence of ZnCl₂ (Rasinski, *J pr* [2] 26, 62, Nencki, *M* 10, 906) Alcohols in presence of ZnCl₂ form alkyl ether and higher homologous phenols —11 Alkyl derivatives of phenols split up on distillation into phenols and olefines (Bamberger, *B* 19, 1819) —12 The acid sulphuric ethers of the form C₆H₄XO.SO₃H derived from *o* and *p*-alkyl-phenols are oxidised by alkaline KMnO₄ to *o*- and *p*-oxy benzoic acids (Heymann, *B* 19, 704) —13 Alkaline solutions of phenols absorb atmospheric oxygen, forming dark coloured products —14 Homologues of phenol frequently yield oxyacids on fusion with potash, the alkyl side-chain being oxidised to carboxyl 15 Aldehydes in presence of dehydrating agents form compounds of the form XOCH(OY), which change to XOCH(Y' OH). Thus (β) naphthol and benzoic aldehyde give PhCH(OC₆H₅)₂, changing to PhCH(C₆H₅OH)₂, which is at once converted into the anhydride PhCH<C₆H₅OH>O (Baeyer, *B* 5, 26, Clausen, *B* 19, 5316). —16 Phthalyl chlorides usually forms phthalic ethers (R Meyer, *B* 24, 2600). —17 Iodine and potash give di- and tri- iodo- derivatives (Messinger a-Vortmann, *B* 22, 2315) —18 Nitrous

acid displaces hydrogen in the *o*- or *p*- position by nitrosyl The products are identical with the mono-oxims formed by warming quinones with hydroxylamine hydrochloride, but yield nitro-phenols on oxidation with alkaline K₂FeO₄. —19 Diazo salts readily form azo-compounds (*q v*) 20 Diazo-amido-compounds form oxy azo-compounds Thus C₆H₄Cl.N₂.NH.C₆H₄Cl heated with phenol on a water bath yields C₆H₄Cl.N₂.C₆H₄OH and C₆H₄Cl.NH₂ (Heumann a Oeconomidis, *B* 20, 904) —21 Benzotrichloride acting on phenols in which there is an atom of hydrogen in the *p* position to hydroxyl yields colouring matters related to aurin (Doebner, *A* 217, 228, 257, 56)

PHENOL *o*-SULPHONIC ACID C₆H₄SO₃H C₆H₄(OH)SO₃H Formed, together with the *p* acid, by the action of H₂SO₄ on phenol, especially in the cold (Kekulé, *Z* 1867, 199, *B* 2, 330, Faust, *Z* 1871, 339, Armstrong, *C J* 24, 1112, 25, 12, 857) Prepared by dropping H₂SO₄ on dry phenol at –10°, allowing the product to stand for a week, and then distilling, treating with BaCO₃ and KHCO₃ successively, and crystallising the K salt (Allan le Cannu, *C R* 109, 225) Crystals (containing 1½ aq), melting at 50° and decomposing at a higher temperature, with liberation of H₂SO₄ Sol ether When heated with water it changes to phenol *p*-sulphonic acid (Post, *A* 205, 64) Possesses powerful antiseptic properties (Serrant, *C R* 103, 1079)

Reactions —1 Potash-fusion gives some pyrocatechin The action begins about 280° and attains a maximum (20 p.c) at 320° Soda-fusion also gives pyrocatechin The action begins at 310° At 330° the yield is 6 p.c Fusion with a mixture of potash and soda gives a still smaller yield (1 p.c) of pyrocatechin (Degener, *J pr* [2] 20, 308) —2 Bromine-vapour acting at –8° on the K salt yields bromo and di bromo derivatives —3 BzCl forms PhOBz on heating with the K salt (Solommanoff, *Z* [2] 5, 296) —4 Heated with dilute HCl at 140° it is split up into phenol and H₂SO₄ (Armstrong)

Salts —KA' 2aq [235°–240°] Colourless trimetric prisms, sol water —NaA' 1½aq —BaA', aq needles *S* 25 at 100° —BaA', 2aq —PhA', aq tables, sl sol water —The aniline salt yields phenol and amido-benzene *p*-sulphonic acid on distillation (Kopp, *B* 4, 978)

Methyl derivative C₆H₄(OMe)SO₃H Formed from the acid, KOH, MeI, and MeOH (Kekulé) —KA' aq needles, more soluble than its *p*-isomeride (Hartinger, *M* 4, 173) Yields a chloride [55°]

Ethyl derivative Forms a K salt crystallising in plates

Phenol m-sulphonic acid C₆H₄(OH)SO₃H Formed by potash-fusion from benzene *m*- or *p*-disulphonic acid (Barth a Senhofer, *B* 9, 969) Needles (containing 2aq) FeCl₃ gives a violet colour Yields resorcin on fusion with potash —NaA' aq —KA' aq [200°–210°] Efflorescent needles —K₂C₆H₄SO₃ aq —PhA', 8aq. tables, v sol water —BaA', ½aq —CaA', 6aq green tables

Ethyl derivative C₆H₄(OEt)SO₃H Got by the action of KOH and EtI on the acid (Dehlis a Lagan, *B* 23, 3393) Deliquescent needles Yields a chloride [38°] and an amide [131°], and is reduced by zinc-dust and dilute H₂SO₄ to C₆H₄(OEt)SH (289°) —Salts KA' aq BaA', ½aq needles (from water) —CaA', 8aq

Phenol *p*-sulphonic acid $C_6H_4(OH)SO_3H$ Formed by warming phenol with H_2SO_4 or $ClSO_3H$. Formed also from amido benzene *p*-sulphonic acid by the diazo-reaction. Highly deliquescent hydrated needles (Le Canu, *C R* 103, 388).

Reactions—1 Bromine acting on a cold solution forms mono- and di-bromo-derivatives and finally tri-bromo-phenol (Le Canu)—2 Boiling $HIAq$ gives phenol (Benedikt & Bamberger, *M* 12, 4)—3 Potash fusion forms a little resorcin (Luncke, *J pr* [2] 8, 43)—4 PCl_5 gives *p*-di-chloro benzene and $C_6H_4ClOPOCl_2$ (Kekulé, *B* 5, 875, 6, 943)—5 MnO_2 and H_2SO_4 yield quinone (Schrader, *B* 8, 759)—6 Dilute HCl at 150° forms phenol and H_2SO_4 .

Salts— KA' [400°] Six sided trimetric lamellae $abc = 879 \times 11002$ — NaA' 2aq monoclinic prisms (Shadwell, *J* 1881, 874)— BaA' 3aq S 50 at 100° — $BaC_2H_5SO_3$ 2aq— PbA' 2aq— CoA' 8aq (Freund, *A* 120, 85)— NiA' 8aq— CuA' 10aq— AgA' —Aniline salt Plates [170°] Decomposed at 190° into phenol and amido benzene *p*-sulphonic acid—*o*-Toluidine salt [c 192°] S 107 at 14° (Lecco, *J* 1874, 747)—*p*-Toluidine salt [202°] S 52 at 17° .

Benzoyl derivative $C_6H_4(OBz)SO_3H$ Formed from $PhOBz$ and SO_3 (Engelhardt & Latschinoff, *Z* 1868, 76)— KA' long needles (from water)— CaA' — BaA' — PbA' 2aq— CuA' 6aq— AgA' .

Methyl derivative $C_6H_4(OMe)SO_3H$ Got by methylation. The K salt forms needles.

Ethyl derivative $C_6H_4(OEt)SO_3H$ Formed from the acid, KOH , and EtH (Kekulé, *Z* 1867, 200), and also, together with the *o*-iso meride, by sulphonating phenetole (Lippmann, *C R* 68, 1332)— BaA' 4aq crystals, v sl sol hot water— KA' aq needles (from alcohol).

Phenyl ether PhA' Formed from phenol (2 mols) and $ClSO_3H$ (Engelhardt & Latschinoff, *Z* 1869, 298). Syrup, split up by water into phenol and phenol sulphonic acid.

Anhydride $C_{12}H_8S_2O_6$ Formed from the acid and $POCl_3$ (Schiff, *A* 178, 171). Powder, v sol water, v sl sol $HClAq$. Coloured violet-red by $FeCl_3$. Ppts gelatin and alkaloids. Yields an acetyl derivative $C_{12}H_8AcS_2O_6$.

Phenol disulphonic acid $C_6H_3(OH)(SO_3H)_2$ [1 2 4] Formed by warming phenol with H_2SO_4 and SO_3 , and by allowing separate vessels of phenol and fuming H_2SO_4 (S G 1 85) to remain for six months *in vacuo*, the acid absorbing the vapour of phenol (Kekulé, *Z* 1866, 693, Le Canu, *C R* 109, 442). Formed also from diazo-benzene sulphate and fuming H_2SO_4 (Griess, *A* 137, 69, Armstrong & Prevost, *B* 6, 664). Nodular groups of deliquescent needles, v e sol water and alcohol. HNO_3 yields picric acid. Potash fusion gives pyrocatechin and its sulphonic acid, soda fusion forms also proto-catechuic acid (Barth & Schmidt, *B* 12, 1260). $FeCl_3$ gives a red colour (Stadeler, *A* 144, 299).

Salts— KA' aq. Needles, decomposing about 270° — S 38 at 100° — BaA' 4aq S 19 6 at 15° — $Ba_2(C_2H_5S_2O_6)_2$ 6aq— $Ba_3(C_2H_5S_2O_6)_3$ 3aq Sl sol water— $Pb_2(C_2H_5S_2O_6)_2$ 6aq Sl sol water— AgA' plates, v sol water.

Methyl derivative $C_6H_3(OMe)(SO_3H)_2$ Formed by sulphonation of anisic acid (Zervas,

A 103, 342), and also from $SO_3(C_2H_5OMe)_2$ and conc H_2SO_4 at 170° (Annaheim, *A* 172, 47)— BaA' 4aq monoclinic crystals.

Ethyl derivative $C_6H_3(OEt)(SO_3H)_2$ [1 2 4] Formed from amido benzene disulphonic acid by the diazo-reaction (Zander, *A* 198, 25). Very deliquescent needles. Yields a chloride [108°] and an amide [233°]— KHA' aq— BaA' 2aq— BaA' 3aq v sol water.

Ethylene derivative $C_6H_3(O C_2H_4 SO_3H)_2$ Formed from $C_2H_4(OPh)_2$ and H_2SO_4 at 120° (Lippmann, *Z* 1869, 447)— BaA' 7aq— PbA' 7aq plates, $insol$ cold water.

Phenol disulphonic acid An unstable acid is formed by heating the trisulphonic acid with KOH (3 pts) and some water at 150° (Senhofer, *J* 1879, 749). Yields K_2A' 3aq— BaA' 4aq— PbA' 4aq long prisms, v sol water.

Phenol trisulphonic acid $C_6H_3(OH)(SO_3H)_3$ [1 2 4 6] Formed by heating phenol (6 pts) with H_2SO_4 (30 pts) and P_2O_5 (15 pts) at 180° (Senhofer, *A* 170, 110). Formed also by heating $SO_3(C_2H_5OH)_2$ with fuming H_2SO_4 at 190° (Annaheim, *A* 172, 28). Needles or short prisms (containing 3 aq). Coloured red by $FeCl_3$ — Na_3A' 3aq— K_3A' 4aq— $K_2C_2H_5S_3O_6$ 2aq— Ba_3A' 4aq scales— Ba_4A' 10aq plates— Cd_4A' 7aq— $Pb_4C_2H_5S_3O_6(OH)_4$ 4aq crystal line powder— Ag_4A' 14aq slender needles.

References—AMIDO-, BROMO-, BROMO NITRO-, DI IODO-, IODO NITRO- PHENOL SULPHONIC ACIDS.

PHENOQUINONE $C_{12}H_6O_4$ [71°] Formed from phenol (1 mol) and quinone (2 mols), or by boiling phenol with aqueous CrO_3 (Wichelhaus, *B* 5, 248, 846, Nietzki, *A* 215, 134, Hesse, *A* 200, 232, Erhart, *Ar Ph* [3] 8, 481). Red needles with green lustre, sol cold water, alcohol, ether, and ligroin. Reduced by SO_2 to hydroquinone. Bromine forms di-bromo phenol.

PHENOSAFRANINE *v* SAFRANINE.

PHENOSE $C_{12}H_{10}O_6$ Formed by the action of aqueous ClO_H on benzene in the dark, the resulting $C_6H_4Cl_2O_3$ [10°] being extracted with ether and heated with very dilute Na_2CO_3 (Carius, *A* 136, 323). Formed also by the electrolysis of toluene mixed with alcohol and dilute H_2SO_4 (Renard, *C R* 92, 965). Deliquescent amorphous mass, v sol water and alcohol, $insol$ ether. Has a sweet taste. Decomposes above 100° . Turned brown by acids and alkalis. Prevents ppn of cupric sulphate by potash, and reduces Fehling's solution. Does not undergo alcoholic fermentation. Reduced by HI to hexyl iodide. HNO_3 yields oxalic acid. Ammoniacal lead acetate ppts $C_6H_4PbO_6$.

PHENOXYACETIC ACID *v* Phenyl derivative of GLYCOLLIC ACID, vol II p 638, and CHLORO-PHENOXYACETIC ACID.

PHENOXYACETIC ACRYLIC ACID *v* Carbonyl methyl derivative of COUMARIC ACID.

PHENOXYACETIC-CARBOXYLIC ACID *v* CARBOXYPHENOXYACETIC ACID.

γ -PHENOXY BUTYRIC ACID $C_{10}H_{12}O_4$ v $C_6H_5OCH_2CH_2CH_2CO_2H$ [60°] Made from the nitrile and $HClAq$ at 100° . Silvery plates, $insol$ water, v sol alcohol— AgA' white crystalline powder, decomposing at 200° .

Nitrile $PhO C_3H_6CN$ [46°] (288°). Formed from $PhO C_3H_6Br$, alcohol, and aqueous $KOCy$ (Lohmann, *B* 24, 2640), and from γ -chlorobutyronitrile and $NaOPh$ (Gabriel, *B* 24 8231).

White needles Conc H_2SO_4 converts it into $\text{C}_6\text{H}_5(\text{SO}_3\text{H})\text{O}\text{C}_6\text{H}_5\text{CONH}_2$ [211°], a crystalline powder which gives BaA^+ , as white crystals insol Aq Yields $\text{PhO}\text{C}_6\text{H}_5\text{NH}_2$ (256°) on reduction

PHENPROPYL-COMPOUNDS v. PROPYL-

PHENYL-COMPOUNDS

PHENOPYLAMINE v. AMIDO PHENYL-

PROPANE

PHENUVIC ACID v. PHENYL METHYL FUR-FURANE CARBOXYLIC ACID

PHENYL The monovalent radicle C_6H_5 . It is more chlorous in character than methyl and ethyl (V Meyer, *B* 20, 534)

Diphenyl $\text{C}_{12}\text{H}_{10}$ vs C_6H_5 , C_6H_5 Mol w 154 [70°] (254°) (Schultz, *A* 174, 205), (253° at 716 mm) (Bamberger a Lodter, *B* 20, 3077) H C v 1,492,800 (Stohmann, *J pr* [2] 40, 86), 1,508,700 (Berthelot, *Bl* [2] 47, 865, *A Ch* [6] 10, 448) H C p 1,494,300 (S), 1,510,100 (B) H F -19,800 (S), -37,100 (B) SVS 154.25 (Schiff). Occurs in the coal tar oils boiling at 200°-300° (Buchner, *B* 8, 22, Schulze, *B* 17, 1203)

Formation—1 By adding slices of sodium to bromo benzene and distilling after 24 hours (Fittig, *A* 121, 361, 132, 201, Schultz, *A* 174, 201, Engelhardt a Latschinoff, *Z* [2] 7, 259)—2 From chloro benzene and sodium amalgam (Cl.urch, *C J* 16, 76)—3 With other hydrocarbons by passing benzene vapour through a red hot tube (Berthelot, *Z* 1866, 707), and formed consequently in many reactions in which benzene is produced at a high temperature—4 By passing benzene vapour mixed with SbCl_5 or SnCl_4 through a red hot tube (Watson Smith, *C J* 30, 30, Aronheim, *B* 9, 1898)—5 A product of the passage of azobenzene through red hot tubes (Claus, *B* 8, 37)—6 By the action of red hot zinc dust on di phenylene ketone-oxide 7 By heating diphenylene ketone dicarboxylic acid with lime (Bamberger a Hooker, *A* 229, 155)—8 From benzidine by the diazo-reaction (Griess, *Tr* 1864 [8] 692)—9 By heating phenol with K at 240° and ppg with water—10 By subjecting bromo benzene to an electric current, using zinc for the positive electrode (Christomanos, *G* 5, 402)—11 In small quantity in the decomposition of diazobenzene salts by alcohol (Griess) and by SnCl_4 (Culman a Gasiorowski, *J pr* [2] 40, 97)

Preparation—1 By slowly passing benzene through a red hot iron tube By successive passage of the unchanged benzene through the tube the yield may be raised to 97 p c of the theoretical (Adam, *A Ch* [6] 15, 224, *C Luddens*, *B* 8, 870)—2 31 g aniline are dissolved in 40 g conc. H_2SO_4 and 150 g water, and diazotized with 31 g NaNO_2 100 g 90 p c alcohol is then added, followed gradually by 50 g finely-divided copper After stirring for one hour it is finally distilled with steam The yield is 6-7 grms Iron and zinc-dust may also be used The temperature must not rise above 80°-40° (L Gattermann, *B* 23, 1226)

Properties—Indescent nacrous scales (from alcohol), v sol hot alcohol and ether

Reactions—1 Readily yields di-bromo- and di-nitro-derivatives Chlorine, in presence of SbCl_5 , yields $\text{C}_{12}\text{H}_8\text{Cl}_2$ and $\text{C}_{12}\text{H}_6\text{Cl}_4$ (Kramers, *A* 189, 142)—2 Heated in a stream of Cl in

presence of I the product is $\text{C}_{12}\text{Cl}_{10}$ (Ruoff, *B* 9, 1048, of Merz a Weith, *B* 18, 2881)—3 A mixture of diphenyl and ethylene passed through a red hot tube yields benzene, styrene, anthracene, and phenanthrene (Barbier, *A Ch* [5] 7, 582)—4 CrO_3Cl_2 in HOAc oxidises it to benzoic acid (Carstanjen, *J pr* [2] 2, 79)—5 AlCl_3 yields, on heating, benzene and a pitchy mass (Friedel a Crafts, *C R* 100, 692) Diphenyl (15 pts) heated with AlCl_3 (1 pt) and CH_2Cl_2 (10 pts) yields diphenylene-methane (fluorene) [118°] and $(\text{C}_6\text{H}_5\text{O}_2\text{H})_2\text{CH}_2$ (810°-820°) (Adam, *Bl* [2] 47, 686)—6 AlCl_3 and COCl_2 give $(\text{C}_6\text{H}_5\text{O}_2\text{H})_2\text{CO}$ [229°] *Acetyl chloride* and AlCl_3 give $\text{C}_6\text{H}_5\text{C}_6\text{H}_5\text{COCH}_3$ [121°]— EtCl and AlCl_3 give $\text{C}_6\text{H}_5\text{C}_6\text{H}_5\text{C}_2\text{H}_5$ (285°) and $\text{C}_6\text{H}_5\text{C}_6\text{H}_5\text{Et}$ (a. 307°) In all these cases the compounds are m-derivatives (Adam, *A Ch* [6] 15, 224)

Dihydrates $\text{C}_{12}\text{H}_{12}$ (249°). Got by the action of boiling alcoholic potash on $\text{C}_6\text{H}_5\text{Br}$, which is formed from $\text{C}_6\text{H}_5\text{I}$ and Br (Bamberger a Lodter, *B* 21, 843) Oil, volatile with steam, sol ether Yields $\text{C}_{12}\text{H}_{12}\text{Br}_2$

Tetra hydrate $\text{C}_{12}\text{H}_{14}$ (245°) at 716 mm Got by reducing diphenyl dissolved in amyl alcohol with sodium (Bamberger a Lodter, *B* 20, 3077) Liquid Yields $\text{C}_{12}\text{H}_{14}\text{Br}_2$ and $\text{C}_{12}\text{H}_{12}\text{Br}_2$ [184°]

References—AMIDO, BROMO, BROMO AMIDO, BROMO NITRO, CHLORO, DI CHLORO DI NITRO, DI IODO, NITRO, and OXY-, DIPHENYL

PHENYL-ACETAMIDE v. Acetyl derivative of ANILINE and Amide of PHENYL-ACETIC ACID

PHENYL-ACETAMIDINE $\text{C}_6\text{H}_5\text{N}_2$ vs $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NH})\text{NH}_2$ Formed from the thio amide $\text{CH}_2\text{Ph CS NH}_2$ by the action of ammonia and atmospheric oxygen, or of ammonia and HgCl_2 (Bernthsen, *B* 8, 1319, 9, 429, *A* 184, 321) Formed also from $\text{CH}_2\text{Ph C}(\text{NH}_2)\text{OEt}$ and ammonia (Luckenbach, *B* 17, 1423) Crystals, decomposed by heat, v sol alcohol, ether, and warm water Absorbs CO from the air Decomposed by heating with water and alcohol into NH_3 and $\text{CH}_2\text{Ph CONH}_2$

Salts— $\text{B}^+\text{HCl aq}$ — $\text{B}^+\text{H}_2\text{PtCl}_4$ — $\text{B}^+\text{H}_2\text{SO}_4$ tables, v sol water and alcohol— $\text{B}^+\text{H}_2\text{S}_2\text{O}_8$ [198°] Needles (from alcohol)— B^+HNO_3 Monoclinic crystals (Lossen, *A* 265, 165)— B^+HOAc [193°] Stellate groups of needles (from alcohol)— $\text{B}^+\text{H}_2\text{C}_2\text{O}_4$ prisms

Di-acetyl derivative

$\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{OAc})\text{NHAc}$ [178°] Four sided tables (from water), al sol alcohol and ether

Phenyl-acetamidine $\text{CH}_2\text{C}(\text{NPh})\text{NH}_2$ Formed from acetonitrile and aniline hydrochloride at 170° (Bernthsen, *A* 184, 358) Oil $\text{B}^+\text{H}_2\text{C}_2\text{O}_4$ v e sol water

s-Di phenyl-acetamidine $\text{C}_{12}\text{H}_{12}\text{N}_2$ vs $\text{CH}_2\text{C}(\text{NPh})\text{NHPh}$ *Ethyl-di-phenyl-amidine* [132°] **Formation**—1 From aniline (8 pts), HOAc (2 pts) and PCl_5 (2 pts) (Hofmann, *C R* 62, 729)—2 From acetanilide (2 mols) and PCl_5 (1 mol) (Lippmann, *B* 7, 541, Wallach, *B* 8, 1567)—3 From acetonitrile and aniline hydrochloride at 240° (Bernthsen).—4 By passing HCl into heated acetanilide (Wallach, *B* 15, 210)—5 By-product in the preparation of this acetanilide from acetanilide and P_2S_5 .—6 By distillation of thioacetanilide (Jacobsen, *B* 19, 1073)

Preparation—By heating a mixture of equal weights of acetanilide and aniline hydrochloride.

Properties—Slender needles or thin prisms, sl sol. alcohol, forming a neutral solution, nearly insol water, v. sol ether. Conc H_2SO_4 forms amido-benzene *p* sulphonic acid and acetic acid. Tin and HCl reduce it to aniline and HOAc. Fuming HNO_3 forms the insoluble nitrate of a di nitro-derivative $\text{C}_{12}\text{H}_9\text{N}_2\text{O}_6\text{HNO}_3$, [182°] (Biedermann, *B* 7, 540) COCl_2 at 60° forms $\text{C}_{12}\text{H}_9\text{N}_2\text{O}_6\text{Cl}_2$, whence NaOEt yields $\text{C}_{12}\text{H}_9\text{N}_2\text{O}_6$, [91°] crystallising from ether (Loeb, *B* 18, 2427, 19, 2340). Excess of COCl_2 in benzene yields $\text{C}_{12}\text{H}_9\text{N}_2\text{O}_6$ [118°], which is decomposed by dilute HCl into aniline and phenyl cyanate. Cyanogen passed into an ethereal solution forms $\text{C}_{12}\text{H}_9\text{N}_2\text{O}_6$, a white crystalline powder [165°]. EtI yields only $\text{CH}_3\text{C}(\text{NPh})\text{NPhEt}$, whence MeI followed by moist Ag_2O produces strongly alkaline $\text{CH}_3\text{C}(\text{NPh})\text{NPhEtMe}(\text{OH})$ — B^+HCl tables, m sol water— $\text{B}^+\text{H}_2\text{PtCl}_4$ — B^+HNO_3 .

u-Di phenyl-acetamide $\text{CH}_3\text{C}(\text{NH})\text{NPh}_2$, [68°] Formed from diphenylamine hydrochloride and acetonitrile by heating for a week at 150° (Bernthsen, *A* 192, 25). Monoclinic tablets or thick prisms, a 0.6142 b 1.1222 c 1.222 V sol alcohol, forming an alkaline solution. CS, at 100° gives di phenyl-thioacetamide. The hydrochloride is v e sol water— $\text{B}^+\text{H}_2\text{PtCl}_4$ — B^+HNO_3 . Colourless tablets.

Di phenyl-acetamide

$\text{C}_{12}\text{H}_{11}\text{CH}_3\text{C}(\text{NPh})\text{NH}_2$ *Phenyl phenyl acetamide* [c 128°] Formed, with H_2S , by heating $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{CSNH}_2$ with aniline hydrochloride (B). Formed also by heating phenyl-acetonitrile (benzyl cyanide) with aniline hydrochloride at 230° and by the action of iodine on a mixture of aniline and phenyl thioacetamide. Small needles or laminae, v sol water, v sol alcohol and ether. May be sublimed. Boiling dilute alcohol decomposes it into aniline and $\text{CH}_3\text{PhCONH}_2$.

Tri-phenyl-acetamide

$\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NPh})\text{NPh}_2$ [108°] Formed from $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NH}_2\text{Cl})\text{OEt}$ (1 mol) and alcoholic aniline (3 mols) (Luckenbach, *B* 17, 1427). Plates (from alcohol)— $\text{B}^+\text{H}_2\text{PtCl}_4$, plates.

Reference—DI-BROMO DI PHENYL ACETAMIDE.

PHENYL ACETATE *v* *Acetyl derivative of PHENOL*.

PHENYL-ACETCHLORAMIDE *v* *Chloracetamide in the article ANILINE*.

PHENYL-ACETIC ACID

$\text{C}_6\text{H}_5\text{CH}_2\text{CO}_2\text{H}$ *Alphatoluylic acid* Mol w 136 [77°] (265.5° cor) SG $\frac{1}{4}$ 1.0778, $\frac{1}{2}$ 1.0834 H C p 933,200 (Stohmann, *J pr* [2] 40, 134). H C v 932,600 HF 94,800 (Stohmann), 59,000 (von Rechenberg).

Formation—1 By saponification of its nitrile (Cannizzaro, *A* 96, 246, *C R* 52, 966, 54, 1225)—2 By boiling vulpic acid with baryta water (Möller a Strecker, *A* 118, 64)—3 By reducing mandelic acid with conc HIAq and P (Orum Brown, *Proc Roy Soc Edinb* 5, 409)—4 By the putrefactive fermentation of proteids (Salkowski, *B* 13, 649, *H* 2, 420, 9, 507).

Preparation—By converting benzyl chloride into the nitrile (benzyl cyanide), mixing 100 grms of the cyanide with 800 grms of a mixture of 8 vols of H_2SO_4 and 2 vols Aq , and heating till

gas bubbles begin to rise. A violent reaction occurs, heat being again applied when this subsides, until no further reaction takes place. The acid partly crystallises out, and is partly extracted with ether (W Slædel, *B* 19, 1949).

Properties—Thin laminae, sl sol cold water, v. sol hot water, alcohol, and ether.

Reactions—1 Yields benzoic aldehyde, formic acid, and CO_2 when oxidised by chromic acid mixture—2 HNO_3 yields *o*- and *p*-nitro acids (Pirogoff, *B* 5, 332)—3 *Electrolysis* of a dilute solution gives benzoic aldehyde and benzoic acid and two neutral substances [93°] and [115°] (Slawik, *B* 7, 1051)—4 *Ozonised oxygen* yields $\text{PhCH}_2\text{COOCH}_2\text{Ph}$ (318°)—5 When administered to animals it appears in the urine as phenyl aceturic acid, and increases the amount of urea (Salkowski, *B* 12, 653, *H* 12, 222)—6 *Phthalic anhydride* and HOAc form benzylidene phthalide on heating. Tetra chlorophthalic anhydride (40 pts), phenyl acetic acid (20 pts), and NaOAc (1 pt) form, in like manner, $\text{CHPhC}_2\text{O}_2\text{C}_6\text{H}_5\text{Cl}_4$, melting above 360°, whence NaOH forms $\text{CH}_2\text{PhCO}_2\text{C}_6\text{H}_5\text{Cl}_4$ [175°] (Gabriel, *B* 20, 2869). Di-chloro phthalic anhydride forms the corresponding compound $\text{CHPhC}_2\text{O}_2\text{C}_6\text{H}_5\text{Cl}_2$ [210°], whence alkalis yield $\text{C}_6\text{H}_5\text{CH}_2\text{Cl}_2\text{O}$ [117°]—7 HIAq and P at 200° form $\text{C}_6\text{H}_5\text{PO}$, [136°], which crystallises from water in needles, and gives CaA'' 2aq, BaA'' 2aq, and AgA'' (Guye, *J* 1884, 468).

Salts— CaA , 3aq— CaA' , 2aq— BaA' , 3aq v sol water— PbA' , aq— AgA' , small laminae. *Methyl ether* MeA' [220°] SG $\frac{1}{2}$ 1.044 Liquid (Radziszewski, *Z* [2] 5, 358).

Ethyl ether EtA' (229° cor) SG $\frac{1}{2}$ 1.086 Converted by heating with sodium into acetic ether, sodium phenyl acetate, a solid $\text{C}_{12}\text{H}_{11}\text{O}_2$, [175°] (? tri phenyl-phloroglucin), and an oil (? $\text{CH}_2\text{PhCOCHPhCO}_2\text{Et}$) (Hodgkinson, *C J* 37, 481, *C J Proc* 2, 189).

Amido ethyl ether $\text{CH}_3(\text{NH}_2)\text{CH}_2\text{A}'$ Formed from $\text{C}_6\text{H}_5\text{BrNHCOCH}_2\text{Ph}$ and hot water (Elfeldt, *B* 24, 3222)— $\text{B}^+\text{C}_6\text{H}_5\text{N}_2\text{O}$, [138°] *n* *Propyl ether* PrA' (238° cor) SG $\frac{1}{2}$ 1.0142 Made by heating alcoholic potassium phenyl acetate with PrI for two days. Sodium acts on it, forming propyl acetate, sodium phenyl acetate, a yellow oil $\text{C}_{12}\text{H}_{13}\text{O}_2$, (335° at 50 mm), and a small quantity of a solid, $\text{C}_{12}\text{H}_{13}\text{O}_2$, forming white needles (from petroleum), [170°], SG $\frac{1}{2}$ 1.039 This solid is also formed by the action of sodium on the oil $\text{C}_{12}\text{H}_{13}\text{O}_2$, as well as on the corresponding oil $\text{C}_{12}\text{H}_{13}\text{O}$, formed from ethyl phenyl acetate. The solid forms an acetyl derivative [100°] (Hodgkinson, *C J* 37, 483).

Iso-butyl ether $(\text{CH}_3)_2\text{CHCH}_2\text{A}'$ (147° cor) Sodium gives isobutyl acetate and A oil (Hodgkinson, *C J* 37, 485).

Benzyl ether $\text{PhCH}_2\text{A}'$ (318°) (S), (270° at 160 mm) SG $\frac{1}{2}$ 1.094 Got by heating benzyl chloride with alcoholic potassium phenylacetate for a week (H). Heated with sodium it forms sodium phenyl acetate, the salt of an acid $\text{C}_{12}\text{H}_{11}\text{O}_2$, [120°], possibly α - β -di-phenyl-propionic acid, and an oil, $\text{C}_{12}\text{H}_{13}\text{O}_2$, (820° at 60 mm), possibly the benzyl ether of that acid.

Chloride CH_2PhCOCl (108° at 17 mm.). SG $\frac{1}{2}$ 1.1692 (Anschütz a Berns, *B* 20, 1889; Hinsberg, *B* 28, 2952).

Anhydride $(\text{CH}_3\text{Ph CO})_2\text{O}$ [72 5°] Formed from the chloride and the Ag salt (A a B)

Amide $\text{CH}_3\text{Ph CO NH}_2$ [168°] (283°) Formed from the nitrile by heating with alcoholic KSH (Weddige, *J pr* [2] 7, 99) Formed also by heating phenylacetamide hydrochloride with oxalacetic ether and dilute (10 p c) NaOH aq (Pinner, *B* 22, 1627), and by the action of yellow ammonium sulphide on acetophenone (Willgerodt, *B* 21, 534) Plates, v sol hot water Forms with HgO a compound crystallising in needles [208°] (Reimer, *B* 13, 741) K_2CrO_4 and HOAc give $\text{CH}_3\text{Ph CO NHBr}$ [12°], crystallising from benzene in needles, and yielding benzylamine on warming with potash (Hoogewerf a Van Dorp, *R T C* 6, 385) Aldehyde and a few drops conc HCl aq give $(\text{C}_6\text{H}_5\text{CH}_2\text{CO NH})_2\text{CHMe}$ [228°] Chloral gives an analogous body

Diethylamide $\text{CH}_3\text{Ph CO NEt}_2$ [86°] (296° uncor) Formed from the chloride and diethylamine in ether (Hausknecht, *B* 22, 324)

Bromo-ethyl amide
 $\text{CH}_3\text{Ph CO NH C}_2\text{H}_4\text{Br}$ [85°] Plates

β Bromo propyl amide
 $\text{CH}_3\text{Ph CO NH CH}_2\text{CH}_2\text{CH}_2\text{Br}$ [46°] Formed from the chloride and $\text{C}_2\text{H}_5\text{Br}(\text{NH}_4)$ Needles

γ Bromo propyl-amine
 $\text{CH}_3\text{Ph CO NH CH}_2\text{CH}_2\text{CH}_2\text{Br}$ [44°] Needles, converted by KOH into $\text{CH}_2\text{CH}_2\text{CH}_2\text{O} \rightarrow \text{C CH}_2\text{Ph}$ (Eilfeldt, *B* 24, 3224)

Amide $\text{CH}_3\text{Ph CO NHPh}$ [117°] (Hofmann, *B* 13, 1225) Got, by intramolecular change, by the action of PCl_5 on the oxim of deoxybenzoin (Günther, *A* 252, 71)

Di-phenyl amide $\text{CH}_3\text{Ph CO NPh}_2$ [72°] Satiny needles (from ether) (Hausknecht)

Phenyl hydrazide $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [167°] White flakes (Bulow, *A* 236, 196)

Nitrile $\text{C}_6\text{H}_5\text{CH}_2\text{CN}$ **Benzyl cyanide** (233° cor) $\text{S G } 131015 \text{ H C } 1,023,000 \text{ H F } -27,900$ (Berthelot a Petit, *C R* 108, 1219) The chief constituent of the oils of garden cress (*Lepidium sativum*) and of nasturtium (*Tropaeolum majus*) (Hofmann, *B* 7, 1293) Formed by boiling benzyl chloride with alcoholic KCy (Cannizzaro, *A Ch* [3] 45, 468) **Preparation**—By digesting benzyl chloride (1 kilo), crude KCy (1 kilo), and dilute alcohol for a week Tribenzylamine remains in the retort after distilling off the benzyl cyanide below 300° **Reactions**—1 A specimen (200°–230°) treated with ZnEt_2 , the temperature being kept below 130°, formed a product which, when decomposed by alcohol, gave cyanobenzene ($\text{C}_6\text{H}_5\text{N}$), and benzoin, $\text{C}_{14}\text{H}_{11}\text{N}_2\text{O}$, an indifferent body [160°]—2 Reduced by zinc and HCl aq to $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{NH}_2$ (Berthsen, *B* 8, 691)—3 Alcoholic ammonium sulphide forms $\text{C}_6\text{H}_5\text{CH}_2\text{CS NH}_2$ [98°]—4 Water at 250° forms the amide, ammonium acetate acts in like manner (Berthsen, *B* 9, 429)—5 Bromine forms $\text{C}_6\text{H}_5\text{CHBr CN}$ and very sparingly soluble $\text{C}_6\text{H}_5\text{CHBr CBr}(\text{NH})$ [c 200°], which is crystalline, is decomposed by hot water and alcohol, and yields mandelic acid when heated with dilute HCl at 150° (Reimer, *B* 14, 1797)—6 Pyruvic acid and H_2SO_4 in the cold form $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [145°] (Böttger, *B* 14, 1600).

Paranitrile $(\text{C}_6\text{H}_5\text{N})_n$, $n=8?$ **Cyanobenzene**, [171°] (F a T), [221°] (P.) Obtained by ex-

tracting with alcohol the product of the action of ZnEt_2 on the isomeric nitrile (Frankland a. Tompkins, *C J* 37, 568) Occurs in small quantity in the product of the action of alcoholic KCy on benzyl chloride (Pinner, *B* 17, 2010) Silky needles Hardly sol alcohol, sol. CS_2 , and glacial acetic acid Forms a gummy mass with warm dilute HCl, possibly a salt

Di-phenyl-acetic acid $\text{C}_{14}\text{H}_{12}\text{O}_2$, etc
CHPh₂CO₂H **Deoxybenzic acid** Mol w 212 [148°] Formed by reducing benzilic acid with HIAq (Jena, *A* 155, 84) and by heating $\text{CHPhBr CO}_2\text{H}$ (1 mol.) with benzene (1 mol.) and zinc dust (Symons a Zincke, *B* 6, 1188, *A* 171, 122) Obtained also by saponifying its nitrile or amide Needles (from water), sl sol cold water, v sol alcohol and ether Yields benzophenone on oxidation, and di phenyl methane on distillation with soda lime Bromine forms $\text{CPh}_2\text{Br CO}_2\text{H}$

Salts— $\text{BaA}'_2\text{2aq}$ Efflorescent monoclinic crystals— $\text{CaA}'_2\text{2aq}$ — AgA' amorphous pp

Methyl ether MeA' [60°] Plates (from alcohol) (Rattnier, *B* 21, 1316)

Ethylether EtA' [58°] Prisms

Amide $\text{CHPh}_2\text{CONH}_2$ [166°] Got by action of KOH (6 g) in alcohol on the nitrile (2 g) (Anschutz a Romig, *A* 233, 347), and by heating the ammonium salt under pressure at 230° (Neure, *A* 250, 141) Plates (from alcohol)

Nitrile CHPh_2CN [76°] (N), [73°] (F a S) (183° at 12 mm) Formed by heating CHPh_2Br with HgCy_2 for 18 hours at 165°, and extracting with benzene (Friedel a Balsahn, *Bl* [2] 33, 589) and by heating the acid with lead sulphocyanide at 170° (Freund a Immerwahr, *B* 23, 2845) Got also, together with a polymeride [168°], by nitrating diphenyl ethane and reducing the resulting $\text{C}_{14}\text{H}_{10}\text{N}_2\text{O}$ [148°] with SnCl_4 and alcoholic HCl (A a R), and by treating the amide with PCl_5 in POCl₃ (N) White needles (from ligroin and ether) Alcoholic NaOEt and benzyl chloride form $\text{CPh}_2(\text{CH}_2\text{Ph})\text{CN}$ [126°] An ethereal solution of iodine (1 mol) gradually added to an alcoholic solution of the nitrile (2 mols) and NaOEt (1 mol) forms $\text{CN CPh}_2\text{CPh}_2\text{CN}$ [c 230°]

Tri-phenyl acetic acid $\text{CPh}_3\text{CO}_2\text{H}$ [264°] Formed by the action of fuming HCl aq and HOAc on the nitrile at 200° (E a O Fischer, *B* 11, 1598, *A* 194, 242) Prepared by heating CCl_4 , CO_2H (250 g), benzene (340 g), and AlCl_3 (250 g), mixing the product with water and distilling with steam, the residue of aluminum triphenylacetate is decomposed by NH_4Aq and the filtrate ppd by HCl, the yield being 5 p c (Elbs a Tölle, *J pr* [3] 32, 624) In this preparation too by products $(\text{C}_6\text{H}_5\text{O})_n$ [825°] and $(\text{C}_6\text{H}_5\text{O})_n$ [75°] crystallising in yellow needles are also formed Monoclinic prisms (from alcohol), sl sol HOAc Very feeble acid The NH_4 salt gives off NH_3 spontaneously The K salt, ppd as needles by conc KOH aq, is decomposed by water Fuming H_2SO_4 at 100° forms $\text{SO}_3\text{H C}_6\text{H}_5\text{CPh}_2\text{CO}_2\text{H}$, which yields $\text{BaA}'_2\text{aq}$, an amorphous salt—Salt AgA' Powder, not affected by light

Nitrile CPh_3CN [127 5°] Formed from HgCy_2 and CPh_3Cl at 160° and from KCy and CPh_3Br (Elbs, *B* 17, 700) Monoclinic prisms

(from ligroin or HOAc) Converted by alcoholic potash into a polymeride [210°] crystallising in colourless needles

References—AMIDO-, BROMO-, BROMO AMIDO, BROMO NITRO-, CHLORO, IODO-, and OXY PHENYL-ACETIC ACID

PHENYL-ACETIC ALDEHYDE C_6H_5O & $C_6H_5CH_2CHO$. (206°) (Radziszewsky, *B* 9, 872), (194°) (Etard)

Formation—1 By distilling calcium phenylacetate with calcium formate (Cannizzaro, *A* 119, 254)—2 From a bromo- (or chloro) β oxyphenyl-propionic acid $CHPh(OH)CHBrCO_2H$ by distilling with dilute Na_2CO_3 , the yield being 75 p.c. (Lupp *B* 16, 1286, Erlenmeyer, *A* 219, 179)—3 By boiling $PhCH(OH)CH_2OH$ (1 pt) for an hour with H_2SO_4 (3 pts) and water (12 pts) (Zincke, *A* 216, 301) Stronger H_2SO_4 yields $C_6H_5H_{12}$ [101°]—4 From ethyl benzene by successive treatment with CrO_2Cl_2 and water (Etard, *A* *Ch* [5] 22, 248)—5 By distilling phenyl glycidic acid with dilute H_2SO_4 (Erlenmeyer, *B* 13, 304).

Properties—Oil. Forms a crystalline compound with $NaHSO_4$.

Reactions—1 With acetoacetic ether and NH_3 , it yields benzyl-di-methyl pyridine di-carboxylic ether dihydride $C_6H_5N(C_2H_5)_2Me_2(CO_2Et)_2$ [1 8 5 2 6] [115°] (Jeaurenaud, *B* 21, 1784)—2 HCl forms $CH_2PhCH(OH)CN$ [58°], *S* 1 at 15°, crystallising in stellate groups of colourless needles, *v* sol alcohol.—3 HNO_3 (*S* G 1 49) at -12° gave *o* and *p*-nitro benzoic aldehyde

Phenyl-hydrasid CH_2PhCHN_2HPh [58°] Prisms, *v* sol alcohol. Converted into phenyl indole by heating with $ZnCl_2$ at 180° (Fischer a Schmitt, *B* 21, 1072)

ψ **Ethyl derivative** $C_6H_5CHCH_2OEt$ (217°) *S* G 3 981 Formed from ω chlorostyrene and alcoholic potash (Erlenmeyer, *B* 14, 1868) Oil, easily decomposed by heating with water into alcohol and the aldehyde

Di-phenyl-acetic aldehyde $CHPh_2CHO$ (315°) Formed by heating hydrobenzoin (1 pt) or isohydrobenzoin with (6 pts of) dilute (20 p.c) H_2SO_4 for 8 hours at 210° (Zincke a Breuer, *B* 9, 1769, *A* 198, 182, Weise, *A* 248, 38) Oil, *v* sol alcohol and ether. Yields benzophenone and CO_2 on oxidation. Forms a crystalline compound with $KHSO_4$. Alcoholic potash yields di-phenyl-carbinol and di-phenyl methane. Nascent HCl yields $CHPh_2CH(OH)CN$, upon which alcoholic hydrogen chloride reacts with formation of $CHPh_2CH(OH)C(NH_2)ClOEt$ [185°]. The aldehyde appears to form condensation products [168°] and [214°] on standing

Phenyl hydrazide $CHPh_2CHN_2HPh$ Flat stellate needles (from hot alcohol), *v* sol ether (Rudolph, *A* 248, 101)

Oxam $CHPh_2CHNOH$ [120°] White needles, formed together with another body [145°] by the action of hydroxylamine in dilute alcohol (Auwers, *B* 24, 1780)

PHENYL-ACETIC CARBOXYLIC ACID *v*. CARBOXY-PHENYL-ACETIC ACID

PHENYL-ACET-IMIDO-ACETATE

$C_6H_5CH_2C(NH)OAc$ [129°] White needles *v* sol alcohol, al sol cold water. Formed by boiling phenyl acet-imido ethyl ether with Ac_2O (Luckenbach, *B* 17, 1493)

PHENYL-ACETIMIDAMIDE *v* **PHENYL-**

ACETAMIDINE

PHENYL-ACET-IMIDO-ETHYL ETHER

$C_6H_5CH_2C(NH)OEt$ The hydrochloride B^+HCl [c 85°] is formed by passing dry HCl into a solution of phenyl-acetomitrile in absolute alcohol (Luckenbach, *B* 17, 1421) The free base is a colourless liquid of aromatic odour, decomposed on distillation into alcohol and phenyl acetomitrile. The hydrochloride is resolved on fusion into phenyl acetamide and $EtCl$

PHENYL-ACETONITRILE *v* **Nitrile** of **PHENYL ACETIC ACID**

PHENYL ACETONYL SULPHIDE C_6H_5SO & $PhSCH_2COCH_3$ [35°] (144° at 15 mm) Formed from chloro acetone and $NaSPh$ (Delisle, *B* 22, 308) Large tables (from ether), turned dark violet by hot H_2SO_4 . Yields a phenyl-hydrazide [83°]

The corresponding sulphone $PhSO_2CH_2Ac$ [58°] is formed from chloro acetone and sodium benzene sulphinate (R. Otto, *B* 19, 1642)

PHENYL ACETO-PHENONE

[1 8] $C_6H_5C_6H_5COCH_3$ [121°] (*c* 326°) Formed from diphenyl, $AcCl$, and $AlCl_3$ (Adam, *A* *Ch* [6] 15, 255) Prisms, reduced by sodium amalgam to the carbinol [86°]

DI PHENYL ACETOXIM (so called) *v* **Oxim** of **BENZOPHENONE**

PHENYL-ACETURIC ACID

$CH_2PhCOONHCH_2CO_2H$ [142°] *S* 73 at 12° Occurs in horses' urine, and is also found in urine after a dose of phenyl acetic acid (Sal kowski, *B* 17, 3010, *H* 7, 162) Formed by the action of the chloride or anhydride of phenyl acetic acid on glycocholi (Hotter, *B* 20, 81, *J* pr [2] 38, 98) Small trimetric crystals (from alcohol), *a* *b* *c* = 890 12374 *V* sl sol ether, *v* sol hot water and alcohol— CaA_2 , 2aq *S* 3 16 at 11 2°— CuA_2 , aq— PbA_2 , aq prisms— ZnA_2 , plates, *v* sol hot water— AgA , amorphous

Methyl ether MeA [86°] Needles

Ethyl ether EtA [79°] Prisms

Propyl ether PrA [31°] Plates

Amide $CH_2PhCOONHCH_2CONH_2$ [174°] Pearly hexagonal plates, *v* sol hot water. With HgO it yields $Hg(C_6H_5N_2O_2)_2$

PHENYL-ACETYL ACETONE $C_6H_5H_3O_2$ & $C_6H_5CH_2COCH_2COCH_3$ *Benzyl methyl methylene di-ketone* (266°–269° at 748 mm) Has weak acid properties

Formation—Phenyl acetyl acetoacetic ether, formed by the action of phenyl acetyl chloride upon sodio aceto-acetic ether, is boiled with water for 6 hours

Properties—Colourless oil. Sol alcohol, ether, benzene, hot water, strong acids, and dilute alkalis, al sol cold water. With phenyl-hydrazine it condenses to phenyl benzyl methyl pyrazole

Salts— A^+Ag white pp— A^+Na^+ crystalline solid (Fischer a Bulow, *B* 18, 2136)

PHENYL-ACETYLENE C_6H_5 & $C_6H_5C\equiv CH$ *Acetylenic benzene* (141 6° cor) *S* G 3 9295 μ = 1 542 (Brühl, *A* 285, 13) *S* V 125 8

Formation—1 By distilling phenyl propiolic acid with dry $Ba(OH)_2$ (Weger, *A* 241, 70)—2 By boiling styrene dibromide with alcoholic potash, and heating the resulting bromo styrene with alcoholic potash (Glaser, *Z* [2] 5, 97, *A* 154, 155, Hollemann, *B* 20, 3080).—3 From

acetophenone by treatment with PCl_5 , the resulting $\text{C}_6\text{H}_5\text{COCl}$, being heated with conc alcoholic potash at 120° (Friedel, *Z* [2] 5, 123)
4 By the passage through a red hot tube of a mixture of styrene and hydrogen, or of benzene and ethylene (Berthelot, *C R* 87, 952)

Properties—Liquid with peculiar odour. Its alcoholic solution forms a yellow pp $\text{Cu}_2(\text{C}_6\text{H}_5)_2\text{O}$ with ammoniacal cuprous chloride and a white pp $\text{Ag}_2(\text{C}_6\text{H}_5)_2\text{O}$ with ammoniacal AgNO_3 . These pps are explosive. Sodium added to its ethereal solution ppts CPh CNa as a white powder, which takes fire in the air, and is reconverted by water into phenyl-acetylene.

Reactions—1 Unites with bromine—2 Sodium and CO_2 give sodium phenyl propiolate, (Paterno, *G* 2, 553)—3 Sodium and EtI give PhCCEt (202°) (Morgan, *C J* 29, 162)—4 H_2SO_4 , followed by water, yields acetophenone (Friedel a Balsoun, *BI* [2] 35, 54)—5 Boiling HOAc and zinc dust reduce it to styrene (Aronstein a Hollemann, *B* 22, 1181)

Di phenyl acetylene C_{10}H_8 , i.e. CPh CPh. **Tolane** [71°] (Béhal) Formed by boiling CPhHBr or the corresponding di chloro di phenyl ethane, with alcoholic potash (Lamprecht a Schwanert, *A* 145, 347, Fittig, *A* 168, 74) Formed also by the action of sodium amalgam on an alcoholic solution of CPhCl_2 , CPhCl , (Liebermann a Homeyer, *B* 12, 1974) Large crystals (from ether) May be distilled. Yields di phenyl ethylene (stilbene) when heated with HIAq and P at 150° (Barber, *J* 1876, 366) Yields benzoic acid on oxidation. Conc H_2SO_4 gives a green colour, and on warming to 60° , diluting with water and distilling with steam, phenyl benzyl ketone (deoxybenzoin) [55°] is produced (Béhal, *BI* [2] 49, 337)

Chlorides—1 Di chloro di phenyl ethylene and tetra chloro di phenyl-ethane

Dibromide v Di bromo di phenyl ethylene

Di phenyl di acetylene C_{10}H_8 , i.e. CPh C C CPh [97°] (G), [88°] (H) Formed by shaking the cuprous compound of phenyl-acetylene with alcoholic NH_3 and air, or better, with alkaline K_2FeCy_4 (Glaser, *A* 154, 159, Baeyer a Landsberg, *B* 15, 57) Long needles (from dilute alcohol), v sol ether. Hot H_2SO_4 carbonises it. In ethereal solution Br forms $\text{C}_{10}\text{H}_8\text{Br}_2$ [178°] and $\text{C}_{12}\text{H}_{10}\text{Br}_2$ [149° – 153°] (Holleman, *B* 20, 3081)

Picric acid compound $\text{C}_{11}\text{H}_9\text{O}_7\text{N}_3$, [108°] Yellow crystals (from alcohol)

References—Amido, Iodo, and Nitro-phenyl-acetylene

TRI PHENYL ACETYLENE-TRIAMINE

$\text{C}_{18}\text{H}_{12}\text{N}_6$, i.e. $\text{N}_3\text{H}(\text{C}_6\text{H}_5)_3$, [190°] Formed from acetylene tetrabromide, aniline, and alcoholic potash (Sabanejeff, *A* 178, 125) Needles, v sl sol cold alcohol—Salts $\text{B}'_2\text{H}_2\text{PtCl}_4$ — $\text{B}'_2\text{H}_2\text{HgCl}_4$ amorphous pp

DI-PHENYL ACETYLENE-DI-THIO-DI-

UREA $\text{CS} \begin{smallmatrix} \text{NH CPh NH} \\ \text{NH CPh NH} \end{smallmatrix} \text{CS}$ Formed from benzil and thio urea at 145° (Anschütz a Geldermann, *A* 261, 134) Crystals, decomposing at 300° , v sl sol alcohol

DI-PHENYL-ACETYLENE-DI-UREA

$\text{CO} \begin{smallmatrix} \text{NH CPh NH} \\ \text{NH CPh NH} \end{smallmatrix} \text{CO}$ Tolane-urea Formed

by heating benzil with urea at 175° (Anschütz a Geldermann, *A* 261, 133, Angeli, *B* 24, 606, *G* 19, 568) Crystals, not decomposed at 315° , v sl sol alcohol and ether. Reduces ammoniacal AgNO_3 .

Di acetyl derivative $\text{C}_{18}\text{H}_{12}\text{Ac}_2\text{N}_6\text{O}_2$ [266°]

PHENYL-ACETYL-SUCCINIC ACID v ACETYL-PHENYL SUCCINIC ACID The mono ethyl ether of this acid yields on treatment with alcoholic NH_3 , a compound $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_2$ [264°], which forms, on saponification, a compound $\text{C}_{12}\text{H}_{11}\text{NO}_2$ [148°], crystallising in small needles (Weltner, *B* 18, 793)

PHENYL ACRIDINE $\text{C}_{15}\text{H}_{13}\text{N}$ i.e.

$\text{C}_6\text{H}_5 \begin{smallmatrix} \text{CPh} \\ \text{N} \end{smallmatrix} \text{C}_6\text{H}_5$, [181°] (c 404°) VD 129.7 [$\text{H} = 1$]

Formation—(Bernthsen, *B* 15, 3011, 16, 1809, 19, 425, 20, 1552, *A* 192, 19, 224, 12) 1 By heating benzoyl diphenylamine (30 g) with ZnCl_2 (30 g) at 210° – 280° —2 From benzotrichloride, diphenylamine, and ZnCl_2 —3 By heating benzonitrile with diphenylamine hydrochloride at 240° —4 By heating di phenyl benzamidine hydrochloride to 250° —5 In small quantity by heating di phenyl amine with cinnamic acid and ZnCl_2 —6 By diazotising chrysaniline (di amido phenyl acridine) and boiling the product with alcohol (Fischer a Körner, *B* 17, 206, *A* 226, 184)

Preparation—By heating benzoic acid (50 g) diphenylamine (70 g) and ZnCl_2 (150 g) at 260° for 10 hours. The yield of crude base (50 g) is good

Properties—Colourless thin prisms (from alcohol), thick yellowish prisms (containing C_6H_5) or tablets (from benzene) V sol benzene m sol ether, sl sol alcohol, insol water. Solutions of its salts exhibit green fluorescence. Not affected by boiling dilute HNO_3 , by fuming HCl at 260° , by AcCl , by AcO at 190° , by Bz_2O at 160° , by potash fusion, by heating with H_2SO_4 (3 vols) diluted with water (1 vol), or by distillation with soda lime

Reactions—1 CrO_3 in HOAc gives benzoic acid and CO_2 —2 On oxidation with KMnO_4 it gives phenyl quinoline carboxylic acid. On the other hand, its alkyl halogen addition products give rise to phenyl amido benzoic acid $\text{C}_{16}\text{H}_{11}(\text{NHPH})\text{CO}_2\text{H}$ on oxidation with KMnO_4 (Claus a Nicolaysen, *B* 18, 2706)—3 Yields on nitration with H_2SO_4 and fuming HNO_3 di nitro phenyl-acridine $\text{C}_{15}\text{H}_{11}(\text{NO}_2)_2\text{N}$, which is sol aqueous or alcoholic HCl but sl sol alcohol, and tri nitro phenyl acridine, which crystallises from toluene and alcohol in minute yellow needles, hardly sol alcoholic HCl , and converted by hot SnCl_4 into a red dye (? tri-amido-phenyl acridine), which becomes colourless on further reduction

Salts—Partially decomposed by water— $\text{B}'\text{HCl}$ orange needles or prisms, sl sol cold water, sol alcohol. Its solution exhibits dark-green fluorescence— $\text{B}'\text{HCl}$ 3aq red crystals— $\text{B}'_2\text{H}_2\text{PtCl}_4$ —Nitrate [188°] Yellow needles, sl sol HNO_3 —Sulphate yellowish-red trimetric crystals, v sl hot water—Picrate Hair-like crystals (from alcohol) Phenyl-acridine does not appear to form an acetate

Methylo-chloride $B'MeCl$ soluble needles— $B'Me.PtCl$, decomposes below 70°

Methylo-nitrate $B'MeNO_3$. Sparingly sol yellow needles

Methylo-iodide $B'MeI$. Black monoclinic prisms (from alcohol), insol ether. Converted by $KOH.Aq$, by $NH_3.Aq$, or by moist Ag_2O , into $B'MeOH$ [108°], which is also got by oxidising $C_6H_5 \begin{smallmatrix} CHPh \\ \diagup \\ NMe \end{smallmatrix} > C_6H_5$, a body to which it is reduced by tin and $HCl.Aq$

Hydrate $C_6H_5 \begin{smallmatrix} CHPh \\ \diagup \\ NH \end{smallmatrix} > C_6H_5$, [164°]

Formed by reducing phenyl-acridine hydrochloride in aqueous solution with zinc-dust or by adding sodium amalgam to an alcoholic solution. Colourless needles, with no basic properties, sol alcohol and ether. Alcoholic $AgNO_3$ oxidises it to phenyl-acridine, a change which is slowly effected even by air. It yields an acetyl derivative $C_{10}H_7.N(Ac)N$ [128°], and is converted by MeI at 140° into $C_{10}H_7.MeN$ [104°], whence HCl and $NaNO_2$ produce the methylo-hydroxide of phenyl-acridine (*v supra*)

Di-sulphonic acid. Got by heating phenyl-acridine (10 g), H_2SO_4 (15 g), and $H_2S_2O_8$ (15 g) for 12 hours at 150° . Its dilute solutions exhibit green fluorescence. The salt $C_{10}H_7.N(SO_3Na)_2$ is insol absolute alcohol, and in very dilute solutions exhibits blue fluorescence. The Ba and mercurous salts are nearly insol. Aq.

ACRIDINE

PHENYL-ACRIDINE CARBOXYLIC ACID

$C_6H_5 \begin{smallmatrix} C(C_6H_5, CO_2H) \\ \diagup \\ N \end{smallmatrix} > C_6H_5$, *Acridyl-benzonic acid*

Formed by heating phthalic anhydride (30 g) with diphenylamine (45 g) and $ZnCl_2$ (75 g) for 12 hours at 190° (Bernthsen & Traube, *B* 17, 1510, *A* 224, 45). Yellow crystalline powder, sol acids and alkalis, insol water, sl sol boiling alcohol. Its solutions in dilute acids have a green fluorescence, in alkalis a blue fluorescence. Split up by heat into CO_2 and phenyl-acridine. Yields a hydride [160° – 165°]

Salts— NaA . aq. colourless pearly plates or long needles— $HA.HCl$ [163°]. Yellow crystals (from hot dilute HCl), sl sol hot water

An isomeric acid $C_6H_5 \begin{smallmatrix} CPh \\ \diagup \\ N \end{smallmatrix} > C_6H_5, CO_2H$, [252° – 255°], formed by oxidation of phenyl-methyl-acridine with chromic acid mixture, is sl sol alcohol, and gives sparingly soluble BaA , (Bonna, *A* 239, 62)

PHENYL-ACRYLIC ACID *v* CINNAMIC ACID and ATROPIC ACID

Di-phenyl-acrylic acid *v* PHENYL-CINNAMIC ACID

PHENYL-ALANINE *v* α -AMIDO-PHENYL-PROPIONIC ACID and PHENYL-AMIDO-PROPIONIC ACID

PHENYL ALDEHYDE *v* PHENYL-ACETIC ALDEHYDE

PHENYL ALDEHYDO-BENZYL KETONE $Ph.CO.CHPh.CHO$ [110°]. Formed from de-oxybenzoin, formic ether, and $NaOEt$ in ether (Claisen & Meyerowitz, *B* 22, 3279). Yellowish-white crystals. $FeCl_3$ gives a dark violet colour

PHENYL ALDEHYDO-ETHYL KETONE $Ph.CO.CHMe.CHO$ [119°]. Formed from

phenyl ethyl ketone, formic ether, and $NaOEt$ in Et_2O (Claisen & Meyerowitz, *B* 22, 3276). White needles, v sol alcohol and water. $FeCl_3$ colours its alcoholic solution dark violet. Gives an anilide [132°] crystallising in needles

PHENYL ALDEHYDO-PROPYL KETONOL $Ph.CO.CHEt.CHO$ [87°]. Formed from phenyl *n*-propyl ketone, formic ether, and $NaOEt$ in ether (Claisen & Meyerowitz, *B* 22, 3278). White plates. $FeCl_3$ gives a dark-violet colour. The anilide [120°] crystallises in white needles

TETRA-PHENYL-ALDINE *v* TETRA-PHENYL-PYRAZINE

PHENYL-ALLENYL-AMIDO-AMINE *v* α -AMIDO-AMINOXIM

PHENYL-ALLOPHANIC ACID *Ethyl ether* $C_6H_5.NH.CO.NH.CO$ [120°]. Formed from phenyl-urea and chloro-glyoxylic ether $COCl.CO.Et$ (Stojentini, *J pr* [2] 32, 18). Needles, v sol alkalis and conc $HCl.Aq$

Phenyl ether $NHPh.CO.NH.CO.Ph$. Formed from phenol and cyanic acid vapour (Tuttle, *J* 1857, 451). Crystals (from alcohol), insol cold water. Decomposes at 150° into phenol and cyanuric acid

Benzyl ether $NHPh.CO.NH.CO.C_6H_5$, [158°]. Formed by heating phenylcyanate with benzyl carbonate at 150° under pressure (Traube, *B* 22, 1574). V sl sol water, m sol alcohol

Di-phenyl-allophanic acid

$NHPh.CO.NPh.CO.H$

Methyl ether MeA [231°]

Ethyl ether EtA [188°]. Formed from di-phenyl diisocyanate $Ph.N=C=O$, and alcohol (Hofmann, *B* 4, 246), and by the action of HgO and alcoholic NH_3 on $NHPh.CS.NPh.CO.Et$ (Seidel, *J pr* [2] 32, 266). Needles, sl sol ether. Yields $(C_6H_5.N_2O_3).3HgO$ [129°], crystallising in prisms (from alcohol)

Isoamyl ether $C_6H_5.A$ [58°]

Reference — DI-BROMO DI-PHENYL ALLOPHANIC ACID

PHENYL ALLYL-CYANAMIDE KETONE

$C_6H_5.CO.CHPh.C_6H_5$, (337°). Formed from de-oxybenzoin, $NaOEt$, and allyl iodide (Buddeberg, *B* 23, 2067). Oil, v sol alcohol

PHENYL ALLYL-CYANAMIDE $C_6H_5.N_2.C_6H_5.N.CO.NH.C_6H_5$, *Carboallylphenylamide* [105°]. Formed from phenyl allyl thio-urea and $Pb(OH)_2$ (Bizio, *J* 1861, 497). Silky needles (from dilute alcohol)— $B.HgCl_2$, amorphous— $B.H.PtCl_5$

PHENYL-ALLYLENE $C_6H_5.C=CH_2$, (185°). Formed by the action of alcoholic potash on the bromo-propenyl-benzene, which is got by boiling $CHPhBr.CMe.CO.H$ with water (Körner, *B* 21, 276). Yellowish liquid, with unpleasant odour. Yields a liquid dibromide (c 258°) and a solid tetrabromide [75°]. Aqueous $HgCl_2$ forms white amorphous $(C_6H_5)_2Hg_2Cl_2O_2$, which on heating with HCl yields phenyl ethyl ketone

v PHENYL-ALLYL-HYDRAZINE

$C_6H_5.NPh.NH_2$, (198° at 184 mm). Formed by reducing the nitrosamine derived from allyl-aniline (Michaelis & Claessen, *B* 22, 2239). Got also from allyl-bromide and phenyl hydrazine. Oil, v sol dilute HCl . Reduces Fehling's solution on warming. Oxidised by aqueous $FeCl_3$ to the tetrazene $C_6H_5.NPh.N.NPh.C_6H_5$, (86°). Benzoic aldehyde yields $C_6H_5.NPh.N.C_6H_5$ [52°].— $B.HCl$ [187°]. Silky needles

Benzoyl derivative $C_6H_5.AcN$, [139°]

s-Phenyl allyl-hydrazine $C_9H_{11}N_2$ \pm e
Ph NH NH C_3H_5 (172° at 60 mm) Got from phenyl-hydrazine and allyl bromide (Fischer a. Knoevenagel, A 239, 203) Oil, sol dilute acids Reduces cold Fehling's solution Oxidises by HgO to benzene-azo propylene $Ph.N_2.C_3H_5$, an oil, (95°–100° at 27 mm)

DI-PHENYL-DI-ALLYLIDENE-DIAMINE
 $C_{18}H_{19}N_2$ \pm e $N_2Ph_2(C_3H_5)_2$ Formed from aniline and acrolein below 0° (Schiff, A Suppl 3, 358) Yellow resin — $B'H_2PtCl_6$

DI-PHENYL-DI-ALLYLIDENE-ETHYLENE DIAMINE $C_{16}H_{17}N_2$ (N CH CH CH C_2H_5)₂ [110°] Formed by mixing ethylene-diamine (1 mol) with cinnamic aldehyde (2 mols) (Mason, B 20, 271) Large colourless tables (from ether) V sol alcohol and benzene, m sol ether Decomposed into its constituents by acids

PHENYL ALLYL OXIDE C_8H_7O C_6H_5 (194°) Formed from allyl bromide and NaOPh (Henry, B 5, 455) Liquid

PHENYL ALLYL SULPHIDE C_8H_7S C_6H_5 (c 208°) Formed by distilling the acid $CH_3C(SPh)CH_2CO_2H$ (Escales a. Baumann, B 19, 1792) Liquid, forming a blue solution in H_2SO_4

PHENYL-ALLYL-THIOSEMICARBAZIDE
 $C_9H_9NH NH CS NHC_6H_5$ [119°] Formed from phenyl hydrazine and allyl thiocarbimide dissolved in benzene (A E Dixon, C J 57, 263, Avenarius, B 24, 268) Silvery needles, insol water, v sol alcohol and ether Gives a mahogany colour with $FeCl_3$

Di phenyl-allyl thiosemicarbazide
 $C_{12}H_{13}N(C_6H_5)_2NH CS NPh$ [103°] Formed from phenyl allyl-hydrazine and phenyl thio carbimide (Michaelis a. Claessen, B 22, 2237) Needles (from hot alcohol)

PHENYL ALLYL THIO UREA $C_{10}H_{11}N_2S$ \pm e
NPh CS NHC_6H_5 *Phenyl thiosumamine* [98°] S (alcohol) 70 at 16° Formed by the action of aniline on oil of mustard (Zinn, A 84, 348) and of allylamine on phenyl thiocarbimide (Weith, B 8, 1529) Monoclinic crystals, insol water Cyanogen passed into its alcoholic solution forms $C_{12}H_{12}N_2S$, which crystallises from alcohol in stellate forms, and is converted by dilute H_2SO_4 into $CS \begin{smallmatrix} N(C_6H_5) \\ N(C_6H_5) \end{smallmatrix} CO$ [161°], whence alcoholic silver nitrate forms $CO \begin{smallmatrix} N(C_6H_5) \\ N(C_6H_5) \end{smallmatrix} CO$ [108°], which is resolved by baryta-water into oxalic acid and phenyl allyl-urea (Maly, Z [2] 5, 258)

PHENYL ALLYL THIO-UREA CARB OXYLIC ACID v **ALLYL-THIO URAMIDO-BENZOIC ACID**

PHENYL-ALLYL UREA NPh CO NHC_6H_5 [97°] Formed as described under phenyl allyl-thio-urea Shining white needles

PHENYL-AMENYL-AMIDINE $C_{11}H_{11}N_2$ \pm e
Me, C(NH₂)(NPh) The oxalate $B'H_2C_2O_4$ [192°] s formed by heating the corresponding valerionitrile with aniline hydrochloride at 170° Freund a. Lenz, B 24, 2155)

PHENYL-AMIDO-ACETIC ACID $C_8H_7NO_2$ \pm s
 $Ph(NHPh)CO_2H$ *Phenyl glycocoll Amidido-acetic acid* [127°] Formed by the action of aniline on bromo acetic acid and on chloro-acetic acid (Michaelson a. Lippmann, Z 1866,

15, Schwebel, B 10, 2046) Prepared by boiling aniline (45 g) dissolved in a little ether with chloro-acetic acid (25 g) and water (1500 cc) for half an hour, and rapidly evaporating to crystallisation (Rebuffat, G 17, 233) By-products are $C_8H_7NO_4$ [99°] (Meyer, B 14, 1325) and $C_8H_7N_2O_2$ [218°], which is perhaps $CH_2(NHPh)CO NPh CH_2CO_2H$, though this formula may also be assigned to an isomeric acid [180°] formed by the action of alcoholic potash on di-oxy-di-phenyl-pyrazine (Hausdörfer, B 22, 1803, Abenius, J pr [2] 40, 432)

Properties—Small crystals, m sol water, insol ether By fusion with potash at 260° it yields a mass which forms indigo on oxidation (Heumann, B 23, 3043, cf Lederer, J pr [2] 42, 383, Biedermann a. Lepetit, B 23, 3289)

Salt— CaA_2 2aq Needles (from dilute alcohol), m sol hot water, insol alcohol On distillation with calcium formate it yields indole (Mauthner a. Suida, M 10, 251)

Methyl ether MeA' [48°] Formed by heating aniline with methyl chloro-acetate (Meyer, B 8, 1157) and by the action of aniline on methyl diazo acetate (Curtius, J pr [2] 38, 437) Rectangular plates (from ether) or needles (from alcohol)

Ethyl ether EtA' [59°] Formed in like manner Colourless plates (from ether)

Formyl derivative
NPh(CHO) CH_2CO_2H [124°] Formed by saponification of its ether (290°–295°), which is the product of the action of chloro-acetic ether on sodium formanilide (Paal a. Otten, B 23, 2593) Needles, v sol ether and hot water Yields $C_8H_7NO_2Na$, a hygroscopic mass

Acetyl derivative NPhAc CH_2CO_2H [191°] Formed from phenyl amido acetic acid, Ac₂O, and benzene (R) Formed also by heating aniline with chloro acetic acid and NaOAc at 110°–150° (Hausdörfer, B 22, 1797), and by the action of boiling alcoholic potash on its ether (300°), which is got from sodium acetanilide and chloro-acetic ether (P a O) Pearly plates (from water) or needles (from HOAc-hgroin), v sol alcohol and hot water Yields the salts NaA' , BaA' , 3aq, and CuA'_2

Chloro-acetyl derivative
 $CH_2Cl CO NPh CH_2CO_2H$ [133°] Formed from phenyl-amido acetic acid and chloro acetyl chloride (Abenius, J pr [2] 40, 429, 499) Plates or prisms, v sol alcohol On boiling with aqueous sodium carbonate it yields $CH_2(OH) CO NPh CH_2CO_2H$ [128°], which crystallises in plates, forms the salts CaA'_2 6aq and BaA'_2 , the anhydride $PhN \begin{smallmatrix} < CO CH_2 > \\ < CH_2 CO > \end{smallmatrix} O$ [169°], and the amide $CH_2(OH) CO NPh CH_2 CONH_2$ [129°]

Bromo-acetyl derivative Plates, decomposing at 153° (Hausdörfer, B 22, 1803)

Benzoyl derivative $CH_2(NPhBz) CO_2H$ [63°] Amorphous pp (Rebuffat)

Nitrosamine NPh(NO) CH_2CO_2H [105°] Yellow needles (Schwebel, B 11, 1132), v sol warm water

Anhydride C_8H_7NO [263°] Got by heating the acid at 150° (Meyer, B 10, 1967) Needles (from alcohol), insol water.

Amide $CH_2(NHPh) CONH_2$ [133°] Formed by heating chloro acetamide with aniline and

NaOAc at 180° (Bischoff, *B* 22, 1809, cf Meyer, *B* 8, 1154) Minute needles (from water)

Amide $\text{CH}_2(\text{NHPh})\text{CO NHPh}$ [112°]

Formed by boiling chloro-acetic ether or $\text{CH}_2\text{Cl CO NHPh}$ with aniline (Wilm a Wischin, *Z* 1868, 74, Meyer, *B* 8, 1156, Hausdörfer, *B* 22, 1796) Formed also by heating aniline with alcohol and the compound of glyoxal with NaHSO_3 (Hinsberg, *B* 21, 110) Needles (from alcohol), sl sol cold water

p-Toluide $\text{CH}_2(\text{NHPh})\text{CO NHC}_6\text{H}_4\text{Me}$ [165°] Formed by heating aniline with fused NaOAc and $\text{CH}_2\text{Cl CO NHC}_6\text{H}_4\text{Me}$ at 150° (Bischoff, *B* 23, 2000, cf Meyer, *B* 8, 1156)

Nitrile $\text{CH}_2(\text{NHPh})\text{CN}$ Formed from chloro acetonitrile and aniline in ether at 90° (Engler, *B* 6, 1004) Thick oil, forming a crystalline hydrochloride, decomposed by water

Reference — Bromo PHENYL AMIDO-ACETIC ACID

Isomeride — AMIDO PHENYL ACETIC ACID

Di-phenyl-di-amido-acetic acid $\text{C}_{16}\text{H}_{15}\text{N}_2\text{O}_2$, $\text{e CH}(\text{NHPh})_2\text{CO}_2\text{H}$ Formed as a yellow crystalline powder by adding aniline to an aqueous solution of glyoxylic acid (Böttinger, *B* 11, 1559) Decomposed by hot water

ω -PHENYL AMIDO ACETOPHENONE

$\text{C}_{16}\text{H}_{15}\text{ON}$ $\text{e C}_6\text{H}_5\text{CO CH}_2\text{NHPh}$ *Aceto phenone-anilide* [93°] Prepared by the action of aniline on ω bromo acetophenone (Möhlau, *B* 14, 171, 15, 2467) Prisms or fine needles Sol alcohol, ether, chloroform, benzene, and CS_2 On boiling with aniline it gives phenyl-indole Nitrous acid forms a nitrosamine $\text{C}_6\text{H}_5\text{CO CH}_2\text{NPh(NO)}$ [73°] — B'HCl prisms, decomposed by water — B'HB'r

Acetyl derivative $\text{C}_{16}\text{H}_{13}\text{NO}_2$ [127°]

Benzoyl derivative [145°] Prisms

PHENYL AMIDO-ACRIDINE

$\text{C}_{16}\text{H}_{13}\text{N}$ $\text{N} \begin{array}{c} \text{—} \text{C CH C NHPh} \\ \text{CH C CH CH} \end{array}$ [176°] Formed by heating di-phenyl *m* phenylene diamine (5 g) with ZnCl_2 (10 g) and formic acid (5 g of 90 p.c.) for 5 hours at 250° (Besthorn a Curtman, *B* 24, 2042) Flat brownish red needles, *m* sol alcohol, sl sol ether

PHENYL-AMIDO-ACRIDYL BENZOIC ACID

$\text{C}_{16}\text{H}_{13}\text{N}$ $\text{N} \begin{array}{c} \text{—} \text{C CH C NHPh} \\ \text{C(CH}_2\text{CO}_2\text{H) C CH CH} \end{array}$ [above 300°] Formed by heating di-phenyl *m* phenylene-diamine (5 g) with phthalic anhydride (10 g) at 250° (Besthorn a Curtman, *B* 24, 2047) Small red crystals, sol HOAc

PHENYL AMIDO-ACRYLIC ACID

$\text{CH}(\text{NHPh})\text{CH CO}_2\text{H}$ [194°] Formed from the product of the action of aniline on di bromo-succinic acid by boiling with potash (Reissert, *B* 20, 5105) Insol water, *v* sol alcohol — $\text{NaA}^2\frac{1}{2}\text{aq}$ silky plates

Ethyl ether EtA' [144°]

PHENYL-AMIDO-AZOBENZENE *v* Benzene-diphenylamine

DI PHENYL-AMIDO-BENZAMIDINE

$\text{C}_{16}\text{H}_{15}\text{N}_3$, $\text{e C}_6\text{H}_5(\text{NH})_2\text{C(NPh)NHPh}$ *Carbo triphenylamine* [198°] Prepared by heating *p*-nitro benzoic acid with aniline and PCl_5 for two hours at 180° and reducing the product with tin and HCl (Weith, *B* 12, 101) Formed also by the action of COCl_2 , of CBr_4 , and of CCl_4 , SO_2Cl_2 on aniline (Hofmann, *Pr* 3, 284, Bolas a Groves, *A*, 180, 173, Michler a Walder, *B* 14,

2174) Four-sided tables Split up by heating with HCl at 180° into aniline and *p* amido-benzoic acid Decomposed on distillation — B'HCl [282°] — $\text{B}'_2\text{H}_2\text{PtCl}_4$

PHENYL-DIAMIDOBENZENE *v* AMIDO-DIPHENYLAMINE

TRI-PHENYL-TRI-AMIDO-BENZENE

$\text{C}_{18}\text{H}_{15}(\text{NHPh})_3$ [198°] Made by heating phloroglucin with aniline at 210° (Minunni, *B* 21, 1984) Needles (from alcohol) — B'HCl yellow powder, melting below 100°, decomposed by warm water — $\text{B}'_2\text{H}_2\text{PtCl}_4$ [c 250°]

Tri acetyl derivative [173°] Needles.

Tri benzoyl derivative [above 304°]

PHENYL AMIDO BENZOIC ACID

$\text{C}_6\text{H}_5(\text{NHPh})\text{CO}_2\text{H}$ [222° uncor] Formed by oxidation of the methyl-o-iodide of phenyl-acridine with MMnO_2 (Claus a Nicolaysen, *B* 18, 2709) Small colourless needles *V* sol ether and chloroform, insol water

Salts — $\text{A}^+\text{Na}^4\text{aq}$ easily soluble colourless plates — $\text{A}^+\text{Ba}^5\text{aq}$ small sparingly-soluble colourless plates — A^+Ag^* very sparingly-soluble white curdy pp

PHENYL AMIDO BENZYL KETONE

$\text{C}_{16}\text{H}_{15}\text{CO CH}(\text{NH}_2)\text{C}_6\text{H}_5$ [60°-70°] Formed by reducing the mono oxim of benzil with HCl and SnCl_2 (Braun, *B* 22, 556) and by heating desyl-phthalamic acid with HCl (Neumann, *B* 23, 996) White crystalline mass, becoming brown in air — B'HCl [210°] White needles — $\text{B}'_2\text{H}_2\text{PtCl}_4$ [193°] — *Picroste* $\text{B'O}_2\text{C}_6\text{H}_5\text{N}_2\text{O}$

Carboxy-benzoyl derivative

$\text{C}_{16}\text{H}_{15}\text{CO CHPh NH CO C}_6\text{H}_5\text{CO}_2\text{H}$ [168°] Got by warming desyl-phthalimide with NaOHAq — $\text{AgC}_6\text{H}_5\text{NO}_2$, crystalline

Phenyl *p* amido benzyl ketone

$\text{C}_6\text{H}_5\text{CO CH}_2\text{C}_6\text{H}_4\text{NH}_2$ [95°] *S* 33 at 100° Formed by reducing nitro benzil or nitro deoxybenzoin with tin and HCl (Golubeff, *J R* 6, 114, 11, 101, *Bn* 3, 109) Thin needles (from dilute alcohol) — B'HCl Tables (from alcohol) *S* 25 in the cold — $\text{B}'_2\text{H}_2\text{PtCl}_4$ — $\text{B}'_2\text{H}_2\text{SO}_4$

Oxim $\text{C}_6\text{H}_5\text{C(NO)}\text{CH}_2\text{C}_6\text{H}_4\text{NH}_2$ [141°]

Crystallises from alcohol (Ney, *B* 21, 2449)

PHENYL- α -AMIDO BUTYRIC ACID

$\text{C}_{16}\text{H}_{15}\text{NO}_2$, $\text{e CH}_2\text{CH}_2\text{CH}(\text{NHPh})\text{CO}_2\text{H}$ [140°] Prepared by heating α bromo butyric acid with an ethereal solution of aniline at 100° (Duvillier, *A Ch* [5] 20, 205, Nastvogel, *B* 22, 1792) Feebly acid — B'HCl — EtA' (278°)

Phenyl β amido-butyric acid

$\text{CH}_2\text{CH}(\text{NHPh})\text{CH}_2\text{CO}_2\text{H}$ [128°] Formed by the action of baryts on the neutral isomeride (? betaine) which is obtained, together with the anilide, by boiling β -chloro butyric ether with aniline (Balbiano, *G* 10, 144, *B* 13, 312) Tufts of needles, sl sol water — BaA' (dried at 100°) Scales — B'HCl — $\text{B}'_2\text{H}_2\text{C}_2\text{O}_4$ [189°]

Anilide $\text{CHMe}(\text{NHPh})\text{CH}_2\text{CO NHPh}$ The hydrochloride B'HCl [207°] crystallises in colourless plates, sl sol hot water

Phenyl- α -amido-isobutyric acid

$\text{OMe}(\text{NHPh})\text{CO}_2\text{H}$ [185°] Formed by saponification of the nitrile or the ether (Tiemann, *B* 15, 2042, Bischoff, *B* 24, 1044) Concentric needles, *m* sol water May be sublimed

Ethyl ether EtA' [80°] (271°) Formed by heating aniline (2 mols.) with bromo isobutyric acid (1 mol.). Thick prisms.

Amide $\text{C}_6\text{H}_5(\text{NHPH})\text{CONH}_2$ [137°]
Needles, sol alcohol and HClAq

Nitrile $\text{C}_6\text{H}_5(\text{NHPH})\text{CN}$ [94°] Made by heating acetone cyanhydrin with aniline Long white prisms, sl sol hot water

Di phenyl di γ amido-butyric acid *Nitrile* $\text{CH}(\text{NHPH})\text{CH}_2\text{CH}_2\text{CN}$ [103°] Formed by heating $\text{CH}_3\text{CH}_2\text{CH}_2\text{CN}$ with aniline at 350° (Chautard, *A Ch* [6] 16, 185) Scales, sol water and alcohol

PHENYL AMIDO CHLORO v CHLORO PHENYL AMIDO

PHENYL β AMIDO CINNAMIC ACID

$\text{C}_6\text{H}_5\text{C}(\text{NHPH})\text{CHCO}_2\text{H}$
Methyl ether MeA' [93°] Formed from methyl benzoyl acetate and aniline (Knorr, *A* 245, 372) Prisms

Ethyl ether EtA' Formed in like manner (Conrad a Limpach, *B* 21, 521) Oil, v sol alcohol At 250° it yields (*Py* 1,3) oxy phenyl-quinoline and alcohol

Anilide $\text{C}_6\text{H}_5\text{C}(\text{NHPH})\text{CHCO}_2\text{NHPH}$ [133°] Needles (from alcohol), almost insol Aq

PHENYL AMIDO CITRACONIC PHENYL IMIDE? $\text{C}(\text{NHPH})\text{CO} \begin{smallmatrix} \diagup \\ \diagdown \end{smallmatrix} \text{NPh}$ [160°] Formed by heating methyl oxalacetic ether with aniline at 180° (Wislicenus a Spiro, *B* 22, 3351) Golden plates, v sol hot alcohol

PHENYL AMIDO GRESOL $\text{C}_6\text{H}_5\text{NO}$ *s.e.* $\text{NHPH C}_6\text{H}_5\text{MeOH}$ [135] [79°] (345°) Formed by heating orcin (1 pt), aniline (2 pts), and CaCl_2 (1 pt) at 260°-270° (Zega a Buch, *J pr* [2] 33, 538) Thick needles (from alcohol) Reduced by distilling over zinc dust to phenyl-m tolyl amine

Salt B'HCl crystalline powder, decomposed by water

Isomeride Oxy BENZYL ANILINE

PHENYL AMIDO CROTONIC ACID *Methyl ether* $\text{CH}_3\text{C}(\text{NHPH})\text{CHCO}_2\text{Me}$ [51°] Formed by mixing aniline with methyl acetoacetate (Conrad a Limpach, *B* 21, 1965) Prisms (from MeOH) Yields (*Py* 1,3) oxy methyl-quinoline when heated to 240°

Ethyl ether $\text{C}_6\text{H}_5\text{NO}$ *s.e.* $\text{CH}_3\text{C}(\text{NHPH})\text{CHCO}_2\text{Et}$ Formed by allowing a mixture of aniline (1 mol) and acetoacetic ether (1 mol) to stand for some days in the cold, drying with K_2CO_3 , and filtering (Knorr, *B* 20, 1397, cf Conrad a Limpach, *B* 20, 944, 22, 83) Strongly refracting oil, split up by acids and alkalis into its components At 200° it forms (*Py* 1,3) oxy methyl quinoline and a smaller quantity of oxy phenyl di methyl pyridine carboxylic ether

The anilide of acetoacetic acid (vol 1 p 19) $\text{CH}_3\text{C}(\text{CH}_3)\text{CONHPH}$ [85°], which is isomeric with phenyl-amido crotonic acid, is completely decomposed by heat, but yields the same oxy methyl quinoline on treatment with conc HClAq

PHENYL AMIDO ψ CUMYL KETONE

$\text{C}_6\text{H}_5\text{CO C}_6\text{HMe}(\text{NH}_2)$ [51346] *Benzocumide* [130°] (c 360°) Formed by saponification of its phthalyl derivative (Froehlich, *B* 17, 1804, 2674) Long yellow needles or plates, v sol. alcohol and ether, not volatile with steam B'H.PtCl_4 orange needles MeI forms $\text{C}_6\text{H}_5\text{CMe}(\text{Bz})\text{NMMe}_2$ [187°], crystallising from water in prisms (containing aq) ClCO_2Et gives

$\text{C}_6\text{HMe}(\text{Bz})\text{NHCO}_2\text{Et}$ [105°], crystallising in needles

Acetyl derivative [170°] Needles
Benzoyl derivative [227°] Needles.
Phthalyl derivative

$\text{C}_6\text{HMe}(\text{Bz})\text{N} \begin{smallmatrix} \diagup \text{CO} \\ \diagdown \end{smallmatrix} \text{C}_6\text{H}_5$ [181°] Formed by heating the phthalyl derivative of ψ cumidine with BzCl and a little ZnCl_2 at 180° Small rhombohedra, v sol hot water On saponification by alcoholic potash it yields the acid $\text{C}_6\text{HMe}(\text{Bz})\text{NHCO}_2\text{C}_6\text{H}_5\text{CO}_2\text{H}$ [195°], which crystallises in minute needles (containing aq)

PHENYL AMIDO-CYANURIC ACID v Cy anuric acid in the article CYANIC ACID

PHENYL-AMIDO-ETHANE SULPHONIC ACID $\text{C}_6\text{H}_5\text{NHCH}_2\text{CH}_2\text{SO}_3\text{H}$ *Phenyl taurine* [c 280°]

Formation —1 By heating the anilide with HCl —2 By heating chloro isethionic acid with an ethereal solution of aniline at 130° (Leymann, *B* 18, 871, James, *C J* 47, 369, *J pr* [2] 31, 415) —3 By the oxidation of phenyl thiohydantoin with KClO_4 and HCl there is formed diphenyltaurocarbamic anhydride $\text{C}_6\text{H}_5\text{N SO}_2$ [186°], which is split up by boiling baryta water into aniline, CO_2 , and phenyl taurine (Andreassch, *M* 4, 137)

Properties —Colourless leaflets, insol alcohol and ether, sol water forming an acid solution Aqueous cyanamide at 110° forms phenyltaurocyanine $\text{NH}_2\text{C}(\text{NH})\text{NPh C}_6\text{H}_5\text{SO}_3\text{H}$, which crystallises from water in plates melting above 300° — BaA' , 3aq leaflets, m sol water

Anilide $\text{NHPH C}_6\text{H}_5\text{SO}_2\text{NHPH}$ [74°] Formed, together with the anhydride $\text{C}_6\text{H}_5\text{N SO}_2$ [69°], by the action of an ethereal solution of aniline (3 mols) on $\text{CH}_2\text{Cl CH}_2\text{SO}_2\text{Cl}$ (1 mol) — B'HCl [169°] Colourless crystals

DI-PHENYL-AMIDO-ETHYL AMIDO ACETIC ACID $\text{NHPH CH}_2\text{CH}_2\text{NPh CHCO}_2\text{H}$ [116°] Formed from oxy di phenyl pyrazine hexahydrate and alcoholic potash (Bischoff, *B* 23, 2026) Prisms, sol ether Converted into the parent substance by boiling with water or alcohol

PHENYL AMIDO-ETHYL KETONE

$\text{C}_6\text{H}_5\text{CO C}_6\text{H}_5\text{NH}_2$ Formed by the action of boiling HClAq on $\text{C}_6\text{H}_5\text{Bz N C}_6\text{O}_2\text{C}_6\text{H}_5$ [85°], which is got from $\text{C}_6\text{H}_5\text{CO C}_6\text{H}_5\text{Br}$ and potassium phthalimide (Schmidt, *B* 22, 3251) — B'HCl crystalline, v *s.e.* sol water and alcohol — B'H.PtCl_4 — $\text{B'C}_6\text{H}_5\text{N}_2\text{O}$, [160°] Needles

PHENYL-AMIDO-ETHYL-PHTHALIMIDE

$\text{C}_6\text{H}_5\text{C}_6\text{O}_2\text{NCH}_2\text{CH}_2\text{NHPH}$ [100°] Formed by heating bromo ethyl phthalimide with aniline at 150° (Gabriel, *B* 23, 2224) Lemon yellow needles, v sol dilute HClAq Converted by NaOHAq into $\text{C}_6\text{H}_5(\text{CO}_2\text{H})\text{CO NH C}_6\text{H}_5\text{NHPH}$ [120°-130°], a crystalline powder

PHENYL-AMIDO-FUMARIC IMIDE

$\text{C}(\text{NHPH}) \begin{smallmatrix} \diagup \text{CO} \\ \diagdown \end{smallmatrix} \text{CHCO} \begin{smallmatrix} \diagup \text{CO} \\ \diagdown \end{smallmatrix} \text{NH}$ [202°] Formed by heating bromo-fumarimide with aniline (Löschner, *B* 21, 2718) Golden plates, sl sol hot water

PHENYL-AMIDO-GLUTACONIC PHENYL-IMIDE $\text{C}_6\text{H}_5\text{N}_2\text{O}$ *s.e.*

$\text{C}(\text{NHPH}) \begin{smallmatrix} \diagup \text{CH}_2\text{CO} \\ \diagdown \end{smallmatrix} \text{CHCO} \begin{smallmatrix} \diagup \text{CH}_2\text{CO} \\ \diagdown \end{smallmatrix} \text{NPh}$ [275°] Formed from acetone dicarboxylic ether and aniline (Emery, *B* 23, 3764) Yellowish plates, v sl sol alcohol

PHENYL-AMIDIMIDO-ETHENYL-*o*-AMIDO-PHENYL MERCAPTAN $C_6H_5N_3S$ probably

$C_6H_5\langle\overset{N}{S}\rangle C(NHPh)NH$ [118°] Formed together with the di-phenyl derivative by heating amido-imido-ethenyl-*o*-amido-phenyl-mercaptan with aniline, ammonia being evolved (Hofmann, *B* 20, 2254) Plates Sol. alcohol and ether

Salts $-B'H_2Cl.PtCl_3$, small needles, m sol water $-B'HClAuCl_2$, soluble yellow plates

Di-phenyl-amidimido-ethenyl-*o*-amido-phenyl-mercaptan $C_{22}H_{15}N_3S$ which is probably

$C_6H_5\langle\overset{N}{S}\rangle C(NHPh)NPh$ [129°] Obtained as above White silvery plates V sol alcohol and ether

Salts $-B'H_2Cl.PtCl_3$, dark-yellow sparingly-soluble plates $-B'H_2Cl_2AuCl_2$, yellow needles

PHENYL-AMIDO-JUGLONE v *Juglone***PHENYL-AMIDO MALEIC ACID**

The phenylimide $NHPh.C_6H_4.C_4O_2.NPh$ [232°] is formed, together with the mono-anilide $NHPh.C_6H_4(CO_2H)CONHPh$ [176°], by boiling dibromo succinic acid or chloro- or bromo-maleic or fumaric acids with aniline and water (Reissert a Tiemann, *B* 19, 626, Michael, *B* 19, 1377) The phenylimide is also formed by heating aniline with oxalacetic ether at 140° (Wishlencus a. Spiro, *B* 22, 3350)

PHENYL-AMIDO MALONIC ACID *Anilide* $CH(NHPh)(CO NHPh)_2$ [162°] Formed by boiling chloro-malonic acid with aniline (Conrad a Bischoff, *A* 209, 231) Prisms

PHENYL-AMIDO-METHENYL-AMIDO-

NAPHTHOL $C_{10}H_7\langle\overset{O}{N}\rangle C(NHPh)$ [168°].

Formed from benzene-azo (β) naphthol by heating with CS_2 at 250° (Jacobson, *B* 21, 419) Small needles, v e sol cold alcohol With $HClAq$ at 190° it yields amido (β) naphthol, aniline, and CO_2 —Picrate [210°] Acetate [120°-130°]

PHENYL-AMIDO-METHENYL-AMIDO-

PHENYL MERCAPTAN $C_6H_5\langle\overset{N}{S}\rangle C(NHPh)$

[159°] Formed from $C_6H_5NS.CCl$ and aniline (Hofmann, *B* 12, 1130) Formed also by heating phenyl thiocarbimide with azobenzene at 270° (Jacobson a Frankenbacher, *B* 24, 1410) Needles, sol alcohol, insol water Decomposed by alcoholic potash at 200° into aniline and amido-phenyl mercaptan $-B'HCl -B'HAuCl_3 -B'_2H_2PtCl_6 -B'_2C_2H_2N_2O_7$ [222°]

Acetyl derivative [167°] Needles

PHENYL-AMIDO-METHENYL-AMIDO-

PHENOL $C_6H_5\langle\overset{N}{O}\rangle C(NHPh)$ [178°] Formed by boiling $C_6H_5\langle\overset{N}{O}\rangle CSH$ with aniline (Kalckhoff, *B* 16, 1826) Needles, sol alcohol, ether, and $HOAc$ May be distilled. Weak base $-B'H_2PtCl_6$

PHENYL-AMIDO-METHENYL-AMIDO-

PHENYL-MERCAPTAN $C_6H_5N_3S$ *see*

$C_6H_5\langle\overset{N}{S}\rangle C(NHPh)$ [159°] Formed by heating chloro-phenyl-thiocarbimide with aniline (Hofmann, *B* 12, 1129, 11, 12). Needles

PHENYL-AMIDO-METHENYL-BENZAMIDESULPHIM

$C_6H_5\langle\overset{NS}{N}\rangle C(NHPh)$ [174°] Formed by boiling benzamidoxim (1 mol) with phenyl thiocarbimide (2 mols) for 10 hours (Koch, *B* 24, 394) White plates, insol water, sol alcohol, ether, and conc $HClAq$, insol water and alkalis Conc $HClAq$ at 150° decomposes into S, H_2S , aniline, $HOBz$, and NH_3 Bromine forms $CPh.N_3S.CNHC_6H_4Br$ [14°] Yields a nitrosamine [119°] and an acetyl derivative [196°], both being crystalline

PHENYL-AMIDO METHYL-ACRIDINE

$C_6H_5\langle\overset{N}{N}\rangle CCH.CNHPh$ [216°] Fc med

by heating the diacetyl derivative of *m*-phenylene-di phenyl diamine (1 pt) with $ZnCl_2$ (2 pts) for 6 hours at 250° (Besthorn a Curtman, *B* 24, 2044) Brownish red needles, v sol alcohol sl sol ether Split up by $HClAq$ at 250° into aniline and oxy methyl-acridine

DI-PHENYL-DI-AMIDO METHYLENE-*o*-PHENYLENE-DIAMINE

$C_6H_5\langle\overset{NH}{NH}\rangle C(NHPh)_2$ [160°] Formed from di-phenyl cyanamide $C(NPh)_2$ and *o*-phenylene diamine at 135° (Moore, *B* 22, 1635, 3190) Needles (from benzene ligroin), insol ligroin, v sol alcohol Yields with nitrous acid a nitrosamine $C_6H_5N_3(NO)_2$, $C(NPhNO)_2$ [138°] Salts $-B'_2H_2Cl_2$, needles, v sol water $-B'_2H_2SO_4$, needles, sl sol hot water $-B'_2H_2PtCl_6$, *see* [165°]

Tetra-benzoyl derivative [148°]

*Tetra-phenyl-tetra-amido-di-methylene-*o*-phenylene-diamine* $C_6H_5N_4C(NHPh)_4$ [139°] Formed by heating $C(NPh)_2$ with *o*-phenylene diamine at 200° (Moore) Colourless prisms v sol alcohol Split up by heat into aniline and the preceding body

Salts $-B'_2H_2Cl_2$, needles, v sol hot water $-B'_2H_2PtCl_6 -B'_2H_2SO_4$, prisms, v sol hot water

Tetra-acetyl derivative

$C_6H_5N_4C(NPhAc)_4$ [126°] White prisms

Tetra-benzoyl derivative [182°]

DI-PHENYL-DI-AMIDO-METHYLENE-*o*-PHENYLENE-PHENYL GUANIDINE

$C_6H_5\langle\overset{N}{N}\rangle C(NPh)\langle\overset{N}{N}\rangle C(NHPh)_2$ [188°]. Formed from phenylene phenyl-guanidine and $C(NPh)_2$ at 210° (Keller, *B* 24, 2506) The homologous compound from *o*-tolylene phenyl-guanidine melts at 200° while the corresponding body from *o*-tolylene-*p*-tolyl guanidine melts at 176° All three compounds crystallise from alcohol in white needles, sol benzene

PHENYL-AMIDO-METHYL-DI-ETHYL-

PYRIMIDINE $N\langle\overset{Cet}{Cet}\rangle CMe_2\langle\overset{N}{N}\rangle C(NHPh)$

[99°] Formed from chloro-methyl-di-ethyl pyrimidine (derived from cyanethine) by heating with aniline and alcohol at 220° (Von Meyer *J. pr* [2] 89, 274) Needles, v sol. alcohol. $-B'_2H_2PtCl_6$, needles

PHENYL-AMIDO-METHYL-MALONIC ACID *Amic ether*

$CO_2Et.OMe(NHPh)CONH_2$ [86°] Formed by dissolving the nitrile in cold conc. H_2SO_4 and

pouring into water (Gersen, *B* 19, 2965) The nitrile $\text{CO}_2\text{Et CMe}(\text{NHPh})\text{CN}$ [102°] is formed by heating $\text{CO}_2\text{Et CMe}(\text{OH})\text{CN}$ with an alcoholic solution of aniline for 24 hours at 80°. The amic ether crystallises in white needles, sol hot water, and is converted by boiling aqueous NaOH into $\text{CH}_2\text{CH}(\text{NHPh})\text{CO}_2\text{H}$

PHENYL-L-(a)-AMIDO METHYL-NAPHTHO-

PHENAZINE $\text{C}_6\text{H}_5\text{Me} \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} \text{C}_6\text{H}_4\text{NHPh}$

[214°]. Formed by heating (1,3,4)-tolylene-diamine with benzene azo phenyl (a)-naphthylamine hydrochloride and alcohol at 140° (Eicker, *B* 23, 306) Brass-yellow needles, forming yellowish-red solutions with yellowish-green fluorescence. — $\text{B}'\text{H}_2\text{PtCl}_6$. minute dark-red needles.

PHENYL-AMIDO-DI-METHYL-PYRIDINE

$\text{N} \begin{smallmatrix} \text{CMe CH} \\ \text{CMe CH} \end{smallmatrix} \text{CNHPh}$. *Phenyl-amido lutidine* [150°] (C a E); [144°] (G a M). (235°-238°) Obtained by heating chloro-di-methyl-pyridine with aniline at 185° (Conrad a Epstein, *B* 20, 165) Formed also by heating the corresponding oxy-di-methyl-pyridine (1 mol) with phenyl cyanate (1 mol.) and benzene at 100°, CO_2 being evolved (Goldschmidt a Meissler, *B* 23, 274) White crystalline solid. V sol. alcohol, ether, and dilute acids With H_2SO_4 and a trace of HNO_3 it gives a blood-red colouration — $\text{B}'\text{H}_2\text{PtCl}_6$ [209°] (C a E), [204°] (G a M), microscopic yellow needles

PHENYL-AMIDO-DI-METHYL-PYRROLE

$\text{NHPh N} \begin{smallmatrix} \text{CMe CH} \\ \text{CMe CH} \end{smallmatrix}$ [92°] (c 270°) Formed by heating its dicarboxylic acid, and also by the action of phenyl hydrazine on acetyl acetone (Knorr, *B* 18, 1568, 22, 170) Crystalline mass, volatile with steam Insol water and alkalis, sol conc HClAq Reddens pine wood moistened with HClAq

PHENYL-AMIDO-DI-METHYL-PYRROLE-

DICARBOXYLIC ACID $\text{NHPh N} \begin{smallmatrix} \text{CMe C CO}_2\text{H} \\ \text{CMe C CO}_2\text{H} \end{smallmatrix}$ Needles. Got from its ether $\text{Et}_2\text{A}''$ [127°], which is formed by mixing solutions of di acetyl-succinic ether and phenyl-hydrazine in HOAc (Knorr, *B* 18, 804, 1568).

PHENYL (Py 1)-AMIDO-(Py 3)-METHYL

QUINOLINE $\text{C}_6\text{H}_5 \begin{smallmatrix} \text{C}(\text{NHPh})\text{CH} \\ \text{N} \text{CMe} \end{smallmatrix}$ [151°]. Formed by heating chloro-methyl-quinoline with aniline at 190° (Conrad a Limpach, *B* 20, 953) Prisms, al sol ether, v sol alcohol.

Phenyl-(Py 3)-amido-(Py 1)-methyl-quinoline $\text{C}_6\text{H}_5\text{N}_2$ [130°] Formed by heating (Py 3,1)-chloro-methyl quinoline with aniline (Knorr, *A* 236, 102) Shining plates. — $\text{B}'\text{H}_2\text{PtCl}_6$ [235°] Yellow needles, insol Aq. *Phenyl-(Py 1)-amido-tri-methyl-quinoline*

$\text{C}_6\text{H}_5\text{Me} \begin{smallmatrix} \text{C}(\text{NHPh})\text{CH} \\ \text{N} \text{CMe} \end{smallmatrix}$ [150°]. Formed by heating the corresponding chloro-tri methyl-quinoline with aniline at 185° (Conrad a Limpach, *B* 21, 538). Prisms (from dilute alcohol).

PHENYL-AMIDO-METHYL-THIAZOLE

$\text{CMe.N} \begin{smallmatrix} \text{CH} \\ \text{S} \end{smallmatrix} \text{CNHPh}$ [117°]. Formed by heating oxy-methyl-thiazole with aniline (Hantzsch a Weber, *B* 20, 8130), and by the action of chloroacetone on phenyl-thio-urea (Traumann, *A* 249, *Yac. III*.

47) Small white needles (from alcohol) Yields aniline when heated with HClAq at 240°

PHENYL-AMIDO-NAPHTHALENE v.

PHENYL-NAPHTHYL-AMINE

Di-phenyl-di-amido naphthalene v. *Di*

PHENYL-NAPHTHYLENE-DIAMINE.

Tri-phenyl tri-amido naphthalene

$\text{C}_6\text{H}_5 \begin{smallmatrix} \text{C}(\text{NHPh})\text{CH} \\ \text{C}(\text{NHPh})\text{CNHPh} \end{smallmatrix}$ [148°] One of the products formed by heating benzene azo (a)-naphthylamine with aniline at 160° (Fischer a Hepp, *A* 256, 251) Needles, v sol alcohol. Yields phenyl-rosinduline and a yellow substance [140°] on oxidation

Tetra-phenyl-tetra-amido-naphthalene

$\text{C}_6\text{H}_5(\text{NHPh})_4$ [191°]. Accompanies the preceding body On oxidation it yields phenyl-amido phenyl-rosinduline, di-phenyl-di-amido-naphthoquinone, and a body melting at 169°.

PHENYL-AMIDO (a)-NAPHTHOQUINONE

$\text{C}_6\text{H}_5\text{NO}_2$, i.e. $\text{C}_6\text{H}_5 \begin{smallmatrix} \text{CO CNHPh} \\ \text{CO CH} \end{smallmatrix}$ [191°].

Formed by heating (a)-naphthoquinone with an alcoholic solution of aniline (Zincke, *B* 12, 1645), by boiling phenyl-amido (β) naphthoquinone with HCl , and by the action of aniline and HOAc on oxy-(a)-naphthoquinone (Liebermann, *B* 14, 1665) Long red needles, v sol. hot alcohol and ether, insol cold alkalis Alcoholic potash forms a purple solution Boiling dilute NaOH splits it up into aniline and oxy-(a)-naphthoquinone.

Anilide $\text{C}_6\text{H}_5 \begin{smallmatrix} \text{CO} \\ \text{C}(\text{NHPh})\text{CH} \end{smallmatrix}$ *Di*.

phenyl di-imidonaphthol [180°]

Formation — 1 By heating each of the naphthoquinone oxims with aniline and HOAc at 100° (Fuchs, *B* 8, 1023, Brömme, *B* 21, 893) — 2 By heating di-imido-(a)-naphthol hydrochloride with aniline at 120° (Göbe, *B* 13, 124) — 3 By boiling (β)-naphthoquinone with an alcoholic solution of aniline (Zincke, *B* 15, 481) — 4 By heating di-bromo-(a)-naphthol with aniline (Meldola, *C J* 45, 157) — 5 By the action of aniline and aniline hydrochloride at 100° on benzene-azo-(a) naphthol, on benzene-azo-(a)-naphthylamine, and on similar bodies (Fischer a Hepp, *B* 21, 679)

Properties — Orange red needles (from alcohol), forming orange solutions in benzene, acetone, and CHCl_3 . Weak base Its solution in HOAc is orange when hot, but crimson when cold Hot HClAq forms a red solution Insol alkalis Not attacked by boiling with alkalis, or by AqO , AcCl , and MeI H_2SO_4 at 120° yields oxy-naphthoquinone and aniline. Zinc dust and HOAc reduce it to aniline and naphthalene. Alcoholic HCl or EtBr at 150° yields aniline and phenyl-amido-(a)-naphthoquinone HNO_3 forms a di-nitro- derivative [148°].

Salts. — $\text{B}'\text{HCl}$: golden-green plates, forming a violet solution in alcohol. Decomposed by water — $\text{B}'\text{H}_2\text{PtCl}_6$: bronze needles. — $\text{B}'\text{H}_2\text{ZnCl}_6$: bronze-green plates. — $\text{B}'\text{HI}$: black needles. — $\text{B}'\text{H}_2\text{SO}_4$ — $\text{B}'\text{HNO}_3$: plates

Di-anilide $\text{C}_6\text{H}_5(\text{NHPh})_2$ [189°].

A product of the action of benzene-azo-(a)-naphthylamine on aniline (Fischer a Hepp, *A* 252, 246). Orange-yellow prisms.

Phenyl-amido-(β)-naphthoquinone

$C_{16}H_9O_2(NHPh)$ or $C_{16}H_8O_2 \begin{matrix} \text{CO} \\ \text{C}(NHPh) \end{matrix} \begin{matrix} \text{OH} \\ \text{OH} \end{matrix}$ *Oxy-*

(α)-naphthoquinone amide. (β)-Naphthoquinone amide' [245°-250°] Prepared by adding aniline to an alcoholic solution of (β)-naphthoquinone (Zincke, *B* 14, 1494, 15, 279, Liebermann, *B* 14, 1664). Red needles, sl sol alcohol. Weak acid. Readily converted by boiling with HOAc into the isomeric phenyl-amido-(α)-naphthoquinone. Boiling HClAq splits it up into aniline and oxy-(α) naphthoquinone. Nitrous acid passed into a solution in alcohol and HOAc forms a nitroso derivative $C_{16}H_9N_2O_2$, crystallising in red needles, and converted by NaOHAlq into a yellow body [217°].

Salts—BaA', red needles, sl sol water—PbA', brown pp—ZnA',—HgA',—AgA' red pp. *Methyl ether MeA'* [161°] Formed from the Ag salt and MeI. Yellow needles, sol alcohol and ether.

Ethyl ether EtA' [104°] Prisms

n-Propyl ether PrA' [104°] Prisms

Isopropyl ether IPA' [100°]

Di-phenyl-amido (α)-naphthoquinone

$C_{16}H_8O_2(NPh)_2$ [164°] Formed by boiling (α) naphthoquinone (5 g) with diphenylamine (6 g), alcohol, and conc HClAq (10 cc) for twenty minutes, and ppg with water (Plimpton, *O J* 37, 644). Needles (from alcohol).

Acetyl derivative $C_{16}H_8AcNO_2$ [173°]

PHENYL-AMIDO NAPHTHYL-UREA

$NHPh \cdot CO \cdot NH \cdot C_6H_4 \cdot NH_2$. Formed from (1,2)-naphthylene diamine and phenylcyanate (Schiefelin, *B* 22, 1377, cf Goldschmidt, *B* 23, 502). Granules (from alcohol), not fused at 335°.

DI-PHENYL-DI-AMIDO-OIAZATHIOLE

$S \begin{matrix} \text{C}(NHPh)N \\ \text{C}(NHPh)N \end{matrix}$ [181°] Formed by adding hydrogen peroxide solution (8 p.c.) to phenylthio urea dissolved in dilute alcohol, acidulated with HCl (Hector, *B* 22, 1176). Needles, insol water, v sl sol cold alcohol. Nitrous acid forms $C_{16}H_{11}(NO)_2S$, a green insoluble powder, exploding at 179°. Cyanogen passed into the warm alcoholic solution ppts $C_{16}H_{12}N_2S$, crystallising in needles—B'HNO₂—B'H₂PtCl₄—B'AgNO₃, aq granules, v sl sol hot alcohol.

Acetyl derivative $C_{16}H_{11}AcN_2S$ [238°].

Benzoyl derivative $C_{16}H_{11}BzN_2S$ [238°].

PHENYL-AMIDO-PALMITIC ACID

$C_{16}H_{21}(NHPh)O_2$ [142°] Formed by boiling α -bromo palmitic acid with aniline (Hell a Jordanoff, *B* 24, 942). Sol ether and benzene.

PHENYL-AMIDO-PHENOL v **Oxy-di-**

PHENYL-AMINE

Di-phenyl-di-amido-phenol *Hydrochloride* $(C_6H_4(NHPh)_2OH)HCl$ [192°] Formed from azophenin, Sn, and HCl in presence of AcOH (Fischer a Hepp, *A* 256, 260). Plates.

PHENYLAMIDO-PHENYL ACETIC ACID

$C_6H_5NO_2$ v $C_6H_5CH(NHPh)CO_2H$ [164°-168°] (S) Formed by saponification of the nitrile (Tiemann a Priest, *B* 15, 2030), and also by boiling bromo phenyl-acetic acid with aniline and alcohol (Stöckemus, *J* 1878, 779). Plates, subliming at 176° as slender white needles (T a F.). V. sl sol water, sol alcohol—HA'HCl·molecules, decomposed by water—HA'HNO₂; thin needles—BaA'; radiating tress.

Ethyl ether EtA' [84°]. Needles.

Amide $C_6H_5CH(NHPh)CONH_2$. Silky

plates, v sol alcohol, nearly insol ligroin.

Nitrile $C_6H_5CH(NHPh)CN$ [85°] Formed by heating an alcoholic solution of the cyanhydrin of benzoic aldehyde with aniline at 100°. Formed also by the action of KCy and HCl on benzylidene-aniline (Cech, *B* 11, 246). Needles or prisms, sol ether and hot alcohol.

Phenyl amido-di-phenyl-acetic acid

$CPh_2(NHPh)CO_2H$ [168°] Formed by passing HCl into an alcoholic solution of benzoic acid and treating the resulting CPh_2ClCO_2Et with aniline (Klinger a Standke, *B* 22, 1212). Needles, v sl sol water. Conc H_2SO_4 forms a yellow solution, becoming crimson on warming.

Methyl ether MeA' [107°]. Monoclinic

Ethyl ether EtA' [115°].

PHENYL-AMIDO-PHENYL-ACRIDINE

$C_6H_5 \begin{matrix} \text{N} \\ \text{C} \end{matrix} \begin{matrix} \text{CH} \\ \text{CH} \end{matrix} \begin{matrix} \text{C} \\ \text{C} \end{matrix} \begin{matrix} \text{CH} \\ \text{CH} \end{matrix} \begin{matrix} \text{N} \\ \text{N} \end{matrix} \begin{matrix} \text{CH} \\ \text{CH} \end{matrix} \begin{matrix} \text{C} \\ \text{C} \end{matrix} \begin{matrix} \text{CH} \\ \text{CH} \end{matrix} \begin{matrix} \text{N} \\ \text{N} \end{matrix}$ [197°] Formed by

heating the di-benzoyl derivative of *m* phenylene di-phenyl di-amine (10 g) with ZnCl₂ (25 g) at 250° (Besthorn a Curtman, *B* 24, 2045). Brownish red needles, m sol alcohol, ether, and benzene. The dilute ethereal solution exhibits a greenish fluorescence. The hydrochloride is v sl sol water, and forms a red solution in alcohol.

DI-PHENYL-DI-AMIDO-TRI-PHENYL-CARBINOL $C_{16}H_{12}N_4O_2$ v

$CPh(OH)(C_6H_5NHPh)_2$. Formed by heating di-phenylamine with benzyl chloride and oxidising the product with arsenic acid. Formed also by heating diphenylamine with ZnCl₂ and benzoyl chloride or benzoic trichloride, the resulting chloride $C_{16}H_{12}N_4Cl_2$ being decomposed by alcoholic NH₃ (Meldola, *C J* 41, 187). Amorphous, v sol ether, sol hot alcohol and acetone. The chloride $C_{16}H_{12}N_4Cl_2$, called 'diphenylamine green,' forms bronzed granules, and, in alcoholic solution, dyes wool bluish green, and gives a dark green pp with H₂PtCl₆. Hot H₂SO₄ converts the chloride into the sulphonic acid $C_{16}H_{12}N_4SO_3$, ppd by water in dark green flakes.

Tri-phenyl tri-amido tri-phenyl-carbinol. The chloride $CCl(C_6H_5NHPh)_3$, or 'diphenylamine blue,' is obtained by heating diphenylamine (1 pt) with oxalic acid (2 pts) (Willm a Girard, *D P J* 221, 192, Hausdörfer, *B* 23, 1963). Formed also by heating pararosaniline with aniline. Brownish red powder, v sol hot aniline and nitro benzene, sl sol cold alcohol.

Hexa-phenyl tri-amido tri-phenyl carbinol $C(OH)(C_6H_5NHPh)_3$. Formed by the action of alcoholic NH₃ on the chloride $CCl(C_6H_5NHPh)_3$, which is got by heating triphenylamine with COCl₂ at 190° (Heydrich, *B* 19, 758). White amorphous pp, forming a bluish-violet solution in H_2SO_4 , turned blue by addition of alcohol.

PHENYLAMIDO-PHENYL-ISOCROTONIC ACID $C_6H_5CH=CHCH(NHPh)CO_2H$ [154°].

Formed by saponification of the nitrile (Peine, *B* 17, 2116). Minute needles, v sol alcohol and ether.

Amide [171°]. Thin plates.

Nitrile $C_6H_5CH=CHCH(NHPh)CN$ [180°] Formed by heating $CHPhCH=CH(OH)CN$ with aniline in alcoholic solution. Crystalline solid, sol hot alcohol.

PHENYLAMIDO-PHENYL-ETHYL-KETONE $C_6H_5(NHPh)CO \cdot C_2H_5$. *Homophenacylamide*.

[88°] Formed from phenyl bromo ethyl ketone and aniline in alcoholic solution (Pampel & Schmidt, *B* 19, 2897) Yellow crystals Yields an acetyl derivative [103°]

PHENYL AMIDOPHENYL HYDRAZINE

*Acetyl derivative $C_6H_5N_2H_2C_6H_5NHAc$
[146°] Gg by reduction of $C_6H_5N_2C_6H_5NHAc$
with alcoholic ammonium sulphide (Schultz, *B*
17, 463) Glistening plates, v sol alcohol and
ether $SnCl_4$ reduces it to aniline and *p*-
phenylene diamine Conc $HClAq$ forms a blue
compound

PHENYLAMIDO DI PHENYL-METHANE

$\text{JH}_2\text{PhC}_6\text{H}_4\text{N}(\text{HPh})$ [c 89°] Formed by heating diphenylamine with benzyl chloride and ZnCl_2 at 100° (Meldola, *C J* 41, 198) White powder, v sol benzene, insol alcohol

Di phenyl-di-amido-tri phenyl-methane

$\text{C}_{21}\text{H}_{18}\text{N}_2$ *see* $\text{CHPh}(\text{C}_6\text{H}_5\text{NHP})_2$, [c 170°]
Formed by heating diphenylamine with benzyl
dene chloride, and also from diphenylamine,
benzoic aldehyde, and ZnCl_2 (Meldola, *C J* 41,
192) White granules, v sol ether, yielding
diphenylamine green on oxidation

PHENYLMETHANE

PHENYLAMIDO-PHENYL METHYL PYR

IMIDINE CPh $\begin{matrix} \text{N CMe} \\ \diagup \quad \diagdown \\ \text{N} \quad \text{C(NHPh)} \end{matrix} \text{CH} \text{ [150°-153°]}$
 Formed from chloro phenyl methyl pyrimidine
 and aniline (Pinner, *B* 18, 2852) —B'HNO₃
 [87°] —H'HC! [240°] Long slender needles

PHENYLAMIDO PHENYL PROPIONIC
ACID Nitrile $\text{CH}_2\text{CPh}(\text{NHPh})\text{CN}$ [152°]

Formed by digesting an ethereal solution of acetophenone cyanhydrin and aniline at 50° (Jacoby, *B* 19, 1515) White prisms (from alcohol) With alcoholic hydroxylamine it yields the oxim of acetophenone Alcoholic HCl gives *s* tri phenyl benzene

Amide $\text{CH}_3\text{CPh}(\text{NHPh})\text{CO NH}_2$ [119°]

Formed from the nitrile by heating with H_2SO_4 at 100° and pouring into water Insol water

PHENYL AMIDO TRI PHENYL PYRROLE

$\text{CH CPh} \searrow$
 $\text{CPh CPh} \searrow \text{N NPh} \quad [232^\circ] \quad \text{Formed from}$
anhydrazetophenone benzil (1 mol) and phenyl
hydrazine (2 mols) in alcoholic solution at 100°
(Japp. B 21, 551, 22, 2885) Yellow needles

PHENYL AMIDO TRI PHENYL QUINOX-
ALINE DIHYDRIDE

$[14^3]C_6H_3(NHPh) \left\langle \begin{array}{c} NPh.CHPh \\ N=CPh \end{array} \right. [223^\circ] \text{ Formed}$
by heating di-phenyl (1,3,4) tri amido benzene
with benzoïn at 160° (Fischer, B 24, 722)
Yellow plates, sl sol alcohol, forming a yellow
solution with green fluorescence

PHENYLAMIDO PHENYL ROSINDULINE

[$\frac{1}{2}$] $C_6H_4(NPh) \left\langle \frac{N-C}{NPh-C} OH C(NHPh) \right\rangle C_6H_4$
 [192] Formed by heating benzene-azo (α -naphthyl)-amine with aniline and benzene (Fischer & Hopp, *A* 262, 297). Formed also by oxidation of (1,2,3,4) tetra phenyl-tetra amido-naphthalene (Fischer & Hopp, *A* 256, 252). Bronzed plates, forming a dark-green solution in some H_2SO_4 , becoming reddish-violet on dilution with HCl bronzed plates

TRI-PHENYL-TRI-AMIDO-DI-PHENYL-
TOLYL-CARBINOL

$$\text{C}(\text{OH})(\text{C}_6\text{H}_4\text{NHPh})_4(\text{C}_6\text{H}_4\text{NHPh}) \quad \text{Aniline blue.}$$

Lyons blue *Triphenylrosaniline* Formed, to
gether with mono and di phenyl rosaniline by
heating rosaniline acetate or benzoate with
aniline (Girard & De Laire, *D P J* 162, 297,
Hofmann, *Pr* 12, 578, 13, 9) Prepared by
heating rosaniline (1 pt) with aniline (10 pts)
and a little benzoic acid, dissolving in alcoholic
 NH_3 , and pouring into water White pp, insol
water, v sol alcohol, m sol ether Yields di
phenyl amine on distillation. Reduced by zinc
and HCl to tri phenyl tri amido di phenyl tolyl
methane or tri phenyl leucaniline (Hofmann,
C R 57, 25)— $\text{C}_{24}\text{H}_{22}\text{N}_3\text{Cl}$ *Spirit soluble blue*
Opal blue Small brassy crystals, insol water and
ether, sl sol alcohol Becomes brown at 100°
Left with coppery lustre on evaporation of the
alcoholic solution Blue dye— $(\text{C}_{24}\text{H}_{22}\text{N}_3)_2\text{SO}_4$, v
sl sol alcohol The salts of mono phenyl ros-
aniline dye violet, those of di phenyl rosaniline
a bluish violet Tri phenyl rosaniline yields
mono, di, tri, and tetra sulphonic acids, the
Na salts of which are v sol water and dye wool
blue (Nicholson, *Bulk*, *B* 5, 417)

The mono and di sulphonic acids are known as *Nicholson's* or *Alkali blue*, the tri sulphonic acid as *Soluble blue*.

TRI PHENYL AMIDO PHOSPHIDE OXIDE

PO(NHPh), [208°] Formed from POCl₃ and aniline (Michaelis & Soden, *J* 229, 334) Six sided plates, insol water, sl sol ether and alcohol, v sol HOAc Yields PO(NHC₆H₄Br)₃, crystallising in needles [253°] The compound HO PO(NHPh)₂, [197°] may be got by treating aniline with ether and POCl₃, followed by water

TRI-PHENYL TRI-AMIDO-PHOSPHINE

SULPHIDE $\text{PS}(\text{NHPh})_2$, [153°] Formed from aniline and P_2S_5 below 150° (Knop, B 20, 3352) Monoclinic crystals

PHENYLAMIDO PROPIONIC ACID

$\text{C}_6\text{H}_{11}\text{NO}_3$, ϵ $\text{CH}_2(\text{NHPh})\text{CO}_2\text{H}$ [162*]
Formed by saponification of the nitrile or of the
ether (Tiemann & Stephan, *B* 15, 2036,
Nastvogel, *B* 22, 1792, 23, 2010). Plates (from
hot water), sol alcohol. May be sublimed.
Yields a hydrochloride decomposed by water,
and a white silver salt.

Ethyl ether EtA' (272°) SG $\frac{19.8}{19.8}$ 1.060

Formed by heating α bromo propionic ether with aniline on the water-bath Oil.

Formyl derivative

$\text{CH}_3\text{CH}(\text{NPhCHO})\text{CO}_2\text{H}$ Prepared from
 $\text{NaNPh}(\text{CHO})$ and α -bromo-propionic ether
(Paal & Otten, *B* 23, 2597) Large prisms,
sol alcohol and ether — BaA' , aq white powder

Acetyl derivative $\text{CH}_3\text{CH}(\text{NaCPh})\text{CO}_2\text{H}$, [143°] Plates (from hot benzene), sl sol cold water — $\text{NaC}_6\text{H}_5\text{NO}_2$ 3aq plates — EtA' (294° 298°) Oil, formed from sodium acetalide and a bromo propionic ether

Amide $\text{CH}_2\text{CH}(\text{NHPh})\text{CONH}_2$ [141°]
 Plates, sol. alcohol and hot water

Anilide $\text{CH}_3\text{CH}(\text{NPh})\text{CO NPh}$ [126°].
Needles, v sol hot water

Nitrile $\text{CH}_3\text{CH}(\text{NHPH})\text{CN}$ [92°] Formed by heating the cyanhydrin of acetic aldehyde with aniline (T & S) White plates, sol also hot and ether Weak base — B^+HCl [86°]

Isomerides: v AMIDO-PHENYL PROPIONIC ACID.

Di-phenyl-di-amido-propionic acid. Nitrile
 $\text{CH}(\text{NHPh})_2\text{CH}_2\text{CN}$ [118°]. Formed by heating CHOCH_2CN with aniline for 30 hours at 310° (Chautard, *A. Ch.* [8] 16, 180). Needles, v. sol. water and benzene — B'HOI . — B' , H_2PtCl_6 : small yellow needles, v. sol. water

Reference.—TRI-BROMO PHENYL-AMIDO-PROPIONITRILE

PHENYL- β -AMIDO-PROPYL-PHTHALIMIDE
 $\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{NCH}_2\text{CHMe.NHPh}$ [93°] Formed from β -bromo-propyl-phthalimide and aniline (Seitz, *B.* 24, 2631). Yellow needles. Decomposed by HCl at 190° into phthalic acid and propylene-diamine

Phenyl- γ -amido-propyl-phthalimide
 $\text{C}_6\text{H}_4\text{C}_6\text{O}_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{NHPh}$ [89°] Formed by heating γ -bromo-propyl phthalimide (54 g) with aniline (37 g) at 150° (Goldenring, *B.* 23, 1168). Yellow crystals (from boiling ligroin). Split up by heating with HCl , yielding phenyl-trimethylene-diamine

PHENYLAMIDO-PROPYL-UREA
 $\text{NHPh.C}_6\text{H}_4\text{NH.CO.NH}_2$ [98°] Formed by warming $\text{C}_6\text{H}_4(\text{NH}_2\text{Cl})\text{NHPh}$ with potassium cyanate at 100° (Goldenring, *B.* 23, 1173). Rose-coloured needles, v. sol. alcohol. Decomposes at 120° in NH_3 and phenyl-trimethylene-urea.

PHENYLAMIDO-PYROTARTARIC ACID
 $\text{CO}_2\text{H.C}_6\text{H}_4\text{CMe}(\text{NHPh})\text{CO}_2\text{H}$ *Anilide methylsuccinic acid* [102°] Obtained by saponification of its ether (Schiller-Wechler, *B.* 18, 1037). White needles (containing aq), v. sol. hot water and alcohol, nearly insol. ether. Its solution in KOH aq is colourless. NH_4aq forms a violet solution. — CuA'' aq — CuA''NH_2 green pp — $\text{H}_2\text{A''HCl aq}$ white crystalline solid

Ethyl ether of the mono-amide
 $\text{CO}_2\text{Et.C}_6\text{H}_4\text{CMe}(\text{NHPh})\text{CONH}_2$ [125°] Formed by digesting $\text{CO}_2\text{Et.C}_6\text{H}_4\text{CMe}(\text{OH})\text{ON}$ with aniline in ether, dissolving the resulting compound $\text{CO}_2\text{Et.C}_6\text{H}_4\text{CMe}(\text{NHPh})\text{ON}$ in H_2SO_4 , and pouring into water. Plates, sol. hot water. Converted into the imide by heating with water, alcohol, acids, or alkalis

Imide $\text{CH}_2\text{CO} > \text{NH}$. $\text{NHPh.CMe.CO} > \text{NH}$. [150°]. Formed as above. White prisms, sol. alcohol and hot water. Yields a nitrosamine $\text{C}_6\text{H}_4(\text{NO})\text{N}_2\text{O}_2$ [173°], an acetyl derivative [285°], and a benzoyl derivative [190°]

Methylimide $\text{CH}_2\text{CO} > \text{NMe}$. $\text{NHPh.CMe.CO} > \text{NMe}$ [108°] Formed from the imide, MeI , MeOH , and KOH . Prisms. Yields a nitrosamine $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$, crystallising in needles [147°]. Forms also $\text{C}_6\text{H}_4\text{MeN}_2\text{O}_2\text{Me.PtCl}_6$, which is sol. aq

Phenylimide $\text{CH}_2\text{CO} > \text{NPh}$. So-called 'n-Phenyl- α -keto- γ -oxy- β - α -dimethyl- β -anilido- α -tetra-hydropyridine carboxylic lactone.' [181°] A product of the action of heat on phenylamido-pyrotartaric acid (Reissert, *B.* 21, 1886; Anschütz, *A.* 261, 140). Prisms (from alcohol). Its acetyl derivative [169°] forms tabular crystals.

Mono-crystals
 $\text{C}_6\text{H}_4(\text{NHPh})(\text{CO}_2\text{H})(\text{CONHPh})$. [150°]. Got by boiling the phenylimide with NaOHAq . Forms with nitrous acid a compound melting at 204° .

Acetyl derivative of the anhydride
 $\text{CH}_2\text{CO} > \text{O}$. $\text{NACPh.CMe.CO} > \text{O}$ [186°] Got by boiling the acid with AcCl (Anschütz) Tables, v. sol. chloroform, al sol. ether

Acetyl derivative of the anilide
 $\text{C}_6\text{H}_4(\text{NACPh})(\text{CO}_2\text{H})(\text{CONHPh})$ [141°] Formed from the preceding body by the action of aniline on its ethereal solution. Prisms

PHENYL-(Py β) AMIDO-QUINOLINE
 $\text{C}_6\text{H}_4\text{CH}(\text{OH})\text{NCHNHPh}$ *Phenyl-quinolinamine* [98°] (above 360°). Formed by heating (Py β)-chloro-quinoline with aniline (Fiedler *id.* a. Weinberg, *B.* 18, 1532). White plates

Reference.—BROMO-PHENYL-AMIDO-QUINOLINE.
PHENYL-AMIDO-QUINOLINEQUINONE-

ANILIDE $\text{CH}(\text{NHPh})\text{C}(\text{CH}_2\text{NHPh})_2\text{CO} > \text{NCH}$ [222°] Formed by adding excess of aniline to an alcoholic solution of $\text{CH}(\text{COCl})\text{CO} > \text{C}_6\text{H}_4\text{N}$ (Hebe-

brand, *B.* 21, 2986). Long needles (from alcohol and HOAc), forms a deep-blue solution in dilute HCl aq — B'HOI . Dark-golden needles — Acetate [199°]. Bronzed needles, decomposed by water — $\text{B'CH}_2\text{N}_2\text{O}_2$. Coppery needles

PHENYLAMIDO-QUINONE *Dianilide*
 $\text{O}_2\text{H}_2(\text{NPh})_2(\text{NHPh})$ [142] [280°] Formed from azophenine and HOI at 160° (Fischer & Hepp, *A.* 256, 261). Reddish-brown needles, forming a blue solution in conc. H_2SO_4 .

Di-phenyl-di-amido-quinone
 $\text{C}_6\text{H}_4(\text{NHPh})_2$ [1435] *Quinone dianilide*
 Formed, together with hydroquinone, by boiling quinone with an alcoholic solution of aniline (Hofmann, *Pr.* 18, 4; Wichelhaus, *B.* 5, 851; Zincke, *B.* 16 1556; Knapp & Schultz, *A.* 210, 178). Formed also by heating chloro-quinone with aniline and HOAc (Niemeyer, *A.* 228, 332) and by strongly heating aniline with di-oxy-quinone (Nietzki & Schmidt, *B.* 22, 1655). Small violet plates, sol. HOAc and aniline, nearly insol. alcohol. May be sublimed. Conc. H_2SO_4 forms a reddish violet solution

Anilide $\text{C}_6\text{H}_4(\text{NHPh})\text{C}(\text{O})\text{NPh}$. [208°].

A product of the action of aniline on quinone in HOAc (Zincke & Hagen, *B.* 18, 785), on o-nitrophenol (Fischer & Hepp, *A.* 262, 247), and on quinone phenylimide (Bandrowski, *M.* 9, 415). Reddish-brown needles, forming a blood-red solution in H_2SO_4 . On warming with alcoholic H_2SO_4 , it yields $\text{C}_6\text{H}_4(\text{NHPh})(\text{OEt})\text{C}(\text{O})\text{NPh}$. Alcoholic potash forms $\text{C}_6\text{H}_4\text{N}_2\text{O}_2$, crystallising in red needles [192°], v. sol. alcohol, and forming a green solution in H_2SO_4 .

Di-anilide $\text{C}_6\text{H}_4(\text{NHPh})_2(\text{NPh})_2$ is **ASOPHENIDE**

DI-PHENYL-DI-p-AMIDO-QUINONE DI-CARBOXYLIC ETHER

$\text{C}_6(\text{NHPh})_2\text{O}_2(\text{C}_6\text{H}_4)_2$ [1,4 2 5 8 6] *Di-anilido-quinone di-carboxylic ether*. [246°]. Formed by the action of aniline in alcoholic solution upon p-di-chloro-quinone-di-carboxylic ether $\text{C}_6\text{Cl}_2\text{O}_2(\text{CO}_2\text{Et})_2$ (Hantzsch & Zeekendorf, *B.* 20, 1812). Glistening garnet-red crystals.

PHENYLAMIDO-SUCCINIC ACID
 $\text{CO}_2\text{H.C}_6\text{H}_4\text{CH}(\text{NHPh})\text{CO}_2\text{H}$ *Phenylsuccinic acid*. [183°] Formed by boiling bromo succinic

acid with aniline, and by the decomposition of an aqueous solution of acid maleate of aniline (Anschütz a. Wirtz, *Am* 9, 248, *A* 289, 140) Small crystals— $\text{H}_2\text{A} \cdot \text{HCl}$ monoclinic prisms.

Phenylimide $\text{C}_6\text{H}_5(\text{NHPh})\text{C}_2\text{O}_2\text{NPh}$. [211°]. Formed by heating maleic anhydride with aniline. Formed also, together with the dianilide $\text{C}_6\text{H}_5(\text{NHPh})(\text{CONHPh})$, [206°], by heating asparagine with aniline (Plutti, *G* 14, 474) Small needles (from alcohol). Yields a nitrosamine [180°]. Alcoholic NH_2 forms the amide-anilide [200°]. The dianilide yields a nitrosamine [190°].

Imide. [158°]. Formed from bromo-succinimide and aniline (Kusseroff, *A* 252, 158)

Ethyl ether $\text{C}_6\text{H}_5(\text{NHPh})(\text{CO}_2\text{Et})_2$. [214°] Oil, forming a crystalline sulphate

Di-phenyl-di-amido-succinic acid $\text{OO}_2\text{H} \cdot \text{CH}(\text{NHPh})\text{CH}(\text{NHPh})\text{CO}_2\text{H}$. [c 190°] Formed by saponifying its ether, which is formed by heating di-bromo succinic ether with aniline in alcohol (Lopatine, *C* R 105, 230; Gorodetzky a. Hell, *B* 21, 1796) Plates (from HOAc), nearly insol. water, m. sol alcohol

Ethyl ether Et_2A . [150°] Needles. Forms with Br a hexa-bromo-derivative [104°]

PHENYL-AMIDO-SULPHO-BENZOIC ACID $\text{C}_6\text{H}_5(\text{NHPh})(\text{SO}_3\text{H})\text{CO}_2\text{H}$ [124] Formed from bromo sulpho benzoic acid and alcoholic aniline (Fischer, *B* 24, 3802) Plates— BaA 5sq— $(\text{NH}_2\text{Ph})\text{HA}$ needles (from water)

PHENYL-AMIDO-THIAZOLE $\text{C}_6\text{H}_5\text{N}_2\text{S}$ t.s. $\text{S.O}(\text{NHPh})\text{CH}=\text{CH} > \text{N}$ [126°] Formed by the action of phenyl-thio-urea on di-chloro-di-ethyl ether (Hantzsch a. Traumann, *B* 21, 940, *A* 249, 47) Small white needles, sl sol water, v sol alcohol

PHENYLAMIDO-TOLUQUINONE $\text{C}_{11}\text{H}_9\text{NO}$, t.s. $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\text{O}_2$. [145°] Formed in small quantity, together with di-phenyl-amido toluquinone and its phenylimide, by the action of aniline in alcohol and HOAc on toluquinone (Hagen a. Zincke, *B* 16, 1559) Red needles (from dilute alcohol)

Anilide $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\text{C}_6\text{H}_4\text{N}$ [151°]. Formed by reducing the anilide of di-phenyl-di-amido-toluquinone with SnCl_2 and HOAc (Fischer a. Hepp, *A* 256, 259) Red needles

Di-phenyl-di-amido-toluquinone $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})_2\text{O}_2$. [238°] Formed as above Brown needles (from alcohol), forming a red solution in H_2SO_4

Anilide $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\text{C}_6\text{H}_4\text{N}$. [178°]

Toluquinone trianilide. Formed as above, and also by heating nitroso-o-cresol (tolu-quinone metho-oxum) (1 pt.) with aniline (4 pts.) and aniline hydrochloride (3 pts.) (O. Fischer a. Hepp, *B* 21, 678) Brown plates with bluish lustre, sol hot alcohol—B'HI. Brownish needles.—B'HI, PtCl₄—B'HBz dark-green needles.

PHENYLAMIDO-TOLYL-ACETIC ACID $\text{C}_6\text{H}_5\text{NO}_2$ t.s. [13] $\text{C}_6\text{H}_5\text{Me}(\text{NHPh})\text{CO}_2\text{H}$. [159°]. Formed by saponifying its nitrile, which is made by heating $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CN}$ with aniline in ether at 100° (Bornemann, *B* 17, 1471) Silvery plates (from dilute alcohol), v sol. hot Aq.

Amide $\text{C}_6\text{H}_5\text{N}(\text{CO}_2\text{NH}_2)$ [128°]. Plates.

Nitrile $\text{C}_6\text{H}_5\text{N} \cdot \text{CN}$. [95°]. Plates.

PHENYL AMIDO-TOLYL KETONE

Phthalyl derivative $\text{C}_6\text{H}_5\text{CO} \cdot \text{C}_6\text{H}_4\text{MeN} \cdot \text{C}_6\text{H}_5$. [202°] Formed, together with an isomeride [160°], by heating the phthalyl derivative of *p*-toluidine with benzoyl chloride and ZnCl_2 (Fröhlich, *B* 17 2872). Dimetric crystals, v sol. hot HOAc

DI-PHENYL-AMIDO-*p*-TOLYL-UREA [184] $\text{C}_6\text{H}_5\text{Me}(\text{NH}_2)\text{NH} \cdot \text{CO} \cdot \text{NPh}_2$. [137°]. Formed by reducing the nitro-compound in alcoholic solution with SnCl_2 and HCl (Lellmann a. Bonhöffer, *B* 20, 2123) Needles, solidifying at 165°–170°, and melting a second time at 220°–260°, yielding diphenylene and tolylene-urea at 300°

PHENYLAMIDO ISOVALERIC ACID

$\text{CHMe} \cdot \text{CH}(\text{NHPh})\text{CO}_2\text{H}$ S. 7 at 100°. Formed from bromo isovaleric acid and aniline (Duvillier, *A* Ch. [5] 21, 446, *C* R 88, 425) Scales (from hot water), v sol alcohol and ether—B'HI needles, decomposing at 100°–110°

DI-PHENYL-*o*-DI-AMIDO-*o*-XYLENE $\text{C}_6\text{H}_5(\text{CH}_2\text{NHPh})_2$. [172°] Formed by boiling *o*-xylylene bromide with an alcoholic solution of aniline (Leser, *B* 17, 1825) Small colourless plates Weak base.

PHENYLAMINE v ANILINE

Diphenylamine $\text{C}_6\text{H}_5\text{N} \cdot \text{C}_6\text{H}_5$ NPh_2 . Mol. w 169 [54°] (302°) (Graebe, *A* 236, 362). S.V 208 4 (Lossen, *A* 254, 72), 208 8 (Ramsay)

Formation—1 By the dry distillation of tri-phenyl-rosaniline (Hofmann, *A* 132, 168)—2 By heating aniline (3 mols.) with aniline hydrochloride (2 mols.) for thirty hours at 210° (De Laire, Girard, a. Chapoteaut, *Bl* [2] 7, 360 *C* R 74, 811, 1254, Merz a. Weith, *B* 5, 268; 6, 1511)—3 By distilling *o*-di-phenyl-urea or tri-phenyl-urea (Michler, *B* 9, 715)—4 By heating phenol with aniline-zinc-chloride to 260° (Merz a. Weith, *B* 13, 1298)—5 By heating a mixture of aniline, phenol, and SbCl_5 at 150°–160° (Buch, *B* 17, 2639)

Preparation.—By heating aniline with aniline hydrochloride at 230° and treating the warm product with HClAq followed by water

Properties—Monoclinic plates Forms a colourless solution in H_2SO_4 , changing on warming to blue, when a trace of nitrous or nitric acid is present (test for nitrous acid in H_2SO_4 : Kopp, *B* 5, 284, Plutti, *A* 227, 181) A solution in conc. H_2SO_4 (5 c c) is coloured blue by shaking with a solution (1 c c) containing nitric acid (test for nitric acid Muller, *Bl* [3] 2, 670). With PbO_2 and alcoholic HOAc it gives a bright olive green colour (Lanth, *C* R 111, 976). Picryl chloride forms dark-red needles of $\text{NPh}_2\text{SO}_3\text{H} \cdot (\text{NO}_2)_2\text{Cl}$ [66°] (Herr, *B* 23, 2540)

Reactions—1 When passed through a red-hot tube it yields carbazole, aniline, benzene, and NH_3 (Graebe, *A* 174, 177)—2 COCl_2 forms NPh_2COCl (Michler, *B* 8, 1664)—3 ClCO_2Et forms $\text{NPh}_2\text{CO}_2\text{Et}$ [73°]—4 Chlorine in presence of I yields $\text{NH}(\text{C}_6\text{H}_5\text{Cl}_2)$, and finally $\text{C}_6\text{H}_5\text{Cl}_2$ (Ruoff, *B* 9, 1488)—5 Bromine and I yield tetra-, hexa-, octo-, and deca-bromo-diphenylamines (Gessner, *B* 9, 1506)—6 Alkaline KMnO_4 yields oxalic acid, a resin, and a substance $\text{C}_{12}\text{H}_9\text{N}_2$, crystallising in yellow needles [176°–180°], which yields quinone on oxidation by MnO_2 and conc. HNO_3 , may be reduced to *p*-phenylene-di-phenyl-diamine [185°], and yields a (hexa ?)-bromo-

derivative [248°] (Bandrowski, *M* 7, 375, 8, 475, 9, 418) —7 Yields acridine on warming with AlCl_3 and chloroform HOAc and ZnCl_2 give methylacridine, and other acids act in like manner —8. PCl_5 and ZnCl_2 at 250° yield $\text{C}_{12}\text{H}_9\text{NPO}$, a white powder (Michaelis, *B* 21, 1504, *A* 260, 89) —9 *Acrolein* in alcoholic solution forms $(\text{C}_6\text{H}_5\text{N})_2\text{C}_2\text{H}_4$, an amorphous powder, sol chloroform, capable of combining with Br (Leeds, *B* 16, 1158, *A C J* 4, 32) —10 Heated with oxalic acid it gives diphenylamine blue —11 Heated with sulphur it gives imido-di-phenyl sulphide —12. HNO_3 forms a hexa-nitro-derivative which decomposes carbonates

Salts — B^+HCl^- needles (from alcohol), decomposed by water — $\text{B}^+\text{H SO}_4^-$ [125°] Insol ether and benzene, decomposed by water — Benzene sulphate [117°] —Toluene *p*-sulphonate [64°] (Norton, *Am.* 10, 129, 140)

Formyl derivative $\text{C}_6\text{H}_5\text{NO}$ *see* NPh, CHO [74°] Formed by heating diphenylamine with oxalic or formic acid (Willm & Girard, *B* 8, 1195) Insol water, sol benzene and alcohol Yields acridine on heating with ZnCl_2 .

Acetyl derivative NPh, Ac [108°] Plates (from ligroin), sol. hot water Yields NPh, Bz on heating with BzCl (Pictet, *B* 23, 3013) PCl_5 followed by water forms an acid $\text{C}_6\text{H}_4\text{ONPh}$, aq and an oil converted by alcoholic NH_3 into $\text{C}_{12}\text{H}_9\text{N}_2\text{O}$ [186°] (Claus, *B* 14, 2367)

Thio-acetyl derivative NPh, CS CH₃ [111°] Formed by heating *u*-di-phenyl-acetamide with CS_2 at 100° (*B*) Tables, sl sol water, v e sol ether

Benzoyl derivative NPh, Bz [177°] Formed from diphenylamine and BzCl (Hofmann, *A* 132, 166, Bernthsen, *A* 192, 13, 224, 12, Wallach, *A* 214, 235), and also by the action of Ph, N COCl on benzene in presence of AlCl_3 (Lellmann & Bonhöffer, *B* 19, 3231) Trimetric needles, *a b c* = 950 1 324 Sl sol ether and water, m sol hot alcohol

p-Toluyyl derivative. [155°]

Di-methyl-benzoyl derivative [43 1] $\text{C}_6\text{H}_4\text{Me}_2\text{CONPh}$ [136°] Formed from *o*-xylene, NPh, COCl, and AlCl_3 (Lellmann, *B* 20, 2119)

Nitrosamine NPh, NO [66 5°] Yellow four-sided tables (from benzene-alcohol) (Witt, *B* 8, 855, Fischer, *A* 190, 174) Yields azophenine when heated with aniline and aniline hydrochloride at 120° Its hydrochloride heated with *p* bromo-aniline at 80° yields tetra-bromo-azophenine $\text{C}_{12}\text{H}_8\text{Br}_4\text{N}_2$ [243°] (Ikuta, *A* 243, 285) On heating with aniline it yields PhN, $\text{C}_6\text{H}_4\text{NH}_2$, PhN, NPh, and diphenylamine by heating with alcoholic HCl it is converted into nitroso-diphenylamine.

Tri-phenyl-amine $\text{C}_6\text{H}_5\text{N}$ *see* NPh, Mol w 246. [127°]. Formed by dissolving K or Na in aniline or diphenylamine and digesting the product with bromo-benzene (Merz & Weith, *B* 6, 1514, Heydnich, *B* 18, 2156) Monoclinic crystals (from ether), *a b c* = 991 1: 412, β = 88° 38' Sl. sol hot alcohol, m sol benzene. Does not form salts. AcCl at 100° gives a greenish substance. Cold conc. H_2SO_4 gives a violet colour, changing to blue. Benzotrichloride and ZnCl_2 give a green colouring matter on heating *A* solution in

HOAc is coloured green by a little HNO_3 . Chlorine and I yield $\text{N}(\text{C}_6\text{Cl}_5)_3$, and finally C_6Cl_5 (Ruoff, *B* 9, 1438)

Isomeride of triphenylamine. $\text{C}_{12}\text{H}_9\text{N}$ Got by distilling the compound of cinnamic aldehyde with $(\text{NH}_4)_2\text{HSO}_4$ (Gössmann, *A* 100, 57) Liquid, volatile in a current of H at 140°–140°, sl sol. water, v sol alcohol and ether Forms unstable salts, decomposed by water and alcohol EtI yields B^+EtI^- , whence moist Ag_2O yields only B^+EtOH^- , while platinum chloride forms $\text{B}^+\text{Et}_2\text{PtCl}_4^-$ — $\text{B}^+\text{H}_2\text{PtCl}_4^-$ monometric crystals — $\text{B}^+\text{PtCl}_4^-$

References — AMIDO, DIBROMO, BROMO-NITRO-, CHLORO, CHLORO NITRO-, NITRO, and OXY, DIPHENYLAMINE

DIPHENYLAMINE SULPHONIC ACID $\text{C}_6\text{H}_5\text{NHSO}_3$ *see* NHPH $\text{C}_6\text{H}_5\text{SO}_3\text{H}$ [200°]. Formed, together with the disulphonic acid, by heating diphenylamine with H_2SO_4 at 160° (Merz & Weith, *B* 5, 283, 6, 1512) Formed also by heating NPh, HSO_3H , at 190° for 2 hours (Vignon, *C R* 107, 263) Crystalline mass, becoming blue in air — KA' plates — BaA'_2 plates, sl sol water — PbA'_2 nodules, sl sol water

Diphenylamine disulphonic acid $\text{NH}(\text{C}_6\text{H}_4\text{SO}_3\text{H})_2$ — BaA'_2 2aq nodules, v e sol water Hydrolysed by HCl aq at 200° (Girard, *Bl* [2] 23, 2)

Diphenylamine disulphonic acid $\text{C}_6\text{H}_5(\text{NHPH})(\text{SO}_3\text{H})_2$ [12 4] Formed from bromobenzene disulphonic acid and aniline in glycerol (Fischer, *B* 24 3807) V e sol aq — BaA'_2 3aq

Anilide $\text{C}_6\text{H}_5(\text{NHPH})(\text{SO}_2\text{NHPH})_2$ [223°] Yellowish crystals, insol water

Triphenylamine trisulphonic acid $\text{N}(\text{C}_6\text{H}_4\text{SO}_3\text{H})_3$ Formed by adding powdered triphenylamine to fuming H_2SO_4 at 60° (Herz, *B* 23, 2541) — $\text{Na}_3\text{A}'''$ crystalline powder (from 95 p c alcohol), v e sol water, insol alcohol

PHENYL-AMMELINE *v* Cyanuric acid in the article CYANIC ACID

PHENYL-AMYL-AMINE *see* AMYL ANILINE Di-phenyl-isomyl-amine $\text{NPh}_2\text{C}_6\text{H}_{11}$ [330°–340°] Formed from diphenylamine, amyl alcohol, and HCl (Girard, *Bl* [2] 23, 2) Gives a blue colouring matter when heated with oxalic acid and H_2SO_4

DIPHENYL-DI-ISOMYL-TETRAZINE $\text{NPh}(\text{C}_6\text{H}_{11})\text{N}$, $\text{NPh}(\text{C}_6\text{H}_{11})$ [86 5°] Formed from phenyl isomyl hydrazine in ether and HgO (Michaelis & Philips, *A* 252, 286) Yellowish crystals

PHENYL-AMYLENE CHPh CHPr (210°–215°) Formed by passing bromine vapour into amyl benzene at 150° and distilling the product (Schramm, *A* 218, 392) Yields a dibromide [54°]

Phenyl-isomylene CHPh CHPr (201°) at 787 mm S G \approx 878 Made in like manner from isomyl-benzene (*S*) Yields a dibromide [129°]

Phenyl-amylene CHPhEt CH CH_3 (173°) S G \approx 846 Formed by boiling $\text{CHPhEt.C}_6\text{H}_5\text{Br}$ with water or alcoholic potash (Dafert, *M* 4, 621). Liquid, readily converted into the polymeride C_6H_5 , (208°–213°), S G \approx 96°, V D. 10.2 (calc 10.1).

DI-PHENYL-AMYLENE DIKETONE $(\text{C}_6\text{H}_5\text{CO CH}_2\text{CH}_2)_2\text{CH}_2$ *see* Di-benzoyl-pentane. [68°]. Formed by the action of boiling KOH is

MeOH on $\text{CH}_2\text{Bz CH}_2\text{CH}_2\text{CH}_2\text{CHBz CO}_2\text{Et}$, which is got from sodium benzoyl-acetic ether and phenyl-bromo-butylketone (Kipping, W H Perkin, jun, *O J* 55, 849) Long colourless needles, insol. water, m. sol. cold alcohol

Ds. osm [176°]. Small needles

PHENYL-ISOAMYL-HYDRAZINE

$\text{NPh}(\text{C}_6\text{H}_5)_2\text{NH}_2$ (260°) Formed from iso-amyl bromide and sodium phenyl-hydrazine in benzene (Michaelis & Philips, *A* 252, 284) Reduces warm Fehling's solution. Ac_2O yields $\text{NPh}(\text{C}_6\text{H}_5)_2\text{NHAc}$ [125°] crystallising in scales

DI-PHENYL-AMYLIDENE DISULPHONE $\text{C}_6\text{H}_5(\text{SO}_2\text{Ph})_2$ [181°] Formed from NaOH , $\text{CH}_3(\text{SO}_2\text{Ph})_2$ and EtI (Fromm, *A* 253, 163) Crystalline, v. sol. hot alcohol.

PHENYL AMYL KETONE $\text{C}_6\text{H}_5\text{COCH}_2\text{Pr}$ (240°) at 720 mm Formed by heating isobutyl-benzoyl-acetic ether with dilute alcoholic potash (W H Perkin, jun, a Calman, *C J* 49, 166) Oil, with aromatic odour

PHENYL AMYL KETONE CARBOXYLIC ACID $\text{C}_6\text{H}_5\text{COCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ [82°] Formed by boiling the compound $\text{CH}_2\text{Bz CH}_2\text{CH}_2\text{CH}_2\text{CHBz CO}_2\text{Et}$ with KOH in MeOH (Perkin a Kipping, *C J* 55, 350) Plates (from light petroleum), or needles (from water) Yields an oxim [75°] Ag^+ amorphous pp

Isomerides, *vo. i* p 482

PHENYL ISOAMYL OXIDE $\text{C}_6\text{H}_5\text{O C}_4\text{H}_9$ (225°) Got from phenol (Cahours, *A* 78, 227)

DI-PHENYL-ISOAMYL-PHOSPHINE OXIDE $\text{P}(\text{C}_6\text{H}_5)_2(\text{C}_4\text{H}_9)_2\text{O}$ [97°] Formed from $\text{PPH}_3\text{C}_4\text{H}_9$ and Ag_2O (Michaelis & Soden, *A* 229, 317) Needles, sol water and ether

DI-PHENYL-ISOAMYL-THIO-SEMICARBAZIDE $\text{C}_6\text{H}_5\text{NPh NHCS NPh}$ [160°] Formed from phenyl isoamyl-hydrazine and phenyl thiocarbimide (Michaelis & Philips, *A* 252, 285) Yellow needles

PHENYL-AMYL-THIO UREA $\text{C}_6\text{H}_5\text{NH}_2\text{N}_2\text{S}$ $\text{NHPh CO NH CH}_2\text{CMe}_2$ [136°] Formed from the corresponding amylamine and phenyl-thiocarbimide (Freund & Lenze, *B* 28, 2868)

PHENYL AMYL UREA $\text{C}_6\text{H}_5\text{NH}_2\text{N}_2\text{O}$ $\text{NHPh CO NH CH}_2\text{CMe}_2$ [155°] Formed from phenyl cyanate and the corresponding amylamine in alcoholic solution (Freund & Lenze, *B* 23, 2867, 24, 2158) White needles

PHENYL-ANGELIC ACID $\text{C}_{11}\text{H}_{12}\text{O}_4$ $\text{CHPh CHEt CO}_2\text{H}$ Mol w 176 [104°] Formed by heating benzoic aldehyde with sodium butyrate and Ac_2O at 100° (Perkin, *C J* 31, 391, 32, 661, 35, 136, *Slocum*, *A* 227, 53) Formed also by heating benzoic aldehyde with butyryl chloride at 125° (Fittig, *A* 153, 364) Needles, v sol ligroin (unlike cinnamic acid) Melts at 81° after having been fused — Ba^+ needles, m sol hot water — Ca^+ — Ag^+ white pp

Chloride $\text{C}_{11}\text{H}_{11}\text{COCl}$ Oil

Amide $\text{C}_{11}\text{H}_{11}\text{CONH}_2$ [128°]

Phenyl-angelic acid

$\text{CHPh CH CH}_2\text{CH}_2\text{CO}_2\text{H}$ Formed from $\text{CHPh CH OH CH CO}_2\text{H}$ by reduction with sodium-amalgam (Perkin, Baeyer & Jackson, *B* 18, 123) Liquid. — Ag^+ white pp

Phenyl-angelic acid $\text{CHPh CH CHMe CO}_2\text{H}$ [110 5°] Formed by boiling the dibasic acid $\text{CHPhBr CH}(\text{CO}_2\text{H})\text{CHMe CO}_2\text{H}$ with water (Penfield, *A* 216, 123), and by distilling $\text{CHPh} \begin{smallmatrix} \text{CH}(\text{CO}_2\text{H}) \\ \text{O} \text{---} \text{CO} \end{smallmatrix} \text{CHMe}$ (Fittig a Liebmman, *A* 255, 262) Plates (from water) — Ba^+ aq. needles, v sol water

Phenyl-angelic acid $\text{CHPh OMe CH}_2\text{CO}_2\text{H}$ [113°] Formed by distilling the lactonic acid $\text{CHPh} \begin{smallmatrix} \text{OMe}(\text{CO}_2\text{H}) \\ \text{O} \text{---} \text{CO} \end{smallmatrix} \text{CH}_2$ (F a L). Thin tables, sl sol water — Ba^+ , groups of needles, sol. water

Phenyl angelic acid Nitrate $\text{C}_6\text{H}_5\text{CHPh CN}$ (c 265°) Formed by heating phenyl-acetonitrile with NaOH and allyl iodide (Buddeberg, *B* 23, 2068) Oil, converted by NaOEt and benzyl chloride into the benzyl derivative $\text{C}_6\text{H}_5\text{CPh}(\text{CH}_2\text{Ph})\text{CN}$ (c 325°)

PHENYL-ANTHRACENE $\text{C}_{20}\text{H}_{12}$, $\text{c c C}_6\text{H}_5\text{Ph}$ [153°] (417°) Formed by heating phenyl-anthranol with zinc-dust (Baeyer, *A* 202, 61), and by the action of chloroform and AlCl_3 on benzene (Friedel, Crafts, a Vincent, *BI* [2] 40, 97; *A Ch.* [6] 1, 495) Leaflets (from alcohol), forming solutions with blue fluorescence Reduced by P and HI to a crystalline dihydride [120°], which is oxidised by CrO_3 in HOAc to phenyl-oxanthranol

PHENYL ANTHRANOL $\text{C}_{16}\text{H}_{10}\text{O}$ c c H $\begin{smallmatrix} \text{CPh} \\ \text{O}(\text{CH}) \end{smallmatrix} \text{C}_6\text{H}_5$ [141°-144°] Formed by dissolving tri phenyl methane *o*-carboxylic acid in H_2SO_4 and ppg with water (Baeyer, *A* 202, 57). Golden needles, sol hot alcohol Its ethereal solution shows greenish yellow fluorescence

Acetyl derivative [166°] Golden needles, turned red by conc KOHaq

PHENYL-TETRAZOLE CPhHN , c c $\text{N} \begin{smallmatrix} \text{N NPh} \\ \text{N CH} \end{smallmatrix} \text{N}$ Formed by heating its carboxylic acid [138°] at 155° (Bladin, *B* 18, 2907) Heavy oil, v sol. alcohol and ether Explodes when strongly heated Sol acids, but reppd on dilution

PHENYL-TRIAZOLE CARBOXYLIC ACID $\text{CH} \begin{smallmatrix} \text{N NPh} \\ \text{N C CO}_2\text{H} \end{smallmatrix}$ [184°]. Formed by boiling

phenyl-hydrazine dicyanide $\text{NH}_2\text{NPh CO}_2\text{NH}$ with formic acid and heating the resulting formyl derivative with alcoholic potash (Bladin, B 23, 3788). Silvery plates (from water).

Methyl ether MeA' [118°] Prisms.

Phenyl-triazole dicarboxylic acid

$\text{CO}_2\text{H C} \begin{smallmatrix} \text{N NPh} \\ \text{N C CO}_2\text{H} \end{smallmatrix}$ Formed by oxidising phenyl-methyl-triazole carboxylic acid with alkaline KMnO_4 (Bladin, B 23, 3785). The free acid is unstable, readily changing to the preceding acid. The acid K and Na salts also readily give off CO_2 .— CuA'' 4aq blue needles.— $\text{Ag}_2\text{A}''$ 3aq? Bulky white pp

Methyl ether MeA'' [167°] Needles

Ethyl ether EtA'' [82°] Needles

Di phenyl-triazole carboxylic acid

$\text{CPh} \begin{smallmatrix} \text{N NPh} \\ \text{N C CO}_2\text{H} \end{smallmatrix}$ Formed by saponification of the nitrile (Bladin, B 22, 797). Crystals (containing EtOH), decomposing at 172° – 182° . V sol. alcohol, m sol ether.— CuA' ,— AgA' white pp

Methyl ether MeA' [159°] Needles

Ethyl ether EtA' [165°] Needles

Nitrile $\text{C}_6\text{H}_5\text{CN}$ [156.5°] Formed from phenyl-hydrazine dicyanide, alcohol, and benzoin aldehyde. Needles, v sol benzene

Amide $\text{C}_6\text{H}_5\text{CONH}_2$ [196°]. Formed from the nitrile by the action of dilute (3 p.c.)

H_2O_2 and KOH aq . Plates (from alcohol) or needles (from water)

Amidozine $\text{C}_6\text{H}_5\text{C}(\text{NOH})\text{NH}_2$ [214°].

Formed from the nitrile and hydroxylamine

(Bladin, B 22, 1752). Prisms (from alcohol)

Yields an acetyl derivative [177°] which yields

$\text{C}_6\text{H}_5\text{Ph} \begin{smallmatrix} \text{N O} \\ \text{N} \end{smallmatrix} \text{CMe}$ [163°], and a benzoyl de

rivative [180°] which yields in like manner

$\text{C}_6\text{H}_5\text{Ph} \begin{smallmatrix} \text{N O} \\ \text{N} \end{smallmatrix} \text{CPh}$ [206°].— B'HCl : crystal

line

PHENYL-TETRAZOLE CARBOXYLIC ACID

$\text{N} \begin{smallmatrix} \text{N NPh} \\ \text{N C CO}_2\text{H} \end{smallmatrix}$ [188°]. Got by saponification

of its nitrile, which is formed by the action of nitrous acid on phenyl-hydrazine dicyanide

(Bladin, B 18, 2907). Colourless needles, v sol

alcohol.— KA' plates, v sol water.— CuA' , 2aq

— AgA' colourless crystalline pp

Methyl ether MeA' [116°]. Plates

Ethyl ether EtA' [74°]. Needles

Amide CN, Ph CO NH_2 [168°] Formed

from the nitrile by treatment with hydrogen

peroxide. Crystals, al sol cold water

Amidozine $\text{CN, Ph C}(\text{NOH})\text{NH}_2$ [177°].

Formed from the nitrile and hydroxylamine

(Bladin, B 22, 1755). Scales, v al sol water.

Yields an acetyl derivative [208°] and a benzoyl

derivative [206°], both crystallising in needles

END OF THE THIRD VOLUME.
